Director of Nuclear Reactor Regulation  
Attention: Mr. G. Knighton, Chief  
Licensing Branch No. 3  
Division of Licensing  
U. S. Nuclear Regulatory Commission  
Washington, D. C. 20555

SUBJECT: Waterford 3 SES  
Docket No. 50-382  
Fire Water System Connection  
(Tertiary Backup)  
to Lubrication and Cooling  
Water for Circulating Water Pumps

Reference: LP&L Letter W3P83-0660, dated March 3, 1983

Dear Mr. Knighton:

The above referenced letter provided the NRC with information regarding the subject connection. In the letter the point was made that the volume/pressure available at the largest demand interface point and the total available fire protection supply is more than adequate while considering usage of 125 gpm for the Circulating Water System.

Furthermore, it should be understood that the 3 inch connection is a tertiary backup means of supply to the Circulating Water System, which is normally closed and is actuated only in the unlikely event that it is required. Should this connection be utilized, the water flow will actuate the jockey pump and the main fire protection system pumps, as required. Again, one must remember that the normal water supply for water to the Circulating Water System is from the Clearwell Water System. The clearwell receives water from the primary water treatment system as well as an alternate source, the Parish water main.

On May 6, 1983, by way of a telephone conversation, Mr. D. Kubeckie of the NRC made a request to LP&L representative, Mr. W. Lobo for the following:

- A) Hydraulic calculations to indicate that the 3" line will not adversely effect the fire protection water supply system.
- B) Status of alarms and signals in the Control Room when the jockey pump is activated and the operator actions to distinguish these signals and alarms from other control functions.

Mr. G. Knighton  
U. S. Nuclear Regulatory Commission  
W3P83-2269  
Page 2.

Please note that a copy of the hydraulic calculations requested has been attached for review. As mentioned above, equipment located at the intake and discharge structures requires a total flow of approximately 125 gpm. The circulating water pumps require approximately 80 gpm for motor cooling and pump seals. The screen wash pumps require approximately 11 gpm for bearing cooling and the circulating water air evacuation pumps require approximately 30 gpm for sealing water.

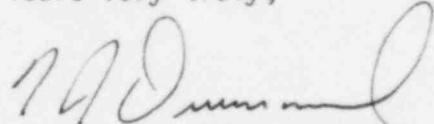

The circulating water pump bearing lubrication water pumps normally supply the required 125 gpm. Each pump is sized for 100% capacity and takes suction from the clearwell tank.

The status of alarms and signals in the Control Room was additional information requested by Mr. D. Kubeckie. A short scenario may be the best means of providing this information. Upon the loss of the subject supply pressure, resulting from loss of both CWP bearing lubrication water pumps, an air operated valve will open and permit fire protection water into the system. The Control Room annunciator E-1204, entitled "CW PUMP BRG BKUP WTR SUPPLY VA OPEN" advises the operators that the CWP bearing water is being provided from the fire protection system. The input logic for E-1204 is a valve 7FP-PM246 or valve 7FP-F245 not closed signal.

The Master Remote Control Panel (MRCP) for the Fire Protection System, in the Control Room would also alarm if the main fire protection system pumps have started and are running.

It is our hope that this information will satisfy the needs of the NRC staff concerning this subject and we await the approval for installation of the subject 3" line.

Yours very truly,

F. J. Drummond

METHOD OF OBTAINING RESULTS

PRESSURE DROP CALCULATIONS WERE BASED ON THE FOLLOWING COMPUTER PROGRAM AND EQUATIONS:

1. COMPUTER PROGRAM FOR "THE ANALYSIS OF PRESSURE AND FLOW IN PIPE DISTRIBUTION SYSTEMS"

A. LINE LOSS

$$h_{LP} = \frac{4.73}{C^{1.852}} \frac{Q^{1.852}}{D^{4.87}} \quad (\text{HAZEN WILLIAMS EQ})$$

$h_{LP}$  = LINE LOSS

D = LINE DIAMETER

C = HAZEN WILLIAMS ROUGHNESS COEFFICIENT

Q = DISCHARGE RATE

B. COMPONENT OF FITTING LOSS

$$h_{LM} = \frac{MV^2}{2g}$$

$h_{LM}$  = COMPONENT OR FITTING LOSS

\* M = MINOR LOSS COEFFICIENT (EL, ELL, T, VALVES ETC.)

V = LINE VELOCITY

g = GRAVITATIONAL CONSTANT

\* MINOR LOSS COEFFICIENTS FOR VARIOUS FITTINGS

\$ VALUES ARE LISTED IN TABLE-1 SH 9 OF 19.

SUMMARY CALCULATION RESULTS

THE SYSTEM FP-M28 (SEE SK-1 SH 19 OF 19) WET PIPE SPRINKLER SYSTEM PROTECTING DIESEL OIL PIPING IN THE PIPING PENETRATION AREA HAS THE LARGEST EXPECTED FLOW RATE DEMAND IN RAB ( $\approx$ 1223 GPM @ 77.98 PSI). SEE TABLE 2 SH 10 OF 19.

THE CURVE 'A' (SEE FIG. 1 SH 8 OF 19) ESTABLISHES THE WATERFLOW AVAILABLE AT THE INTERFACE POINT OF FP-M28 FOR ANY GIVEN FLOWRATE. PT. A REPRESENTS THE AVAILABLE PRESSURE OF 95.00 PSI FOR FLOW OF  $\approx$ 1223.00 GPM (LARGEST DEMAND IN RAB) AT THE INTERFACE PT. POINT B REPRESENTS THE REQUIRED PRESSURE OF 77.98 PSI FOR THE SAME FLOW RATE OF  $\approx$ 1223.00 GPM @ THE INTERFACE PT.

FROM THE PRECEDING RESULTS, ONE COULD CLEARLY CONCLUDE THAT THE PRESSURE AVAILABLE AT THE INTERFACE PT. IS MORE THAN ADEQUATE WITH THE ADDITIONAL REMOVAL OF 125 GPM FOR THE CWP BEARING LUBRICATION.

THE TOTAL WATER DEMAND FOR THE WORST CASE FIRE FOR A DURATION OF 120 MINUTES IS 221,760 GAL WHICH INCLUDES  $\approx$ 1223 GPM FOR SPK. SYSTEM FP-M28, 500 GPM FOR HYDRANT DEMAND AND 125 GPM FOR CWP BEARING LUBRICATION DEMAND.

WATER AVAILABLE AT EACH FIRE PROTECTION WATER STORAGE TANK IS 243,462 GAL.

THEREFORE, FIRE PROTECTION WATER SUPPLY IS MORE THAN SUFFICIENT TO MEET NOTED DEMAND.

SPRINKLER SYSTEM - FP-M28

SEE TABLE-3  
 500 GPM @ 114.85 PSI @ INTERFACE PT.  
 1000 GPM @ 102.37 PSI @ INTERFACE PT.  
 1500 GPM @ 84.65 PSI @ INTERFACE PT.

THIS CURVE REPRESENT THE WATER SUPPLY  
 AVAILABLE AT THE INTERFACE PT. FOR  
 SPRINKLER SYSTEM AFTER 500 GPM HAS  
BEEN TAKED OFF FOR HYDRANT DEMAND AND  
125 GPM HAS BEEN TAKEN OFF FOR CUP. DEMAND.
