NUCLEAR PRODUCTION DEPARTMENT

Office of Nuclear Reactor Regulation U.S. Nuclear Regulatory Commission Washington, D.C. 20555

Attention: Mr. Harold R. Denton, Director

Dear Mr. Denton:

SUBJECT: Grand Culf Nuclear Station

Units 1 and 2

Docket Nos. 50-416 and 50-417

License No. NPF-13 File 0272/0756

Evaluation of Containment and Penetrations for External Pressure Due to Hydrogen

Combustion AECM-84/0066

The containments for the Grand Gulf units have been designed for 3.0 psid external pressure differential (see Table 6.2-1 of FSAR) at 1 designed in accordance with Section 3.8 in the FSAR. Mr. C. G. Tinkler of the NRC Containment Systems Branch has requested Mississippi Power & Light Company (MP&L) to evaluate the containment and containment penetrations for a negative internal differential pressure due to a hydrogen combustion event which depleted oxygen, condensation of steam due to operation of sprays, and loss of containment inventory due to leakage. A pressure differential of 5 psid was agreed to as a bounding value for the containment after the events described above.

We have completed our evaluation of the aforementioned conditions with regard to the containment, liner, and penetrations and have determined that they are capable of withstanding the 5 psid negative internal pressure and have assured that the containment pressure boundary will not be compromised.

Yours truly,

& NHotbe

L. F. Dale

Manager of Nuclear Services
