## EVENT DESCRIPTION AND PROBABLE CONSEQUENCES ⑩

0 2 While in mode 1, the "UHI surge tank hi/lo pressure" alarm was received in the control room indicating that the upper head injection (UHI) system pressure had decreased to the technical specification 3.5.1.2 setpoint of 1206 psig. This is reportable per T.S.6.9.1.13(b) and is similar to previous R0's #369/81-57 and 81-160. Since the UHI system is passive and is only used if a large reactor coolant system break occurs, and the system would have functioned properly if it had been needed, the health and safety of the public were not affected.

## CAUSE DESCRIPTION AND CORRECTIVE ACTIONS ⑦

1 0 The exact cause of the pressure decrease could not specifically be determined but contributing factors were the packing leakoffs from four UHI block valves on the UHI water accumulator. The nitrogen system was aligned to the UHI system and the nitrogen accumulator repressurized. Modifications will be made in order to provide more complete indication of UHI system pressure in the control room.
