Subject: Chemical Explosion and Fire at Union Carbide on December 11, 1982

As you know, in the early morning hours of December 11, 1982, a chemical explotion and fire occurred at the Union Carbide plant located in Taft, Louisiana about 2 miles from Waterford 3. As a result, approximately 17,000 persons were evacuated from 2 parishes in a 5-mile area around to plant, including two to three hundred non-essential personnel from Waterford 3. The evacuation was implemented in accordance with St. Charles Parish and St. John the Baptist Parish Emergency Plans. These offsite plans, which have been developed for a variety of emergencies under the authority of State of Louisiana statutes. are reviewed and evaluated by the Federal Emergency Management Agency (FEMA). While we understand that the evacuation was highly successful. FEMA intends to review the results of the evacuation to determine if any inadequacies existed at the time of the evacuation, or if any State or local emergency procedures need to be improved. The results of a FENA fact-finding study (now underway) will be reviewed by FEMA and the NRC staff, and any improvement that may be required in emergency planning preparedness will be addressed by the staff during the NTOL emergency preparedness inspection phase currently scheduled to commence in February, 1983.

Because of the nature of this external event, it is requested that you provide the staff with an evaluation of the expected plant response (which should include all actions expected of onsite personnel) that this event would have caused had the unit been operating at full power. This evaluation should compare the expected behavior to the anticipated operational occurrences and postulated accide to which form the design basis envelope for the Waterford 3 station.

We request that this information be submitted with 30 days of receipt of this letter.

Industrial Preparedness

Our review of the December 11, 1982 chemical explosion at the Union Carbide plant indicates that there were at least two chemicals (acrolein and agrylic acid) stored in significant quantities, neither or which appear in the list of hazardous chemicals in the Waterford Unit 3 FSAR (Table 2.2-4). Specifically, the explosion appears to have involved one or two 45,000 gallon acrolein tanks with an additional three acrolein tanks and three acrylic acid tanks nearby being threatened by the ensuing 16 hour fire. In view of the above, we request that the current hazardous chemical Xisting in the FSAR be updated to include all significant quantities of hazardous chemicals near the site. This information should be provided in an amendment to the FSAR prior to issuance of the OL.

In recognition of the multitude of chemicals that are handled or stored near the Waterford Unit 3 site, the staff has previously concluded that there is a need for several diverse means of protection against potential toxic gas releases. Several methods were outlined in Section 2.2-1 of Supplement 1 to the Waterford 3 Safety Evaluation Report (NUREG-0787). In particular. one measure involves a periodic survey of the industrial and transportation activities in the area. The intent is " maintain an awareness of any significant chemical feedstock or product changes which may dictate modifications in the existing toxic gas protection features. We will include this requirement in the Waterford 3 Technical Specifications.

Sincerely.

Darrell G. Eisenhut, Director Division of Licensing

Docket No.: 50-382

Mr. L. V. Maurin Vice President - Nuclear Operations Louisiana Power and Light Company 142 Delaronde Street New Orleans, Louisiana 70174

Dear Mr. Maurin:

Subject: Chemical Explosion and Fire at Union Carbide on December 11, 1982

As you know, in the early morning hours of December 11, 1982, a chemical explotion and fire occurred at the Union Carbide plant located in Taft, Louisiana about 2 miles from Waterford 3. This event has ramifications on two aspects of our licensing review; (1) offsite emergency preparedness, and (2) the onsite impacts of industrial hazards in the plant vicinity. Those aspects are discussed separately below. In order to assist us in completing the licensing process for Waterford 3, we request that you provide to us, within 30 days of receipt of this letter, an evaluation of the effect that the December 11, 1982 accident would have had on Waterford 3 if the plant had been operating at full power. If your evaluation shows that modifications to your current operating procedures are desirable, we request that you submit all such changes to us for review and approval as soon as possible, in order to avoid licensing delays.

Emergency Preparedness

As a result of the December 11, 1982 explosion, approximately 17,000 persons were evacuated from 2 parishes in a 5-mile area around the plant, including two to three hundred non-essential personnel from Waterford 3. The evacuation was implemented in accordance with St. Charles Parish and St. John the Baptist Parish Emergency Plan. These offsite plans, which have been developed for a variety of emergencies under the authority of State of Louisiana statutes, are reviewed and evaluated by the Federal Emergency Management Agency (FEMA). While we understand that the evacuation was highly successful, FEMA intends to review the results of the evacuation to determine if any inadequacies existed at the time of the evacuation, or if any State or local emergency procedures need to be improved. The results of a FEMA fact-finding study (now underway) will be reviewed by FEMA and the NRC staff, and any improvement that may be required in emergency planning preparedness will be addressed by the staff during the NTOL emergency preparedness inspection phase currently scheduled to commence in February, 1983.

As described in Section 2.2-1 of Supplement 1 to the staff's Safety Evaluation Report, you have agreed to perform a periodic survey of the local industrial and transportation activities in order to remain cognizant of any changes in potential external hazards near the Waterford 3 plant site. This agreement was sought by us in order to assure that the control room protection at Waterford 3 remains commensurate with the toxic gas hazards in the vicinity throughout the life of the plant. This commitment will appear as a technical specification in Appendix A of the operating license for Waterford 3. The Union Carbide event indicated that the assessment of the toxic gas hazards, as reported in Table 2.2-4 of the FSAR, may not be complete. Specifically, it appears that acrolein and acrylic acid were not analyzed. This reises the possibility that other chemicals also may have been overlooked. In view of this, and your commitment to survey and address significant changes from the initial toxic gas hazards assessment, we request that you revise Table 2.2-4 on the basis of a more complete survey.

Please furnish a response to this request with 30 days.

Sincerely,

Darrell G. Eisenhut, Director Division of Licensing Office of Nuclear Reactor Regulation
