MEMORANDUM FOR: Stefan S. Pawlicki, Technical Advisor
Materials and Qualification Engineering
Division of Engineering

FROM: Goutam Bagchi, Section Leader
Equipment Qualification Branch
Division of Engineering

SUBJECT: INTEGRATED PLANT SAFETY ASSESSMENT REPORT - GINNA

I looked at the topics under seismic design considerations. Among these topics Item 3.3.2 Topic III-6, Seismic Design Considerations presents the areas considered, and the actions taken by the licensee. Under areas considered it is stated that "the integrity and ability to function of mechanical and electrical equipment and engineered safety features system (including containment)" are reviewed against the postulated safe shutdown earthquake. The manner in which this discussion is presented, could create an impression in the licensee's mind that once the agreed upon modifications are made, there will be a reasonable assurance of operability of all safety related mechanical and electrical equipment under earthquake loading.

It is our impression that the SEP review deferred the operability qualification of safety-related equipment until the resolution of A-46.

I suggest that the subject section of the report be modified to remove the ambiguity.
