Subject: Annual Radiological Environmental Operating Report

Dear Sir:

Florida Power Corporation hereby submits the 1990 Annual Radiological Environmental Operating Report in compliance with Crystal River Unit 3's Technical Specification, Appendix A, Section 6.9.1.5(c). The report contains the data obtained from the radiological environmental surveillance program conducted for the Crystal River site for 1990.

Sincerely,

G.L. Boldt,  
Vice President  
Nuclear Production

## INTRODUCTION

This report is submitted as required by Technical Specification 6.9.1.5(c) to Crystal River Facility Operating License No. DPR-72. In accordance with this specification, the following information must be included in this report:

- Summaries
- Interpretations
- Unachievable LLDs, and
- An analysis of trends of the results of the radiological environmental studies and previous annual reports.
- An assessment of any observed impact of plant operation on the environment.

**NOTE:** If harmful effects or evidence of irreversible damage are detected by the monitoring, the Report shall provide an analysis of the problem and a planned course of action to alleviate the problem.

- Summarized and tabulated results, in the format of Regulatory Guide 4.8 (December 1975), of all radiological environmental samples taken during the report period.

**NOTE:** If some results are not available for inclusion, the report shall note and explain the reason for the missing results. The missing results shall be submitted as soon as possible in a supplementary report.

- A summary description of the REMP.
- A map of all sampling locations keyed to a table giving distances and directions from the reactor.
- Unavailability of milk or fresh leafy vegetable samples required by Table 3.12-1 of Technical Specifications.
- The results of land-use censuses.
- Results of Interlaboratory Comparison Program.

## I. SUMMARY DESCRIPTION OF RADILOGICAL ENVIRONMENTAL MONITORING PROGRAM

The analytical results of the Crystal River Unit 3 (CR-3) operational Radiological Environmental Monitoring Program (REMP) for 1990 are contained in this report. The operational program began on January 1, 1977 just prior to initial criticality, which was achieved on January 14, 1977.

Sampling of the facility environs is performed by the State of Florida Department of Health and Rehabilitative Services (FDHRS), Office of Radiation Control. The State also performs the required analyses, participates in the Environmental Protection Agency's (EPA's) Interlaboratory Comparison Program, and performs the annual land-use census.

Sample station locations are given in Table I-1 and Figures I-2, -3, and -4. Sample frequency and analysis type may be determined from Table I-2. Figure I-1 illustrates the relevant exposure pathways.

Except for air sample gross beta results and direct radiation measurements, most of the analytical results are below the lower limit of detection (LLD) of the sample. Sample LLDs are generally much lower than the required "a priori" LLD. When measurable results are reported, the values are also usually less than the required "a priori" LLD.

The results of the 1990 REMP have been compared to previous years' results. This comparison, in part illustrated by the trend graphs<sup>1</sup> of Section IV, shows no evidence of increasing radionuclide buildup in any of the sample media. Additionally, these results verify the effectiveness of in-plant measures for controlling radioactive releases. When combined with dose calculation results<sup>2</sup> (based upon actual release data and a hypothetical individual residing at the Site Boundary), the REMP data indicate that the environmental impact of CR-3's operation is not significant.

---

<sup>1</sup>Trend graphs illustrate the mean measured concentration of a particular radionuclide for the year. When measurable results are not obtained, the highest sample LLD is plotted.

<sup>2</sup>For 1990 releases, the whole body dose commitment to the maximum individual was calculated to be 0.38 mrem.

## II. LAND-USE CENSUS

A land-use census to identify the nearest residences, vegetable gardens, and potential milk-producing animals within a five mile radius of the nuclear plant was conducted in June. The distance in miles and bearing in degrees for each receptor type in each of the sixteen sectors is summarized below.

SECTOR	NEAREST RESIDENCE	NEAREST GARDEN	NEAREST MILK ANIMAL
N	4.4 @ 2°	4.5 @ 2°	**
NNE	3.8 @ 15°	4.5 @ 13°	**
NE	3.8 @ 55°	4.3 @ 52°	**
ENE	3.4 @ 60°	4.2 @ 61°	4.3 @ 70°
E	3.5 @ 97°	4.1 @ 93°	**
ESE	4.2 @ 101°	4.2 @ 101°	**
SE	4.4 @ 136°	*	**
SSE	3.4 @ 150°	*	*
S	*	*	*
SSW	*	*	*
SW	*	*	*
WSW	*	*	*
W	*	*	*
WWW	*	*	*
NW	4.6 @ 319°	*	*
NNW	4.5 @ 338°	4.5 @ 339°	**

\* None

\*\* All sectors around the plant which are not exclusively water or marshland might occasionally have milk-producing animals at the plant boundary. Most of the land adjacent to the plant site is woodland; however, much of the land in the immediate area is pastureland for cattle and a few horses. Stray cattle are often seen in the wooded areas adjacent to the plant site. These cattle are raised for beef or veal. At times there may be fresh females in these herds, but these animals roam freely and are not milked. A few goats have also been located at residences within the survey area. None of these cows or goats are known to be providing milk for human use, and the owners are not willing to make samples of milk available.

**NOTES:**

**Normal.: Range** Normalized range. As defined in "Environmental Radioactivity Laboratory Intercomparison Studies Program Fiscal Year 1981 - 1982", Environmental Monitoring Systems Laboratory, U. S. Environmental Protection Agency, P. O. Box 93478, Las Vegas, Nevada, 89193-3478. EPA-600/4-81-004, February, 1981.

**N.D.K.:** Normalized deviation of the mean from the known value, as defined in EPA-600/4-81-004.

**NDP:** No data provided. No data was provided to EPA for inclusion in their report.

**NA:** Not available. Report containing this data has not yet been received from EPA, Las Vegas.

**ACTION LEVEL:**

(1) Cause: Erroneously over estimated chemical recovery of strontium carrier.  
Corrective Action: Try to improve purity of isolated strontium carrier.

(2) Cause: Incorrect counting efficiency used in calculation.  
Corrective Action: Double check all parameters used in the calculation.

#### IV-A. AIRBORNE PATHWAY

Air samples are taken at five locations in the vicinity of the plant. The control location is 80 miles ESE of the plant.

Table IV-A.1 provides a statistical summary of the analytical results for 317 gross beta samples and 317 Iodine samples.

The results for one gross beta and one Iodine sample were not reported for the following reason:

C40 7/30/91: Sample not collected due to power outage.

Of 317 particulate samples analyzed for gross beta activity, 316 had measurable activity. The average indicator concentration was 15 pCi/1,000 m<sup>3</sup> with a range of 3 to 131 pCi/1,000 m<sup>3</sup>. The average indicator concentration during 1987 was 16 pCi/1,000 m<sup>3</sup>; 6 pCi/1,000 m<sup>3</sup> for 1988; and 15 pCi/1,000 m<sup>3</sup> for 1989.

Three hundred and seventeen samples were analyzed for Iodine activity, with none having measurable activity.

Tables IV-A.2 and IV-A.3 provide the results for each weekly air sample.

Second Quarter composite data are summarized in Table IV-A.4. Measurable quantities of Cesium were not identified. The highest LLD was 1.3 pCi/1,000 m<sup>3</sup>.

FIGURE IV.A  
AIRBORNE NUCLIDE TRENDS

#### IV-B. DIRECT RADIATION

Direct radiation measurements (using TLDs) were taken at sixteen locations within one mile of the plant, at thirteen locations ranging from 2.8 to 6.3 miles from the plant, and at one control location 80 miles from the site. The highest on-site dose was 77 mrem/yr at station C62 (NNE at 5300 feet). The highest off-site dose was 51 mrem/yr at station C75 (East at 4.2 miles). The control station (C47) dose was 47 mrem/yr. The average for all stations was 53 mrem/yr.

Third Quarter results for station C64 are not available since the TLD package was missing at collection time.

#### IV-C. WATERBORNE PATHWAY

To evaluate the waterborne pathway, seawater, groundwater, drinking water, and shoreline sediment samples are taken.

1. Monthly seawater grab samples are taken at two locations in the discharge canal and at one control location near the mouth of the intake canal. Of twenty-four indicator samples, nine had a measurable amount of Tritium at an average level of 301 pCi/L. Five samples taken at the control location, C13, indicated measurable amounts of Tritium at an average level of 127 pCi/L.

Gamma spectral analysis was performed on thirty-six samples. For the required radionuclides, there were no measured activities.

2. Semiannual groundwater samples are taken at one location, station C40. Gamma spectral and Tritium analyses are preformed on both samples. All results were less than the LLD. Since plant startup, all results, except for the results of one 1985 Tritium analysis, have been less than LLD. As indicated by Figure IV-C.2, the 1985 Tritium value of 170 pCi/L is less than the typical LLD, and much less than the required "a priori" LLD of 2,000 pCi/L.
3. Quarterly drinking water samples are drawn from three locations: the Crystal River Public Water Plant (C07), the Indian Waters Public Water Supply (C10), and the Yankeetown City Well (C18). All samples were collected and analyzed for gamma emitters and Tritium. None of the samples yielded measurable activities for Tritium or the required gamma emitters.
4. Semiannual shoreline sediment samples are taken at three indicator locations in the discharge canal (C14H, C14M, C14G) and one control location (C09) at Fort Island Gulf Beach. Of the eight samples analyzed, four had measurable amounts of Cs-137. Cobalt-60 was identified in all six indicator samples taken in the discharge canal. (See Table IV-C.4.a.) Cobalt-58 was identified in five of the six discharge canal samples. No other gamma emitters attributable to CR-3 were found in measurable quantities.

TABLE IV-C.1

(1) C09 is the control station at Ft. Gulf Island Beach. C14H, M, &amp; G are discharge canal stations.

FIGURE IV-C.4  
SHORELINE SEDIMENTS NUCLIDE TRENDS

#### IV-D. INGESTION PATHWAY

To evaluate the ingestion pathway, fish, oysters, citrus, and watermelon samples are taken.

1. Quarterly carnivorous fish samples were taken at two locations: C29 at the end of the discharge canal, and C30, the control location near the mouth of the intake canal. None of the required radionuclides were found in measurable quantities. The highest Cs-137 LLD for station C29 is 48 pCi/kg.
2. Quarterly oyster samples were taken at the same locations as fish samples, C29 and C30. Two of four C29 samples had measurable amounts of Co-58 at an average level of 47 pCi/kg. The Third Quarter sample at C29 indicated Co-60 at a level of 76 pCi/kg. Radionuclides attributable to CR-3 were not identified in the four samples taken at C30, the control station.
3. Monthly broadleaf vegetation samples were taken at two indicator locations, C48a and C48b, and one control location, C47. Twenty of twenty-four indicator samples had measurable amounts of Cs-137 with an average concentration of 90 pCi/kg and a range of 17 to 288 pCi/kg. Twelve of twelve control station samples had measurable amounts of Cs-137 with an average of 167 pCi/kg and a range of 32 to 970 pCi/kg.
4. Annual watermelon and citrus (oranges) samples are taken at stations C04 and C19, respectively. Cesium-137 was measured in the watermelon sample at a level of 7 pCi/kg.
