SUMMARY

OYSTER CREEK NUCLEAR GENERATING STATION

1982-2 SEMIANNUAL EFFLUENT RELEASE REPORT

The Semiannual Effluent Release Report is submitted to the United States Nuclear Regulatory Commission (NRC) every six months in accordance with the Oyster Creek Nuclear Generating Station (OCNGS) Technical Specifications. It summarizes the radioactive liquid and gaseous effluents released and solid radioactive wastes shipped from the OCNGS. In addition, it describes the results of environmental measurements undertaken to determine the effects of such radioactive releases to the environment. Samples were collected of environmental media such as air, sediment, surface water, well water, soil, precipitation, vegetation, and shellfish. These media are sampled on a routine basis at semimonthly, monthly and/or quarterly frequencies at 37 locations. The annual magnitude of effort to collect and analyze the environmental samples is in excess of four man years at a cost exceeding \$200,000.00. This report concludes that exposures to man from OCNGS radioactive effluents are well below the federal limits contained in Title 10, Part 50 of the Code of Federal Regulations and are considered by the NRC to be within acceptable limits in protecting the health and welfare of the public.

For clarity, the report is organized into three parts. Section I provides a summary of plant operations for the reporting period. OCNGS operated approximately 191 days between June through December.

Section II summarizes the meteorological data and effluents released from the facility. It itemizes stack releases of  $1.07 \times 10^4$  curies of fission and activation gases, 4.74 curies of Tritium, 2.17 curies of non-particulate halogens, and  $5.72 \times 10^{-1}$  curies of particulates. In addition,  $1.26 \times 10^{-4}$  curies of fission and activation products,  $5.61 \times 10^{-3}$  curies of dissolved gases, and 1.05 curies of Tritium were released in 5 batch liquid releases. Section II also itemizes  $1.29 \times 10^3$  curies of radioactivity contained in 552 cubic meters of waste shipped offsite in 49 shipments, as well as  $4.53 \times 10^2$  curies of radioactivity contained in 17 cubic meters of irradiated material which were shipped offsite in 6 shipments. These releases are similar to or less than releases of nuclear plants of comparable type, age, and size. The report underscores the fact that all effluents released were within the federal regulatory requirements of OCNGS Technical Specifications.

Section III summarizes the results of the Radiological Environmental Monitoring Program (REMP). This section concludes that no radioactive levels in the environment were attributable to facility operations for the reporting period. Natural radioactivity and weapon testing fallout were considered the causes of slightly higher than background readings, where detected. All levels of radioactivity in the environment fall well within the acceptable levels considered by the NRC to safeguard the health and welfare of the general public.

I. INTRODUCTION

## I. INTRODUCTION

The Oyster Creek Nuclear Generating Station has generated electricity since December, 1969. The operating license permits station operation up to a power level of 1930 megawatts (thermal) at a leveled, installed annual capacity of 620 megawatts (electrical). A more detailed description of the facility can be obtained from the Final Environmental Statement.

This report is submitted in accordance with Section 6.9.3 of the Technical Specifications - Appendix A of the Oyster Creek Unit Number 1 Provisional Operating License, DPR-16. Section I includes a brief summary of the plant status from June 1, 1982 through December 31, 1982. This summary reports dates of reactor scrams, controlled reactor shutdowns, reactor startups, and selected reactor power levels.

Section II follows the format of USNRC Regulatory Guide 1.21 for the provision of summaries of OCNGS gaseous effluents, liquid effluents and solid waste offsite shipments. In addition, this section provides information on meteorological data for the reporting period of July 1, 1982 through December 31, 1982. A description of the meteorological data collection system is provided, as well as joint frequency distribution tables for the various stability classes (in USNRC Regulatory Guide 1.21 format) and cumulative wind roses.

Section III provides a summary of the Oyster Creek Radiological Environmental Monitoring Program and its associated sampling data for the reporting period of June 1, 1982 through November 30, 1982 as

required by section 4.6.B(3) of the Technical Specifications - Appendix A. Radiological Environmental data are presented as recommended in proposed USNRC Regulatory Guide 4.8. This section also correlates plant effluent releases to radiological environmental data.

PLANT OPERATIONS SUMMARY

June 1, 1982	Operating at Approximately 63% Rated Power
June 4, 1982	Reactor Scram
June 5, 1982	Reactor Startup
June 15, 1982	Operating at Approximately 76% Rated Power
June 30, 1982	Operating at Approximately 75% Rated Power
July 15, 1982	Operating at Approximately 69% Rated Power
July 31, 1982	Operating at Approximately 65% Rated Power
August 15, 1982	Reactor Shutdown
August 29, 1982	Reactor Startup
August 31, 1982	Operating at Approximately 69% Rated Power
September 15, 1982	Operating at Approximately 60% Rated Power
September 30, 1982	Operating at Approximately 56% Rated Power
October 15, 1982	Operating at Approximately 53% Rated Power
October 31, 1982	Operating at Approximately 50% Rated Power
November 15, 1982	Operating at Approximately 47% Rated Power
November 30, 1982	Operating at Approximately 44% Rated Power
December 10, 1982	Reactor Shutdown
December 20, 1982	Reactor Startup
December 31, 1982	Operating at Approximately 41% Rated Power

II. EFFLUENT AND WASTE DISPOSAL SUMMARY

## EFFLUENT AND WASTE DISPOSAL SUMMARY

### A. Gaseous Effluents

During the reporting period, July 1, 1982 through December 31, 1982, a total of 1.07 E4 curies of fission and activation gases, 1.46 E-1 curies of non-particulate halogens (iodines) with half-lives greater than eight days, 5.30 E-2 curies of particulates with half-lives greater than eight days, and 4.74 curies of tritium were released. Totals include effluents released from both the elevated stack and the ground-level radwaste vent. The maximum hourly release rate of gross activity from the stack was 4.16 E3 microcuries per second which occurred at approximately 1300 hours on July 26, 1982. The airborne releases are summarized in Tables 1 through 4.

### B. Liquid Effluents

A total of 2.11 E7 liters of water was processed through the radwaste system. Of this, 3.58 E5 liters containing 1.05 curies of activity were released to the environment. The maximum concentration of gross radioactivity (beta-gamma) released to the unrestricted area (average over the period of release) was 3.29 E-8 microcuries per milliliter on October 10, 1982. The liquid releases are summarized in Tables 5 and 6.

### C. Solid

During the reporting period, a total volume of 5.69 E2 cubic meters of solid waste containing 1.75 E3 curies of activity was shipped off site in 55 shipments. No irradiated fuel was shipped. The solid waste shipments are summarized in Table 7.

D. Meteorological Data

During the reporting period, onsite meteorological conditions were monitored and recorded. Joint frequency distribution of 116 meter (380 feet) and 10 meter (33 feet) wind speed and direction per atmospheric stability class per quarter is summarized. Also included are cumulative wind roses for 10 meter (33 feet) and 116 meter (380 feet). The meteorological data are summarized in Tables 8 through 13.

EFFLUENT AND WASTE DISPOSAL SEMIANNUAL REPORT

SUPPLEMENTAL INFORMATION

FACILITY - Oyster Creek Nuclear Generating Station

LICENSEE - Jersey Central Power & Light Company

1. Regulatory Limits

a. Fission and Activation Gases:

Technical Specification 3.6.A.1

$$Q = \frac{0.21}{E} \text{ Ci/sec}$$

b. Iodines and particulates, halflives > 8 days:

Technical Specification 3.6.A2

4 uCi/sec

c. Liquid Effluents:

Technical Specification 3.6.B.1

Maximum permissible concentrations,

Appendix B, Table II, Column 2

of 10 CFR 20.

2. Maximum Permissible Concentrations (MPC)

a. Fission and Activation Gases:

1. Third Quarter - 2.80 E-3 uCi/cc

2. Fourth Quarter - 2.93 E-3 uCi/cc

b. Iodines and Particulates:

1. Third Quarter - 4.21 E-8 uCi/cc

2. Fourth Quarter - 4.21 E-8 uCi/cc

c. Liquid Effluents:

From Appendix B, Table II, Column 2, of  
10 CFR 20

(NOTE: MPC's for isotopes detected listed below)

Unit - uCi/ml

H-3 3 E-3

Co-60 5 E-5

Sr-89 3 E-6

Xe-133 3 E-6

Xe-135 3 E-6

Cs-137 2 E-5

Ce-143 4 E-5

3. Average Energy

a. Third Quarter - 7.77 E-1 MeV

b. Fourth Quarter - 7.55 E-1 MeV

4. Measurements and Approximation of Total Radioactivity

a. Fission and Activation Gases:

The incorporation of a weekly grab sample analysis using gamma ray spectrometry with a GeLi Detector, a conversion factor and the continuous recording of the stack effluent on a continuous activity monitor.

b. Iodines:

Semi-weekly sample analysis using gamma ray spectrometry with a GeLi Detector.

c. Particulates:

Semi-weekly sample analysis using gamma ray spectrometry with a GeLi Detector, low background beta counter, internal proportional beta counter, and a single channel gamma counter.

d. Liquid Effluents:

Analysis per batch release using gamma ray spectrometry with a GeLi Detector, a low background beta counter, and a liquid scintillation counter.

Analysis of Error Associated with the Measurement of Radioactive

Materials in Effluents and Solid Wastes

Effluents

All stages of the production of effluent estimates have been assigned an upwardly conservative error potential. Stages include sample collection, radiochemical analysis, and compilation of the effluent estimation process. The use of these error factors assures that facility effluents will not be underestimated.

Solid Waste

The process by which the levels of radioactive materials in solid wastes are estimated is one which requires conservatism throughout. Representative sample analyses and/or surface contamination surveys are combined with estimates of waste volume to provide the level of radioactive materials in solid wastes. Upwardly conservative techniques are used in all phases of this process to assure that the amount of radioactive material in solid wastes are not underestimated.

5. Batch Releases

a. Liquid

1. Number of batch releases:

- a. Third Quarter - 4 releases
- b. Fourth Quarter - 1 release

2. Total time period for batch releases:

- a. Third Quarter - 4.97 E2 minutes
- b. Fourth Quarter - 2.70 E2 minutes

3. Maximum time period for a batch release:

- a. Third Quarter - 1.40 E2 minutes
- b. Fourth Quarter - 2.70 E2 minutes

4. Average time period for a batch release:

- a. Third Quarter - 1.24 E2 minutes
- b. Fourth Quarter - 2.70 E2 minutes

5. Minimum time period for a batch release:

- a. Third Quarter - 1.05 E2 minutes
- b. Fourth Quarter - 2.70 E2 minutes

6. Average stream flow during periods of release of effluent in a flowing stream:

- a. Third Quarter - 2.75 E6 liters/minute
- b. Fourth Quarter - 2.38 E6 liters/minute

6. Abnormal Releases

a. Liquid

1. Number of releases:

None

2. Total activity released:

Not Applicable

b. Gaseous

1. Number of releases:

None

2. Total activity released:

Not Applicable

Meteorological Data

Abstract

The Oyster Creek Nuclear Generating Station obtains meteorological data from the Forked River meteorological instrument tower. The tower is 400 feet tall and located approximately west-northwest of the site at a distance of 2529 feet from the stack. The following instrumentation is located on the tower:

---

HEIGHT OF INSTRUMENT ABOVE GROUND (feet)	INSTRUMENT
33	Wind Speed
	Wind Direction
	Temperature
	Dew Point
150	Wind Speed
	Wind Direction
	Temperature
380	Wind Speed
	Wind Direction
	Temperature
	Dew Point

There are redundant wind speed, wind direction, and temperature sensors at the 33 and 380 foot levels to insure an efficient amount of data recovery and to comply with regulatory requirements. In addition, a

processor calculates temperature differentials ( $\Delta T$ ) between (150-33)- and (380-33)-foot levels. These data are then stored in the on-site computer and are used to determine atmospheric stability and, in turn, atmospheric dispersion. Some of the previously mentioned parameters are also monitored at the Oyster Creek Control Room (380' level wind speed and direction, and the 380-33'  $\Delta T$ ).

The meteorological tower sensors, chart recorders, and processors are calibrated four times a year, according to the proposed U.S. Nuclear Regulatory Commission Regulatory Guide 1.23. Periodic tower inspections are done to insure maximum data integrity . Table 13 shows the monthly Oyster Creek Meteorological Tower data recovery for the six month period from July through December of 1982. Meteorological data are an integral part of the off-site dose assessment program. Occasionally lower percentages of data recovery, as in the month of September, are the result of sensor, computer hardware, and chart recorder malfunctions.

#### Data Analysis

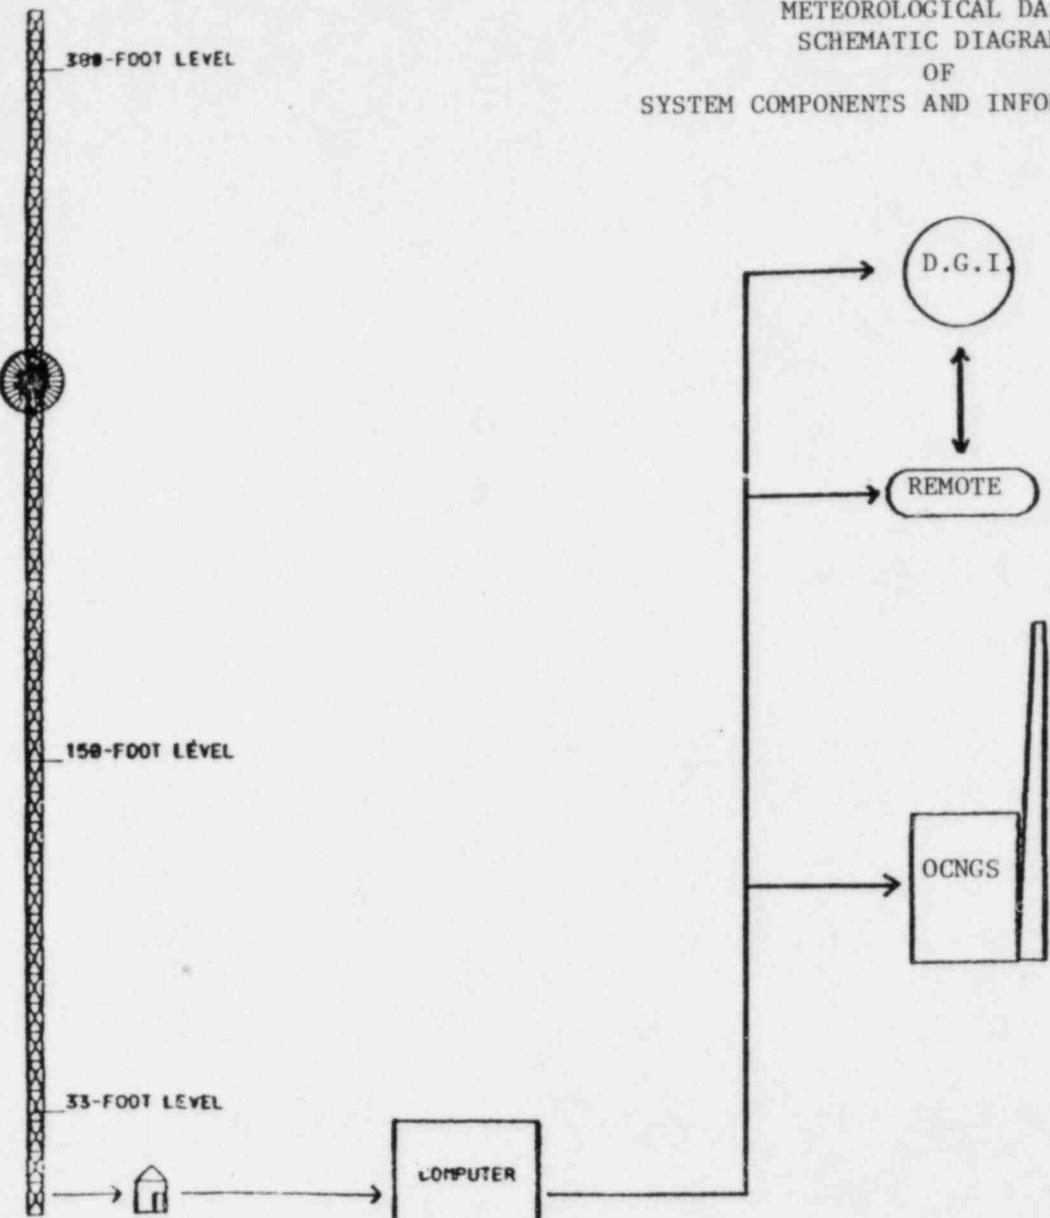

Tables 9 through 12 are the joint frequency distribution tables for the various stability classes as described in U.S. Nuclear Regulatory Commission Reg. Guide 1.21. These atmospheric stability classes are defined in Table 8. Joint frequency tables are represented in Figures 2 and 3 as cumulative semi-annual wind roses. Figures 2 and 3 represent wind roses at the 33-foot and 380-foot levels, respectively. The predominant wind directions are from the northwest, west, and southwest. According to Critchfield (1974) the reason for the diversity of wind directions is a result of changing seasonal heat budget at different

latitudes. During the summer season, the prevailing winds are generally from the southwest. In late fall and winter the prevailing winds are generally from the west and northwest. Obviously, with a large representative data set over such a relatively long period of time, any relatively small weather feature producing infrequent wind directions such as sea breezes and extratropical storms will fail to appear in the cumulative six-month wind roses. For example, the common daytime summer seabreeze creates an easterly wind with high atmospheric stability and thereby suppresses major effluent plume dispersion. This thermally-induced phenomenon disappears at night and ushers the return of normal climatologically prevailing winds.

Precipitation for the period was below normal (12.24 inches). Normal 6-month rainfall is about 21 inches. Rainfall events were primarily due to extratropical storms of light to medium intensity and long duration or violent convective uplift in the form of showers and thunderstorms. This condition is characteristic of heavy rainfall intensity of relatively short duration. Generally, the heavier the intensity (convective showers) the greater the particulate fallout (washout) from the atmosphere which has implications for radionuclide deposition. Such convective showers are characteristic of late spring and summer weather patterns. Suppression of these summer precipitation events so close to the ocean is accomplished by the previously mentioned seabreeze effect. It is common for the showers to build up to the west, move east-northeast, but become stagnant and eventually decay up to 12 miles inland due to the highly stable seabreeze.

III. RADIOLOGICAL ENVIRONMENTAL SUMMARY

### SECTION III - RADIOLOGICAL ENVIRONMENTAL SUMMARY

#### Radiological Environmental Monitoring Program

##### Introduction

The Radiological Environmental Monitoring Program was conducted during the reporting period in accordance with Technical Specification 4.6.B.3. The Technical Specifications, which refer to the Application for Reactor License, Docket No. 50-219, Amendment No. 65, require five general types of monitoring: (1) atmospheric radiation, (2) fallout, (3) domestic water, (4) surface water, and (5) marine life. This monitoring was accomplished by collecting samples from the various environmental media at sample collection stations as outlined in Table 14 and Figures 4 and 5.

Specifically, film badges and thermoluminescent dosimeters (TLDs) were analyzed for immersion dose. Particulate filters, air iodine cartridges, precipitation, vegetation, soil, and crops were analyzed for atmospheric radiation and fallout. Well water, surface water, aquatic sediment, and clams, as well as the aforementioned media, were analyzed because of their close association with either plant effluents and/or man's consumption. All results from these analyses are reported in Tables 15 through 18.

Film badges used during the reporting period were inadvertently exposed to gamma radiation in transit. As a result, the high levels of exposure are not representative of environmental radiation levels and in no way represent environmental impact of OCNGS operation. Thermoluminescent dosimeters reflect environmental exposures.

### Sampling Techniques

This sampling process is conducted around the OCNGS as described below:

<u>Environmental Media/Pathway</u>	<u>Mode of Sampling</u>
Atmosphere/direct radiation, inhalation	Composite of Air Particulates on filter
	Adsorption of air iodines on charcoal filter
Atmosphere/direct radiation	TLD/Film Badge
Surface Water/ingestion	Grab Sample
Well Water/ingestion	Grab Sample
Precipitation/direct radiation	Composite
Vegetation, Crops/ingestion	Grab
Soil/direct radiation	Grab
Aquatic Sediment/direct radiation	Grab
Shellfish/ingestion	Grab

All samples collected are processed and packed at an offsite lab near the OCNGS, then shipped to the vendor laboratories by overland courier for analysis. Vendor laboratories prepare samples as instructed by the Oyster Creek Environmental Controls Department. Radiochemical analyses are then performed by vendor laboratory, and results are sent to the Oyster Creek Environmental Controls Department.

Data

Tables 15 through 20 represent a summary of all radiological environmental data for the reporting period. Tables 18, 19, and 20 present the data in the manner prescribed in proposed USNRC Regulatory Guide 4.8 and USNRC Branch Technical Position.

TABLE 17

RADIOLOGICAL ENVIRONMENTAL MONITORING PROGRAM SUMMARY  
 OYSTER CREEK NUCLEAR GENERATING STATION  
 JUNE, 1982 THROUGH NOVEMBER, 1982

THE FOLLOWING PAGES ARE A SUMMARY OF REMP DATA FOR THE SCHEDULED COLLECTION PERIOD JUNE, 1982 THRU NOVEMBER, 1982. DATA IS SUMMARIZED ON A SEMI-ANNUAL AND QUARTERLY BASIS, WHERE

- 1.) XXX-MEAN(N/TOTAL); MEAN AND RANGE BASED ON RANGE DETECTABLE ACTIVITIES OF ALL XXX STATIONS
- 2.) XXX=BACKGROUND OR INDICATOR STATIONS
- 3.) (N/TOTAL)=FRACTION OF DETECTABLE ACTIVITIES/ TOTAL NUMBER OF ANALYSES PERFORMED
- 4.) STATION=STATION WITH HIGHEST SEMI-ANNUAL MEAN
- 5.) BACKGROUND STATIONS USED ARE:

STATION	A,C,H	31
SAMPLE TYPE	AIR PARTICULATE	SEDIMENT
	AIR IODINE	CLAMS
	PRECIPITATION	SURFACE WATER

- 6.) IN ADDITION, THE FOLLOWING FOOD PRODUCTS WERE SAMPLED FOR GAMMA ISOTOPIC CONTENT DURING THE SUMMER MONTHS:

SAMPLE TYPE	STATION
CORN	1,2,3,4,C
CABBAGE	1,C
TOMATOES	2,3,4,5,A,H
CUCUMBERS	5
GREEN BEANS	A,H

#### ANALYSIS OF DATA

A statistical analysis was performed on each analytical result during the reporting period according to sample type, station, and analysis to determine which results, if any, were outside the normal or expected range of environmental activities. These ranges were based upon historical data amassed from Oyster Creek's Radiological Environmental Monitoring Program surveys from past years. While these "higher-than-expected" results are somewhat elevated, they are in no way considered to be abnormal. Except where noted, elevated results were not attributed to plant effluents and were, in most cases, naturally occurring isotopes. A discussion of the elevated results follows.

Gamma spectroscopy analysis of air particulate filters revealed higher than usual amounts of K-40 at both indicator and background stations during five of the six months in the sampling period. Since K-40 is a naturally occurring isotope found in a variety of environmental media, the excessive amount on air particulate filters is presumed to be due to dust loading, especially in those sampling locations (e.g. Station 3) near sandy areas. Elevated amounts of K-40 were also found in pasture samples collected during July at Stations 28 and 29 (also adjacent to sandy areas). K-40 is also found in many types of plants which, in conjunction with the sand, accounts for these elevated results. Surface water samples analyzed for gamma-emitting isotopes during the reporting period also showed infrequent elevated activity of K-40, as did soil samples that were collected. Soil and aquatic sediment samples also showed some slightly higher than normal amounts of Ra-226 and Th-232,

both naturally occurring isotopes and not considered to be related to facility effluents. Elevated gross beta activity in both soil and aquatic sediment during the reporting period can be attributed to the elevated K-40, a beta- as well as a gamma-emitter. Ra-226 has a history of being found in regional groundwaters, along with other uranium daughters, which explains the elevated amount of Ra-226 found at well water stations 19 and 21 collected during October. It is also believed to account for elevated gross alpha activity at Stations 19 and 21 during the same time period. Finally, Be-7 was detected in several media during the six-month sampling period. Elevated amounts were detected in air and aquatic sediment. Being of cosmic origin, the presence of this isotope is not considered to be due to plant operations.

Several fission-product isotopes were detected in various media throughout the reporting period. However, these were either not plant-related and/or already documented. Cs-137 was detected in soil and air particulate samples collected at Station 1 during the fourth quarter. However, no appreciable quantities of this isotope were released from Oyster Creek during the reporting period. Additionally, predominant winds were to the northeast, while Station 1 lies southwest of the plant. For these reasons the Cs-137 detected at station 1 is not considered to be facility-related. For the same reason, a marginally elevated amount of Co-60 at Station 1 is not considered to be due to plant effluents.

During the month of September, Cs-137 was detected in soil at Station 3. Since no appreciable quantities of Cs-137 were released from the plant during this time, this result is not considered to be related to plant operations.

The presence of several gamma-emitting isotopes found in aquatic sediment in Oyster Creek's discharge canal has already been documented in previous semiannual reports, as well as other publications (Olson et al, 1980). For this reason, Mn-54 activity (June) and Cs-137 activity (August and September) detected at Station 32 at the mouth of the discharge canal are not considered to be abnormal.

An air particulate filter collected at Station A during September revealed a slightly elevated concentration of Sr-89. Similarly, Station C exhibited higher than normal gross alpha activity and Station H had elevated tritium concentration in precipitation in October. All of these stations are background stations and are outside the influence of Oyster Creek. Therefore, these elevated levels of activity are not related to plant operations. Tritium activity in precipitation collected at Station 2 was observed to be slightly higher than normal. However, as has been previously mentioned, this same condition occurred at a background station (Station H) during the same time period and is therefore not considered to be plant related.

A clam sample collected from Station 24 in Barnegat Bay during October exhibited an elevated gross alpha activity. Station 24 lies just east of the Oyster Creek discharge canal. Since some radionuclides have previously been detected in sediment in the discharge canal, the

potential exists that some may find their way, in small quantities, to Barnegat Bay. Any isotopic concentrations in the bay would be concentrated by the clams (Mercenaria mercenaria), themselves being filter feeders. It is possible, then, that this biological characteristic of the clam accounts for the occasionally elevated gross alpha activity.

Finally, a minutely elevated gross beta (soluble) activity was measured in a surface water sample collected at Station 25 during November. The activity measured was 294 pCi/liter while the maximum predicted activity for this station was 292 pCi/liter. With a ten per cent analytical error associated with this analysis, the difference between the measured and expected activity is not considered to be statistically significant and therefore the activity not considered to be abnormal.

In conclusion, no concentrations of radioactivity in the environs of Oyster Creek were found to be abnormal during the reporting period.

## RADIOLOGICAL IMPACT ON MAN

Two principle exposure pathways, inhalation and ingestion, are available to gaseous and liquid effluent isotopes, respectively, in the vicinity of Oyster Creek. Intakes via the inhalation pathway are from gaseous effluents, while the ingestion pathway is via consumption of shellfish from Oyster Creek's discharge canal and Barnegat Bay and consumption of garden vegetables. Additionally, a third means of exposure is from direct radiation from Oyster Creek effluents. The maximum hypothetical exposure to any individual from liquid pathways would occur to someone standing at the offsite boundary on the shore of the discharge canal (direct exposure) consuming shellfish (ingestion). For purposes of this report this hypothetical individual is designated as Receptor #1. Maximum exposure due to gaseous pathways (inhalation, ingestion, and direct radiation) would depend on the predominant wind direction and the location of persons living in a given sector with respect to the plant. The direction and distance for this individual is given in Tables 21 and 22.

The following tables represent the offsite dose summary for the two quarters of the six-month reporting period. The information provided was calculated using the models and methodology outlined in NRC Regulatory Guide 1.109 and proposed NRC Regulatory Guide 1.111. The analysis herein represents the maximum hypothetical liquid and gaseous pathway individual doses (Tables 21, 22, and 23). Also included are the appropriate dose

limits as given in 10CFR50, Appendix I, the age group, and the receptor location. The semiannual estimated dose and percent of applicable limit complete the offsite dose assessment of maximum hypothetical doses for the semiannual period.

For both quarterly periods, the maximum individual exposures resulting from OCNGS operation from all pathways are well below the USNRC limits of 10 CFR 50, Appendix I and in turn, concentrations in environmental media were well below 1% of concentrations in 10 CFR 20, Appendix B, Table II. It should be noted that such low offsite doses are probably the result of 1) the average reactor power level being only 60% of full rated power and 2) the efficient operation of the augmented off-gas system (AOG) during the period.

Federal regulation 40 CFR 190 requires that doses to any real person from uranium fuel cycle activities (including nuclear power plants) will not exceed 25 mrem/year for the whole body and other organs, with the exception of 75 mrem/year for the thyroid. Dose limits were well below those of 40 CFR 190.

TABLE 21
