Two allegations were made to the Nuclear Regulatory Commission. The first concerned the use of an incorrect splicing technique used to install butt splices on control/instrumentation conductors and the second concerned an improper technique used to remove outer jacketing from multiconductor cabling resulting in nicks/cuts to the conductor insulation.

Inspections were performed in Unit 1 and 2 and repairs were made as required. This LER is submitted voluntarily for informational purposes.

- Conductor insulation was under the nylon insulation of the splice see note below.
- End of the conductor was flush with or extended beyond end of terminal wire barrel.
- Butt splice was covered with Okonite taping sequence in the Containment, Reactor Bldg. or Steam Tunnel.
- Any nicks or cuts identified in the conductor insulation were repaired.

NOTE: During this inspection it was determined that the Electrical Contractor used a calibrated crimping tool sized for \$16 - \$22 AWG connectors to crimp the PIDG window splices on \$14 AWG conductors and that the insulation thickness of \$14 Okonite conductors will not fit under the insulation barrel of the splice preventing the insulation crimp from pripping the conductor insulation. Review of these items by the splice manufacturer and CECo Engineering indicates that the splices as installed will meet their design function - for details see Discrepancy Report 1-84-132.

Repair packages were initiated and completed for all butt splices which either failed a pull (tug) test or the required visual inspection criteria. It should be noted, however, that the visual inspection criteria was upgraded after the inspection the Unit I safety related Switchgear and Motor Control Centers and seven (7) of the Unit I containment penetrations. This upgrade was the result of a concern that the pull (tug) test might disable a control circuit. A work request has been written to reinspect the 94 (110-16) Switchgear and MCC butt splices and the II containment penetration butt splices identified during the first stage of the inspection to the upgraded visual inspection criteria. (All of these 105 butt splices were acceptably pull tested during the initial inspection and are therefore not a concern for continued operation). Any splice found that does not meet this criteria will be replaced.

To resolve the nick/cut insulation allegation, Project Construction performed an inspection on certain panels as indicated on page 20, using "Special Inspection Procedure to Ascertain Cable or Conductor Damage Due to Misapplication of Craft Tools." The results are tabulated on pages 21 through 24; any required repairs completed per Work Requests L33996,7. CECo Station Nuclear Engineering Department has reviewed the repair procedures for the nicked/cut conductors and has determined that the repair method restores the insulation system to its full 600v. level. During a meeting with the NEC on 3/7/84, SNED committed to further confirm one aspect of the repair procedure by actual test. An environmental test is to be performed on the Okonite taping sequence applied over a nick/cut at the point where the cables outer jacket has been removed. Discrepancy Report 1-84-113 has been written to track this item.

TEXT If more apace is required, use addressed NRC Form 386A's/(17)

I EVENT DESCRIPTION:

An allegation made to the Nuclear Regulatory Commission pertaining to the use of an incorrect splicing technique resulted in the inspection of butt splices used to extend control/instrumentation conductors (usually \$14AWG). Initial inspection of the Unit 1 safety related Switchgear and Motor Control Center panels identified 110 butt splices. Of the 110 identified butt splices, sixteen (16) were rejected. Based on these results, the inspection was expanded to include the remaining safety related Panels, Penetrations (containing control cables), Switchgear and MCC's in Units 1 and 2. The results are tabulated on page 5.

A separate, but related allegation was made on an improper technique used to remove the outer jacketing from multiconductor cable which could result in nicking/cutting of the individual conductors insulation. This LER is submitted voluntarily for informational purposes.

II. CAUSE:

The apparent cause in both of the above allegations was the failure of the particular terminator to follow the Electrical Contractors termination procedure WI500 (specifically paragraphs 3.2.6 and 3.2.12) and good work practices commensurate with the Journeyman Electrician trade classification. In addition, a minor procedural deficiency added incorrect butt splices not being identified by contractor Quality Control in that the installer was not specifically required to inform QC when a butt splice was installed to extend a conductor nor was QC specifically required to inspect this type of installation.

III. PROBABLE CONSEQUENCES OF THE OCCURENCE:

An evaluation of the safety significance was performed for each of the conductors that failed the pull test during this inspection. As detailed on pages 6 through 19, the potential loss of 58 conductors was evaluated, 33 in Unit 1 and 25 in Unit 2. No safety impact would have resulted from failure of 48 of the conductors and 9 additional conductors could have failed with only minimal impact. Loss of the remaining conductor, 1RM256, would have prevented valve 1E12-F042C (BO) from opening and initiation of LPCI "C". The health and safety of the public was not affected due to the remote possibility of this failure occurring and the availability of other ECCS systems.

IV. CORRECTIVE ACTIONS;

The safety related Panels, Penetrations, Switchgear and MCC's in Units 1 and 2 were inspected for the installation of butt splices on control and instrumentation cables. Except as indicated below, all of the butt splices identified were visually inspected to the following criteria:

- 1. FIDG window splice was sized correctly for the wire spliced.
- Crimp shape and "dots" indicate correct crimping tool was used i.e. not pliers - see note below.

OFADER 1HP156, Orange, is the Control Room Closing Control leg for

system Aux. transformer to bus 143 normal feed. ACB 1432. With the loss of 1MP156, orange. ACB 1432 can still be

closed at PNL 1E22-P301B.

Safety Impact:

No safety impact. Bkr will trip if required, and D/G will

pick up bus.

Cable No:

1PR137. White

Wire Color: Function:

1PR137, orange, is the -15VAC power supply from the

trip/aux unit, 1018-x751C, to the Detector Assy.

1D18-N451C, (Control Room ventilation radiation monitor.) A break in 1PR137, orange, will de-energize the pre-amp. causing the monitoring unit to drive down scale. This will cause the Green "Operating" light to go out on Pnl OPM14J, and bring up the "Control Room HVAC Rad Monitoring PNL

trouble" slarm at PNL 1PH13J.

Safety Impact:

No safety impact 1) failure is in conservative direction. 2) VC logic is 1 of 2 twice so no action occures except

alarm.

Cable No:

1PR210

Wire Color:

Function:

1PR210, orange, is the high range signal connection between the RM-80, micro-processor unit, and the RM-23, Remote

Control and display device, for Standby Gas Treatment Vent W.R.G.M. A break in 198210, orange, will cause the "High Range" backlit selector button, of the RM-23 Unit, to flash. Per LOP-PR-04 the operator would then perform a channel check, which would point out the problem. Also a break in 1PR210, orange, would not affect the input to the

Process Comp.

No safety impact: Low range readings still available. Old

SBGT Monitors still available.

Safety Impact:

1RH124,81k, is a wire connection in "Norm" leg of the "Open" control circuit of the RHR Containment Spray

Outboard Valve, 1E12-F0168.

1E12-F016B has two control locations one from the Control 'Room (Norm) and one from the Renote shutdown panel (Emer.) A break in 1RH124, blk, will disable "OPEN" Control of 1E12-F016B from the Control Room. The Valve can still be

opened from the remote shutdown panel.

Safety Impact:

Minimal impact: valve could still be operated from Rem S/D

panel. Not required to auto open during accident.

Cable No .: Wire Color: Function:

1RH156

1RH156, White, is a wiring connection for the over-load bypass of RHR injection valve, 1212-F042B. ('B' LPCI injection) A breek in the 1RH156, White, will disable the

overload bypass function.

Safety Impact:

Minimal impact: Valve has been tested to cycle with

Thermal O/L protection in place.

Cable No.:

1EH256 Black

Wire Color: Function:

1RM256, black, is a wiring connection in the Rr low pressure permissive circuit to OPEN RHR injection Valve.

1E12-F042C.

A break in 1RH256, black, would prevent both automatic and

manual (handswitch) opening of 1E12-F042C, as well as

disabling the 1812-FOA2C OL by pass circuit.

Safety Impact:

Because of the pull test failure of this wire, it is believed that under certain seismic conditions, this wire could have pulled loose, preventing valve 1E12-F042C from opening and initiation of LPCI "C". The chance of this occuring is possible, but remote. Further more this would have been isolated to the 1E12-F047C valve and all other

ECCS systems would remain available.

Cable No.: Wire Color: Function:

181033

1RIO33, white, is a wire connection in the "Norm" leg of thy "OPEN" Control Circuit of the RCIC Pump Suction from

condensate storage tank valve, 1851-F010. Note: 1251-F010 has two control locations. One from the Control Room (Norm) and one from the remote shutdown Panel (EMER). A break in 181033, white, will prevent opening 1851-Folo from the control room. The valve can still be

opened from the remote shutdown penel.

Safety Impact:

. No safety impact: Valve is normally open, and can be closed if needed to shift suction to Supp. Pool.

Cable No.:

1VE015

Wire Color: Function: Black Connection for indication lights and part of trip circuit

for OVEO3CA (same as orange & white of 1VEO15)

Failure will result in the following:

1) Lose indication at local panel OPAO9J for OVEO3CA
2) Lose manual remote trip from handswitch for OVEO3CA
3) Lose trip of OVEO3CA on no supply air flow with OVEO1CA

running.

Safety Impact:

Minimal impact: only trip function & indication effected.

Cable No.:

1VE015

Wire Color:

Red

Function:

Wire to trip coil for OVEO3CA failure will result in the

loss of all remote trip functions for OVEO3CA.

Safety Impact:

Minimal impact: only trip function & indication effected.

Cable No .:

Wire Color:

1DOO44

Function:

White Cable 100044 is the wire connection of U1 control power to

the ODG fuel oil transfer pump discharge valve ODOOO4. A break in 100044, white, would eliminate the automatic transfer of UZ control power to the valve along with loss

of Ul control power.

Safety Impact:

Minimal Impact: Power would have to be transferred manually

when O D/G day tank low level Alarm occurred.

Cable No.:

1AP251 Black

Punction:

Cable 1AP251, black, is the common power connection for the positive indicator lamps of the "Bus 136% 480v breaker. A

break in 1AP251, black, would eliminate power to position lamp resulting in loss of breaker position indication.

Safety Impact:

No safety impact, indication only.

Cable No.:

1VP019 Blue

Wire Color: Function:

Cable 1VP019, blue, controls the trip lamp of the PC 1A vent supply fan. A break in 1VP019, blue, would eliminate

trip indication.

Safety Impact:

No safety impact, indication only.

Cable No .:

145015

Wire Color:

Orange

Function:

Is a wire for closing circuit of 480v swgr 136x Comp. 303C

A.E.E.R. Air Cooled Cond. Fan OA EPN OVEO3CA. Failure 2

would prevent closing the breaker remotely.

Safety Impact:

No safety impact breaker could still be closed locally.

Cable No .:

IVEO15 White

Wire Color: Function:

Is a wire for the closing circuit of the breaker for

OVEO3CA - same as orange of 1VEO15 cable above. Failure

would prevent closing the breaker remotely

Safety Impact:

No safety impact breaker could still be closed locally

Cable No .:

10G013

Wire Color:

White/Black

Function:

One of two wires to closing circuit of 136% Comp. 303A, 1A DG Cooling Water Pump "Auto start circuit". Failure causes

the auto start capability of cooling water pump to be lost.

Safety Impact:

None, Pump can be manually started with the control switch

through the other wire.

Cable No .:

Wire Color: Function:

drain (shield cable)

Shielded cable, shield.

" Safety Impact:

None.

Panel No .:

1H22-P026

Terminals:

NN-1 to AV-10

Function:

Same as 1RP066, Black.

Safety Impact:

Minimal Impact: 1.) Fails to trip logic systesm. 2.)

Logic strings are 1 of 2 twice, so no actions occur, only

elarms.

TEXT (If more space is required, use additional NAC Form 386A's) (17)

Cable No.: Wire Color: 2DC053

Red

Function:

The red wire of 2DC053 is connected to the 125VDC Batt 2A Ground detector Alarm circuit. A failure of this wire will remove the +65V power supply from the annunciator input card for R-Point RO197 125VDC Batt 2A Ground detector alarm.

Safety Impact:

No Safety Significance: Alarm only, and failure will cause

alarm.

Cable No.:

2DC047

Wire Color: Function:

Orange Cable not used.

Safety Impact:

No Safety Significance.

Cable No .:

Wire Color:

White/Black

Function:

2NBD31, White/Black, is a wire connection in the open position indication and startrec computer point circuit for

SRV 2821-F013E.

A Break in 2NBD31, White/Black, would prevent the "OPEN" indicating light for 2B21-F013E from lighting. Also it would disable Startrec computer point #197, "Monitor Relief

Vlv. E position".

Safety Impact:

No Safety Impact: Doesn't affect valve function or alarms. Redundant open indication is available in the Control Room.

Cable No .:

Wire Color:

2NBD31 Green

Function:

2NBD31. Green, is a wire connection in the "OPEN" position indication and Startrec computer point circuit for ADS

Valve 2821-F013D.

A Break in 2NBD31, Green, would prevent the "OPEN" indicating light for 2821-F013D from lighting. Also it would disable Startrec signal No. 196, "Monitor Relief Vlv

"D" position".

Safety Impact:

No Safety Impact: See previous evaluation of 2NBD31

White/Black.

Cable No .:

2NBD32

Wire Color:

Blue/Black

Function:

2NBD32, Blue/Black, is a wire connection in the "OPEN"

position indication circuit for SRV 2821-F013K.

A bresk in 2NBD32, Blue/Black, would prevent the "OPEN"

indicating light for 2B21-F013K, from lighting.

Safety Impact:

No Safety Impact: See evaluation of 2NBD33 Green.
