## Summary

The Vitrification Facility Steam/Condensate System (63SC) receives steam from the Main Plant Utility Room and distributes it to various components, instrument racks, and systems within the Vitrification Facility and Cold Chemical Building for heating, educting, and purging. Steam is also directed to the Waste Tank Farm Equipment Shelter. Condensate collected in the piping system is returned to the Utility Room boilers for steam generation.

The system begins where the Main Plant steam header meets the Vitrification Facility main steam line at the 113 ft. elevation of the Vitrification Facility. The Utility Room steam supply delivered to the Vitrification Facility is 150 psig under nominal conditions. With the exception of the steam line to the Vitrification Cell tank bubblers and the Waste Tank Farm Equipment Shelter, steam pressure is reduced to 100 psig for distribution throughout the facility.

Main Plant Operations is responsible for operation and maintenance of the Main Plant Steam/Condensate System.

## 1.0 SYSTEM FUNCTIONS & DESIGN CRITERIA

### 1.1 Functions

The functions of the Vitrification Facility Steam/Condensate System are to receive steam from the Main Plant Utility Room and to distribute it within the Vitrification Facility and Cold Chemical Building for steam heating, steam educting, and steam purging. Steam is also diverted to the Waste Tank Farm Equipment Shelter. Condensation formed in the steam piping system is collected with steam traps and returned to the Main Plant boilers for steam generation. Regulating steam to individual components or systems is controlled by the component or system being supplied.

### 1.2 Design Criteria

The Vitrification Facility Steam/Condensate System shall be designed to the requirements stated in DC-022 and the "Operational Safety Design Criteria Manual", ID-12044.

The design life of the Steam/Condensate System shall be seven years.

#### 1.2.1 Process Requirements

Steam shall be supplied from the Plant Utility Room Boilers to the Vitrification Facility at nominal pressure of 150 psig. The steam shall be distributed to the Vit Facility User via a system of welded carbon or stainless steel pipes. Protection traps (drip traps) shall be provided throughout the steam supply system to remove steam condensate and air. The condensate shall be collected and returned to steam generating plant for reprocessing. The steam user shall provide process traps or other means to accommodate the process condensate and/or steam. Condensate collected at process traps shall also be returned to the plant.

#### 1.2.2 Structural Requirement

The Vitrification Steam/Condensate System shall be constructed of welded carbon steel or stainless steel pipes. Construction of piping shall comply with ASME B31.3 and with the Uniform Building Code.

#### 1.2.3 Essential Features

The condensate shall be gravity fed to a Condensate Collection Sump and pumped to a Condensate Return Header that takes it back to the steam generating plant.

Condensate shall be monitored for radioactive contamination prior to return to the Main Plant Utility Room.

Pressure Reduction Stations shall be designed into the steam distribution system, when they are appropriate for general usage.

1.2.4 Maintenance and Inspection

Provisions shall be made for the yearly calibration of pressure gauges.

Provisions shall be made for monthly inspections of the protection steam traps (Drip Traps) and replacement if they have failed.

Provisions shall be made for the quarterly greasing of condensate pumps.

Provision shall be made for bi-yearly inspection and maintenance of all steam traps.

1.2.5 Instrumentation and Control

Adequate instrumentation and control shall be provided to verify, set, and maintain necessary steam pressure to Vitrification Facility, Cold Chemical Building systems and components, and the WTF Equipment Shelter.

1.2.6 Interfacing Systems

The VF Steam/Condensate System has direct interfaces to the following systems:

System 8 (Waste Tank Farm)

System 31 (Plant Steam)

System 63G (Waste Header)

System 63H (Off-Gas & Vessel Vent)

System 63I (Main Process)

System 63J (Canister Decontamination)

System 65 (VF Cold Chemical)

System 67 (VF HVAC)

System 69B (VF Sample Transfer)

### 1.2.7 Quality Assurance

The Quality Assurance requirements for this system shall be in accordance with NQA-1 and the West Valley Nuclear Services Quality Assurance Program Plan.

### 1.2.8 Reliability Assurance

Operational reliability shall be achieved by adherence to WVNS Standard Operating Procedures and Periodic Maintenance Procedures. Special attention shall be given to the installation and maintenance of the protection traps, so that the user receives steam devoid of excessive condensate.

### 1.2.9 Safety Classes and Quality Levels

Safety Classes and Quality Levels are in accordance with Quality Management Manuals WVDP 002, Section 2, "Organization" and Section 3, "Quality Assurance Program." (see paragraph 2.6 for component levels)

### 1.2.10 Codes and Standards

ANSI/ASME B31.3 - Chemical Plant and Petroleum Refinery Piping

ANSI/ASME NQA-1 - Quality Assurance Program Requirements

MIL-STD-45662A - Calibration, System Requirements

## 2.0 DESIGN DESCRIPTION

### (Background)

Steam is produced in the Main Plant Utility Room by one or both of the gas-fired boilers, 31F-1 and 31F-1A. Boilers are nominally rated at 40,000 lbs. per hour of steam at 150 psig. Boilers are "A" type with one steam drum on top and two water drums below and have a rapid response time to sudden changes in steam loads. Boiler feed is made from softened and chemically-treated utility water. Steam is delivered from the Main Plant to the Vitrification Facility in a six-inch header at 150 psig.

Vitrification and Cold Chemical condensate return to the Main Plant Utility Room via the Vitrification Facility Condensate Collection Sump for use as boiler feed. The condensate is monitored for radioactive contamination prior to collection in the Vitrification Facility Condensate Collection Sump and once again in the Main Plant Utility Room prior to use as boiler feed.

## 2.1 Functional Description

The Vitrification Steam and Condensate System (63SC) receives steam from the Main Plant Utility Room and distributes it to the steam user components within the Vitrification Building and the Cold Chemical Building. Pressure Reduction Stations are deployed where lower pressure steam is required for a block of users. The system further traps the steam condensate and returns it to the main plant.

### 2.1.1 Distribution

Steam is channeled to the user with an array of pipes and tubing, while the flow is controlled with a diversity of valves that either direct the flow, reduce the pressure, isolate components or modulate the flow for the user. Section 2.2 addresses the physical path to each steam user. Steam is also provided to Utility Stations, located throughout the two buildings, for general purpose usage (see paragraph 2.2.13 for further information on utility stations). As steam is distributed to the user it expends some of its energy and forms condensate in the distribution pipes. This condensate is removed with Drip Traps. When the user transfers steam energy to the process (i.e. warms the air through a heat exchanger) the steam turns to condensate which is removed with a Process Trap. Protection or drip traps are employed upstream of the user components and process traps downstream of the user. The condensate from the traps is channeled to the Condensate Collection Sump, pumped to the condensate header and returned to the main plant for reprocessing. A radiation monitor samples the condensate before it enters the sump. If the radiation level exceeds the threshold, the monitor sets an alarm in the Vit Control Room, and further action will be initiated by the operator. Not all user processes, such as the steam jets, can collect the condensate with process traps. These users must be able to absorb the condensate within the process and accommodate any remaining steam with the ventilation system. In either case, the user is responsible for the operation and performance of any equipment inside the user interface. Section 2.2 identifies the interfaces with the user.

### 2.1.2 Steam Usage

During vitrification steam is used for the following processes:

- A. to purge bubbler tubes in the CFMT and MFHT
- B. to heat slurries in the CFMT,
- C. to heat decon fluids in the Canister Decon Tank and Decon Preparation Tanks,

- D. to heat the Vit Building air with heater units 67-V001,
- E. to heat the Cold Chem Building with Area Heaters,
- F. to heat demineralized water with heater unit DW-E-040, and
- G. to transfer fluids and slurries, between in-cell tanks and headers, via steam jet eductors.

### 2.1.3 Other

Steam is also provided to the Waste Tank Farm via a header that interfaces with the main steam line in the Vitrification Building, upstream of the 63SC system interface valve. Although this user is not part of the vitrification systems, a description of the user components and interfaces located in the Vit Building are included in this document. The steam is used for area heaters in the Waste Tank Farm Equipment Shelter.

## 2.2 Physical Description

The Vitrification Facility Steam and Condensate System (63SC) is a steam distribution and condensate collection system comprised mainly of piping, valves, steam traps and pressure instruments.

Steam is delivered from the Main Plant Utility Room by a six-inch header, 15-SH-181-6, that enters the facility in the south end of the Middle East Operating Aisle (MEOA) at the 113.7 ft. elevation. Once inside the Vitrification Facility, but prior to the VF steam system interface valve, 6-SH-H-140, a two inch line branches off to the Waste Tank Farm Equipment Shelter. Downstream of the Vit System interface valve, a second 150 psig steam drop is deployed before a pressure reduction station reduces the header pressure to 100 psig. From this point the main steam header, 6-SH-6-005A, is directed to the utility pipe rack in the Upper East Operating Aisle (UEOA). The rack and the steam header then traverses the east, north and west upper operating aisles (UEOA, UNOA, and UWOA respectively) supplying steam to the remaining users in the Vitrification Building and the Cold Chemical Building through nine additional drops from the steam header.

Condensate collected at various traps located in the VF and Cold Chemical Building gravity drains to the Condensate Collection Sump, located at the 100 ft. elevation, in the Southwest corner of the Vitrification Facility. The top of the sump is at floor elevation 100 ft. Sump dimensions are approximately 5 ft. in diameter and 8 ft. deep. The sump has a stainless steel liner and a capacity of 1,165 gallons.

Back-flow prevention across the zone 1 boundaries, from contaminated areas (in-cell) to clean areas (ex-cell), has been incorporated in the design through the use of check valves, isolation valves, and a positive pressure differential that maintains an ex-cell to in-cell flow pattern (see P&ID's for piping details). Further, any steam use by in-cell components is automatically followed with a utility air purge. This process prevents the formation of negative pressure in the user steam pipes that could be produced by a rapid drop in steam temperature below 100°C.

A Radiation Monitor, located West of the sump, and comprised of a gamma scintillation detector, heat exchanger and pump, is used to monitor the condensate for radioactive contamination before it is collected in the sump. Condensate is pumped from the sump, with pumps SC-G-10 and/or SC-G-11, to the three-inch condensate header (6-SC-3-001), and then dispatched to the Main Plant Utility Room via line 15-SCL-276-3.

The following paragraphs describe the drops from the steam header, and the services provided through these drops. The tables identify the user, the interface points, the process traps and other pertinent steam usage data. User interface points are upstream of the steam input interface valves and downstream of the process condensate valves. Flow rates and usage data are engineering estimates used to determine the steam interface requirements presented in section 2.4. Refer to the user system description for details on the user steam applications. Paragraph 2.2.13 summarizes information on the Utility Stations and paragraph 2.2.14 identifies the protection traps and their location in the system.

**NOTE:** The instrument racks in the vitrification building are tagged with alphanumeric identifiers (i.e. 2E9), consisting of the floor level (1, 2 or 3), the floor location (E, N or W) and the rack sequence number (1 through 10). Dash numbers (-7A) provide a reference to old rack designator and are not part of the tag number. Tag and dash numbers (2E9-7A) are used in this document for consistency with the designations used in the P&IDs.

#### 2.2.1 Drop #(undefined)

The first drop is initiated with line 6-SH-2-102 and activated with valve 6-SH-H-179, located in the MEOA. After passing a steam main drip trap the line exits the Vit Building and goes to the Waste Tank Farm.

Non-Rack - MEOA - P&ID 905-D-047 S01+S03

Interface Pt Steam/Condst	User System Proc. Trap	User Application	Stm Press Flow Rate	Operations per Period
6-SH-GL-103 TBD	System 8 TBD	Heaters, Waste Tank Farm Shelter	150 psig TBD	Six Months per Year

2.2.2 Drop #(undefined)

The second 150 psig drop is initiated through line 6-SH-2-004 and activated with valve 6-SH-H-007, located in the MEOA. The drop provides steam to Instrument Rack 3W8 to purge the tubes of the CFMT and MFHT bubbler systems. The following table summarizes the pertinent system/interface data for each user on this drop.

Instrument Rack - 3W8 - P&ID 905-D-045 S21

2.2.3 Drop #(undefined)

The third drop is initiated from the 100 psig header with line 6-SH-2-501 and activated with valve 6-SH-H-501. This drop provides steam to three utility outlets, which are located in the Crane Maintenance Room (CMR), the Transfer Tunnel and the Crane Maintenance Operating Aisle (CMOA). Manual controls for each outlet are located in the CMOA. Pertinent data for these stations are provided in section 2.2.13 and P&ID 905-D-028.

2.2.4 Drop #(undefined)

The fourth drop is initiated with line 6-SH-1-015, located in the MEOA, and activated with valve 6-SH-GT-91. From here the steam pressure and flow rate is adjusted to provide the proper number of calories to heat exchanger 6-DW-E-040, to heat Demineralized Water to 180° F.

Non-Rack - MEOA - P&ID 905-D-047 S01

2.2.5 Drop #(undefined)

The fifth drop is initiated with line 6-SH-1 1/2-020 and activate with valve 6-SH-GL-023, Which is located in the UEOA. The drop provides steam to Instrument Rack 3E10 for user applications listed in the following table.

Instrument Rack - 3E10 - P&ID 905-D-045 S18

2.2.6 Drop #1

The sixth drop, identified as drop #1 on the P&ID, is initiated with line 6-SH-3-093 and activated with valve 6-SH-GL-009, which is located in the UEOA. This drop provides steam to three Utility Stations, Instrument Rack 2E9-8, and the Vitification Building Ventilation Supply Air Handling Unit (AH-67-V001) which is located in the UNOA. Utility Stations are summarized in section 2.2.13, steam provided to the Instrument Rack 2E9-8 (P&ID 905-D-045 S06) is not used, and the steam to the HVAC Unit is PLC controlled to heat the

air in the building. The following table summarizes the HVAC data.

Non-Rack - MEOA - P&ID 905-D-047 S03

2.2.7 Drop #3

The seventh drop is initiated with line 6-SH-3-008 and capped in the UNOA.

2.2.8 Drop #4

The eighth drop is initiated with line 6-SH-3-089 and activated with valve 6-SH-GL-016, which is located in the UNOA. It supplies steam to Instrument Rack 2N6-5 and, through a non-rack station in the UNOA, to the Melter. Instrument Rack provides steam to an inductor for the North Sump, while the non-rack supplies steam to clean the melter viewing port. The following tables provide pertinent interface data with the user.

Instrument Rack - 2N6-5 - P&ID 905-D-045 S04

2.2.9 Drop #5

The ninth drop is initiated with line 6-SH-3-011 and activated with valve 6-SH-GL-013, which is located in the UWOA. The drop provides steam to two Utility Stations and three Instrument Racks. Data on Utility Stations is summarized in section 2.2.13, while the pertinent interface data for the Instrument Racks is summarized in the following tables. The table for Instrument Rack 3W7 and 2W5 were combined since the steam input to the CFMT side heating/cooling coils comes through rack 2W5 and exits to the condensate sump through rack 3W7 (This is the only steam input to rack 2W5).

2.2.10 Drop #6

The tenth drop is initiated with line 6-SH-3-012 and capped in the UWOA.

2.2.11 Drop #(undefined)

The eleventh drop is initiated with line 6-SH-3-401 and activated with valve 6-SH-GL-401, which is located in the UWOA, and supplies steam to the Cold Chemical Building. Once in the Cold Chemical Building line 6-SH-1 1/2-402 branches off to the Steam Eductors, and line 6-SH-3-405 proceeds to a steam pressure reducing valve, where the pressure is dropped to 25 psig. The 25 psig steam is distributed to two Utility Stations, two Decon Tanks, three heater coils to heat make-up air, and five Area Heaters. The Steam Eductors operate suction Wands that are used to add liquid chemicals to the

Decon Tanks and Slurry Tanks respectively, the Utility Stations supply steam for general purpose use as required by the user, the Decon Tanks use steam jackets to heat the chemicals in the tanks, and the space/make-up heaters use steam to heat the building. Pertinent interface data for the Utility Stations is summarized in section 2.2.13, while the interfaces and uses for the other steam users are summarized in the tables below.

Cold Chemical Building - P&ID 905-D-018

2.2.12 Drop #7

The twelfth drop is initiated with line 6-SH-3-013 and activated with valve 6-SH-GL-015, which is located in the UWOA. This drop provides steam to three Utility Stations and four Instrument Racks. Pertinent information on the Utility Stations is provided in section 2.2.13, while the tables below summarize interface and other data for the instrument Racks. Input and output for the CFMT bottom heating/cooling coils are divided between Rack 3W2-1A and 3W1, and the data has been combined into one table.

2.2.13 Utility Stations

Utility Stations provide steam throughout the vitrification facility for general purpose and intermittent usage. Their usage is out of the ordinary and often unpredictable. Utility Stations located in the Vitrification Building are provided with steam at 100 psig, while the Stations in the Cold Chemical Building are provided with 25 psig steam. The following table summarizes the location, line and valve number for the Utility Stations connected to the Vitrification Facility Steam System.

Utility Stations

Location	Line Number	Valve Number
Vit Bldg, Drop-U, CMR	6-SH-1-505	6-SH-GL-508
Vit Bldg, Drop-U, Transfer Tunnel	6-SH-1-507	6-SH-GL-507
Vit Bldg, Drop-U, CMOA	6-SH-1-506	6-SH-GL-509
Vit Bldg, Drop-1, UEOA	6-SH-1-062	6-SH-GL-074
Vit Bldg, Drop-1, MEOA	6-SH-1-063	6-SH-GL-075

2.2.14 Protection Traps

The following table identifies the safety traps in the steam distribution system. These drip traps are used to remove condensate from the distribution pipes before the steam is deployed by the user process. Condensate line numbers followed by a "CH" drain directly to the condensate return header, line numbers followed by a "DR" release the condensate to the facility drain system, all other condensate lines drain to the Condensate Collection Sump (SC-D-001) located in the LWOA.

Steam System Protection Traps

Location	User Component(s)	Trap Number	Condensate Line
1st Drop, MEOA	Waste Tank Farm	6-SH-T-181	6-SC-1/2-113 CH

2.3 Component Descriptions

Radiation Monitor Skid:

6-SC-E-001 (Heat Exch.) - Young Radiator Co. baffled heat exchanger. Procured as part of the Off-Line Radiation Monitor Skid package.

RE-0102 (Rad. Monitor) - Victoreen, model 943-36 or equivalent, gamma scintillation detector including NaI scintillation crystal, photomultiplier tube, preamplifier assembly, cabling, and power supply. The detector housing is carbon-steel. Operating temperature is 32-122°F. Power is +1400 VDC max. at 500 microamps.

SC-G-12 (Pump) - Price Pump Co. stainless-steel, centrifugal motor pump. Procured as part of the Off-Line Radiation Monitor Skid package.

Condensate Sump Pumps:

SC-G-10. SC-G-11 - Aurora pump, model 532 or equivalent, 7 1/2 hp, 3 phase, semi-open propeller, iron construction, 60 gpm, 125' head, 1,750 rpm.

Protection Traps:

SH-T-607, SH-T-616,  
SH-T-625, SH-T-631,  
SH-T-635, SH-T-661,  
SH-T-663, SH-T-666,  
SH-T-680, SH-T-684,  
SH-T-696, SH-T-705. Spirax Sarco, Inc. Thermodynamic Steam Trap, model TD-S-52 with socket weld ends, blow down valve and integral strainer. Maximum operating pressure - 600 psi  
Maximum operating temperature - 800°F

SH-T-423, SH-T-424,  
SH-T-425, SH-T-432,  
SH-T-433. Armstrong Cast Iron Bucket Trap, model 880 with integral strainer. Maximum operating pressure - 150 psi

SH-T-008, SH-T-147,  
SH-T-152, SH-T-157,  
SH-T-164, SH-T-164,  
SH-T-169, SH-T-174. Spirax Sarco, Inc. Thermodynamic Steam Trap, model TD-S-52 NPT with blow down valve and integral strainer. Maximum operating pressure - 600 psi  
Maximum operating temperature - 800°F

SH-T-006, SH-T-009,  
SH-T-010, SH-T-011,  
SH-T-012, SH-T-013,  
SH-T-177, SH-T-181,  
SH-T-183, SH-T-505. Spirax Sarco, Inc. Thermodynamic Steam Trap, model UTD 30L with socket weld ends, blow down valve and swivel connector. Maximum operating pressure - 450 psi  
Maximum allowable temperature - 725°F

## 2.4 Interface Descriptions

This section summarizes the interface parameters between the VF Steam/Condensate System, it's input source and it's user requirements. The interface points with the source and users, and the components requirements, have been identified in section 2.2, Physical Description. This section only consolidates the user system demands on the VF steam system and the demand of the system on the source during normal Vit Operation.

### 2.4.1 System 8 (Waste Tank Farm)

TBD

### 2.4.2 System 31 (Plant Steam)

During Vit Operation steam is supplied by the Main Plant Utility System to satisfy the requirements of the VF Steam/Condensate System. System input requirements are:

Average usage rate with heaters - 2843 lbs/hr

Average usage rate without heaters - 543 lbs/hr

Intermittent demand rate - 0 to 9250 lbs/hr

Supply pressure - 150 psig

Condensate return rate - TBD

The maximum intermittent demand is based on the premiss that each user system is operating independently and possibly at the same time. With coordination the maximum demand can be reduced to 6500 lbs/hr.

### 2.4.3 System 63G (Waste Header)

Uses steam eductor to reduce fluid level in the South Sumps.

Average usage rate - 2.5 lbs/hr

Maximum flow rate - 1000 lbs/hr

Supply pressure - 100 psig

2.4.4 System 63H (Off-Gas & Vessel Vent)

Uses steam eductors to recirculate the SBS, and move fluid to the Waste Header.

Average usage rate - 5 lbs/hr

Maximum flow rate - 1000 lbs/hr

Supply pressure - 100 psig

2.4.5 System 63I (Main Process)

Uses steam to clear Bubbler Probes, clean Melter Viewing Port, heat CFMT and move Slurry from CFMT to MFHT and SBS to CFMT.

Clear Bubblers in CFMT and MFHT:

Average usage rate - 2.2 lbs/hr

Maximum flow rate - 1000 lbs/hr

Supply pressure - 150 psig

Heat CFMT via side and bottom coils:

Average usage rate - 494 lbs/hr

Maximum flow rate - 2000 lbs/hr

Supply pressure - 100 psig

Clean Melter Viewer:

Average usage rate - 1 lbs/hr

Maximum flow rate - 1000 lbs/hr

Supply pressure - 100 psig

Move Slurry from CFMT to MFHT:

Average usage rate - 5 lbs/hr

Maximum flow rate - 1000 lbs/hr

Move Fluids from SBS to CFMT:

Average usage rate - 9.8 lbs/hr

Maximum flow rate - 1000 lbs/hr

Only the Viewer will be operated simultaneous with the Heater creating requirements of:

Average usage rate - 512 lbs/hr

Maximum flow rate - 3000 lbs/hr

2.4.6 System 63J (Canister Decontamination)

Uses steam to move decon fluids from Canister Decon Tank to Neutralizer Tank to SBS in turn, heat Decon fluid in Canister Decon Tank. These operations are not done simultaneously.

Average usage rate - 16 lbs/hr

Maximum flow rate - 600 lbs/hr

Supply pressure - 100 psig

2.4.7 System 65 (VF Cold Chemical)

Uses steam for Fluid Transfer Wands and Tank Heaters. The usage is independent and separate from each other.

Wand Eductors:

Average usage rate - 0.1 lbs/hr

Maximum flow rate - 750 lbs/hr

Supply pressure - 100 psig

Tank Heaters:

Average usage rate - 0.4 lbs/hr

Maximum flow rate - 200 lbs/hr

Supply pressure - 25 psig

Maximum User Requirements:

Average usage rate - 0.5 lbs/hr

Maximum flow rate - 950 lbs/hr

2.4.8 System 67 (VF HVAC)

Uses steam to heat the Vitrification Building and the Cold Chemical Building during cold weather.

Vit Building:

Average usage rate - 1300 lbs/hr

Maximum flow rate - 2000 lbs/hr

Supply pressure - 100 psig

Cold Chem Building:

Average usage rate - 1000 lbs/hr

Maximum flow rate - 1500 lbs/hr

Supply pressure - 25 psig

Maximum User Requirements:

Average usage rate - 2300 lbs/hr

Maximum flow rate - 3500 lbs/hr

2.4.9 Utility Stations

Steam is available to all stations identified in paragraph 2.2.13. These stations are designed for general purpose usage which is difficult to quantify. A best estimate of their usage is provided below.

Maximum flow rate - 800 lbs/hr

Nominal flow rate - 400 lbs/hr

Estimated usage - 3 hrs/week

Average usage rate - 7.1 lbs/hr

2.4.10 Condensate Return

Condensate, collected by process traps and drip traps in the Condensate Collection System, is returned to the Plant Utility Room. The condensate collection rates are as follows.

Average process trap collection rate - 1.0 gpm

Average protection trap collection rate - TBD

Average heater trap collection rate - 4.6 gpm

2.5 Periodic Test Requirements

Check the protection traps (drip traps) on a monthly schedule to assure that they are not plugged and hot steam is available to the process systems.

2.6 Safety Classes and Quality Levels

Component	Location	Safety Class	Quality Level
Piping	VF, Cold Chemical	N	C
Valves	VF	N	C
Instrumentation	VF, Cold Chemical	N	C
Pumps	VF	N	C

3.0 OPERATIONAL REQUIREMENTS

The Vitrification Facility Steam/Condensate System is a passive distribution and collection system. The system should perform all its required functions without operator intervention. Regulating steam pressure and flow to individual components is controlled by the component or system being supplied.

For information purposes, operation of the Main Plant Steam System is described in SOP-31-2, "Steam Generation."

3.1 Power Outage

During an electrical power outage the Vitrification Facility steam loads are reduced to standby operations. Continuous steam pressure is required to maintain safe fluid levels and temperatures in the process system. Power operated controls are backed by emergency power systems.

Boilers in the Main Plant Utility Room will remain operational during power outages. Refer to SOP 31-2, "Steam Generation."

4.0 LIMITATIONS, PRECAUTIONS, RANGES/SETPOINTS

4.1 Limitations

Relief valve, 6-SH-RV-006, on the Vitrification Facility main steam header will vent to the atmosphere if pressure in the system reaches 180 psig or higher.

4.2 Precautions

After isolating instrument racks to perform maintenance on steam/condensate equipment, block valves must be opened slowly to gradually warm the system.

4.3 Ranges/Setpoints

LSHL-001, LSH-002 (pump controls) -

Pumps SC-G-10 and SC-G-11 run alternately or together to maintain sump levels. The primary pump starts when the level in the sump reaches elevation 96.83 ft. The alternate pump starts when the sump level reaches elevation 97.33 ft. Both pumps shut-off when the sump level drops below elevation 93.83 ft. A high-level alarm, LAH-002, will sound in a local panel if the sump level reaches elevation 98 ft. It is estimated that the pumps will run every half hour during Vitrification Operations.

6-SH-GL-020 (PRV) -

This valve located on the main steam header into the Vitrification Facility is set at 100 psig.

6-SH-RV-006 -

This relief valve located on the main steam header into the Vitrification Facility is set to vent at 180 psig

5.0 CASUALTY EVENTS AND RECOVERY PROCEDURES

WVNS RECORD OF REVISION

DOCUMENT

If there are changes to the controlled document, the revision number increases by one. Indicate changes by one of the following:

- Placing an arrow at the beginning of the sentence or paragraph that was revised
- Placing a vertical black line in the margin adjacent to sentence or paragraph that was revised
- Placing the words GENERAL REVISION at the beginning of the text
- Placing either FC#> or PC#> at the beginning of a field/page change

Example:

The arrow in the margin indicates a change.

The vertical line in the margin indicates a change.

## Summary

The Vitrification Sample Transfer System is a branch line addition and modification to the existing Societe Generale pour les Techni ques Nouvelles (SGN) Pneumatic Sample Transfer System. This branch connection modification consists of the following: a Sample Transfer Cell (STC) installed on the cold face of the Vitrification Cell (for sample preparation before transfer); an SGN slide ring sending unit atop the STC; new transfer tubing from the sending unit to the junction with the existing Supernatant Treatment System (STS) to Process Building pneumatic transfer line; a diverter valve at the junction (to select transfer paths); SGN equipment installed in the Vitrification Facility (VF) to provide for a reverse transfer; and associated control devices with applicable instrumentation, identical to existing, to monitor and control system operation.

Sample transfers from STS will functionally remain the same after the modifications, with the exception that the STS path, one of two transfer path selections, must be made and verified at the start of the transfer sequence.

## 1.0 SYSTEM FUNCTIONS AND DESIGN CRITERIA

The systems' function is to transfer 10 ml radioactive waste, mixture, and product samples from the vitrification hot cell to the analytical laboratory in the Process Building for analysis. Sample access to the laboratory is to be via the existing SGN pneumatic transfer system installed for STS. The modified system must be capable of transporting a sample from either the STS or VF. In case of a system malfunction, the design must allow for returning a sample to the facility from which it originated. The STS system has this capability now and any modification must include the same return sample capability for the VF. Transfer tubing, couplings, pneumatic equipment, control devices, and monitoring instrumentation must be identical to those items installed for the existing system.

### 1.1 Functions

- 1.1.1 Within the STC, accept from the VF hot cell, 10 ml samples each contained within a rounded, glass sample bottle, one inch square by 2 1/4 inches tall, including a cap. As the sample is received, it is dropped into a "rabbit" that is placed in receiving position with a slave manipulator. With the use of the manipulators, the "rabbit" containing the sample is capped and then placed in the storage rack for later transfer, or placed directly into the sending unit for transfer to the analytical laboratory. If any additional decontamination of the sample is required for whatever reason, a demineralized water rinse can be accomplished within the cell.
- 1.1.2 From the Process Building, select the Vitrification transfer path by positioning a switch on control panel CB-10 which sets the diverter valve to the desired transfer path, (STS or VF).
- 1.1.3 Verify on the Process Building control panel CB-10 that the diverter valve is in the proper position. (Selected path indicator light will be illuminated.)
- 1.1.4 Using one of the slave manipulators, place a capped "rabbit" containing a sample in the sending unit chamber.
- 1.1.5 With the foot switch, activate the sending unit to seal the chamber and draw the "rabbit" up into the transfer tube.
- 1.1.6 From the Process Building, activate transfer.
- 1.1.7 After initiating transfer, the "rabbit" is received in the Process Building analytical laboratory hot cell within approximately one minute.
- 1.1.8 "Rabbit" is tracked during transfer with installed passage detectors that energize panel mounted signal lights as the "rabbit" passes each detector.

- 1.1.9 If the "rabbit" is not received, panel mounted lights are to indicate the relative position of the "rabbit" in the transfer line. The first light not lit in the sequence indicates relative position and an audible alarm in the vicinity of the "rabbit" is to sound. (Alarm is tripped by the first passage detector that does not detect the "rabbit".)
- 1.1.10 Once it is determined a "rabbit" has become stuck in the transfer line, the activation of a reverse transfer function must be available from the Process Building. After the "rabbit" is reversed back to the STC in the VF, the system can be returned to the normal mode of operation.

## 1.2 Design Criteria

### 1.2.1 Operational Requirements

- A. The STC, the reverse transfer equipment, the slide ring sending unit, and a portion of the transfer tubing is to operate under indoor temperature conditions. The diverter valve and transfer tubing installed on the roof of the VF are to operate under outdoor ambient temperature conditions at WVDP.
- B. Sample transfers are to be accomplished under negative pressure or vacuum conditions.
- C. Transfer line tubing and the diverter valve installed outside must be maintained at a temperature above the ambient dew point temperature to prevent condensate formation on the inside of tube and valve surfaces. This is to be accomplished by expanding the heat trace system and installing insulation on the new outside tubing and diverter valve, the same as for the existing STS transfer line.
- D. Inlet and discharge air for the transfer line must pass through HEPA filtration to control air flow direction and prevent contamination to or from the transfer line.
- E. Radiation shielding is required around the STC to keep exposure level rates less than 2.5/t mrem/hr.
- F. The system must be capable of maintaining a vacuum in the transfer line from the Process Building for normal sample transfers, and from the VF for reverse transfers.

- G. Materials for the inside surface of the STC and the transfer tubing and fittings must be stainless steel. Radiation shielding material surrounding the STC is to be carbon steel. Sample bottles will be glass and the "rabbit" is polyethylene plastic.
- H. The STC must be able to receive up to ten sample bottles and send those samples in the transfer system within a 15 minute time span. After the samples are sent, the STC must then be ready to receive additional samples.
- I. A means to introduce supplies into the STC must be provided. These supplies will consist of:
  - 1) materials for the decontamination of sample bottle exterior surfaces, "rabbits", and the STC interior;
  - 2) items used to transfer samples out of the STC, such as "rabbits" and caps;
  - 3) maintenance items such as small tools, HEPA filters, equipment used inside the STC, and minor repair equipment.
- J. A means to send waste materials out of the STC must be provided. This waste consists of:
  - 1) materials used in the decontamination of sample bottle exterior surfaces, "rabbits", and equipment;
  - 2) spilled sample and broken sample bottle;
  - 3) no longer usable supplies;
  - 4) small tools and items of equipment used for maintenance purposes;
  - 5) used HEPA filters (8" diameter filter for STC ventilation air intake)

#### 1.2.2 Structural Requirements

- A. The containment boundary afforded by the STC shall be sufficiently intact after a seismic event to maintain air flow ventilation into the VF hot cell.

- B. The STC and shielding must be prevented from making an independent response to the VF hot cell walls during a seismic event, i.e., the STC or its shielding shall not impact or pound the VF hot cell wall during a seismic event.
- C. Support for the STC and shielding shall be designed in accordance with the seismic criteria contained in the Uniform Building Code (UBC) 1988 edition using the site developed .1g ground acceleration factor and broadened response spectra.

### 1.2.3 System Configuration and Essential Features

- A. The installed location for the STC is on the cold face of the north wall of the VF hot cell near the west corner so as to be operable from the 100 ft. elevation.
- B. Transfer equipment and components will be located directly across the aisle to the north of the STC in the VF.
- C. The STC will have provisions to utilize two Model "G-HD" Manipulators by Sargent Industries to facilitate any decontamination of the outside sample bottle surface, and in general, to process the sample bottles for transfer.
- D. The sending unit will be a Model SGN slide ring assembly.
- E. The STC will be shielded with carbon steel plate and have a dry lead glass shielding window for operator viewing.
- F. Provisions for glove-port access to the STC shall be included. Glove-port access will be on a maintenance need basis and will require the removal of specially designed shielding panels.
- G. Internal lighting of the STC shall be provided in sufficient intensity to perform sample preparation and maintenance activity as viewed through the shielding window.
- H. Tie-in to the existing SGN pneumatic transfer line from STS shall be made outside on the east side of the roof over the VF at the 140 ft elevation.

- I. Electrical power and control wiring shall interface with existing panels in the Process Building with the exception of heat trace circuits which will interface with an existing electrical heat trace panel in the STS facility.

#### 1.2.4 Maintenance Requirements

- A. Maintenance of the STC shall be by:
  - 1) remote removal and replacement of components; or by
  - 2) contact adjustment, repair, removal or replacement using glove-ports with source samples removed and STC shielding sections removed as required.
- B. Manipulators will be available to perform in-cell maintenance, handling, and adjustments on components.
- C. Lighting and manipulators shall be removable without the requirement for disassembly of the STC shielding.
- D. STC shielding shall be constructed in segments for ease of assembly and so segments can be removed without opening the STC.
- E. Maintenance of the reverse transfer equipment can be performed at the 100 ft elevation at the northwest corner of the VF.
- F. The diverter valve can be accessed for maintenance by using the maintenance access walkway and platform on the east roof section of the VF at the 140 foot elevation.

#### 1.2.5 Instrumentation and Control Requirements

- A. Instrumentation shall be the same as the existing components used in the STS transfer system and shall provide for the necessary signals to monitor transfer functions utilizing panel mounted lights in the Process Building.
- B. Control circuitry shall provide for the operation of the new reverse transfer equipment to be installed in the VF, the slide ring sender, and the diverter valve. Control devices shall be identical to the existing control equipment.

- C. New instrumentation and controls must be integrated into the existing instrumentation and control design. This requires that the existing programmable controller in the PLC panel of the Process Building be modified to accommodate the additional functions.

#### 1.2.6 Interface Requirements

- A. The STC will interface with the VF hot cell on the cold side of the north wall, near VF column location D-2.
- B. The STC will utilize the following utilities:
  - 1) Electrical Power--120 volt; single phase; 60 Hertz for lighting, manipulators, and small equipment as required.
  - 2) Water--Demineralized water for decontamination as required.
  - 3) Gases--Compressed instrument air inside the STC to operate tools and equipment as required. Ambient air from the gallery around the STC is drawn in through a HEPA filter for ventilation. Air then exits into the VF hot cell.
  - 4) Drain--A gravity drain line will be provided from the STC to the VF hot cell pit. This drain line is shielded to accommodate the flushing of a spilled sample.
- C. The transfer and reverse transfer equipment installed near the STC will require the following:
  - 1) Electrical Power--480 volt; three phase; 60 Hertz for the exhauster. 120 volt; single phase; 60 Hertz control and power from the PLC and CB 10 electrical panels in the Process Building to the exhauster, flow control valve, the SGN slide ring, the diverter valve, and two new passage detectors in the transfer line.
  - 2) Air--Instrument air at 80 psig will be required for the flow control valve, the SGN slide ring, and the diverter valve.

- D. Operationally the STC interfaces with the Vitrification Sampling System - No. 69A. The sampling system includes the equipment and methods to take and bottle the samples before depositing them in the drop tube that terminates within the STC. Functionally the STC interfaces with the cold face of the Vit Cell and the drop tube.

The sample "rabbits", caps, and liners interface with the STC through a drop tube on the west side of the STC. The receiving system for "rabbits" and samples is System 90 - Analytical Laboratory.

#### 1.2.7 Quality Assurance Requirements

- A. The STC containments, including structure, shielding features, and shielding portions of the sample sender, are considered to be Safety Level "B" and Quality Level "B".
- B. The sample transfer system is considered to be Safety Level "C" and Quality Level "B".
- C. The miscellaneous equipment items inside the STC are considered to be Safety Level "N" and Quality Level "N".

#### 1.2.8 Codes and Standards

- A. WVDP design criteria for Vitrification of High Level Waste-WVNS-DC-022, Section 13.0, contains a list of codes and standards, which are applicable to the VC. For the STC and Transfer System, the list includes:

ANSI-NQA-1	Quality Assurance Program
ANSI/ASME	Boiler & Pressure Vessel Code, Sections- II, V, VIII Division I, & IX
ANSI B1.20.1	Pipe Threads, General Purpose
ANSI B16.5	Flanges for Pipe and Fittings
ANSI B31.3	Chemical Plant and Petroleum Refinery Piping
ANSI B46.1	Surface Texture
ANSI Y14.5M	Dimensioning and Tolerancing
ASNT SNT-TC-1A	Recommended Practice for Nondestructive Testing

ASTM A6	General Requirements for Rolled Steel Plates, Shapes, Sheet Piling, and Bars for Structural Use
ASTM A36	Structural Steel
ASTM A108	Specification for Steel Bars, Carbon, Cold Finished, Standard Quality
ASTM A177	Specification for High-Strength Stainless and Heat Resisting Chromium-Nickel Steel Sheet and Strip
ASTM A182	Forged or Rolled Alloy-Steel Pipe Flanges, Forged Fittings, and Valves & Parts for High Temperature Service
ASTM A240	Heat Resisting Chromium & Chromium Nickel Stainless Steel Plate, Sheet & Strip for Pressure Vessels
ASTM A269	Seamless and Welded Austenitic Stainless Steel Tubing for General Service
ASTM A276	Stainless and Heat Resisting Steel Bars and Shapes
ASTM A283	Low and Intermediate Tensile Strength Carbon Steel Plates, Shapes and Bars
ASTM A285	Pressure Vessel Plates, Carbon Steel, Low and Intermediate Tensile Strength
ASTM A312	Seamless and Welded Austenitic Stainless Steel Pipe
ASTM A325	Specification for High-Strength Bolts for Structural Steel Joints
ASTM A351	Specifications for Steel Castings, Austenitic, for High-Temperature Service
ASTM A370	Methods and Definitions for Mechanical Testing of Steel Products
ASTM A380	Cleaning and Descaling Stainless Steel Parts, Equipment and Systems
ASTM A480	General Requirements for Flat Rolled Stainless and Heat-Resisting Steel Plate, Sheet and Strip

ASTM A484	General Requirements for Stainless and Heat-Resisting Bars, Billets and Forgings
ASTM A519	Seamless Carbon and Alloy Steel Mechanical Tubing
ASTM A582	Standard Specification for Free Machining Stainless and Heat Resisting Steel Bars, Hot Rolled, and Cold Finished
ASTM C852-81	Design Criteria for Plutonium Gloveboxes
ASTM E165	Methods for Liquid Penetrant Inspection
AWS A2.4	Symbols for Welding and Nondestructive Testing Including Brazing
AWS D1.1	Structural Welding - Steel
AWS D1.3	Structural Welding - Sheet Metal
AWS QC1	Standard for Qualification and Certification of Welding Inspectors
DOE 5480.1	DOE Safety and Health Program
MIL-F-51079C	HEPA Filters
NBS H-28	Screw-Thread Standard for Federal Standards
SP7	Dry Abrasive Blasting
SSPC	Steel Structures Painting Council

1.2.9 Reliability Assurance

- A. A system reliability requirement includes a tracking capability for the "rabbit" as it traverses the tubing path. If any single passage detector does not indicate a passage, then an alarm is sounded and the "rabbit" location is known to be between the first detector that did not light the panel light and the last detector that did.

- B. An important reliability feature is the reversing capability for the "rabbit" transfer. This requires redundant air filters, an exhauster, automatic control valves and control circuitry to be installed at the sample origin. In the event a "rabbit" does not make it to the analytical laboratory receiving hot cell, the reverse transfer can be activated to return the sample to its point of origin.
- C. Both the tracking and the reverse transfer functions are existing system capabilities that are duplicated with the addition of vitrification to the system. Hardware required to accomplish these functions is identical to that already installed.

## 2.0 DESIGN DESCRIPTION

### 2.1 Background

2.1.1 This modification to the existing SGN Pneumatic Sample Transfer System is a duplication of the presently installed capability for STS. The modification necessary for the VF allows for the processing and sending of samples from the vitrification process, the same as for STS. The unique part of the modification provides for a common destination for all samples regardless of origin and a common use of the last approximate 300 feet of transfer tubing prior to sample entry into the analytical laboratory.

### 2.2 Detailed System Description

2.2.1 Using remote handling techniques and the components that comprise the Vitrification Sample System - System No. 69A, a 10 ml liquid sample of process fluids is taken in the VF hot cell. This sample is contained within a square glass bottle with a screw top lid. Next the sample bottle is released to the gravity drop tube which deposits the bottle in a plastic container ("rabbit") in a holding fixture inside the STC. Using slave manipulators, the sample bottle can be capped and transferred to the laboratory or cleansed of surface contamination if required, dried, and then placed inside another "rabbit" for transport.

Within the STC, a shielding storage block is provided for storage of ten samples contained in transfer "rabbits". This block provides an additional three inches of steel shielding around the samples and forces the operator to store samples in the middle of the STC, up against the VF hot cell shielding wall to keep radiation exposure ALARA.

### 3.0 OPERATIONAL REQUIREMENTS

#### 3.1 Sample Transfer

- 3.1.1 To initiate a sample transfer, the "rabbit" containing a sample is placed in the SGN sending unit by an operator using the STC slave manipulators. With a foot switch the operator activates the slide ring by causing the "rabbit" to be loaded into the suction portion of the sending unit. The operator by operating a switch requests a sample transfer of the analytical laboratory. After acknowledgement the analytical laboratory operator activates the transfer from the Process Building control panel.
- 3.1.2 First, the analytical lab operator places the selector switch in the VF position. After confirmation of position (panel light for VF lights), the transfer switch is activated by the operator. Panel is then observed for indicator lights to light as the "rabbit" passes the in-line passage detectors. In approximately one minute after the transfer switch is activated, the "rabbit" should appear in the SGN receiver inside the laboratory hot cell.
- 3.1.3 As the "rabbit" is received in the laboratory hot cell, detectors in the transfer line will have been tripped to allow the PLC to automatically shut the suction system down and close off the inlet and outlet suction line valves.
- 3.1.4 If the "rabbit" is not received in the laboratory hot cell, indicator lights on the control panel will reveal the relative position of the rabbit in the transfer system. The reverse transfer switch can be activated to dislodge the "rabbit" and return it to the VF sending unit.

### 4.0 CONTROLS

- 4.1 All operation of the system is controlled through the PLC located in the operating aisle of the Analytical Laboratory. Trouble shooting, operational verification, and sequencing of functions are established and set or adjusted at this programmable controller.

## NOTES:

1. ALL SAMPLE PROBES CONTAIN HEATED FILTERS. PROBES 64-P-SP-1 AND 64-P-SP-3A CONTAIN DILUTION UNITS. PROBE 64-P-SP-4 INCLUDES A PERMEATION DRYER.
2. SAMPLE TUBING BUNDLE ROUTING SHOULD BE AS VERTICAL AS POSSIBLE. A MINIMUM SLOPE OF 1 (RISE) TO 3 (RUN) IS REQUIRED.
3. ALL SAMPLE LINE BUNDLES INCLUDE GAS SAMPLE TUBE, CALIBRATION GAS TUBE, ELECTRICAL LINES AND AIR TUBES AS REQUIRED. SAMPLE PROBE AND SAMPLE LINES PROVIDED BY ENCLOSURE SUPPLIER. SAMPLE LINES ARE HEAT TRACED.
4. EACH CALIB GAS CYLINDER WILL HAVE ITS OWN PRESSURE REGULATOR AND PRESSURE SWITCH.
5. EACH ENCLOSURE CONTAINS ALL THE CONTROLS FOR OPERATION OF THE ENCLOSED ANALYZER, THE SAMPLE PROBES AND SAMPLE LINES. A PROGRAMMABLE LOGIC CONTROLLER (PLC) IS INCLUDED IN EACH CABINET. WHERE REQUIRED, THE ENCLOSURE INCLUDES CONTROLS FOR THE DILUTION UNITS OR PERMEATION DRYER. THE  $NO_2$  ANALYZER IN ENCLOSURE 64-I-003 IS A CHEMILUMINESCENT TYPE. ALL OTHERS ARE INFRARED TYPE.
6. ALL INSTRUMENT NUMBERS PREFIXED BY SYSTEM NO 64.
