- I. LER NUMBER: 82-148/03L-0
- 11. LASALLE COUNTY STATION: Unit 1
- III. DOCKET NUMBER: 050-373
- IV. EVENT DESCRIPTION:

ġ

Technical Specification 3.3.7.5 requires the drywell oxygen monitoring channels to be operable during conditions 1 and 2. On 11/12/82 it was noticed that the Div II Post LOCA oxygen channel indication had drifted down to 4% from the normal 18-20% range. The Div II channel was subsequently declared inoperable.

VI. PROBABLE CONSEQUENCES:

At the time of the occurrence, LaSalle County Station was at 1548 MWT and 438 MWE. The drywell was not inerted with nitrogen since inerting is not a requirement for the present phase of the startup test program. (Re: Special Text Exemption 10.3.5). The Div I oxygen channel remained fully operable at all times. Safe operation of the plant was maintained. (A similar incident occurred on 10/30/82. See LER No. 82-139/03L-0.)

VI. CAUSE:

10 10

The erratic oxygen readings were a result of instrumentation drift which resulted in false indication in the control room. Until recently, the Div I and Div II post LOCA monitoring channels were used alternately since only one channel is required at any one time. The on/off cycling however seems to disrupt the flow metering of the reagent and sample gas mixtures thus causing a drift from calibration whenever the channels are switched over. Instruments are manufactured by Consip Del Phi, Inc.

VII. CORRECTIVE ACTION:

Work Request #L20452 was written to troubleshoot and repair the Div II Post LOCA oxygen channel. Adjustments were made to the reagent gas and sample gas flows. A calibration was also performed and completed on 11/15/82. The instrument was declared operable on the same day. In addition, both channels are now being used to monitor the oxygen concentration in the drywell in an effort to avoid the on/off cycling of the instrumentation.
