Mr. Domenic B. Vassallo, Chief  
Operating Reactors Branch #2  
Division of Licensing  
Office of Nuclear Reactor Regulation  
U.S. Nuclear Regulatory Commission  
Washington, DC 20555

Subject: Response to Request for Further Information on Previous Response to  
Generic Letter 81-04

Reference: 1) Letter, D. B. Vassallo to J. M. Pilant, dated November 8, 1982

Dear Mr. Vassallo:

This letter is in response to Reference 1. Further information in addition to our previous response to Generic Letter 81-04 is provided below.

## 1. Determining Coolant Inventory Changes

Refer to Attachment A for information requested on determining coolant inventory changes.

## 2. Augmented Inservice Inspection

NUTECH has completed a study of welds in austenitic stainless steel primary coolant piping at CNS where the SRI is used in conjunction with carbon content of the base metals to determine relative susceptibility of the welds.

This report categorizes a majority of the welds ( $> 3"$  diameter) in the Core Spray, Reactor Water Cleanup, Residual Heat Removal and Reactor Recirculation Systems in a highly susceptible region. However, because IGSCC is unconfirmed at CNS (pending the results of analyses being performed on two cracked RWCU samples removed during 1982 outage), the SRI has not been a significant factor in selecting welds for examination.

In view of recent cracking in recirculation systems at several operating BWRs, CNS will examine a selection of welds in a loop of large bore reactor recirculation piping during the 1983 refueling outage. Welds from all ranges of SRI will be examined, with the majority of exams focusing on welds with a SRI  $> 1.20$  without regard to carbon content.

Results will be compared to the findings of the NUTECH study for use in determining future examinations.

A001

3. Augmented ISI of Nonconforming Nonservice Sensitive Piping

CNS considers all nonconforming austenitic stainless steel primary coolant piping to be service sensitive. Therefore, the Augmented ISI of Nonconforming Nonservice Sensitive Piping is not applicable.

4. Augmented ISI of Nonconforming Service Sensitive Piping

a. CNS currently uses an ultrasonic examination procedure developed by General Electric for detecting IGSCC indications within the counter bore area, heat affected zone, fusion zone, weld area and base material area within two thicknesses of the weld. This procedure has been in use at CNS since 1980.

b. General Electric procedure MIGSCC-S752 Rev. 2, "Ultrasonic Examination of Pipe Welds for IGSCC", is available onsite for your review. Important features of this procedure are listed below.

1. Use of miniature size ( $\frac{1}{4}$ ",  $\frac{1}{2}$ ") transducers.
2. Use of calibration standards of the same nominal diameter, material type and schedule as pipe being examined.
3. Use of  $\frac{1}{2}$ " "V" sound path to examine weld and one inch of base material on each accessible side of weld.
4. Angulated scan motion  $45^{\circ}$  in each direction when scanning both transverse and parallel to the weld.
5. Grinding or machining to make weld crown flush with adjoining base metal surfaces is performed where necessary to aid in detection of axial cracks.
6. Use of graphic evaluation of examination data to assist in determination of weld and base metal thickness variations.
7. Training of UT operators and evaluators in specific application of technique, and providing understanding of IGSCC, is a requirement.

c. The minimum requirements for those personnel qualified to GE procedure MIGSCC-S752 Rev. 2 are as follows:

1. All personnel performing, interpreting or evaluating ultrasonic examinations shall be qualified and certified in accordance with SNT-TC-1A (1975 Edition) including Supplement C.
2. All personnel performing ultrasonic examinations shall be certified to at least a Level IT (trainee). The level IT classification is used by I&SE for personnel who have satisfied all the education, training and examination requirements for

certification as a Level I, but have not yet completed all of the work experience requirements. Level IT's shall work only under the immediate technical direction and supervision of a Level II or III. A Level IT shall not conduct independently any examination, interpret any results of an examination, or write a report or examination results. Level I's shall also be used to perform ultrasonic examinations and shall work under the general technical direction and supervision of a Level II or III.

3. All personnel assigned to interpret and evaluate results with respect to applicable codes, standards, specifications and procedures shall be certified to at least Level II.
4. All personnel must be trained on actual weld specimens that exhibit IGSCC.
- d. CNS is examining nonconforming service sensitive piping per the guidelines set forth in General Electric's Service Information Letter (SIL) No. 117, Revision 1, March 1976. The extent of examinations recommended by SIL No. 117, Rev. 1 is as follows:

<u>Piping System</u>	<u>Extent of Examination</u>
Recirculation Bypass	100% of welds
Core Spray System	100% of welds
RHR Shutdown Cooling	100% of welds in one loop
Recirculation System	Select welds per ASME Section XI, 1974 Edition, Summer 1975 Addenda. Welds selected to be examined should be completed during the first 80 month period. For the balance of plant service lifetime, examination shall revert to the schedule in ASME Section XI.
Inservice inspection of austenitic stainless steel pipe runs within the reactor coolant boundary that operate with full coolant (RWCU) during normal reactor operation.	These examinations should be conducted in accordance with the schedule specified in ASME Code, Section XI - Subsection IWB, as required by the applicable flow categories B-F and B-J, with the exception that the required examinations be completed during the first 80 month period. After the first 80 month period the examinations shall revert back to the ASME Section schedule.

- e. The inspection intervals for nonconforming service sensitive piping are presented in two parts:

Part 1: Inspections performed to date.

Part 2: Inspection schedule for future examinations in accordance with GE SIL 117, Rev. 1.

Part 1:

Refer to Attachment B for inspections performed to date.

Part 2:

<u>System</u>	<u>Examinations Scheduled</u>
Recirculation Bypass	1984, 1987, 1997, 2007
Core Spray System	1983, 1986, 1989, 1999
RHR Shutdown Cooling connection to recirculation loops A & B	1983, 1993, 2003, 2013
Recirculation Piping	Selection of welds to be examined during 1983 refueling outage based on SRI numbers. (These inspections are above and beyond minimum inspections recommended in GE SIL 117, Rev. 1, in view of recent cracking in recirculation systems at several operating BWRs.)
RWCU	No examinations scheduled for 1983 refueling outage. Future examinations in accordance with ASME Section XI, 1974 w/S75 Addenda requirements.

- f. Refer to Attachment C for the SRI numbers of welded joints in nonconforming service sensitive pipe.

5. Coolant Leakage

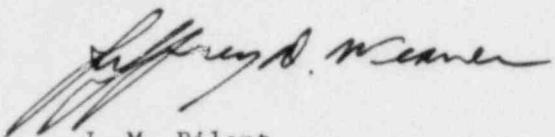

The CNS Final Safety Analysis Report (FSAR) establishes the allowable unidentified primary coolant leakage rate at 15 gpm. This is based, with adequate margin for contingencies, on the calculated leakage from a crack large enough to propagate rapidly. However, CNS Technical Specifications limit unidentified primary coolant leakage to 5 gpm, which is a factor of three times more conservative than the allowable limit set by the FSAR.

Mr. Domenic B. Vassallo  
December 2, 1982  
Page 5

Plant operating experience has indicated that normal unidentified leakage is less than .5 gpm. The District is confident that the current limit provides sufficient margin for corrective action in the event of a significant primary coolant leak.

Should you have any further questions regarding this response, please contact me.

Sincerely,

J. M. Pilant  
Division Manager of  
Licensing & Quality Assurance

JMP:SSF:1b
