

## Washington Public Power Supply System

P.O. Box 968 3000 George Washington Way Richland, Washington 99352 (509) 372-5000

Docket No. 50-508

September 21, 1982  
G03-82-963

Mr. Frank J. Miraglia, Chief  
Licensing Branch No. 3  
Division of Licensing  
U. S. Nuclear Regulatory Commission  
7920 Norfolk Avenue  
Bethesda, Maryland 20014

Dear Mr. Miraglia:

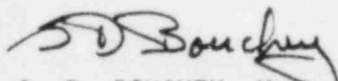

Subject: NUCLEAR PROJECT NO. 3  
FORMAL NRC APPROVAL OF ASME CODE CASE N-249-2

Reference: Letter G03-82-760, GD Bouchey to FJ Miraglia, dated July 30, 1982, "WNP-3 Response to NRC Questions on Pipe Clamps."

This letter requests formal NRC approval of ASME Code Case N-249, "Additional Materials for Subsection NF Class 1, 2, 3 and MC Component Supports Fabricated Without Welding, Section III, Division 1" (copy attached). Approval is requested to cover strap and rivet materials used in the ITT-Grinnell Figure 215 Stiff Clamps. The subject Code Case was approved by the ASME Council on June 17, 1982. Due to its recent approval, N-249-2 is not currently listed in Regulatory Guide 1.85. Details relative to application of this Code Case were presented to the NRC staff in Bethesda on June 18, 1982 and as further discussed in the referenced letter.

Your expeditious response will be appreciated.

Very truly yours,

G. D. BOUCHEY, Manager  
Nuclear Safety and Licensing

CASES OF ASME BOILER AND PRESSURE VESSEL CODE

Meeting of March 12, 1982  
Approved by Council, June 17, 1982

This Case shall expire on June 17, 1985  
unless previously annulled or reaffirmed.

Case N-249-2

Additional Materials for Subsection NF Class 1, 2, 3, and  
MC Component Supports Fabricated without Welding  
Section III, Division 1

*Inquiry:* What materials, in addition to those listed in Tables I-11.0, I-12.0, and I-13.0 of Appendix I of Section III, Division 1, may be used for Class 1, 2, 3, or MC component supports constructed to the requirements of Subsection NF when the items are fabricated without welding?

*Reply:* It is the opinion of the Committee that the additional materials, design stress intensity and allowable stress values, the yield strength, and the ultimate tensile strength values,<sup>1</sup> listed in Tables 1, 2, 3, 4, and 5 of this Code Case may be used in the construction of Class 1, 2, 3, and MC component supports fabricated without welding for Section III, Division 1, in addition to those listed in Table NF-2121 (a) - 1.

<sup>1</sup> The tabulated values of tensile strength and yield strength are those which the Committee believes are suitable for use in design calculations required by Section III, Division 1. At the temperatures above room temperature, the values of tensile strength tend toward an average or expected value which may be as much as 10% above the tensile strength trend curves adjusted to the minimum specified room temperature tensile strength. At temperatures above room temperature, the yield strength values correspond to the yield strength trend curve adjusted to the minimum specified room temperature yield strength. Neither the tensile strength nor the yield strength values correspond exactly to either "average" or "minimum," as these terms are applied to a statistical treatment of a homogeneous set of data.

Neither the ASME or ASTM Material Specifications nor the rules of Section III, Division 1, require elevated temperature testing for tensile or yield strengths of production material for use in Code components. It is not intended that results of such tests, if performed, be compared with these tabulated tensile and yield strength values for ASME Code acceptance/rejection purposes for materials. If some elevated temperature test results on production material appear lower than the tabulated values by a large amount (more than the typical variability of material suggesting the possibility of some error), further investigation by retest or other means should be considered.

The following additional requirements shall apply:

(1) The requirements of Subsection NF shall be met except as modified by this Case.

(2) Repair welding is not permitted on carbon and low alloy steels containing more than 0.35% carbon, nor on precipitation hardened or age-hardened steels, nor on the free machining steels permitted in (3) below, unless permitted by the material specification. Weld repairs of base material shall be made on annealed material and such repaired material shall be reheat treated in accordance with the material specification.

(3) When the Nominal Composition column references AISI grades, only materials meeting the chemical composition requirements of the specific AISI grades listed shall be used, with the exception that 0.60% maximum silicon is permitted for castings. Free machining modifications of the specific AISI grades listed may be used at the same design stress intensities, allowable stresses and yield strengths of the reference grades but their use is limited to 400°F (200°C) maximum temperature.

(4) When the ASTM specification referenced in Tables 1 through 4 does not specify minimum tensile and yield strengths, the values listed under the appropriate columns shall be met by the material.

(5) The maximum measured ultimate tensile strength (UTS) of the component support material should not exceed 170 ksi (117 MPa) in view of the susceptibility of high-strength materials to brittleness and stress corrosion cracking. Certain applications may exist where a UTS value of up to 190 ksi (131 MPa) could be considered acceptable for a material and, under this condition, the Design Specification should specify impact testing for the material. For these cases, it should be demonstrated by the owner that (1) the impact test results for the material meet Code requirements and (2) the material is not subject to stress corrosion cracking by virtue of the fact that (a) a corrosive environment is not present and (b) the component that contains the material has essentially no residual stresses or assembly stresses, and it does not experience frequent sustained loads in service.

**CASE (continued)**

**N-249-2**

**CASES OF ASME BOILER AND PRESSURE VESSEL CODE**

(6) Materials in Tables 1 through 4 whose nominal composition is referenced as an AISI composition may be accepted as satisfactory; the requirements of the ASTM specification provided the chemical requirements of the AISI specification are within the specified range of the designated ASTM specification, and certification of the material shall be in accordance with the requirements of NCA-3867.4(e) or (f). The term "each piece of stock material" in NCA-3867.4(e) may be taken to refer to

that portion of the material of the same heat and lot which has traceability established by the Manufacturer through his program. Where Certificates of Compliance are acceptable under Subsection NF, testing of each piece is not required.

(7) The material shall be furnished with the requirements of NF-2600.

(8) This Case and revision number shall be listed on the applicable documentation accompanying shipment.

TABLE 1

Design Stress Intensity Values,  $S_{DP}$ , for Ferrous Steels and Copper Alloys for Class 1 Plate and Shell Type Component Supports

| Nominal Composition         | Product Form | Specification No. | Type or Grade                 | Class | Notes*       | Min. Yield Strength, ksi | Min. Ultimate Tensile Strength, ksi | Design Stress Intensity, ksi (multiply by 1000 to obtain psi) for metal temperatures, °F, not to exceed |      |      |      |      |      |      |      |      |      |   |   |

\*Notes follow Table 5.

TABLE B (Continued)

## Notes:

1. This material may be made from ASTM A 546-77.
2. Over 1 in. to 2 in. incl.
3. These materials are limited for use only for component standard supports.
4. Max. BHN 215.
5. Max. BHN 225.
6. For each forging 250 lb net weight and less, the marking requirements of A 668-79a shall be met by a suitable code or symbol identified by the Material Manufacturer in his Certificate of Compliance or Certified Material Test Report. The hardness test requirement may be performed only on the tensile test specimen.
7. ½ in. and under.
8. Over ½ in. to 1 in. incl.
9. By agreement between Purchaser and Material Manufacturer, these materials may be procured to the lower specified minimum ultimate tensile strength and minimum yield strength values given in this table.
10. Over 2 in. to 3 in. incl.
11. 4 in. and under.
12. Over 4 in. to 7 in. incl.
13. Over 7 in. to 10 in. incl.
14. This material may be used only in fully constrained applications, such as thread inserts, so that failure of the wire would not affect the function of the component support.
15. Solution heat-treated (for thickness 3/16 in. and under, tensile strength is 140 ksi, yield strength is 80 ksi).
16. Solution heat-treated and hardened (1325° F for 8 hr, furnace cooled to 1150° F, held to a total of 18 hr, air cooled).
17. Half hard.
18. Hot rolled.
19. Hot finished, heat treated.
20. E4340H may be used, with the molybdenum range increased, by agreement to 0.40% max.
21. The minimum specified yield strength shall be taken at 0.2% offset.
22. This material may be used only in fully constrained applications such as valve disc or flow restrictor balls or mechanical snubber parts such as gears so that failure of these parts does not significantly affect the function of the item. Design stresses are limited to 0.4 Sy.
23. For bar sizes under ½ in. nominal size, this material may be ordered to A 581-79.
24. 1½ in. and under.
25. Over 1½ in. to 2½ in. incl.
26. Over 2½ in. to 4 in. incl.
27. Over 7 in. to 9½ in. incl.
28. Austenitize 1850° F to 1950° F, oil quench, temper at 700° F min.
29. Austenitize 1850° F to 1950° F, oil quench, temper at 600° F min.
30. A 564 Type XM-13 shall be modified so that age hardening treatment shall be 1050° F only.
31. For gages less than ¼ in. in diameter, wire to AMS 5737 may be supplied, with or without heads. These values also apply to material that has been solution treated in a vacuum at 1650° F for 30 minutes and oil quenched and aged at 1325° F for ½ to 1½ hours and air cooled.
32. The Elongation and Reduction of Area requirements for Grade 105-85 may be specified as 14% and 30%, respectively.
33. The Elongation and Reduction of Area requirements for Grade 120-85 may be specified as 11% and 25%, respectively.
34. Threaded rods only.
35. Minimum Tempering Temperature shall be 850° F.
36. No yield or tensile strength specified. Assume to be the same as A 325-80a Type 1 bolts for nut design calculations.
37. 3 in. maximum diameter, cold drawn and tempered.
38. 10 in. maximum diameter.
39. ¼ in. to 1 in. incl.
40. Over 1 in. to 1½ in. incl.
41. Over 1½ in. to 3 in. incl.
42. Nuts may be as listed in ASTM A 563-78a, Table XI.
