PREFACE

On November 4, 1993 Umetco Minerals Corporation, Rust Geotech Inc. and Roberts & Schaefer Company personnel attended a project kickoff meeting at Umetco Minerals, White Mill Site in Blanding, Utah. Options were discussed for the Uranium tailings unloading, conveying and truck wash system at the White Mesa Mill Facility. Under Umetco Minerals Corporation direction, Roberts & Schaefer Company has investigated and prepared a budget capital cost estimate for first year materials, equipment and installation with a delta cost for second year materials, equipment and installation. Design criteria was discussed and is described later in this document.

SECTION I

OBJECTIVES

As briefly mentioned in the preface, the objective of this report is to provide budget capital costs ($\pm 10\%$) and preliminary general arrangement drawings for the option of truck dump, conveying, and stacking system for the Umetco Minerals Uranium White Mesa disposal site. Following is a more detailed description of the option, its advantage, and estimated capital cost.

Roberts & Schaefer Company has based its design criteria on the information gathered at the site visit and by subsequent phone conversations with Umetco Minerals corporation personnel. The design temperature used was 20 degrees F, the material angle of repose for the conveyor system was established at 35 degrees. The design capacity of the system was based on 610 TPH. The hours of operation of the system was established at (3) eight hour shifts and the haulage was established at (2) 10 hour shifts.

Umetco Minerals in a cooperative effort with Roberts & Schaefer Company have provided an economical way to dump and convey the uranium tailings to the existing cells at the White Mesa site. The placement sequence of the material and the turn around time for the tractor trailer haulage has been considered in the design. The ability to keep haulage equipment undercarriage from contacting the contaminated material dictated the need for a truck dump, and tractor trailer wash station.

SECTION II

SYSTEM DESCRIPTION

Roberts & Schaefer Company has divided the Uranium Tailings waste storage system and truck wash system into first and second year capital cost estimates and operating philosophies.

FIRST YEAR OPERATIONS

The uranium tailings storage system operations start with the unloading of the uranium tailings at the secondary truck dump system. A pad of material is built using the secondary belt feeder and the forty foot starter conveyor. After the completion of the starter pad and the 105 foot radial stacker the secondary system preparation is complete and ready for use as the backup system to the primary unloading system for the first year of operation. The primary system utilizes a 1100 foot field conveyor positioned on the dike between cell #3 and cell #4.

The forty foot starter conveyor (used to set up the secondary system) shall be moved to the end of the 1100 foot field conveyor for use in the preparation of the cell #4 pad. The primary radial stacker and grasshopper transport conveyors shall be placed at the discharge of the 40' starter conveyor. The primary pad will continue to be the storage area for the product being shipped from Monticello, Utah. Only when a the relocation of the mobile conveyors or mechanical malfunction of the system will the secondary storage area be utilized. Roberts & Schaefer Company, with input from Umetco Minerals Corporation have estimated that the pad #4 will be utilized during the first year of operation.

OFF SEASON OPERATIONS & CONSTRUCTION

During the off season (when haulage has stopped) the addition a 600 foot re-locatable conveyor system will be placed into the east end of cell #3, the tail of this conveyor shall be located at the head of the 1100 foot field conveyor and a radial stacker shall be relocated from cell #4 to its new position in cell #3 at the head of the 600 foot re-locatable conveyor. The radial stacker shall be move and grasshoppers added as the storage process continues.

The additional 1000 feet of field conveyor support steel will be placed on the dike between cell #3 and cell #4 leaving a space for the relocation of the head frame during the second year operation.

SECOND YEAR OPERATION

This area is now ready for beginning the second year operation. At some time during the second year of operation an addition to the 1100 foot field conveyor of a 1000 foot field conveyor will be accomplished. This addition will make the field conveyor 2100 foot in length. The starter conveyor used in the first year of operation will be placed at the end

February 24, 1994

of the 2100 foot conveyor in order to start a new pad for the portable equipment. The placement of these portable grasshopper conveyors and the radial stacker should finish the haulage for the second year. Just prior to the completion of the second year (final year) of haulage the emergency space in cell #4 is to be filled with tailings. Coordination with the haulage will need to be considered at this time. An outage of the primary system will be necessary to string the conveyor belting, relocate the head frame and starter conveyor to the west end of cell #3 when the east end of the cell #3 is to its capacity. During this period of time the secondary system shall be available for the storage of material into cell #4.

Details of the capital cost are contained in Section V of this report. The estimated capital cost for this option amounts to **\$2,872,733** for the first year of operation, with an additional **\$186,404** for the second year of operation.

SECTION III

FACILITY DESCRIPTION

The White Mesa Mill disposal site is located approximately 2 miles from Blanding, Utah. The waste product will be hauled approximately twenty miles from the mill tailings site near Monticello, Utah to the White Mesa site. The uranium tailings shall be transported to the site via over-the-highway haul trucks and trailers. The plan incorporates only truck haulage of material to the plant. The unloading system will be shut down over the winter months and the disposal is expected to last two seasons. Design temperature for the plant is 20°F to +105°F. The truck haulage operates 6 days per week, (2) two 10 hours shifts per day. The facility shall operate 6 days per week with three (3) eight hour shifts.

PRODUCTS

The White Mesa facility currently has room in the existing lined cells for the storage of the uranium mine tailings from the Monticello plant site. The uranium tailings have a moisture content that varies from 5% to 30%. The material is sand like with a sieve analysis of 65 to 325 mesh and weighs 2700 pounds per cubic yard.

HAULAGE

All raw materials from the Monticello site are transported to the unloading facility by a fleet of thirty (30) belly dumps and pups tractor-trailers. Each truck trailer shall have the capacity of 28,000 pounds each (gross weight). Tractor-trailers are loaded at the Monticello site by others. The trucks shall deliver material on an approximate 4 minute interval.

TRANSFERS AND HOPPERS

The truck hoppers shall be stainless steel lined with a minimum slope of 60 degrees. The transfer points on the conveyor system shall be equipped with the spray nozzles for the dust suppression of material as needed.

The truck dump station primary and secondary hoppers are constructed of 1/4" mild steel plate lined with stainless steel. A structural steel bridge will be designed between the two truck hoppers. The estimate for bridge is included in the truck dump estimate sheet (1-S-1).

DECONTAMINATION PAD

The tractor trailer decontamination pad shall be a closed loop system. The wash station will have (40) nozzles to accommodate the cleaning of the undercarriage of trucks at an interval of 4 minutes for each unit. The Uranium tailings cleaned from the truck washing shall be recycled through the clariflocculator as indicated on Roberts & Schaefer drawing 6261-FS1. The recycled water shall also be used for transfer station dust suppression.

MOBILE EQUIPMENT

The six (6) "Grasshopper type" transfer conveyors (36' x 105') are capable of 610 TPH with a transfer height of 6 feet at the head end discharge. The conveyors are equipped with a 20 HP TEFC, 480 volt, 3 phase, 60 hertz motor, Dodge shaft mounted reducer with V-belt drive and guard, lagged head pulley, flat bar tail pulley, Dodge pillow block bearings, S/A CEMA "C" roller bearing idlers, 2-ply rubber belting,

The two (2) CRS portable Radial stackers (36" x 105') are capable of 610 TPH. The stackers are equipped with 30 HP TEFC electric motors, Dodge shaft mounted reducers with V-belt drives and guards, lagged head pulley, flat bar tail pulleys, Dodge pillow block bearings, S/A CEMA "C" roller bearing idlers, 2-ply rubber belting, single axle carrier with four (4) 10:00 x 20 tires and rims, air brakes, king pin, manual luffing. Electric traversing includes a 3 HP Dodge gear drive, chains and sprockets, motor mount and electric panel with controls and limit switches, and travel folding head and tail sections.

The Transfer conveyor (36" X 40' starter conveyor) is equipped with a 10 HP TEFC electric motor, Dodge shaft mount reducer, V-belt drive and guard, S/A CEMA "C" roller bearing idlers, 2-ply rubber belting.

Budget quotes for the portable conveyors and stackers have been obtained from Crusher Sales and Rental Inc., Cedar City, Utah.

FIELD CONVEYORS

The field conveyors are supported on steel stringer sections utilizing wood ties as the foundation. Conveyor covers are not included to cover the belt. The conveyor CV-C shall be designed so that it is easily extendible for the second year installation.

The stationary field conveyors will be built on stringer frames supported from wood ties. Conveyor CV-C will be extended from 1100 (first year operation) to 2100 feet (second year operation). The remainder of the field conveyors shall remain the same length throughout the storage process.

SECTION IV

CLARIFICATIONS

CLARIFICATIONS

The following clarifications are presented to establish the basis for Roberts & Schaefer Company's estimated capital cost and to define our understanding of the work. This report is intended to be as responsive as possible and these clarification statements are intended to identify questions and comments regarding the proposed Scope of Work.

- 1) Roberts & Schaefer Company has excluded all earthwork costs.
- 2) The capital cost estimate is based on the conceptual design drawings developed by Roberts & Schaefer Company. Capital costs have been established utilizing historical unit prices for major mechanical equipment, structural steel, and concrete. Costs for piping, platework, and electrical disciplines have been calculated based on projects similar in nature which have been completed by Roberts & Schaefer Company.
- 3) All costs are in fourth quarter 1993 dollars.
- 4) Cost associated with winter construction are excluded.
- 5) Construction labor is assumed to be competitively bid, open shop labor.
- 6) The estimate is based on new equipment purchases. No evaluation for used equipment has been considered.
- 7) Rental rates for the mobile equipment have been received by Crusher Rental & Sales and may be found in the section V of the report.
- 8) Roberts & Schaefer Company based Construction Management costs on historical percentages of projects similar in nature.
- 9) Mobile conveyor and stacker equipment prices are based on F.O.B. Cedar City, Utah. Mobile equipment prices from Crusher Rental and Sales are good 60 days from the issue of this report.
- 10) Pricing for Conveyor covers have not been included in this estimate.
- 11) Roberts & Schaefer Company has not included pricing for geotechnical investigation, site surveying or permits in the capital cost estimate.
- 12) Escalation factor has not been considered in the preparation of the capital cost estimate.

NOTE ▷ : STARTING FROM THE PRIMARY OR SECONDARY FEED CONVEYOR, THIS STRING OF PLACEMENT CONVEYORS SHOWN, REPRESENTS BOTH A PRIMARY AND A SECONDARY PLACEMENT CONVEYING SYSTEM. THE PRIMARY PLACEMENT CONVEYING SYSTEM MAY VARY IN NUMBER OF CONVEYORS FROM ONE TO NINE, AND MAY CONSIST OF ONE OR TWO FIELD CONVEYORS, AND FROM ZERO TO SIX PORTABLE "GRASSHOPPERS", AND EITHER A "STARTER" OR A STACKER. THE LOCATION IN THE STRING

OF ANY ONE OF THESE CONVEYORS MAY VARY, EXCEPT THAT THE STRING ALWAYS ENDS WITH EITHER A "STARTER" OR A STACKER. THE SECONDARY PLACEMENT CONVEYING SYSTEM CONSISTS OF FROM ZERO TO TWO PORTABLE "GRASSHOPPERS" AND EITHER A "STARTER" OR A STACKER. PLEASE REFER TO DRAWING G261-LS.

Subject: Transmittal of Tailings Chemistry Data

Dear Mr. Brice:

Pursuant to the meeting held on October 20, 1993, RUST Geotech is transmitting the following data:

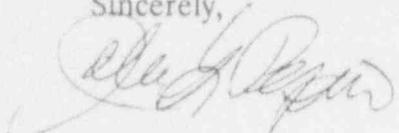

- Monticello Remedial Action Project Analysis of Drilling Data, dated 3/19/87 noting bottom of contamination; and Table 6, Borehole Contamination Summary.
- Bendix Memorandum dated December 3, 1984 results obtained from the Monticello tailings drilling and sampling project with attachments.
- Monticello Mill Tailings Drilling and Sampling Project #00-79-8027.
 - Acid Tailings Pile, dated 5/7/80, pages 1 through 9.
 - Carbonate Tailings Pile, dated 4/17/80, pages 1 through 10.
 - Composite Tailings Samples, dated 6/5/80, page 1 of 1.
 - East Tailings Pile, dated 4/8/80, pages 1 through 23.
 - Special Holes, dated 6/16/80, pages 1 through 5.
 - Vanadium Tailings Pile, dated 5/29/80, pages 1 through 9.
- Monticello Tailings Drilling and Sampling Project drawings BFEC No. NC 193 Drill Hole As Bid, As Drilled, (1) working drawing (no title).
- Allied Signal Memorandums dated:
 - October 30, 1985 - MRAP
 - January 7, 1986 - Water
 - April 10, 1986 - Water Sampling
 - July 8, 1986 - Water Sampling
 - October 6, 1986 - Water Sampling

Mr. W.W. Brice
Page 2
October 28, 1993

- Dames and Moore, Tabular Results from Metals and Radiological Samples, obtained during 1991 investigation, page 1 through 7.

Feel free to contact John Pepin at (801) 587-2615 or Don Leske at (303) 248-6008 regarding any questions you may have.

Sincerely,

John G. Pepin
Area Manager

Subject Results Obtained from the Monticello Tailings Drilling and Sampling Project

The sample analyses and drilling log notes for the 1979 drilling project on the tailings piles were used to determine, for each hole location, the depth to tailings and depth to subsurface material. From chemical analysis of uranium, tailings were assumed to have a U₃O₈ content greater than or equal to 100 parts per million (ppm).

A map of the hole locations with resulting tailings depths and N-S cross sections of the tailings on 100' centers have been produced.

Attached is a listing of the information developed. The forthcoming assessment of radiometric logs should supplement this data, from which volumes of tailings and contaminated subsurface material can be determined.

Bendix
Aerospace

Memorandum

Bendix Field Engineering Corporation
Grand Junction Operations
Grand Junction, Colorado

Date: 30 October 1985

To: S. Wagner and D. Ealey

From: N. Korte *NK*

Subject: MRAP and GJPORAP monitoring

MRAP

January - monitoring plan due.

During FY-1986 plan for semi-annual monitoring with one additional short trip in the summer. We will work out all details of wells and analyses later. During FY-1986 drop from the analytical list Ba, Zn, Fe, Mn and Si.

GJPORAP

Sampling for GJPORAP in FY-1986 will be quarterly. Drop Ba, Zn, Fe, Mn and Si and check with me prior to each trip to determine the number of wells and analyses.

NK/ir

xc: N. Abramiuk
R. Chessmore

Date: January 7, 1986

To: Nic Korte

From: Sandy Wagner SW

Subject: January 1986 Water Sampling, GJPO

The winter water sampling for the GJPO compound is scheduled for January 6-13, depending on the weather. The following sites and analyses listed here are in accord with various conversations and information given in regard to this sampling.

All well locations and surface water sites (listed below) will be analyzed for: As, Mo, Se, V, U, Na, K, Ca, Mg, Cl, SO₄, NO₃, PO₄, and Ra-226 (starred sites only); physical parameters: pH, Eh, temp., CDT, alkalinity, and DTW. Two 125-ml samples should be adequate for these analyses, one liter additional for the Ra analysis.

The RCRA samples will be slightly modified from last year. Those parameters required are: Cl, Mn, Fe, Na, SO₄, phenols, TOC, TOX, Ra-226. pH and CDT are also required. Four replicate readings of each of these physical parameters will be taken and recorded on the field log sheet. Additional analyses will require the collection of two extra liters, one filtered and acidified and the other taken directly from the well as is.

Five additional Gunnison River samples will be collected and analyzed for the same parameters as were done in the October 1985 sampling (As, Mo, V, Se, U).

Date: April 10, 1986
To: Nic Korte
From: Sandy Wagner SW
Subject: April 1986 Water Sampling, GJPO

The spring water sampling for the GJPO compound is scheduled for April 14-18, depending on the weather. The following sites and analyses listed here are in accord with various conversations and information given in regard to this sampling.

All well locations and surface water sites (list attached) will be analyzed for: As, Mo, Se, V, U, Na, K, Ca, Mg, Cl, SO₄, NO₃, PO₄, and Ra-226 (starred sites only); physical parameters: pH, Eh, temp., CDT, alkalinity, and DTW. Two 125-ml samples should be adequate for these analyses, one liter additional for the Ra analysis.

An unfiltered, acidified sample for metals (125 ml) should be collected for all RCRA wells. These samples should then be digested and analyzed for As, Se, U, Mn, Fe, Na in addition to the analysis of the filtered sample for the same parameters.

Additional samples for speciation of organics will be collected from well 13-16N (S): VOA, acids, B/N, plus identification [PCBs (\$175), VOA (\$200), acids (\$250), B/N (\$375)] of any other peaks.

The RCRA samples will be slightly modified from last year. Those parameters required are: Cl, Mn, Fe, Na, SO₄, phenols, TOC, TOX, Ra-226. Four replicate readings of each of the physical parameters (ph and CDT) will be taken and recorded on the field log sheet. TOC and TOX will also be run in quadruplicate.

Memorandum

Bendix Field Engineering Corporation
Grand Junction Operations
Grand Junction, Colorado

Date: July 8, 1986
To: Dennis Ealey
From: Sandy Wagner SW
Subject: July 1986 Water Sampling, GJPO

The summer water sampling for the GJPO compound is scheduled for July 14-18, depending on the weather. The following sites and analyses listed here are given in regard to this sampling:

All well locations and surface water sites (list attached) will be analyzed for: As, Mo, Se, V, U, Na, K, Ca, Mg, Cl, SO₄, NO₃, PO₄, and Ra-226 (starred sites only); physical parameters: pH, Eh, temp., CDT, alkalinity, and DTW. Two 125-ml samples should be adequate for these analyses, one liter additional for the Ra analysis.

An unfiltered, acidified sample for metals (1000 ml) should be collected for all RCRA wells. These samples should then be digested and analyzed for As, Se, U, Mn, Fe, Na for total metals.

Additional samples for speciation of organics will be collected from wells 13-16N(S), P-7, 10-19N, GJ84-5: VOA, B/N, plus identification of any other peaks.

The RCRA parameters required are: Cl, Mn, Fe, Na, SO₄, phenols, TOC, TOX, Ra-226. Four replicate readings of each of the physical parameters (pH and CDT) will be taken and recorded on the field log sheet. TOC and TOX will also be run in quadruplicate.

The required sampling bottles for the analyses requested are as follows:

Size	Bottle Type	Preservative	Filtered	Analysis
125 ml	poly	nitric acid	yes	metals, dissolved
1000 ml	poly	nitric acid	no	metals, total
125 ml	poly	4° C	yes	anions, dissolved
1 liter	poly	nitric acid	yes	Ra-226
1 liter	glass	1.0 ml H ₂ SO ₄	no	TOC & phenols
1 liter	glass	none 4° C	no	TOX
1 liter	glass	none 4° C	no	B/N
40-ml vial	glass	none 4° C	no	VOAs

Please collect the organic samples (VOA, B/N) with the bladder pump fitted with Teflon tubing, if possible. Otherwise, use the Teflon bailers.

also 125 ml with HgSO₄ for nitrate

Dennis Ealey
Page 2
July 8, 1986

Ship the B/N and VOA samples out overnight delivery to get to RMAL before Friday (18th).

Mitch has prepared QC samples for all parameters. Please submit them as a field sample. A minimum of 10% of the samples shall be collected as blind duplicates.

Grand Junction, Colorado

Date: September 19, 1986
To: Dennis Ealey
From: Sandy Wagner SW
Subject: October 1986 Water Sampling, GJPO

The fall water sampling effort for the GJPO compound is scheduled for October 6-10, depending on the weather and personnel available. The following sites and analyses listed here are given in regard to this sampling:

All well locations and surface water sites (list attached) will be analyzed for dissolved metals: As, Mo, Se, V, U, Na, K, Ca, Mg; (anions): Cl, SO₄, NO₃, PO₄; and Ra-226 (starred sites only); physical parameters: pH, Eh, temp., CDT, alkalinity, and DTW.

An unfiltered, acidified sample for metals (1000 ml) should be collected for all RCRA wells identified on the attached list. These samples should then be digested and analyzed for total metals: As, Se, U, Mn, Fe, and Na--check EPA SW-846 methods.

The RCRA parameters required are: Cl, Mn, Fe, Na, SO₄, phenols, TOC, TOX, Ra-226. Four replicate readings of each of the physical parameters (pH and CDT) will be taken and recorded on the field log sheet. TOC and TOX will also be run in quadruplicate.

The required sampling bottles for the analyses requested are as follows:

Size	Bottle Type	Preservative	Filtered	Analysis
125 ml	poly	sulfuric	yes	nitrate
125 ml	poly	nitric acid	yes	metals, dissolved
1000 ml	poly	nitric acid	no	metals, total
125 ml	poly	4° C	yes	anions, dissolved
1 liter	poly	nitric acid	yes	Ra-226
1 liter	glass	1.0 ml H ₂ SO ₄	no	TOC & phenols
1 liter	glass	none 4° C	no	TOX

Mary has completed a well log list with depths to screen from top of casing. Mitch has prepared QC samples and trip blanks for all parameters. Please submit them as field samples. A minimum of 10% of the samples shall be collected as blind duplicates.

Dennis Ealey

Subject: OCTOBER 1986 WATER SAMPLING, GJPO

The quarterly sampling of the ground and surface water at the Grand Junction Project Office was completed on October 6 thru October 13. See the attached list for sample numbers and sample sites.

The procedures as listed in the "Environmental Sciences Procedure Manual" were used.

All wells with the exception of GJ84-10 and GJ84-11 were sampled with a masterflex portable pump model 7549 and purged with a masterflex model 7570. GJ84-10 and 11 were sampled with the new Fultz pump. All RCRA analysis for organics were sampled with a teflon bailer.

There were six wells sampled in duplicate, one Q.C. sample, two equipment blanks and one trip blank. See attached list for sites and sample numbers.

Wells P-1-B and P-2-B were dry and well GJ84-7 has been removed because the property is scheduled to be sold.

All depth to water were measured from the top of the well casing.
