No. 20-70899

IN THE UNITED STATES COURT OF APPEALS
FOR THE NINTH CIRCUIT

PUBLIC WATCHDOGS,
Petitioner,
v.
UNITED STATES NUCLEAR REGULATORY COMMISSION,
Respondent.

PETITIONER'S MOTION FOR TEMPORARY INJUNCTIVE RELIEF PENDING JUDICIAL REVIEW OF AGENCY ACTION

Pursuant to 5 U.S.C. § 705, 28 U.S.C. § 1651, Federal Rule of Appellate Procedure 27, and Ninth Circuit Rule 27-1, Petitioner Public Watchdogs files this Motion for Temporary Injunctive Relief Pending Judicial Review. For the reasons discussed herein, Public Watchdogs respectfully requests that the Court order Respondent United States Nuclear Regulatory Commission ("NRC") to temporarily suspend all spent nuclear fuel transfer operations at San Onofre Nuclear Generating Station ("SONGS") Units 2 and 3 pending this Court's review of the NRC's arbitrary and capricious denial of Public Watchdog's petition under 10 C.F.R. § 2.206 (the "2.206 Petition").

INTRODUCTION

Spent nuclear fuel "poses a dangerous, long-term health and environmental risk. It will remain dangerous for time spans seemingly beyond human comprehension." *New York v. Nuclear Regulatory Comm'n*, 681 F.3d 471, 474 (D.C. Cir. 2012). Despite the incalculable hazards posed by spent nuclear fuel, the long-term storage and management of spent nuclear fuel has proven to be an intractable, Sisyphean task. Decades-long efforts by Congress, federal agencies, and numerous stakeholders to construct a deep geological permanent repository for the country's ever-growing stockpile of spent nuclear fuel have been unsuccessful, and no viable plan currently exists for a permanent storage solution.

Due to the lack of a centralized permanent repository, millions of pounds of deadly spent nuclear fuel are currently stored on site at nuclear power plants across the country. Although it is well known in the government and the nuclear power industry that there is no permanent storage solution on the horizon, the NRC routinely permits nuclear power plant licensees to store spent nuclear fuel in "temporary" on site storage installations, relying on the plainly false assumption that this waste will

be transferred to a permanent repository in the relatively near future. Indeed, the NRC has adopted a feckless general policy of allowing licensees to store spent nuclear fuel indefinitely at locations throughout the United States without any plan or strategy for actively monitoring, managing or funding such indefinite storage operations.

The NRC's arbitrary and dangerous general policy regarding long-term storage and management of spent nuclear fuel poses serious public health and safety risks at all decommissioned nuclear facilities in the United States. But the policy poses unique, acute, and wholly unreasonable public health and safety hazards at SONGS. Situated only 108 feet from the Pacific Ocean, near one of California's most populated beaches, within a tsunami inundation zone, and surrounded by active fault lines, the SONGS Independent Spent Fuel Storage Installation ("ISFSI") is in perhaps the most perilous location possible. Moreover, the SONGS licensees are hastily burying spent nuclear fuel in the SONGS ISFSI in welded thin-walled canisters that have a limited useful lifespan and cannot be safely opened when the interred spent nuclear fuel (inevitably) needs to be repackaged. Finally, the SONGS licensees have proven to be negligent, if not reckless, in transferring spent nuclear fuel

from the relative safety of the SONGS spent fuel pools to the SONGS ISFSI. Indeed, from August 2018 to July 2019, the SONGS licensees had to suspend the transfer of spent nuclear fuel because they nearly caused a nuclear catastrophe, losing control of (and almost dropping) two fully loaded canisters of spent nuclear fuel more than 18 feet into the ISFSI.

Shortly after the NRC permitted the SONGS licensees to resume spent fuel transfer operations, Public Watchdogs submitted its 2.206 Petition, requesting that the NRC immediately (1) suspend all decommissioning activities at SONGS and (2) require the SONGS licensees to submit a new decommissioning plan that properly accounted for the reality that spent nuclear fuel will be buried at SONGS indefinitely.[1] On February 26, 2020, the NRC denied the 2.206 Petition without even addressing the primary issue raised by Public Watchdogs—

[1] Separately, Public Watchdogs filed suit in federal district court against the NRC and the SONGS licensees, alleging violations of the Administrative Procedure Act as well as state and federal tort and nuisance laws. *Public Watchdogs v. U.S. Nuclear Regulatory Comm'n, et al.*, Case No. 3:19-cv-1635-JLS-MSB (S.D. Cal.). Respondent NRC moved to dismiss that case, in part by arguing that challenges to the SONGS licensees' actions could only be brought in a 2.206 proceeding. The district court's dismissal of that separate civil lawsuit is currently on appeal, and this Court has granted expedited briefing and scheduled oral argument for June 2020. *Public Watchdogs v. Southern California Edison Co.*, Case No. 19-56531, Docket No. 10 (9th Cir. Jan. 27, 2020).

namely, the dire public health and safety hazards posed by allowing the continued burial of spent nuclear fuel at SONGS pursuant to a decommissioning plan that falsely assumes that all spent nuclear fuel will be transferred to a permanent repository in the foreseeable future.

Public Watchdogs has filed a petition for judicial review of this arbitrary and capricious decision by the NRC. In connection with that petition, Public Watchdogs seeks temporary injunctive relief to preserve the Court's jurisdiction and prevent irreparable harm to Public Watchdogs and the public. Every eight days, the SONGS licensees are able to load another defective canister with deadly spent nuclear fuel and bury it on the Pacific Coastline, imperiling the lives of millions of Southern California residents. At this rate, all spent nuclear fuel will be buried at SONGS, and all alternative storage options at SONGS will be demolished, long before the Court has the opportunity to consider the serious issues raised in Public Watchdogs' petition for judicial review. Accordingly, Public Watchdogs respectfully requests that the Court order the NRC to temporarily suspend all spent nuclear fuel transfer operations at SONGS, pending this Court's resolution of Public Watchdogs' petition for judicial review.

BACKGROUND

A. The Long History of Operational Failures at SONGS.

SONGS began operating as a nuclear electric generating station in the 1960s. Throughout its time as an operational nuclear power plant, SONGS was marred by numerous instances of poor safety and regulatory compliance, which ultimately contributed to the premature cessation of operations at the site. The SONGS licensees' compliance debacles included the backward installation of a 420-ton nuclear reactor vessel, and the unlicensed replacement of steam generators with defective substitutes. These failures were not mere technical violations—the unlicensed steam generators ultimately malfunctioned and leaked deadly radioactive steam into the environment. As a result of these and other operational errors, in June 2013, Southern California Edison and the other SONGS licensees ("Licensees") submitted written certification to the NRC that they were permanently ceasing operations and intended to commence decommissioning of the site. [APP 000041, 000048.][2]

B. The Falsely Predicated Decommissioning Plan.

[2] All citations to "APP" refer to Petitioner's Appendix of Exhibits, which is being submitted in support of this Motion.

In 2014, Licensees submitted their decommissioning plan to the NRC, including a Post-Shutdown Decommissioning Activities Report ("PSDAR"), an Irradiated Fuel Management Plan ("IFMP"), and a Site Specific Decommissioning Cost Estimate ("DCE"). The PSDAR provided a general overview of the timetable for the decommissioning, decontamination, restoration, and license termination activities at the SONGS site. [APP 000051.] The PSDAR specified that the SONGS licensees would begin transferring spent nuclear fuel from spent fuel pools to dry storage in the SONGS ISFSI in 2014 and complete the transfer by June 2019. *Id.* Thereafter, Licensees proposed to store the spent nuclear fuel in the ISFSI during decommissioning from June 2019 to December 2031. *Id.* Finally, Licensees proposed to store the spent nuclear fuel in the ISFSI during a post-decommissioning period from December 2031 to December 2049. *Id.* This timeline was based on the assumptions that the Department of Energy ("DOE") will begin accepting spent nuclear fuel from the industry in 2024, that all spent nuclear fuel will be permanently removed from the ISFSI and transferred to an off-site permanent repository by 2049, and that the SONGS site will be

restored to a condition acceptable for unrestricted use by 2051. *Id.* These critical assumptions have proven to be pure folly.

The IFMP provides additional details regarding Licensees' strategy for storing, monitoring, and managing spent nuclear fuel buried at SONGS during and after the decommissioning period. [APP 000078-000091.] Like the PSDAR, the IFMP is expressly based on the false assumptions that the DOE would begin accepting spent nuclear fuel from the industry in 2024 and that all spent nuclear fuel would be permanently removed from SONGS by 2049. [APP 000082.]

Finally, the DCE provided a detailed estimate of the anticipated costs of the decommissioning and spent fuel management activities at SONGS. [APP 000093-000185.] Licensees projected that the total cost of decommissioning and restoring the SONGS site would exceed $4 billion, of which approximately $1.3 billion was allocated for spent fuel management at the SONGS site through 2049. [APP 000101, 000127.] Once again, the DCE was based on the false assumptions that the DOE will begin accepting spent nuclear fuel from the industry in 2024 and that all spent nuclear fuel will be removed from SONGS by 2049. [APP 000100, 000102, 000104, 000106, 000118.]

At the time Licensees submitted the PSDAR, IFMP, and DCE, there was, in fact, no viable plan or intention for the DOE to begin accepting spent nuclear fuel in 2024, or any other time. Indeed, Licensees submitted their decommissioning plan approximately 4 years after the DOE withdrew its application for a license to construct a permanent repository for spent nuclear fuel at Yucca Mountain in Nevada, and approximately 3 years after the NRC suspended its adjudicatory proceeding regarding the withdrawal of the DOE's license application. [APP 000187-000201.] Nevertheless, on July 17, 2015, the NRC granted a license amendment that allowed Licensees to commence decommissioning of SONGS according to Licensees' falsely predicated decommissioning plan. [APP 000325-000326.]

C. Selection of a Perilous Storage Location, Defective Storage System, and Irretrievable Thin-Walled Canisters.

At the time Licensees submitted their decommissioning plan to the NRC, they had not yet identified a location for expanding the SONGS ISFSI, nor had they selected storage equipment or vendors for the build

out of the ISFSI. [APP 000043.] In December 2014, Licensees selected a location for the ISFSI and selected Holtec International's ("Holtec") HI-STORM UMAX storage system for the "temporary" on-site storage of spent nuclear fuel. [APP 000203.] The location selected for the ISFSI is a mere 108 feet from the Pacific Ocean, within a tsunami inundation zone surrounded by active fault lines, and little more than a foot above the mean high tide level, making it especially susceptible to flooding as sea levels rise. [APP 000207-000208.] Moreover, though Licensees' decommissioning plan falsely claimed that spent nuclear fuel would be stored at the SONGS ISFSI for approximately 30 years, Holtec only warranted its storage system for 10 years. [APP 000220.] What's more, Licensees selected Holtec's thin-walled canisters to store the spent nuclear fuel at SONGS, which were surreptitiously redesigned by Holtec after they were approved by the NRC. Not only are these canisters unsuitable for indefinite storage of spent nuclear fuel, but every single canister that is downloaded into the SONGS ISFSI incurs contact deformities, which can eventually grow into cracks, rendering them susceptible to leaking and preventing their safe removal. [APP 000213-000214.] Making matters worse, Licensees have admitted that the

technology does not currently exist to enable them to remove and repackage spent nuclear fuel from a canister once it has been welded shut and downloaded into the ISFSI, and that any technology that might be developed in the future would require either a spent fuel pool or a dry transfer station. [APP 000698-000699.]

D. The Decommissioning Disasters and Temporary Suspension of Fuel Transfer Operations at SONGS.

On July 22, 2018, Licensees were attempting to insert a 49-ton canister full of radioactive nuclear fuel into the ISFSI. Because of their negligent design and oversight, they did not notice when the canister became stuck on a ¼-inch thick steel guide ring near the top of the chamber. Although the canister had halted its descent, the SONGS licensees continued to unwind the safety cables that were designed to secure the canister, leaving the canister caught on a thin piece of metal and unprotected from a fall of more than 18 feet to the concrete floor below. [APP 000583-000584.] In contravention of NRC regulations, Licensees failed to disclose this near catastrophe to the NRC.

Ten days later, on August 3, 2019, Licensees once again lost control of a 49-ton canister full of deadly spent nuclear fuel, leaving it precariously perched on a narrow metal flange more than 18 feet above

the concrete floor of the ISFSI for almost an hour. As before, the SONGS licensees did not timely disclose this near catastrophe to the NRC. [APP 000576.]

Both of these incidents might have been concealed from the public were it not for a courageous whistleblower who bravely spoke out during a SONGS public engagement panel meeting. [APP 000209.] Following the disclosure of these incidents, the NRC conducted an investigation and ultimately imposed a paltry fine of $116,000. [APP 000528.] Although the NRC did not order Licensees to cease operations, Licensees "voluntarily agreed" to suspend fuel transfer operations at SONGS for 11 months. [APP 000209.] At no time during this extended suspension of fuel transfer operations did the NRC or Licensees suggest that continued storage of spent nuclear fuel in pools posed a danger to the public.

In July 2019, with the NRC's blessing, Licensees resumed fuel transfer operations at SONGS, with a goal of completing the burial of all spent nuclear fuel at SONGS as quickly as possible. [APP 000876.] Indeed, according to Licensees, all spent nuclear fuel will be removed from the relative safety of the spent fuel pools by July or August 2020, and the pools will be demolished shortly thereafter. [APP 002723,

002730-002731.] Thus, by the end of this summer, all spent nuclear fuel is expected to be buried in the defective and precariously located ISFSI, and soon thereafter there will be no alternative storage location at SONGS for the dangerous material, or any means to repackage the spent nuclear fuel that has already been buried.

E. Public Watchdogs' 2.206 Petition.

On September 24, 2019, Public Watchdogs filed the 2.206 Petition and asked the NRC to immediately suspend all decommissioning activities at SONGS and require Licensees to submit a new decommissioning plan that accounts for the reality that spent nuclear fuel will be stored at SONGS indefinitely.[3] [APP 000013-000037.] On December 18, 2019, the NRC's Petition Review Board preliminarily rejected the 2.206 Petition, but granted Public Watchdogs an opportunity to clarify or supplement the 2.206 Petition at a public meeting. [APP

[3] The NRC's month-long delay in even acknowledging receipt of the 2.206 Petition required Public Watchdogs to file an Emergency Petition for Writ of Mandamus with this Court. *In Re Public Watchdogs*, Case No. 19-72670, Docket No. 1 (9th Cir. Oct. 21, 2019). Although this Court denied this request, it recognized that the petition raised "serious issues about the present disposal of spent nuclear fuel" and expected the NRC "to rule on the petition expeditiously." *In Re Public Watchdogs*, Case No. 19-72670, Docket No. 19, at 4 (9th Cir. Dec. 20, 2019).

000008.] On January 21, 2020, Public Watchdogs participated in a public meeting in which it clarified the issues raised in the 2.206 Petition and provided supplemental information in support of the 2.206 Petition. *Id.* On February 26, 2020, the NRC again rejected the 2.206 Petition, and provided Public Watchdogs with a letter explaining the reasons for the rejection. [APP 000007-000010.] Significantly, the NRC failed to even address the primary issue raised by Public Watchdogs—namely, the various hazards to public health and safety caused by the NRC continuing to allow the SONGS licensees to implement their falsely predicated decommissioning plan. *Id.* The NRC's decision on the 2.206 Petition became final on March 23, 2020, *see* 10 C.F.R. § 2.206(c)(1), and on March 30, 2020, Public Watchdogs filed with this Court a Petition for Judicial Review of the NRC's decision.

ARGUMENT

A. Applicable Legal Standards.

When a party seeks judicial review of a final agency action, the reviewing court is statutorily authorized to "issue all necessary and appropriate process to postpone the effective date of an agency action or to preserve status or rights pending conclusion of the review

proceedings." 5 U.S.C. § 705. Similarly, the All Writs Act authorizes federal courts to "issue all writs necessary or appropriate in aid of their respective jurisdictions . . . " 28 U.S.C. § 1651(a).

"Typically, a preliminary injunction issued regarding APA review of agency decisionmaking preserves the court's jurisdiction to grant complete relief by simply suspending the implementation of the challenged agency action pending full court review." *Alto v. Black*, 738 F.3d 1111, 1120 (9th Cir. 2013). The standard for obtaining injunctive relief pending judicial review of an agency action is effectively the same as the standard for obtaining a preliminary injunction. *Humane Soc. of U.S. v. Gutierrez*, 558 F.3d 896, 896 (9th Cir. 2009). That is, the party seeking injunctive relief must show: (1) a likelihood of success on the merits; (2) a likelihood of irreparable harm absent injunctive relief; (3) the balance of equities favor injunctive relief; and (4) an injunction is in the public interest. *Winter v. Nat. Resources Def. Council, Inc.*, 555 U.S. 7, 20 (2008); *Alliance for the Wild Rockies v. Cottrell*, 632 F.3d 1127, 1131 (9th Cir. 2011).

The Ninth Circuit has adopted a "sliding scale" approach to these four factors, under which "a stronger showing of one element may offset

a weaker showing of another." *Cottrell*, 632 F.3d at 1131. For instance, "'the more net harm an injunction can prevent, the weaker the plaintiff's claim on the merits can be while still supporting some preliminary relief.'" *Id.* at 1133 (quoting *Hoosier Energy Rural Elec. Co-op, Inc. v. John Hancock Life Ins. Co.*, 582 F.3d 721 (7th Cir. 2009)). Under the sliding scale approach, so long as the two other *Winter* factors are met, "[a] preliminary injunction is appropriate when a plaintiff demonstrates that serious questions going to the merits were raised and the balance of hardships tips sharply in the plaintiff's favor." *Id.* at 1134-35.

B. The Court Should Order a Temporary Suspension of Spent Nuclear Fuel Transfer Operations at SONGS Pending Review of the NRC's Arbitrary and Capricious Denial of the 2.206 Petition.

1. Public Watchdogs is likely to succeed on the merits.

Under the Hobbs Act, the Courts of Appeals have original jurisdiction to review all final orders of the NRC concerning the granting, suspending, revoking, or amending of any license. 28 U.S.C. § 2342(4); 42 U.S.C. § 2239; *see also Fla. Power & Light Co. v. Lorion*, 470 U.S. 729, 737 (1985). This original jurisdiction extends to the NRC's final orders denying 2.206 petitions. *See Riverkeeper, Inc. v. Collins*, 359 F.3d 156, 164 (2nd Cir. 2004).

Although courts of appeals have original jurisdiction over the NRC's final orders denying 2.206 petitions, various courts have held that such orders may be presumptively unreviewable because they involve enforcement decisions that are committed to the NRC's discretion by law. *Id.* at 166; *see also Safe Energy Coalition of Michigan v. U.S. Nuclear Regulatory Comm'n*, 866 F.2d 1473, 1477 (D.C. Cir. 1989). Notably, however, this presumption of unreviewability may be rebutted when the NRC "has consciously and expressly adopted a general policy that is so extreme as to amount to an abdication of its statutory responsibilities." *See Heckler v. Chaney*, 470 U.S. 821, 833 n. 4 (1985); *see also Com. of Mass. v. U.S. Nuclear Regulatory Comm'n,* 878 F.2d 1516, 1525 (1st Cir. 1989). Indeed, the presumption of unreviewability "does not place the agency above the law," and the denial of a 2.206 petition may be reviewed and reversed if a court concludes that the NRC is "inexcusably defaulting on its fundamental responsibility to protect the public safety from nuclear accidents." *Com. of Mass.*, 878 F.2d at 1525.

Here, the NRC's denial of Public Watchdogs' 2.206 Petition is reviewable by this Court because the NRC has adopted a general policy that is so extreme as to amount to an abdication of its paramount

statutory responsibility to protect the public from nuclear accidents. Specifically, the NRC has adopted a general policy of allowing licensees to implement decommissioning plans predicated on the false assumption that spent nuclear fuel will be transferred from "temporary" on-site storage installations to a centralized permanent repository in the relatively near future. [APP 002553, 002571-002572.] By routinely allowing licensees to implement such falsely predicated decommissioning plans, the NRC is effectively permitting licensees to store spent nuclear fuel indefinitely at numerous locations across the United States, without any plan or strategy for monitoring, managing, or funding such indefinite on-site storage.

The NRC's general policy of willful ignorance taints various aspects of the NRC's regulatory mandate related to long-term storage and management of spent nuclear fuel and poses a dire threat to public health and safety throughout the country. For instance, at SONGS, the NRC has permitted licensees to bury millions of pounds of spent nuclear fuel a mere 108 feet from the Pacific Ocean, near one of California's most populated beaches, within a tsunami inundation zone surrounded by active fault lines, and little more than a foot above the mean high-tide

level. Because the NRC falsely assumes that the spent nuclear fuel will only be stored at this precarious location temporarily, it has not analyzed or required Licensees to demonstrate that this location will remain suitable for storage of spent nuclear fuel indefinitely. Moreover, the NRC is permitting Licensees to store spent nuclear fuel at SONGS in thin-walled canisters that have a limited useful lifespan but cannot be safely opened when the spent nuclear fuel inside inevitably needs to be repackaged. NRC regulations expressly require that "storage systems must be designed to allow ready retrieval of spent fuel . . . for further processing or disposal." 10 C.F.R. § 72.122. But because the NRC falsely assumes that spent nuclear fuel will only be stored in these canisters temporarily, it has not analyzed or required Licensees to demonstrate their ability to repackage the spent nuclear fuel when these canisters' useful lifespan expires. Finally, NRC regulations expressly require Licensees to provide assurance that they will have sufficient financial resources to pay for the full cost of decommissioning and spent fuel management. 10 C.F.R. §§ 50.75, 50.82. But because the NRC falsely assumes that spent nuclear fuel will only be stored at SONGS temporarily, it has not required Licensees to provide assurance that they

will have sufficient financial resources to pay for the cost of storage and management of spent nuclear fuel at SONGS beyond 2049.

In the 2.206 Petition, Public Watchdogs plainly raised the dire public health and safety hazards posed by the NRC allowing Licensees to continue implementing their falsely predicated decommissioning plan. In fact, Public Watchdogs expressly requested that the NRC suspend all decommissioning activities at SONGS and require "Licensees to submit an amended decommissioning plan that properly accounts for the reality that the spent nuclear fuel being buried at SONGS will remain there indefinitely." [APP 000015.] Remarkably, the NRC failed to even address the issue of Licensees' falsely predicated decommissioning plan in its decision to deny the 2.206 Petition. [APP 000007-000010.] Thus, the NRC has acted arbitrarily and capriciously both in permitting Licensees to implement their falsely predicated decommissioning plan, and in failing to address this important aspect of the problem raised by the 2.206 Petition. *See Greater Yellowstone Coalition v. Lewis*, 628 F.3d 1143, 1148 (9th Cir. 2010), *as amended* (Jan. 25, 2011) (explaining that an agency's decision is arbitrary and capricious if it, among other things, "entirely failed to consider an important aspect of the problem"). As such,

Public Watchdogs is likely to succeed on the merits of its petition for judicial review, or, at minimum, has shown there are serious questions going to the merits.

2. Public Watchdogs will likely suffer irreparable harm absent temporary injunctive relief.

Based on false assumptions that spent nuclear fuel will be buried at SONGS only temporarily, the NRC is permitting Licensees to transfer hundreds of tons of one of the deadliest substances known to mankind from the relative safety of spent fuel pools to the most hazardous location possible—a mere 108 feet from the Pacific Ocean, in a tsunami inundation zone surrounded by active fault lines, and in damaged and defective canisters that Licensees, through their demonstrated negligence, have already almost dropped on at least two occasions. Absent temporary injunctive relief, Licensees intend to bury all spent nuclear fuel at SONGS and demolish the pools in a matter of months. Once all spent nuclear fuel is buried at SONGS and the pools are demolished, there will be no facilities available onsite to safely retrieve and repackage the spent nuclear fuel. Millions of residents who live in the area will be forced to live with the specter of a nuclear disaster at SONGS for generations. In other words, absent a temporary suspension

of decommissioning at SONGS, the NRC will permit Licensees to set a proverbial ticking time bomb that will threaten indefinite irreparable harm to the residents and environment of Southern California.

Public Watchdogs is a 501(c)(3) non-profit corporation that advocates for public safety by ensuring that government agencies and special interests comply with all applicable laws, including public-safety and environmental protection laws, especially in the public-utilities industry. [APP 002754.] At least one of Public Watchdogs' members lives within the zone of exposure to a catastrophic release of radioactive material from SONGS, and may of Public Watchdogs' members regularly visit San Onofre State Beach to enjoy the world-famous surfing area, the beautiful sandstone bluffs, and the rare, even endangered, wildlife that make the riparian and wetland habitats their home. [APP 002755-002756.] Accordingly, Public Watchdogs is likely to suffer irreparable injury absent a temporary injunctive relief. *See Ecological Rights Found. v. Pac. Lumber Co.*, 230 F.3d 1141, 1147-1151 (9th Cir. 2000) (explaining that injury to a group's members is imputed to the group itself).[4]

[4] Likewise, the Court will likely lose its jurisdiction to review the denial of the 2.206 Petition absent temporary injunctive relief. This is because once all spent nuclear fuel is buried at SONGS and the spent fuel pools

3. The balance of equities tips sharply in favor of temporary injunctive relief.

It is impossible to overstate the likely harm to Public Watchdogs and millions of Southern California residents if the NRC continues to allow Licensees to implement their falsely predicated decommissioning plan. Indeed, absent an injunction, Southern California will face nothing less than a looming nuclear catastrophe for generations to come. On the other hand, the NRC will not suffer any harm if the Court temporarily suspends decommissioning at SONGS pending review of the NRC's denial of the 2.206 Petition. Spent nuclear fuel transfer operations have already been suspended at SONGS for nearly a year without any deleterious effect on the NRC's regulatory capabilities or other negative impact on the NRC, and there is no reason to expect that the NRC would be harmed by a temporary pause of spent nuclear fuel transfer operations at SONGS to allow this Court to review the serious public health and

---

are demolished, it will be impossible for the Court to grant Public Watchdogs the relief it seeks in the 2.206 Petition. Therefore, this Court should grant temporary injunctive relief pending its review of the NRC's decision to deny the 2.206 Petition. *See FTC v. Dean Foods Co.*, 384 U.S. 597, 603 (1966).

safety issues raised by Public Watchdogs. Accordingly, the balance of equities tips sharply in favor of temporary injunctive relief.

4. Temporary injunctive relief is manifestly in the public interest.

It is axiomatic that there is a paramount public interest in avoiding a nuclear catastrophe that could cause incalculable loss of human life, devastating and lasting physical injuries, damage to property, and loss of economic opportunity throughout wide swaths of Southern California. Moreover, this Court has recognized a "well-established public interest in preserving nature and avoiding irreparable environmental injury." *Cottrell*, 632 F.3d at 1138 (internal quotations omitted). Conversely, no public interest would be injured by the granting of temporary injunctive relief. To be sure, if spent nuclear fuel transfer operations at SONGS are temporarily paused, spent nuclear fuel that has not already been buried in the SONGS ISFSI will remain in the relative safety of the spent fuel pools, where it has been stored for decades. Accordingly, temporary injunctive relief is manifestly in the public interest.

CONCLUSION

For the foregoing reasons, Public Watchdogs respectfully requests that the Court order the NRC to temporarily suspend all

decommissioning activities at SONGS relating to the transfer of spent nuclear fuel, pending this Court's review of the NRC's arbitrary and capricious decision to deny Public Watchdogs' 2.206 Petition.

PETITIONER'S MOTION FOR TEMPORARY INJUNCTIVE RELIEF PENDING JUDICIAL REVIEW

No. 20-70899

IN THE UNITED STATES COURT OF APPEALS
FOR THE NINTH CIRCUIT

PUBLIC WATCHDOGS,
Petitioner,
v.
UNITED STATES NUCLEAR REGULATORY COMMISSION,
Respondent.

DECLARATION OF CHARLES G. LA BELLA IN SUPPORT OF MOTION FOR TEMPORARY INJUNCTIVE RELIEF

I, Charles G. La Bella, hereby declare as follows:

1. I am an attorney at law duly licensed to practice before all of the courts of the State of California and admitted before the United States Court of Appeals for the Ninth Circuit. I am "Of Counsel" at the law firm Barnes & Thornburg LLP, which represents petitioner Public Watchdogs ("Petitioner") in connection with the above captioned action. I make this declaration in support of Petitioner's Motion for Temporary Injunctive Relief Pending Judicial Review of Agency Action.

2. Attached hereto are true and correct copies of the following exhibits for the Motion for Temporary Injunctive Relief:

a. Exhibit 2 is a letter dated February 29, 2020, from the United States Nuclear Regulatory Commission (NRC) rejecting Public Watchdogs' 10 C.F.R. § 2.206 Petition ("2.206 Petition");

b. Exhibit 3 is Public Watchdogs' 2.206 Petition, dated September 24, 2019, requesting immediate suspension of the decommissioning operations at San Onofre Nuclear Generating Station Units 2 and 3;

c. Exhibit 4 contains the exhibits (1 – 38) filed in support of Public Watchdogs' 2.206 Petition;

d. Exhibit 5 is Petitioner Public Watchdogs' written supplement to the 2.206 Petition, along with exhibits in support, dated January 21, 2020; and

e. Exhibit 6 is the Declaration of Nina J. Babiarz in Support of the instant Motion for Temporary Injunctive Relief.

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Executed this 30th day of March, 2020.

Respectfully submitted,

/s/ Charles G. La Bella

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

February 26, 2020

Mr. Charles G. La Bella
Barnes & Thornburg LLP
655 West Broadway, Suite 900
San Diego, California 92101

SUBJECT: PETITION REQUESTING ENFORCEMENT ACTION UNDER SECTION 2.206 OF TITLE 10 OF THE *CODE OF FEDERAL REGULATIONS* AGAINST SOUTHERN CALIFORNIA EDISON RELATED TO DECOMMISSIONING OEPRATIONS AT THE SAN ONOFRE NUCLEAR GENERATING STATION UNITS 2 AND 3

Dear Mr. La Bella:

On behalf of the U.S. Nuclear Regulatory Commission (NRC), I am responding to the petition submitted pursuant to Title 10 of the *Code of Federal Regulations* (10 CFR), Section 2.206, "Requests for action under this subpart," dated September 24, 2019 (Agencywide Documents Access and Management System [ADAMS] Accession Nos. ML19309D323 and ML19311C699), as supplemented on January 21, 2020 (ADAMS Accession No. ML20023A182). The NRC's Executive Director for Operations referred your petition to the Office of Nuclear Material Safety and Safeguards (NMSS) for appropriate review or action.

Petition

In the petition, you requested that the NRC immediately suspend all decommissioning operations at the San Onofre Nuclear Generating Station (SONGS) and require Southern California Edison (SCE or the licensee) to submit an amended decommissioning plan to account for spent nuclear fuel being placed in storage at SONGS. As the basis for the request you stated: burial of spent nuclear fuel at SONGS poses an immediate threat to public safety (for example, integrity of fuel canisters); the licensee's estimated cost of decommissioning SONGS is based on unreasonable and fundamentally flawed assumptions; and the NRC has not considered the environmental and safety effects of sea level rise caused by climate change and has not addressed the environmental impacts of decommissioning on environmental justice, threatened and endangered species, offsite land use, offsite aquatic and terrestrial ecology, and certain cultural and historic resources.

Staff Action

On October 25, 2019, the NRC provided a response to Public Watchdogs by e-mail (ADAMS Accession No. ML19326A969) stating that the NRC staff concluded, in accordance with Section II.B.1 of Management Directive (MD) 8.11 "Review Process for 10 CFR 2.206 Petitions" (ADAMS Accession No. ML18296A043), that the request does not warrant immediate action. The NRC staff has determined that the decommissioning activities at SONGS do not constitute an immediate threat to public health and safety.

On December 18, 2019, the NRC informed you via e-mail (ADAMS Accession No. ML19353A048) that the petition review board (PRB) concluded that the petition did not meet the criteria for consideration under 10 CFR 2.206 because it appears that all of the issues raised in the petition have previously been the subject of NRC staff review, and do not raise concerns that the NRC staff has not previously considered and resolved. On January 21, 2020, the PRB conducted a public teleconference with Public Watchdogs at your request, to discuss the PRB's initial assessment and any supplemental information for the PRB's consideration. The transcript for the January 21st public meeting can be found at ADAMS Accession No. ML20028E467. The PRB considered the information presented during the January 21, 2020, discussion, as well as the original petition and the supplemental information submitted in reaching its final determination, as discussed below.

NRC Staff Response to Specific Concerns

Protection of Public Health and Safety. The NRC has continued to carefully regulate the licensee's decommissioning activities at SONGS, which include its review of the fuel storage facility design, inspections encompassing the physical facility as well as the licensee's operational performance, and appropriate enforcement actions. More specifically, the NRC performed a thorough review of the UMAX Independent Spent Fuel Storage Installation (ISFSI) design used at SONGS, a design the NRC approved in 2017 through a public rulemaking (ADAMS Accession No. ML16341B061). In addition, NRC staff continually performs oversight to ensure that the storage of spent nuclear fuel at SONGS does not pose a threat to public health and safety. NRC inspections of decommissioning activities at SONGS, including inspections related to the ISFSI, are documented in inspection reports that are publicly available. See for example ADAMS Accession Nos. ML18200A400 and ML19316A762.

The NRC staff has also considered the events described in the petition regarding the licensee's fuel loading operations and potential scratching of the fuel canisters. See ADAMS Accession No. ML19190A217. The NRC's regulatory review and oversight actions included a detailed assessment of the significance of the events, specific enforcement actions, and subsequent consideration of the licensee's corrective actions. Specifically, regarding integrity of the fuel canisters, NRC inspectors concluded that localized scratches (peak stresses) on the canisters are not a safety concern (using the ASME Code Section III, Subsection NB stress intensity limits as reference). NRC inspectors also concluded that canister evaluations performed by SCE using visual scratch assessments and statistical evaluations acceptable. These evaluations were adequate to demonstrate that canister scratches from incidental contact for previous and future canisters, will continue to meet the confinement design functions as specified in the UMAX Final Safety Analysis Report and ASME Code Section III canister wall thickness tolerances.

As a result, the NRC remains confident that reasonable assurance of adequate protection of the public health and safety can be maintained for as long as fuel is stored in accordance with the requirements of the SONGS license, the certificate of compliance for the UMAX system (and any other licensed systems that may be implemented in the future at the SONGS site), and other applicable requirements.

Decommissioning Cost Estimate. Regarding your concern about the estimated cost of completing decommissioning at SONGS, the NRC staff concluded in its review of the SONGS Decommissioning Cost Estimate (DCE) (ADAMS Accession No. ML15204A383) that the site-specific DCE and the cost of long-term storage of spent fuel for SONGS, Units 2 and 3, are reasonable and provide a sufficient level of detail on the funding mechanisms to meet the

requirements of 10 CFR 50.82(a)(4)(i). In addition, the NRC staff reviewed the 2019 Decommissioning Funding Status (DFS) report for SONGS and determined that the licensee complies with the decommissioning funding assurance requirements of 10 CFR 50.75 and 10 CFR 50.82, as applicable, for the 2019 DFS reporting cycle (ADAMS Accession No. ML19346E375). The SONGS DFS reports are submitted and reviewed annually by the NRC staff to ensure continued compliance with the decommissioning financial assurance requirements. Finally, the NRC safety evaluation for the SONGS Irradiated Fuel Management Plan (IFMP) (ADAMS Accession No. ML15182A256) states that "the NRC staff finds the SONGS IFMP estimates to be reasonable, based on a cost comparison with similar decommissioning reactors...."

Environmental Impacts. Regarding your concern about the environmental impacts of the decommissioning activities, the NRC staff concluded in its review of the SONGS Post Shutdown Decommissioning Activities Report (ADAMS Accession No. ML15204A383) that these activities are bounded by the previously issued NUREG-0586, "Final Generic Environmental Impact Statement [GEIS] on Decommissioning of Nuclear Facilities," and its supplements, and did not find any deviations from the previously issued Environmental Statement for SONGS (ADAMS Accession No. ML18239A414). Therefore, the NRC is confident that the environment can be adequately protected, and all impacts bounded, during decommissioning activities at SONGS.

Retrievability of Spent Fuel. On January 21, 2020, you raised concerns regarding spent nuclear fuel currently stored at SONGS being non-retrievable, in violation of10 CFR 72.122(l), and with potential impacts from flooding. Specifically, you stated that "although the Holtec Final Safety Analysis Report and Certificates of Compliance clearly contemplate a potential flooding event and state that a site-specific analysis will be submitted by Licensees, Public Watchdogs is not aware that any such analysis has been performed or submitted."

Interim Staff Guidance No. 2, Revision 2, "Fuel Retrievability in Spent Fuel Storage Applications" (ADAMS Accession No. ML16117A080), defines ready retrieval as "the ability to safely remove the spent fuel from storage for further processing or disposal." A licensee can demonstrate the ability for ready retrieval by demonstrating that it can remove a canister loaded with spent fuel assemblies from a storage cask/overpack. As discussed in NRC Supplemental Inspection Report 2018-002 for SONGS (ADAMS Accession No. ML19190A217), the NRC inspection team observed the licensee implementing all the corrective action enhancements to download and retrieve a simulated canister at the SONGS ISFSI pad, during exercises conducted between January 28-30, 2019. SCE was fully successful in downloading and retrieving the canister during the exercises, and the corrective actions taken were determined by the NRC inspectors to be adequate.

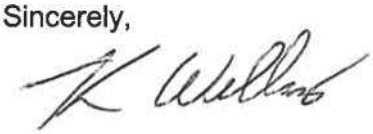
Flood Analysis. Regarding your concerns with flooding at the SONGS ISFSI, SCE's flood analyses determined that the UMAX maximum design flood parameters envelope the SONGS site flooding parameters. The NRC staff verified this flood evaluation in the SONGS 10 CFR 72.212 report to qualify the use of the UMAX system at SONGS, and the NRC documented this in an inspection report (ADAMS Accession No. ML18200A400). The NRC did not identify any issues as a result of its review of the flood evaluation for SONGS.

Having considered the results of recent inspections, the NRC's evaluation of past SONGS DFS reports, the applicable environmental documents, and the supplemental information provided, the PRB's final determination is that your petition does not meet the acceptance criteria in

MD 8.11, Section III.C.1(b), because the issues raised in the petition have been "the subject of a facility-specific or generic NRC staff review," and none of the circumstances in Section III.C.1(b)(ii) applies. The NMSS Office Director was briefed on and supported this conclusion.

Thank you for bringing these issues to the attention of the NRC.

Sincerely,



Kevin Williams, Deputy Director
Division of Materials Safety, Security, State,
and Tribal Programs
Office of Nuclear Material Safety
and Safeguards

Attorneys for Petitioner,
Public Watchdogs

UNITED STATES NUCLEAR REGULATORY COMMISSION

Before the Executive Director for Operations

PUBLIC WATCHDOGS, a California 501(c)(3) corporation, Petitioner, v. SOUTHERN CALIFORNIA EDISON COMPANY AND SAN DIEGO GAS & ELECTRIC COMPANY, Licensees.	**10 C.F.R. § 2.206 PETITION TO IMMEDIATELY SUSPEND DECOMMISSIONING OPERATIONS AT SAN ONOFRE NUCLEAR GENERATING STATION UNITS 2 AND 3**

Pursuant to 10 C.F.R. § 2.206, Petitioner Public Watchdogs ("Petitioner") hereby submits its Petition to Immediately Suspend Decommissioning Operations at San Onofre Nuclear Generating Station ("SONGS") Units 2 and 3:

PRELIMINARY STATEMENT

1. As part of the ongoing decommissioning of SONGS Units 2 and 3, Licensees Southern California Edison Company ("Edison") and San Diego Gas & Electric Company (collectively, "Licensees") are in the process of burying hundreds of tons of deadly spent nuclear fuel a mere 108 feet from one of California's most populated public beaches, within a tsunami zone surrounded by active fault lines, in canisters that are damaged, defective, and not properly designed to serve their intended purpose. Throughout the decommissioning process, the Nuclear Regulatory Commission ("NRC") has effectively turned a blind eye to multiple alarming safety hazards created by Licensees' burial of spent nuclear fuel at SONGS, including evidence that the canisters being used by Licensees are damaged and defective, and that Licensees do not have adequate safety procedures or competent staff to complete the transfer of the spent nuclear fuel from wet to dry storage.

2. What's more, the NRC's various actions permitting the implementation of Licensees' decommissioning plan and authorizing Licensees' dangerous burial of spent nuclear fuel at SONGS are based on unreasonable and fundamentally flawed assumptions that: (1) the United States Department of Energy ("DOE") will begin accepting spent nuclear fuel from nuclear generating stations like SONGS in 2024 or 2028; (2) all of the spent nuclear fuel currently being buried at SONGS will be permanently removed from the site by 2049; and (3) the SONGS site will be restored to a condition that is acceptable for unrestricted use by 2051. In fact, no central repository for permanent storage of spent nuclear fuel exists in the United States, there is no viable plan to open such a permanent repository, and the DOE undoubtedly will not begin accepting spent nuclear fuel for permanent storage from SONGS or any other nuclear generating station in 2024, 2028, or any other time in the foreseeable future. As the United States Court of Appeals for the District of Columbia Circuit has observed: "At this time, there is not even a prospective

site for a repository, let alone progress toward the actual construction of one." *New York v. Nuclear Regulatory Com'n*, 681 F.3d 471, 474 (D.C. Cir. 2012).

3. By ignoring the manifold safety hazards posed by Licensees' decommissioning operations and permitting Licensees to implement their decommissioning plan based on the unreasonable assumption that spent nuclear fuel will be stored at SONGS only temporarily, the NRC has abdicated its paramount responsibility to protect public health and safety and it has failed to ensure Licensees will have adequate funds to pay for the full cost of decommissioning and restoring the SONGS site through the termination of their license. Accordingly, Petitioners respectfully request that the NRC issue an order immediately suspending all decommissioning operations at SONGS, including the burial of spent nuclear fuel at the SONGS site, and requiring Licensees to submit an amended decommissioning plan that properly accounts for the reality that the spent nuclear fuel being buried at SONGS will remain there indefinitely.

FACTUAL BACKGROUND

I. LICENSEES' NEGLIGENT OPERATION OF SONGS

4. In August 1963, Congress enacted Public Law 88-82 authorizing the "construct[ion], operate[ion], maintain[enance], and use" of a nuclear power plant on approximately 90 acres of land located at the Camp Pendleton military base. In May 1964, the United States of America granted Licensees an easement for the sole purpose of "construction, operation, maintenance and use of a nuclear electric generating station" at the Camp Pendleton site.

5. Licensees operated three nuclear electric generating units at SONGS. Licensees operated Unit 1 from approximately 1968 until 1992, when they began the decommissioning process for that unit. Licensees operated Units 2 and 3 from approximately 1983 and 1984 (respectively) until June 12, 2013, when they submitted written certification to the NRC that they were permanently ceasing operation of those units.

6. Throughout its time as an operational nuclear power plant, SONGS was marred by numerous instances of poor safety and regulatory compliance, which ultimately contributed to the cessation of operations at the site. These compliance debacles included the backward installation of a 420-ton nuclear reactor vessel and the installation of replacement steam generators, without obtaining the requisite approval from the NRC, which ultimately malfunctioned and leaked deadly radioactive steam at the site.

II. LICENSEES' FUNDAMENTALLY FLAWED DECOMMISSIONING PLAN

7. On September 23, 2014, Licensees submitted their decommissioning plan to the NRC, including a Post-Shutdown Decommissioning Activities Report ("PSDAR"), an Irradiated Fuel Management Plan ("IFMP"), and a Site Specific Decommissioning Cost Estimate ("DCE"). *See* **Exhibits 1, 2, and 3.**

8. Licensees' PSDAR provided a general overview and timetable for the decommissioning, decontamination, restoration, and license termination activities at the SONGS site. The PSDAR specified that Licensees would begin transferring spent nuclear fuel to dry storage in the SONGS Independent Spent Fuel Storage Installation ("ISFSI") in 2014, and complete the transfer by June 2019. *See* **Exhibit 1**. Thereafter, Licensees proposed to store the spent nuclear fuel in the ISFSI during decommissioning from June 2019 to December 2031. *Id.* Finally, Licensees proposed to store spent nuclear fuel in the ISFSI during a post-decommissioning period from December 2031 to December 2049. *Id.* This timeline was based on the assumption that the DOE will begin accepting spent nuclear fuel from the industry in 2024, that all spent nuclear fuel will be permanently removed from the SONGS ISFSI and transferred to an off-site permanent repository by 2049, and that the SONGS site will be restored to a condition acceptable for unrestricted use and returned to the U.S. Navy by 2051. *Id.* Licensees expressly based this assumption on some unspecified "previously documented positions of the DOE, which indicates that shipments from the industry could begin as early as 2024 and SONGS place in the current queue." *Id.* Notably, however, Licensees acknowledged that both the date on which the

DOE would begin accepting spent nuclear fuel from the industry and SONGS place in the queue "are subject to change." *Id*.

9. Licensees' IFMP provides additional details regarding their strategy for storing, monitoring, and managing spent nuclear fuel at the SONGS ISFSI during and after the decommissioning period and through ultimate termination of the SONGS licenses. *See* **Exhibit 2**. Like the PSDAR, Licensees' IFMP is expressly based on the assumptions that the DOE would begin accepting spent nuclear fuel from the industry in 2024 and that all spent nuclear fuel would be permanently removed from the SONGS ISFSI by 2049. *Id.* Again, however, Licensees provided no objective evidentiary support for these critical assumptions.

10. Finally, Licensees' DCE provided a detailed estimate of the anticipated costs of the decommissioning and spent fuel management activities at SONGS. *See* **Exhibit 3**. Licensees projected that the total cost of decommissioning and restoring the SONGS site would exceed $4 billion, of which approximately $1.3 billion was allocated for spent fuel management through 2049. *Id*. Once again, Licensees based their DCE on the assumptions that the DOE will begin accepting spent nuclear fuel from the industry in 2024 and that all spent nuclear fuel will be removed from the SONGS ISFSI by 2049. *Id*. Significantly, however, Licensees' DCE expressly acknowledged that "DOE has not committed to accept [Edison's] canistered spent fuel." *Id*. Despite this acknowledgment, the DCE also confusingly stated: "But for purposes of this estimate, it is assumed that an [Edison-funded] dry storage facility will not be necessary." *Id.*

11. At the time Licensees submitted their PSDAR, IFMP, and DCE, there was, in fact, no viable plan or intention for the DOE to begin accepting spent nuclear fuel in 2024 or any other time. Indeed, Licensees submitted their PSDAR, IFMP, and DCE approximately 4 years after the DOE withdrew its application for a license to construct a permanent repository for spent nuclear fuel at Yucca Mountain in Nevada and approximately 3 years after the NRC suspended its adjudicatory proceeding regarding the withdrawal of the DOE's license application. *See* **Exhibit 4**. In other words, the

fundamental predicate for Licensees' decommissioning plan was, and remains today, a pure fiction that is completely untethered to objective reality.

III. LICENSEES' SELECTION OF HOLTEC'S HI-STORM UMAX STORAGE SYSTEM AND DEFECTIVE THIN-WALL CANISTERS

12. At the time Licensees submitted their decommissioning plan, they had not yet identified a location for the expanded SONGS ISFSI, nor had they selected storage equipment or vendors for the build out of the ISFSI. *See* **Exhibit 2**.

13. In December 2014, Licensees selected a location for the expanded SONGS ISFSI and selected Holtec International's ("Holtec") HI-STORM UMAX storage system for the "temporary" storage of spent nuclear fuel. *See* **Exhibit 5**. The location selected for the ISFSI is a mere 108 feet from the Pacific Ocean, within a tsunami zone surrounded by active fault lines, and little more than a foot above the mean high tide level, making it especially susceptible to flooding as sea levels rise. *See* **Exhibit 6**. Notably, although Licensees' decommissioning plan contemplated, albeit fancifully, that spent nuclear fuel would be stored at the SONGS ISFSI for at least 30 years, Holtec only warranted its storage system for 10 years. *See* **Exhibit 7**.

14. Moreover, the Holtec dry storage canisters in which the spent nuclear fuel is being stored at the SONGS ISFSI are defective and unfit for the indefinite storage of spent nuclear fuel. Each and every one of the 73 individual canisters will contain more deadly radioactive Cesium-137 than was released globally during the Chernobyl disaster, as well as dozens of other radioactive and toxic fission byproducts. The failure of even one of these canisters will have calamitous consequences. Severe problems with Licensees' decommissioning plan make this nightmare scenario a real possibility.

15. First, although the radioisotopes in each canister remain radioactive, toxic, and deadly for hundreds of years (and one, Plutonium-239, remains deadly for over 24,000 years), Holtec warrants the canisters for only 25 years. *See* **Exhibit 7**. Thus, the warranty on the canisters will expire long before 2049, when Licensees unreasonably assume that all spent fuel will be transferred to permanent storage, and there is no objective basis for

determining that the canisters will remain viable beyond 2049, even though they will likely remain in the SONGS ISFSI indefinitely.

16. Second, the design of the Holtec canisters the Licensees are using to store the spent nuclear fuel deviates from the acceptable minimum safety thresholds required for the design and manufacture of nuclear waste storage containers. Indeed, the Holtec canisters are so-called "thin-wall" canisters with only a 5/8-inch thick stainless-steel wall with an aluminum egg-crate structure designed to hold up to 37 spent fuel assemblies. Holtec designs, manufactures, and supplies the canisters under strict guidelines promulgated by the NRC and, more important, under the conditions of applicable certificates of compliance ("CoCs"). *See* **Exhibit 8**. The NRC issues a CoC conditioned on the holder strictly hewing to specific technical specifications and approved contents and design features. But after receiving CoCs for the thin-wall canisters being used at SONGS, Holtec secretly modified the design and manufacture of the canisters, apparently to reduce manufacturing costs and/or to correct a flaw in the original design. By making the change surreptitiously, Holtec avoided a costly and time-consuming NRC design review and attendant risk analysis. In any case, the design change introduced a critical flaw into the casks that is discussed in further detail below.

17. Third, due to the design of the canisters, the narrow slots in which they are loaded into the storage system, and the equipment used to load the canisters into the storage system, extensive gouging of the canisters occurs during routine loading into the storage system. Over time, the gouges in the canisters can grow into deeper cracks that make the canisters susceptible to leaking and make it impossible for the canisters to be safely removed from the ISFSI in the future. However, there is no way to adequately monitor or inspect the canisters once they are in the ground, and no way to fix them even if critical damage to them could be identified.

IV. NRC GRANTS A LICENSE AMENDMENT THAT PERMITS DECOMMISSIONING OF SONGS ACCORDING TO LICENSEES' FLAWED DECOMMISSIONING PLAN

18. Because the original license granted to the Licensees was narrow in scope—in that it only permitted them to operate the plant and temporarily store spent nuclear fuel and waste—a license amendment would be necessary to decommission the plant. However, when Licensees decided to permanently cease nuclear operations, they sought to utilize the nuclear power plant for an entirely different purpose—that is, the long-term storage of spent nuclear fuel. Thus, the grant or denial of the Licensees' request for a license amendment was a matter of significant public concern, requiring an opportunity for meaningful public participation.

19. Without meaningful public participation or an independent assessment, on July 17, 2015, the NRC granted Licensees' request for a license amendment that permitted them to begin decommissioning the SONGS facility. *See* **Exhibit 9**. Specifically, the NRC authorized Licensees to "Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition." *Id*. In so doing, the NRC "found" that there was "reasonable assurance (i) that the activities authorized by this amendment can be conducted without endangering the health and safety of the public, and (ii) that such activities will be conducted in compliance with the Commission's regulations." *Id*. In fact, the NRC simply relied on Licensees' own flawed analysis instead of objective criteria or independent analysis, enabling Licensees to present their internal, untested, and unchecked conclusions, without even a suggestion of an objective analysis or oversight.

20. In addition, the NRC repeatedly granted Licensees' numerous subsequent license amendments and exemptions, regardless of the scope and magnitude of the proposed changes. *See* **Exhibit 10**. Among these exemptions was a staggering reduction in the amount of onsite liability insurance required to be maintained by Licensees from the $1.06 billion required by NRC regulations to a paltry $50 million. *See* **Exhibit 11**.

V. LICENSEES' MULTIPLE DECOMMISSIONING DISASTERS

21. From the outset, Licensees' decommissioning operations have been marred by a series of miscues, lackadaisical managerial oversight, and attempts to conceal the same. Unsurprisingly, this behavior has caused Licensees to repeatedly fall short of the NRC's identified standards and promulgated regulations. Among the many failures of the Licensees' decommissioning efforts are the following:

A. Licensees compromised the structural integrity of twenty-nine canisters they buried at SONGS.

22. Licensees have consistently used fewer personnel than necessary to ensure that the Holtec canisters are safely and effectively loaded into the ISFSI. For example, Licensees have employed an inadequate number of "spotters" at different vantage points, resulting in limited visibility of the canister as it is being loaded into its enclosure. This negligent deviation from safe fuel-handling procedures has already caused substantial harm to the millions of people around the SONGS facility. *See* **Exhibit 12**.

23. On information and belief, and as revealed in NRC documents and noted at public hearings, the Licensees negligently gouged and then buried twenty-nine (29) fully loaded canisters at SONGS. Experts believe this gouging may lead to deeper, through-the-wall cracks, which will make the future safe movement of these canisters impossible (despite the fact that the safety of the canisters' storage location is only warranted for 10 years). Experts also point out that damage to the canisters will be exacerbated, *inter alia*, by the presence of salt air, fog, rain, and salt water—the precise weather conditions that the canisters will be exposed to at the current location just steps from the Pacific Ocean. *See* **Exhibit 6**.

24. Upon information and belief, many (if not all) of the canisters were negligently scratched during transportation to the ISFSI. According to an NRC inspection report, and as admitted at a Community Engagement Panel Meeting by NRC spokesperson Scott Morris, **every single canister was damaged** during the downloading process: "The canister involved in the near-drop event [and] all the other canisters . . . experienced a little

bit of scuffing, and a little bit of contact going into the ISFSI." *See* **Exhibit 13**. As discussed below, one NRC inspector concluded that the damage to the canisters during loading into the SONGS ISFSI caused them to fall out of compliance with requirements of the applicable CoC. *See* **Exhibits 27 and 29**. The NRC, however, simply ignored this assessment and cleared the way for even more defective and non-compliant canisters to be buried at SONGS.[1]

B. Licensees nearly dropped two 49-ton canisters full of deadly radioactive nuclear waste and attempted to cover it up.

25. On July 22, 2018, Licensees nearly dropped a 49-ton canister full of deadly radioactive nuclear waste more than 18 feet into the ISFSI when it was caught on a quarter inch thick steel guide ring. Licensees referred to this event as an "unsecured load event." In actuality, this event could have turned San Onofre State Beach Park into a permanently uninhabitable nuclear wasteland.

26. Pursuant to 10 C.F.R. § 72.75, any incident involving nuclear waste ***must*** be reported to the NRC within ***twenty-four hours***, yet the July 22 failure was not formally reported on the NRC's Event Notifications Report. The sole purpose of 10 C.F.R. § 72.75 is to insure that potentially hazardous events are promptly reported and investigated and to allow for public disclosure of potential safety risks.

27. Despite the regulation's clear obligation to provide a formal written report for events of this nature, Licensees ***never*** provided a formal report for the July 22 unsecured load event. As a result, the public was kept in the dark about the potentially disastrous incident in July.

28. Ten days later, on August 3, 2018, the Licensees once again lost control of a 49-ton canister full of deadly radioactive nuclear waste while it was being lowered into a

[1] Despite the Licensees' efforts to downplay the significance of the gouging found on Holtec canisters, the potential consequences are staggering. Holtec's CEO admitted as much during a public meeting, acknowledging that even a microscopic crack in a canister is enough to cause a release of "millions of curies of radioactivity." *Dr. Kris Singh, CEO, Holtec International, on Dry Canister Nuclear Waste Storage*, YouTube (Oct. 14, 2014), at 31:04-34:30(at https://www.youtube.com/watch?v=s5LAQgTcvAU). *See* **Exhibit 14**.

below-ground storage silo. While moving the canister, Licensees' employees snagged the 49-ton canister on the same quarter-inch wide steel flange that captured the canister during the July 22 event. Licensees' personnel did not realize that the equipment holding the canister had been caught on the flange.

29. A whistleblower, David Fritch, came forward and publicly reported the event six days later during the August 9 Community Engagement Panel Meeting. Prior to the whistleblower's disclosure, Licensees' representative did not disclose the August 3 "near-miss" disaster when discussing the work stoppage put in place after the event. In fact, Edison's then Vice President and Chief Nuclear Officer, Tom Palmisano, affirmatively misled the public and misrepresented that the work stoppage was a planned stop so that they could perform necessary maintenance, provide employees with time off, and analyze the overall efficiency and effectiveness of the decommissioning process at that point.

30. However, during the public comment portion of the event, Fritch (a Safety Professional employed as a contractor at the SONGS facility) disclosed the misconduct as the actual cause for the work stoppage. Fritch informed the public about the near-miss event of August 3rd, and directly contradicted Licensees' public statements that the work stoppage was a "planned event."

31. Fritch's whistle-blowing sparked widespread media attention on the safety hazards posed by the Defendants' negligence at the facility. This alone should have prompted the NRC to perform a professional and independent risk assessment to determine the actual risks at the site, and take appropriate remedial steps to avoid or minimize future risks. Again, however, the NRC abdicated its responsibilities and continued to do nothing to protect the public or adequately monitor the situation.

32. As before, the Licensees failed to issue an NRC Event Notification Report within twenty-four hours of the Friday, August 3 event as required the NRC's regulations. Instead, they waited more than six weeks to report the incident. Moreover, rather than submitting the legally required written report, Licensees waited until Monday, August 6, to informally call the NRC. Licensees' private phone call deprived the public not only of

a written contemporaneous report of the near fatal disaster but prevented transparency of their actions at SONGS. This oral notification both failed to comply with the NRC's own "Event Reporting Requirements" under 10 CFR § 72.75, and failed to notify the public of the significant public safety hazards being posed by Licensees' decommissioning operations. In this way, Licensees attempted to keep the August 3 near-catastrophic-miss a secret.

33. This concealment was not accidental. In fact, the July 22 and August 3 near-miss events occurred during a required public comment period for the California State Lands Commissions Draft Environmental Impact Report ("EIR") directly related to the SONGS decommissioning project. That period ran from June 28 until August 30. By delaying formal written notice of the events, Licensees were able to avoid meaningful public participation in connection with the interrelated EIR.

34. Rather than taking precautionary steps to protect the public in light of the Licensees' demonstrated negligence, upon information and belief, the NRC completely deferred to Licensees and blindly relied upon their assurances that everything was under control. Indeed, the NRC went so far as to summarily reject a written request by Congressman Mike Levin for the installation of permanent NRC inspectors at the facility. *See* **Exhibit 15**.

35. On August 17, 2018, in response to the August 3 "near-miss," the NRC issued an Inspection Charter for SONGS, which found five violations that were ultimately penalized by the imposition of a wrist-slapping fee of $116,000 on Edison. *See* **Exhibits 16 and 17**. Perhaps more troubling, the NRC has not required Licensees to file an Event Notification Report for the July 22 event, and has ignored their flagrant violation of federal law for not filing an Event Notification Report for 47 days after the August 3 event.

36. Instead of ordering the Licensees to cease operations at SONGS, the NRC seemingly accepted the Licensees' "verbal commitment" to discontinue loading until the NRC issued its final Inspection Report.

VI. HOLTEC'S SURREPTITIOUS REDESIGN OF THE DRY STORAGE CANISTERS

37. In February 2018, while preparing to load one of the thin-wall canisters with spent nuclear fuel, Licensees discovered a loose bolt inside. After reporting the issue to Holtec, Holtec revealed that it had redesigned the already defective canisters to include a different "stand-off shim." The purpose of these shims is to enhance convection cooling of the hot fuel assemblies by creating additional space to allow cooling helium gas to flow throughout the canister so that the spent nuclear fuel does not overheat. The newly designed shims included bolts that were not part of the original design. As Licensees discovered, the newly introduced bolts are susceptible to breaking loose inside the canister, which could ultimately cause a restriction of airflow within the canister and a failure of the canister's cooling mechanism. Left uncooled, spent nuclear fuel will heat up to the point of a critical—and deadly—nuclear reaction. Thus, a failure of the canister's cooling mechanism would be disastrous.

38. Under NRC regulations, Holtec was required to obtain a CoC amendment prior to implementing any proposed change to the design of its canisters if the change would result in more than a minimal increase in the frequency or likelihood of an accident, malfunction, or the consequences of such accident or malfunction. Despite the serious risks posed by Holtec's design changes, however, Holtec failed to even notify the NRC, much less obtain a CoC amendment, before changing the design of the canisters.

39. On March 22, 2018, Licensees' admitted during a Community Engagement Panel Meeting that four canisters with the defective shim design had already been filled with spent nuclear fuel and buried at SONGS. To make matters worse, Mr. Palmisano made a stunning admission that there is no existing method for safely opening defectively designed canisters to see if the stand-off shims were broken in the four buried canisters. Thus, the SONGS Defendants have no way of ensuring that the fuel assemblies and/or cooling mechanisms have not been critically compromised. Mr. Palmisano admitted that

it would be at least three years before the techniques necessary to unload and inspect a canister ***could possibly*** be developed:

> So nobody has unloaded a commercial canister, either a bolted cask or a welded cask or canister. . . . What you would do is basically have a mechanism, either to do it in a fuel pool or do it in a dry transfer facility. . . . The real challenge as we would understand it today, and nobody has had to do it yet, is the reflood. Certainly, technically possible. What I would tell you is just I was back in Washington with the NRC last week, if you were just to brainstorm, ***this would probably be a two- to three-year project to develop the techniques***, pile up the techniques. The NRC would want to have explicit approval on this because of the ***radiological hazards***.

See **Exhibit 18** (emphasis added).

40. Although the NRC found that Holtec failed to establish adequate design control measures of components important to safety, and failed to perform evaluations before making the design changes, it failed to impose any fine or other penalty on Holtec for these violations.

41. Notably, this was not the first time Holtec flouted its obligations to disclose critical information to a regulator. In October 2010, Holtec was "debarred" as a contractor by the Tennessee Valley Authority ("TVA") in connection with improper and undisclosed payments made to a federal official to secure a contract to design and construct a dry cask storage system for spent nuclear fuel rods at the Brown Ferry Nuclear Plant. *See* **Exhibit 25**. Following that debarment, Holtec sought a $260 million tax break related to a nuclear plant project in Camden New Jersey. As part of that process, Holtec's CEO Kris Singh submitted certified forms where he answered "no" to the question of whether Holtec had ever been barred from doing business with a state or federal agency. In June 2019, New Jersey regulators froze Holtec's $260 million tax-incentive award pending further investigation. *See* **Exhibit 26**. Despite Holtec's history of misconduct and deceit, the NRC has continued to blindly accept its representations regarding its defective and dangerous canisters and has approved multiple amendments to the applicable CoCs to permit the continued use of Holtec's defective and dangerous canisters at SONGS and elsewhere.

VII. LICENSEES' UPDATED, BUT NO LESS FLAWED, DCE, AND DECOMMISSIONING FUNDING STATUS REPORTS

42. As required by the California Nuclear Facilities Decommissioning Act of 1985, Licensees updated their DCE for SONGS Units 2 & 3 in 2017. *See* **Exhibit 19**. Although Licensees' updated DCE continued to estimate that all spent nuclear fuel will be removed from the SONGS ISFSI by 2049, and that the site will be acceptable for unrestricted use by the end of 2051, Licensees changed their assumptions regarding the date the DOE will commence accepting spent nuclear fuel from the industry. Specifically, Licensees' 2017 DCE assumed the DOE will begin accepting spent nuclear fuel from the industry in 2028, rather than 2024, because of the "DOE's continued failure to perform its contractual obligation to remove spent fuel from commercial nuclear reactors in the past four years." Licensees' 2017 DCE does not explain, however, why pushing back the estimated date on which the DOE will begin accepting spent nuclear fuel from the industry by four years would not also necessitate pushing back the estimated date for removal of all spent nuclear from the SONGS ISFSI by four years and concomitantly increasing the estimated cost of storing that fuel for an extra four years. Nor does Licensees' 2017 DCE provide any objective evidence supporting its updated assumption that the DOE will, in fact, begin accepting spent nuclear fuel from the industry in 2028.

43. In subsequent decommissioning funding status reports submitted to the NRC, Licensees repeated this updated assumption regarding the date on which the DOE will begin accepting spent nuclear fuel from the industry. *See* **Exhibits 20 and 21**. Specifically, Licensees' status reports expressly acknowledge that the "current site-specific decommissioning cost estimates for San Onofre Unit 1 and San Onofre Units 2 and 3 assume that the DOE will commence transporting fuel in 2028." As in the 2017 DCE, however, Licensees' status reports do not provide any basis for the 2028 assumption, nor do they explain how pushing back the estimated date on which the DOE will begin accepting spent nuclear fuel from the industry would not also necessitate pushing back the date for removal of all spent nuclear fuel from SONGS and concomitantly increasing the

estimated cost of storing that fuel for an extra four years. Notably, however, Licensees' status reports do effectively acknowledge that their fundamental assumptions regarding the DOE's acceptance of spent nuclear fuel are uncertain at best. Indeed, the status reports expressly state that the 2028 assumption "may be updated periodically due to the ongoing uncertainties regarding the availability of a permanent repository for spent fuel."

VIII. DESPITE SERIOUS PUBLIC CONCERNS AND HAZARDOUS CONDITIONS THE NRC PERMITS LICENSEES TO RESUME DANGEROUS BURIAL OF SPENT NUCLEAR FUEL

44. In March 2019, an NRC inspector, Lee Brookhart, issued an internal report concluding that the damaged and defective Holtec canisters would require a formal design change, approved by the NRC, if they were to continue in service under the applicable CoCs, which require loading into the ISFSI to be accomplished without any scratching or damage to the canisters. *See* **Exhibits 27 and 29**. On May 21, 2019, however, the NRC disregarded Mr. Brookhart's warnings, Licensees' string of poor project oversight, Holtec's history of incompetence and malfeasance, and the fanciful assumptions underlying Licensees' entire decommissioning plan, and announced its determination that burial of spent nuclear fuel could continue at SONGS. *See* **Exhibit 22**. Thereafter, in July 2019, Licensees resumed their decommissioning operations, including the burial of spent nuclear fuel at the SONGS ISFSI.

45. Given the uncertainty surrounding the renewed canister burial, as well as litigation seeking to halt the process pending development of a record, Counsel for Petitioner—on September 6, 2019—requested that Licensees briefly abate further interment. *See* **Exhibit 23**. Licensees declined the request and are apparently poised to "continue the transfer operations" and complete the burial of spent nuclear fuel at SONGS as fast as possible. *See* **Exhibit 24**; *see also* **Exhibit 15**.

GROUNDS FOR ORDER IMMEDIATELY SUSPENDING DECOMMISSIONING OPERATIONS

I. APPLICABLE STANDARDS

46. Under 10 C.F.R. § 2.206, "Any person may file a request to institute a proceeding pursuant to § 2.202 to modify, suspend, or revoke a license, or for any other action as may be proper." Upon the filing of a petition under § 2.206, the NRC "may institute a proceeding to modify, suspend, or revoke a license or take such other action as may be proper by serving on the licensee or other person subject to the jurisdiction of the Commission an order that will," among other things, "[a]llege the violations with which the licensee or other person subject to the Commission's jurisdiction is charged, or the potentially hazardous conditions or other facts deemed to be sufficient ground for the proposed action, and specify the action proposed." Petitioner respectfully requests that the NRC issue an order immediately suspending all decommissioning operations at SONGS, including the burial of spent nuclear fuel at the SONGS ISFSI, and requiring Licensees to submit an amended decommissioning plan that properly accounts for the reality that the spent nuclear fuel being buried at SONGS will remain there indefinitely.

II. LICENSEES' BURIAL OF SPENT NUCLEAR FUEL AT SONGS POSES AN IMMINENT THREAT TO PUBLIC SAFETY

47. As detailed above, Licensees are burying hundreds of tons of deadly spent nuclear fuel in thin-wall canisters that cannot be loaded into the storage system without being critically damaged, and cannot be monitored, inspected, repaired, or safely removed once they are loaded. Moreover, at least some of the canisters were surreptitiously redesigned in a way that makes them even more susceptible to failure, and there is no way for anyone to determine whether or when those canisters might fail and cause a nuclear disaster. To make matters worse, Licensees have a proven track record of negligence, if not recklessness, in their past attempts to load the canisters into the SONGS ISFSI, nearly dropping a 49-ton canister full of spent nuclear fuel on at least two occasions.

48. As if this weren't enough, Licensees have elected to bury these defective canisters in perhaps the most hazardous location possible—merely 108 feet from, and only

inches above, a rising Pacific Ocean, in a tsunami zone surrounded by active fault lines, and in a humid environment that is likely to corrode and cause stress-induced cracking of the canisters' outer walls.

49. In other words, the SONGS ISFSI is a proverbial "ticking time bomb," and it is not a matter of whether a nuclear disaster will occur at the site, but a matter of when and how damaging the nuclear disaster will be. Accordingly, the NRC should immediately suspend all decommissioning operations at the SONGS site, including, and especially, the continued burial of spent nuclear fuel, and require Licensees to submit a proposed decommissioning plan that will not pose an imminent threat to public safety.

III. LICENSEES' ESTIMATED COST OF DECOMMISSIONING SONGS IS BASED ON UNREASONABLE AND FUNDAMENTALLY FLAWED ASSUMPTIONS

50. The fundamental premise for Licensees' various decommissioning cost estimates is that the spent nuclear fuel being buried at SONGS will remain there only temporarily. Indeed, Licensees initial DCE was based on the assumption that the DOE will begin accepting spent nuclear fuel from the industry in 2024 and that all spent nuclear fuel will be permanently removed from SONGS by 2049. Accordingly, Licensees' have allocated only enough funds to store and monitor spent nuclear fuel at SONGS through 2049.

51. Both Licensees and the NRC know full well that these assumptions are unreasonable and untethered to reality because there is currently no viable plan for the DOE to construct a permanent repository for spent nuclear fuel and there is certainly no plan or intention for the DOE to begin accepting spent nuclear fuel from the industry in 2024. In fact, the NRC states in its own publications that, although it "considers that 25 to 35 years is a reasonable timeframe for repository development, it acknowledges that there is sufficient uncertainty in this estimate that the possibility that more time will be needed cannot be ruled out." *See* **Exhibit 28**.

52. Although Licensees' 2017 DCE and decommissioning funds status reports push back to 2028 the assumed date on which the DOE will begin accepting spent nuclear

fuel from the industry, this is no more realistic or supported by any actual evidence than the initial 2024 estimate. Furthermore, this updated assumption renders Licensees' cost estimates even more fanciful, because, while they push back the date on which they assume the DOE will begin accepting spent nuclear fuel from the industry, they inexplicably maintain the assumption that all spent nuclear fuel will be permanently removed from SONGS by 2049.

53. By unreasonably assuming that all spent nuclear fuel will be permanently removed from SONGS by 2049, and only allocating sufficient funds to store and monitor the spent nuclear fuel at the site through that date, Licensees grossly understate the full cost of decommissioning SONGS and storing and monitoring spent nuclear fuel at the site through the termination of the SONGS licenses. Among other things, Licensees' cost estimates fail to account for the costs associated with: (1) storing and monitoring fuel beyond 2049 and perhaps permanently; (2) replacing and/or repairing canisters that have degraded, been damaged, and/or outlived their 40-year certifications; and (3) transferring canisters to another location when the storage system itself inevitably degrades and becomes unfit for storage of spent nuclear fuel. Accordingly, the NRC should suspend all decommissioning operations currently underway at SONGS and require Licensees to submit a new decommissioning cost estimate that is grounded in the reality that spent nuclear fuel will be stored at SONGS indefinitely.

IV. LICENSEES' FLAWED DECOMMISSIONING PLAN POSES A LONG TERM THREAT TO PUBLIC SAFETY

54. By falsely assuming that spent nuclear fuel will be stored at SONGS only temporarily, Licensees have not only understated the total cost associated with their decommissioning operations but they have set a disaster off on the horizon that will be unavoidable if not addressed immediately. As already discussed at length, Licensees' entire decommissioning plan, including all decisions related to the location of the SONGS ISFSI, the selection of the Holtec storage system and canisters, and the estimated cost of

decommissioning and monitoring spent fuel at SONGS, are predicated on the false assumption that spent nuclear fuel will be stored at SONGS only temporarily.

55. Licensees selected a storage system with an extremely limited warranty and usable life based on the false assumption that it will be empty and demolished in thirty years. Licensees selected defective canisters with limited warranties that cannot be safely replaced when damaged based on the false assumption that the DOE would be removing them in thirty years. And Licensees selected a hazardous storage location near a rising sea based on the false assumption that the spent nuclear fuel will be permanently removed by the time the storage facility is underwater. If the NRC does not suspend decommissioning operations now, these fanciful assumptions will inevitably lead to a disastrous reality for the millions of people who reside in the vicinity of SONGS. Accordingly, the NRC should immediately suspend all decommissioning operations at SONGS, including and especially the burial of spent nuclear fuel in the SONGS ISFSI, and require Licensees to submit a new decommissioning plan that is grounded in the reality that the spent nuclear fuel being buried at SONGS will remain there indefinitely, if not permanently.

V. THE NRC'S FAILURE TO PREPARE AN ENVIRONMENTAL ASSESSMENT OR SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT PRIOR TO APPROVING DECOMMISSIONING ACTIVITIES VIOLATES NEPA AND THE APA

56. The NRC failed to prepare either an environmental assessment ("EA") or an environmental impact statement ("EIS") prior to issuing the July 17, 2015 license amendment or otherwise approving decommissioning activities at SONGS Units 2 and 3, in violation of the National Environmental Policy Act ("NEPA"), the Administrative Procedure Act ("APA"), and the NRC's own regulations.

57. NEPA requires all federal agencies to conduct environmental evaluations of any "major federal actions significantly affecting the quality of the human environment." 42 U.S.C. § 4332(2)(C). "Major federal actions" are defined broadly to include "new and continuing activities, including projects and programs entirely or partly financed, assisted, conducted, regulated, or approved by federal agencies." 40 C.F.R.

§ 1508.18. When an agency is uncertain whether a proposed action will significantly affect the environment, it must prepare an EA to determine whether the preparation of a more detailed EIS is necessary. 40 C.F.R §§ 1508.9(a), 1508.13 (2009); *see also California Wilderness Coal. v. U.S. Dep't of Energy*, 631 F.3d 1072, 1097 (9th Cir. 2011) ("If the proposed action does not categorically require the preparation of an EIS, the agency must prepare an EA to determine whether the action will have a significant effect on the environment."). In either case, NEPA obligates federal agencies to take a "hard look" at the potential environmental consequences of proposed actions. *California Wilderness Coal.*, 631 F.3d at 1097 (9th Cir. 2011).

58. The NRC's issuance of a license amendment and approval of decommissioning activities at SONGS Units 2 and 3 constituted a "major federal action" that required NEPA compliance. As an initial matter, the NRC has historically prepared either an EA or EIS upon issuing a license amendment at SONGS Units 2 and 3. In 1981, the NRC prepared an EIS when it issued the initial operating license to Edison for Units 2 and 3. *See* **Exhibit 30**. The NRC then prepared EAs each time it amended the license. For example, in 1996, it prepared an EA prior to approving a license amendment to allow an increase in fuel enrichment. *See* **Exhibit 31**. In 2001, it prepared an EA prior to approving a license amendment to allow Edison to increase its maximum reactor core power level. *See* **Exhibit 32**. And in 2015, it prepared an EA prior to approving an amendment allowing security personnel to use certain firearms and ammunition on site. *See* **Exhibit 33**. The NRC's failure to prepare either an EA or EIS prior to issuing a license amendment and approving decommissioning activities is contrary to its prior practice at SONGS.

59. Furthermore, the NRC's own regulations and guidance documents state that the NRC will prepare an EA or EIS prior to authorizing decommissioning. The NRC's regulations provide that "[i]n connection with the amendment of an operating or combined license authorizing decommissioning activities . . . the NRC staff will prepare a supplemental environmental impact statement for the post operating or post combined

license stage or an environmental assessment." 10 C.F.R. part 51.95(d). Similarly, the NRC's Environmental Review Guidance for Licensing Actions Associated with NMSS Programs NUREG-1748 (2003) states that the NEPA review process is "usually initiated by . . . a decommissioning plan submitted to the NRC." *See* **Exhibit 34** at 1-2.

60. Numerous federal courts have also noted that "decommissioning is an action which, even under the [NRC's] new policy, requires NEPA compliance." *See, e.g.*, *Citizens Awareness Network, Inc. v. U.S. Nuclear Regulatory Comm'n*, 59 F.3d 284, 293 (1st Cir. 1995); *see also New Jersey v. U.S. Nuclear Regulatory Comm'n*, 526 F.3d 98, 103 (3d Cir. 2008) ("[T]he NRC will conduct site-specific environmental analyses when licensees decommission…"); *see also Benton Cty. v. U.S. Dep't of Energy*, 256 F. Supp. 2d 1195, 1202 (E.D. Wash. 2003) ("Prior to committing any resources to any one of the options for decommissioning, the [agency] must prepare an EIS."). Thus, the NRC was required to prepare either an EA or EIS prior to approving the Decommissioning Plan.

61. The NRC partially discharged its duty to comply with NEPA prior to decommissioning through the Final Generic Environmental Impact Statement on Decommissioning of Nuclear Facilities, NUREG-0586 (1988), as supplemented by NUREG-0586, Supplement 1 (2002) (collectively, the "Decommissioning GEIS"). *See* **Exhibit 35**. The generic EIS analyzed the environmental impacts of decommissioning that are common to all sites. But the Decommissioning GEIS concluded that a site-specific supplemental EIS would be necessary to evaluate non-generic issues, such as the environmental impacts of decommissioning on environmental justice and threatened and endangered species:

> The staff has considered available information on the potential impacts of decommissioning on environmental justice, including comments received on the draft of Supplement 1 of NUREG-0586. Based on this information, the staff has considered that the adverse impacts and associated significance of the impacts must be determined on a site-specific basis . . . . Subsequent to the submittal of the PSDAR, the NRC staff will consider the impacts related to environmental justice from decommissioning activities.

See **Exhibit 35** Supp. 1 at 4-65.

> The staff has considered available information on the potential impacts of decommissioning on threatened and endangered species, including comments received on the draft of Supplement 1 of NUREG-0586. Based on this information, the staff has considered that the adverse impacts and associated significance of the impacts must be determined on a site-specific basis.

See **Exhibit 35** Supp. 1 at 4-30. The NRC's regulations and guidance documents purport to fill these gaps in the Decommissioning GEIS by requiring the NRC to prepare either an EA or supplemental EIS prior to approving a decommissioning plan. *See, e.g.*, 10 C.F.R. 51.95(d). The NRC, however, failed to prepare either an EA or supplemental EIS when it approved Edison's license amendment and authorized decommissioning at SONGS Units 2 and 3.

62. The City of Laguna Beach ("City") notified the NRC of this failure to comply with NEPA at SONGS in its August 12, 2016 letter. *See* **Exhibit 36**. Notably, the California State Lands Commission ("CSLC") correctly determined that the decommissioning activities required the CSLC to prepare an Environmental Impact Report ("EIR") under California's Environmental Quality Act ("CEQA"), which is the State of California's NEPA analog. In connection with preliminary scoping of the CSLC EIR, the City insisted that the NRC prepare a supplemental EIS, as required by NEPA, or alternatively prepare a joint EIS with the CSLC, as authorized by NEPA's implementing regulations. *See* 40 C.F.R. 1506.2. The City expressed specific concern over the following issues:

- The NRC has not considered the environmental and safety effects of sea level rise caused by climate change.

- The NRC has not addressed the environmental impacts of decommissioning on environmental justice, threatened and endangered species, offsite land use, offsite aquatic and terrestrial ecology, and certain cultural and historic resources.

- The NRC has not approved the design of the Holtec UMAX system that Edison has proposed for the ISFSI and that a partially subterranean design may reduce radiation safety.

- The NRC has not addressed certain radiological safety concerns, such as the site-specific radiological safety concern of storing SNF in a seismically active marine environment, which is not addressed in the Decommissioning GEIS.

- The proposed changes and alterations to the SONGS facility's design associated with decommissioning, including the Spent Fuel Pool Island Project and the expanded and modified ISFSI, were never addressed in the SONGS Final Safety Analysis Report ("FSAR") and thus require a separate license amendment.

63. Despite the City's letter, the NRC failed to take corrective action. Instead, the NRC took the incorrect and inconsistent position that it was not required to prepare an EA or supplemental EIS in connection with approving decommissioning, because the "decommissioning activities remain within the scope of the Decommissioning GEIS [and] applicable site-specific NEPA analyses conducted in support of previous licensing actions." *See* **Exhibit 37**. Specifically, the NRC claimed that review of "site-specific environmental impacts (*i.e.*, those not dispositioned generically in the Decommissioning GEIS) are first addressed in the [1981 EIS]" and were additionally "analyzed in the EA/FONSIs for license amendment or exemption requests during the plant's operation," such as the 1996 EA, 2001 EA, and 2015 EA. But this is plainly untrue. The prior site-specific analyses at SONGS never addressed the potential environmental impacts of decommissioning. They addressed the potential environmental impacts of the proposed actions stated therein (*e.g.*, a license amendment to allow security personnel to carry certain ammunition on-site). *See* **Exhibit 33**. These prior analyses do not act to satisfy the NRC's duty to prepare a site-specific supplemental EIS for non-generic decommissioning issues, as contemplated by the Decommissioning GEIS and NRC.

64. This is not the first time the NRC has failed to comply with its own regulations in the context of preparing site-specific supplemental EISs that tier off of a

generic EIS. In August 2013, the Office of the Inspector General ("OIG") audited the NRC's NEPA compliance and concluded that the NRC had an "incorrect understanding of the regulations related to scoping for EISs that tier off of a generic EIS." *See* **Exhibit 38** at 24. The issue here is similar. The NRC's reasoning for refusing to prepare a supplemental site-specific EIS is based on an incorrect understanding of its own regulations and the role of the Decommissioning GEIS.

65. The NRC's failure to prepare either an EA or supplemental EIS prior to approving Edison's license amendment and authorizing decommissioning at SONGS Units 2 and 3 is contrary to the Decommissioning GEIS, NRC regulations, and federal court opinions. In addition, it violates NEPA, 42 U.S.C. § 4332(2)(C), and constitutes arbitrary and capricious conduct under the Administrative Procedure Act, 5 U.S.C. § 706. Petitioner therefore requests that the NRC immediately suspend all decommissioning operations at SONGS and prepare a supplemental EIS that evaluates site-specific environmental issues not addressed in the Decommissioning GEIS or prior site-specific NEPA analyses, such as the those issues referenced herein. In so doing, the NRC should (1) discuss mitigation measures the agency could take to reduce environmental impacts; (2) discuss the direct, indirect, and cumulative impacts that may result from decommissioning activities; and (3) ensure the use of "accurate scientific analysis" and "high quality" information. 40 C.F.R. §§ 1500.1(b), 1508.25(b).

Subject: **Docket Nos. 50-361 and 50-362,**
San Onofre Nuclear Generating Station, Units 2 and 3
Post-Shutdown Decommissioning Activities Report

Reference Letter from P.T. Dietrich (SCE) to the U.S. Nuclear Regulatory Commission dated June 12, 2013; Subject: Certification of Permanent Cessation of Power Operations, San Onofre Nuclear Generating Station, Units 2 and 3

Dear Sir or Madam:

On June 12, 2013, in accordance with 10 CFR 50.82(a)(1)(i), Southern California Edison (SCE) submitted the referenced letter to the U.S. Nuclear Regulatory Commission (NRC) certifying the permanent cessation of operations at San Onofre Nuclear Generating Station (SONGS), Units 2 and 3. In accordance with 10 CFR 50.54(bb) and 10 CFR 50.82(a)(4)(i), SCE is required to submit an Irradiated Fuel Management Plan (IFMP), Site Specific Decommissioning Cost Estimate (DCE) and Post-Shutdown Decommissioning Activities Report (PSDAR) within two years of permanent cessation of operations.

The SONGS, Units 2 and 3 PSDAR is attached. The SONGS, Units 2 and 3 IFMP and DCE are being concurrently submitted under separate cover letters. The descriptions of decommissioning activities and phases in the PSDAR are consistent with those described in the DCE. Both the PSDAR and DCE represent SCE's current plans and are subject to change as the project progresses.

Changes to significant details will be included in subsequent revisions to the PSDAR as required by 10 CFR 50.54(bb). Financial assurance information will be provided on an annual basis as required by 10 CFR 50.75(f)(1).

This letter does not contain any new commitments.

If there are any questions or if additional information is needed, please contact me or Ms. Andrea Sterdis at (949) 368-9985.

Sincerely,

G. G. Warnick, NRC Senior Resident Inspector, San Onofre Units 2 and 3
S. Y. Hsu, California Department of Health Services, Radiologic Health Branch

San Onofre Nuclear Generating Station Units 2 and 3
Post-Shutdown Decommissioning Activities Report

TABLE OF CONTENTS

List of Acronyms and Abbreviations

AADT	Average Annual Daily Traffic
AIF	Atomic Industrial Forum
ALARA	As Low As Reasonably Achievable
BMP	Best Management Practices
CCC	California Coastal Commission
CFR	Code of Federal Regulations
CRWQCB	California Regional Water Quality Control Board
CSLC	California State Lands Commission
DBA	Design Basis Accident
DCE	Decommissioning Cost Estimate
Decon Pd	License Termination Period
DGC	Decommissioning General Contractor
DOE	United States Department of Energy
DOT	United States Department of Transportation
DSC	Dry Storage Canister
FES	Final Environmental Statement, SONGS Units 2 and 3 (NUREG-0490)
GEIS	Generic Environmental Impact Statement (NUREG-0586)
GTCC	Greater than Class C
HSM	Horizontal Storage Modules
IFMP	Irradiated Fuel Management Plan
ISFSI	Independent Spent Fuel Storage Installation
LTP	License Termination Plan
LLRW	Low Level Radioactive waste
MARRSIM	Multi-Agency Radiation Survey and Site Investigation Manual
MWDOC	Municipal Water District of Orange County
MWt	Megawatt-thermal
NEI	Nuclear Energy Institute
NPDES	National Pollutant Discharge Elimination System
NRC	United States Nuclear Regulatory Commission
ORISE	Oak Ridge Institute for Science and Education
PSDAR	Post-Shutdown Decommissioning Activities Report
PWR	Pressurized Water Reactor
RCS	Reactor Coolant System
REMP	Radiological Environmental Monitoring Program
RV	Reactor Vessel
SONGS	San Onofre Nuclear Generating Station
SCE	Southern California Edison
SDAPCD	San Diego Air Pollution Control District
SFP	Spent Fuel Pool
SNF Pd	Spent Fuel Period
SFSM	Spent Fuel Storage Modules
SPCC	Spill Prevention Control and Countermeasures
SR Pd	Site Restoration Period
SSC	Structures, Systems, and Components
UFSAR	Updated Final Safety analysis Report
USCB	United States Census Bureau

I. INTRODUCTION AND SUMMARY

A. Introduction

1. Historical Perspectives

San Onofre Nuclear Generating Station (SONGS) Units 2 and 3 have been owned by four entities. Two are municipalities (Riverside and Anaheim) and two are investor owned utilities: San Diego Gas & Electric (SDG&E) and Southern California Edison (SCE, the Owner-Operator and agent for the participants). The relative obligation for operation and decommissioning varies by unit and entity. The term "SONGS Participants" is used in this report to represent the four entities that have continuing decommissioning obligations.

SONGS Unit 1 was shut down in 1992 with on-shore facilities largely dismantled by 2009 and off-shore conduits being fully dispositioned this year (2014). The decision has been made to shut down and decommission Units 2 and 3. Since the decision to shut down SONGS Units 2 and 3, the focus of SONGS staff and other personnel has been to plan and begin execution of the necessary steps to achieve timely, cost-effective, and safe decommissioning and restoration of the SONGS site.

In developing its plans, SONGS has benchmarked the experiences of commercial decommissioning projects in the 1990s and 2000s and has sought the input from experienced individuals and groups with a wide range of such experience. SONGS maintains close communications with those facilities currently undergoing decommissioning and with many of the organizations supporting those efforts. In particular, both the Zion and Humboldt Bay plants are currently undergoing active decommissioning. Three others (Kewaunee, Crystal River 3, and Vermont Yankee) are, or soon will be, entering SAFSTOR conditions of varying durations prior to dismantlement.

Earlier decommissioning projects faced a number of first-time technical challenges, such as cutting reactor vessel (RV) internals in a high radiation environment. SONGS' reviews indicate that many of the technical challenges confronting SONGS decommissioning now have mature solutions. Similarly, our predecessors provide a wealth of knowledge to minimize worker radiation exposure, efficiently plan, and sequence a decommissioning project and safely manage and transport waste.

The SONGS Participants have the responsibility to restore the site in accordance with applicable regulations and agreements. The SONGS Participants have a responsibility to their stakeholders and the communities they serve to do so in a transparent and effective manner while striving to attain high standards of safety and environmental protection. Further, the SONGS Participants will have a limited, if any, role in the future use of the site. The ultimate use for the site is for the land-owner (U.S. Navy) to determine with input from the community at large.

2. Community Engagement

A key lesson-learned in our review of other decommissioning projects is the continued importance of community engagement during the decommissioning process. The SONGS Participants are committed

to engaging the local community and its leaders in an open, transparent, and proactive manner. SONGS is actively engaged with external stakeholders to: understand their priorities; inform them of SONGS plans; and, to seek their input on the safe, timely, and cost-effective decommissioning of SONGS.

The SONGS Participants are actively engaging with the community through public outreach including briefings for community groups and routine educational updates for local, state, and federal officials. The SONGS participants have formed the Community Engagement Panel (CEP) with members representing a broad range of stakeholders to advise SONGS on decommissioning matters. The panel meets at least quarterly to facilitate dialogue and includes several representatives of government, members from academia, labor, business, environmental organization, and a local anti-nuclear leader. Members of the CEP were provided with the opportunity to review and provide input on this document as well as the Decommissioning Cost Estimate (DCE) and the Irradiated Fuel Management Plan (IFMP). As a precursor to review of these submittals, SONGS hosted two workshops with external technical experts to provide the CEP members with a depth of knowledge in these areas. Feedback from the panel was addressed prior to finalization and SCE senior management authorization of the submittals.

SONGS also has established a website, www.SONGScommunity.com, as a dedicated online source for information on the plant and the decommissioning process. The website includes background information on decommissioning, links to other websites including the NRC, and an "opt-in" feature that allows members of the community to register for automatic updates on decommissioning matters.

3. Regulatory Basis

In accordance with the requirements of 10 CFR 50.82, "Termination of License," paragraph (a)(4)(i), this report constitutes the Post-Shutdown Decommissioning Activities Report (PSDAR) for SONGS Units 2 and 3. The PSDAR contains the following:

1. A description of the planned decommissioning activities along with a schedule for their accomplishment.
2. A site-specific DCE including the projected cost of managing irradiated fuel and site restoration (being submitted concurrently).
3. A discussion that provides the basis for concluding that the environmental impacts associated with the site-specific decommissioning activities will be bounded by the appropriate previously issued generic and plant specific environmental impact statements.

The PSDAR has been developed consistent with NRC Regulatory Guide 1.185, Revision 1, "Standard Format and Content for Post-Shutdown Decommissioning Activities Report." This report is based on currently available information; however, the plans discussed may be modified as additional information becomes available or as circumstances change. As required by 10 CFR 50.82(a)(7), SCE will notify the Nuclear Regulatory Commission (NRC) in writing before performing any decommissioning activity inconsistent with, or making any significant schedule change from, those actions and schedules described in the PSDAR, including changes that significantly increase the decommissioning cost.

The IFMP and DCE are being submitted concurrently with the PSDAR. The technical, schedule, and cost information provided is consistent among these submittals.

B. Background

The SONGS site is located on the coast of southern California in San Diego County, approximately 62 miles southeast of Los Angeles and 51 miles northwest of San Diego. The site is located entirely within the boundaries of the United States Marine Corps Base Camp Pendleton. The site is approximately 4,500 feet long and 800 feet wide, comprising 84 acres. The site does not include office buildings and related facilities located east of Interstate 5 (I-5) referred to as "the Mesa" or other adjacent parcels.

The property on which the station is built is subject to an easement from the United States Government through the U. S. Navy. The nearest privately owned land is approximately 2.5 miles from the site.

SONGS Units 2 and 3 is a two-unit site with supporting facilities. The reactors were previously licensed to produce 3,438 MWt each. An on-site Independent Spent Fuel Storage Installation (ISFSI) used to store SONGS Units 1, 2 and 3 fuel, located on the portion of the site previously occupied by SONGS Unit 1. Storage at the ISFSI was initiated in 2003 and the pad was subsequently (2007) expanded to support the currently placed 63 Horizontal Storage Modules in which 51 Dry Storage Containers (DSCs) have been installed to-date: 50 containing irradiated fuel and one (1) containing Greater-Than-Class-C (GTCC) materials. The most recent loading campaign was conducted in 2012. As discussed in the Spent Fuel Management Period details and the concurrently submitted IFMP, it will be necessary to further expand the current ISFSI capacity to store the complete inventory of Units 2 and 3 spent fuel. The location, capacity, and technology to be employed have not yet been finalized.

A brief history of the major milestones related to plant construction and operation is as follows:

	UNIT 2	UNIT 3
• Construction Permit Issued	October 18, 1973	October 18, 1973
• Operating License Issued	February 16, 1982	November 15, 1982
• Full Power Operation	June 15, 1983	November 18, 1983
• Final Reactor Operation	January 9, 2012	January 31, 2012

On June 7, 2013, SCE announced its decision to permanently cease power operations and decommission SONGS Units 2 and 3. By letter dated June 12, 2013 (Reference 3), SCE notified the NRC of its decision to permanently cease power operations. SCE has submitted two letters dated July 22, 2013 (Reference 5) and June 28, 2013 (Reference 4) certifying that fuel has been removed from the Unit 2 and 3 reactors, respectively.

Pursuant to 10 CFR 50.51(b), "Continuation of License," the license for a facility that has permanently ceased operations, continues in effect beyond the expiration date to authorize ownership and possession of the facility until the NRC notifies the licensee in writing that the license has been

terminated. During the period that the license remains in effect, 10 CFR 50.51 (b) requires the licensee to:

(1) Take actions necessary to decommission and decontaminate the facility and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition, and

(2) Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the provisions of the specific 10 CFR part 50 licenses for the facility.

C. Summary of Decommissioning Alternatives

The NRC has evaluated the environmental impacts of three general methods for decommissioning power reactor facilities in NUREG-0586, "Final Generic Environmental Impact Statement (GEIS) on Decommissioning Nuclear Facilities," Supplement 1 (Reference 6). The three general methods are:

- **DECON:** The equipment, structures, and portions of the facility and site that contain radioactive contaminants are promptly removed or decontaminated to a level that permits termination of the license after cessation of operations.
- **SAFSTOR:** The facility is placed in a safe stable condition and maintained in that state (safe storage) until it is subsequently decontaminated and dismantled to levels that permit license termination. During SAFSTOR, a facility is left intact or may be partially dismantled, but the fuel has been removed from the reactor vessel and radioactive liquids have been drained from systems and components and then processed. Radioactive decay occurs during the SAFSTOR period, thus reducing the levels of radioactivity in and on the material and potentially the quantity of radioactive material that must be disposed of during the decontamination and dismantlement.
- **ENTOMB:** Radioactive structures, systems, and components are encased in a structurally long-lived substance such as concrete. The entombed structure is appropriately maintained and continued surveillance is carried out until the radioactivity decays to a level that permits termination of the license.

The SONGS Participants have chosen the DECON method. SONGS is currently in the planning period during which the site is preparing for safe and orderly transition to dismantlement. More specifically:

- Permanent cessation of operations was announced on June 7, 2013.
- DECON methodology was selected (prompt decontamination and dismantlement after initial planning period).
- Additional ISFSI capacity will be added to meet all of the site's needs.
- Initial site characterization activities are underway.
- Plans to isolate the Spent Fuel Pools (referred to as "islanding") are in development.
- Other necessary actions to facilitate safe system retirement and removal (referred to as "cold and dark") are in development.

When the required regulatory reviews, planning, and preparation are sufficiently complete, the site will move into active decontamination and dismantlement. Current plans are for that period to overlap with completion of the relocation of spent fuel from the Spent Fuel Pools to the ISFSI.

The SONGS facility will be decontaminated and dismantled (D&D) to levels that permit termination of the NRC licenses and in accordance with the requirements agreed to by the United States Navy in the easement for the site. In support of this and in accordance with 10 CFR 50.82(a)(9), a License Termination Plan will be developed and submitted for NRC approval at least two years prior to termination of the license.

The decommissioning approach for SONGS is described in more detail in the following sections:

- Section II summarizes the planned decommissioning activities and general timing of their implementation.
- Section III summarizes the cost estimating methodology employed by Energy*Solutions* and references the site specific DCE being submitted concurrently.
- Section IV describes the basis for concluding that the environmental impacts associated with decommissioning SONGS Units 2 and 3 are bounded by the most recent site-specific environmental impact statement and NRC GEIS related to decommissioning.

II. DESCRIPTION OF PLANNED DECOMMISSIONING ACTIVITIES

The SONGS Units 2 and 3 decommissioning project is currently in the planning period transitioning to DECON as soon as necessary planning, approvals, and conditions permit doing so in a safe and cost-effective manner. DECON is defined in Section I.C of this report.

Table II-1 provides a summary of the current decommissioning plan and schedule for SONGS Units 2 and 3. The major decommissioning periods and general sequencing of the activities that will occur during each period identified in Table II-1 are discussed in more detail in the sections that follow. The periods are logical groupings of activities. The categories are also consistent with the Nuclear Decommissioning Trust (NDT) funds which are allocated based on specific regulatory requirements. The activities executed during these periods will, in many cases progress in parallel, and may not be as completely segregated as the description implies. For instance, while distinct decontamination and dismantlement activities are listed, it may be determined to be more effective from dose, labor, or waste disposal perspectives to dismantle structures and systems and dispose of them as radioactive waste rather than decontaminate them and dispose of the balance as non-radioactive waste.

The planning required for each decommissioning activity, including the selection of the process to perform the work, will be performed in accordance with appropriate governance and oversight processes. Based on current plans, no decommissioning activities unique to the site have been identified and no activities or environmental impacts outside the bounds considered in the GEIS have been identified. Appropriate radiological and environmental programs will be maintained throughout

the decommissioning process to ensure radiological safety of the workforce and the public and environmental compliance is maintained.

Table II-1
San Onofre Nuclear Generating Station Units 2 and 3
Current Schedule of Decommissioning Periods

Task Name	Start	Finish
Part 50 License Termination (other than ISFSI)		
Announcement of Cessation of Operations	06/07/2013	N/A
Decon Period 1 – Transition to Decommissioning	06/07/2013	12/31/2013
Decon Period 2 – Decommissioning Planning and Site Modifications	01/01/2014	06/30/2015
Decon Period 3 – Decommissioning Preps/Reactor Internals Segmentation	06/30/2015	06/01/2019
Decon Period 4 – Plant Systems and Large Component Removal	06/01/2019	09/24/2022
Decon Period 5 – Building Decontamination	09/24/2022	07/13/2024
Decon Period 6 – License Termination During Demolition	07/13/2024	12/24/2032
Spent Fuel Management		
SNF Period 1 – Spent Fuel Management Transition	06/07/2013	12/31/2013
SNF Period 2 - Spent Fuel Transfer to Dry Storage	01/01/2014	06/01/2019
SNF Period 3 – Dry Storage During Decommissioning – Units 1, 2 & 3	06/01/2019	12/05/2031
SNF Period 4 – Dry Storage Only – Units 1, 2 & 3	12/05/2031	12/31/2035
SNF Period 5 – Dry Storage Only – Units 2 & 3	12/31/2035	12/31/2049
SNF D&D Period 1 – ISFSI Part 50 License Termination	12/31/2049	05/06/2050
SNF D&D Period 2 – ISFSI Demolition	05/06/2050	09/08/2051
Site Restoration		
SR Period 1 – Transition to Site Restoration	06/07/2013	06/30/2015
SR Period 2 – Building Demolition During Decommissioning	06/30/2015	07/11/2017
SR Period 3 – Subsurface Demolition Engineering and Permitting	10/01/2019	07/13/2024
SR Period 4 – Building Demolition to 3 Feet Below Grade	07/13/2024	10/14/2028
SR Period 5 – Subgrade Structure Removal Below -3 Feet	10/14/2028	12/5/2031
SR Period 6 – Final Site Restoration and Easement Termination	05/06/2050	12/15/2051
Final Easement Termination	12/15/2051	N/A

Note [1]: Shipping dates are assumed based on the previously documented positions of the DOE, which indicates that shipments from the industry could begin as early as 2024 and SONGS place in the current queue. Both are subject to changes.

A. Detailed Breakdown of License Termination Periods

The License Termination Periods (referred to as decontamination periods) include those activities necessary to remove or reduce the levels of radioactive contamination to levels necessary to terminate the Part 50 licenses for the site (other than the ISFSI) and release it back to the Navy. Also included are the development, submittal, and support for the review of the primary decommissioning documents.

Periods 1 and 2 generally consist of planning and transition of the site to a condition where it is ready for significant decontamination and dismantlement activities. As detailed below, these periods include: system abandonment and isolation of the remaining structures, systems and components (SSC) from normal power and water sources. System abandonment and isolation allow the decontamination and dismantlement to proceed safely and in an efficient sequence. Additionally, the selection of the contractor for managing the bulk of the decommissioning activities will be made.

Period 3 is focused on decontamination and dismantlement of the major components in the containment building (RV internals, vessel, head, steam generators, pressurizer, and main piping).

Period 4 addresses the decontamination and dismantlement of SSCs known to be substantially contaminated and the removal of the components from both Periods 3 and 4.

Period 5 is focused on decontamination of the various buildings. As noted elsewhere it may be more appropriate to simply proceed with dismantlement if it is more timely and cost-effective to simply dispose of building material as radioactive waste.

Period 6 is focused on the final site survey to confirm that the site is acceptable for release back to the Navy. The process for doing so "Multi-Agency Radiation Survey and Site Investigation Manual" (MARRSIM) was developed by the four federal agencies having authority over radioactive materials (Department of Defense, Department of Energy, the Environmental Protection Agency and the NRC) and is the consensus standard endorsed by other stakeholders. Its application will be validated by the NRC.

Decontamination Period 1 – Transition to Decommissioning

- Announcement of Cessation of Operations
- Defuel Reactors
- Notification of Permanent Fuel Removal
- Disposition of legacy Low Level Radioactive Waste (LLRW)

Decontamination Period 2 – Decommissioning Planning and Site Modifications

- Preparation of Decommissioning Related Licensing Submittals
  - Permanently Defueled Technical Specifications (Submitted March 21, 2014)
  - Permanently Defueled Radiological Emergency Plan (Submitted March 31, 2014)
- Submit PSDAR, DCE and IFMP to NRC
- Perform Historical Site Assessment and Site Characterization
- Planning, Design, and Implementation of Cold and Dark (Site Repowering)
- Design and Install Spent Fuel Pool Islanding, Control Room Relocation, and Security Modifications
- Select Decommissioning General Contractor (DGC)

Decontamination Period 3 – Decommissioning Preparations and Reactor Internal Segmentation

- DGC Mobilization and Planning
- System Decontamination
- Reactor Internals Removal Preparations

- Reactor Internals Segmentation Planning and Implementation
- Purchase Dry Storage Canisters for GTCC Waste
- Segment and Package Reactor Internals for Storage in the ISFSI

Decontamination Period 4 – Plant Systems and Large Component Removal

- Upgrade Rail Spur in Owner Controlled Area
- Install Large Array Radiation Detection System to Monitor Shipments In/Out of Site
- Remove, Package, and Dispose of Non-Essential Systems
- Asbestos and Lead Abatement
- Spent Fuel Pool Closure
- Remove Spent Fuel Pool Racks, Spent Fuel Pool Island Equipment, and Bridge Crane
- Remove and Dispose of Legacy Class B and C Wastes
- Remove, Package, and Dispose of Essential Systems
- Removal and Disposal of Spent Resins, Filter Media, and Tank Sludge
- Large Component Removal
- Prepare License Termination Plan

Decontamination Period 5 – Building Decontamination

- Decontaminate Containment Buildings
- Decontaminate Turbine Buildings
- Decontaminate Fuel Handling Buildings
- Decontaminate Auxiliary Rad-waste Building
- Decontaminate Auxiliary Control Building
- Decontaminate Penetration Buildings
- Decontaminate Safety Equipment and Main Steam Isolation Valve (MSIV) Buildings
- Radiological Survey of Structures During Decontamination

Decontamination Period 6 – License Termination

- Final Status Survey
- Verification and NRC Approval

B. Detailed Breakdown of Spent Fuel Management Periods

The Spent Nuclear Fuel Management Periods began with all spent fuel off-loaded from the reactor vessel into the Spent Fuel Pools and the certification of permanent defueling letters submitted to the NRC in accordance with 10 CFR 50.82(a)(1)(ii) (References 4 and 5).

During Period 1 measures will be planned, designed, and implemented to ensure spent fuel storage and handling systems will continue to function to support fuel storage in the spent fuel pool and to facilitate transfer of the spent fuel to the ISFSI. Systems, structures, and programs needed to support the safe storage and transfer of spent fuel such as security, fire protection, and environmental and radiological monitoring will be maintained in accordance with applicable requirements. Equipment maintenance, inspection, and operations will be performed on these systems and structures as appropriate.

During Period 2 the ISFSI capacity will be expanded to accommodate transfer of all spent fuel to dry storage. All spent fuel for Units 1, 2 and 3 will be transferred to the ISFSI and stored there until it is accepted by the Department of Energy (DOE) and transferred to an off-site facility.

The next three periods reflect slightly different ISFSI conditions. Period 3 is concurrent with ongoing site decontamination and dismantlement activities. Period 4 reflects the ISFSI with spent fuel from all three units in dry storage and Period 5 recognizes the potential that Unit 1 fuel may be accepted by the DOE earlier than Units 2 and 3 fuel and ends with DOE acceptance of all Units 2 and 3 fuel.

The SNF D&D Periods (1 and 2) follow DOE acceptance and may be well after License Termination for the balance of the site.

Spent Nuclear Fuel Period 1 – Spent Fuel Transfer Management Transition
- Implementation of Initial Security Enhancements Required for Reductions in Staff
- Design and Fabricate Dry Storage Canisters for Current ISFSI Scope

Spent Nuclear Fuel Period 2 – Spent Fuel Transfer to Dry Storage
- Submit IFMP
- Select Dry Storage System Canister Design and Vendor for Balance of the ISFSI
- Design and Construct ISFSI Expansion
- Purchase, Deliver, and Load Dry Storage Canisters and Storage Models for Balance of the ISFSI
- Complete Transfer of Spent Fuel to ISFSI

Spent Nuclear Fuel Period 3 – Dry Storage during Decommissioning Units 1, 2, and 3 Fuel

Spent Nuclear Fuel Period 4 – Dry Storage Only – Units 1, 2, and 3 Fuel

Spent Nuclear Fuel Period 5 – Dry Storage Only – Units 2 and 3 Fuel

Spent Nuclear Fuel Period D&D 1 – ISFSI License Termination
- Preparation and NRC Review of ISFSI Portion/Revision of License Termination Plan

Spent Nuclear Fuel Period D&D 2 – ISFSI Demolition

- Decontamination of Storage Modules (SFSMs)
- Final Status Survey of ISFSI
- Clean Demolition of HSM's and ISFSI Pad
- Clean Demolition of ISFSI Support Structures
- Restore ISFSI Site
- Preparation of Final Report on ISFSI Decommissioning and NRC Review

C. Detailed Breakdown of Site Restoration Periods

The Site Restoration periods reflect the planning and implementation of dismantlement activities not associated with radioactive materials. The DCE and descriptions below conservatively include activities

from which the SONGS Participants will plan to seek alternatives. These include the complete removal of the intake and discharge conduits in the Pacific Ocean currently required by the California State Lands Commission (CSLC) easement. Previously, the CSLC and SONGS developed an alternative for the SONGS Unit 1 conduits. Another is associated with removal of all subsurface structures that may be required by the US Navy easement. The typical practice has been to remove structures to that depth necessary to remove contaminated materials.

Also included as part of site restoration are severance costs and cost associated with returning the Mesa and other parcels to the U. S. Navy.

Site Restoration Period 1 –Transition to Site Restoration

- Severance Costs Associated with Staffing Reduction in Accordance with State Law
- Other off-site activities are included in the DCE but are not considered part of the Units 2 and 3 PSDAR activities

Site Restoration Period 2 –Building Demolition During Decommissioning

- Demolish South Access for Decommissioning, South Yard Facility
- Other off-site activities are included in the DCE but are not considered part of the Units 2 and 3 PSDAR activities

Site Restoration Period 3 – Subsurface Demolition Engineering and Permitting

- Hydro-geologic Investigation and Outfall Conduit Survey
- Subsurface Structure Removal Analyses for Lease Termination Activities
- Final Site Grading and Shoreline Protection Engineering Planning and Design

Site Restoration Period 4 – Building Demolition to Three Feet Below-Grade

- Demolition Preparations
- De-tension and Remove Containment Building Tendons
- Demolish Diesel Generator Buildings
- Demolish Condensate Buildings and Transformer Pads
- Demolish Full Flow Areas and Turbine Buildings
- Demolish Auxiliary Rad-waste Building
- Demolish Auxiliary Control Building
- Remove Systems and Demolish Make-up Demineralizer Structures
- Demolish Penetration Buildings
- Demolish Safety Equipment and MSIV Buildings
- Demolish Fuel Handling Buildings
- Demolish Containment Buildings
- Demolish Intake and Discharge Structures

Site Restoration Period 5 – Subgrade Structure Removal below Three Feet (if required)

- Install Sheet Piling and Excavation Shoring, Dewatering System, and Effluent Treatment and Discharge Controls

- Demolish and Backfill Subsurface Structures
- Demolish and Backfill Intake Structure Inside Seawall
- Remove Off-shore Intake and Outfall Conduits
- Remove Sheet Piling and Excavation Shoring, and Perform Dewatering and Effluent Treatment
- Finish Grading and Re-vegetate Site As Needed/Required

Site Restoration Period 6 – Final Site Restoration and Easement Termination [details subject to final resolution of negotiations with the U. S. Navy]

- Install Dewatering System and Effluent Treatment and Discharge Controls
- Remove and Stockpile Existing Seawall Erosion Protection
- Remove Seawall and Pedestrian Walkway
- Remove Remaining Intake Structure Beneath Seawall
- Backfill and Compaction of Excavation
- Remove Dewatering System and Effluent Treatment
- Remove Railroad Tracks, Stabilized Slopes, Access Road, and North Parking Lot
- Finish Grading and Re-vegetate Site as Needed/Required

D. General Decommissioning Considerations

1. Major Decommissioning Activities

As defined in 10 CFR 50.2, "Definitions," a "major decommissioning activity" is "any activity that results in permanent removal of major radioactive components, permanently modifies the structure of the containment, or results in dismantling components for shipment containing greater than Class C waste in accordance with 10 CFR 61.55." The following discussion provides a general summary of the major decommissioning activities currently planned for SONGS Units 2 and 3. These activities may be modified as conditions dictate.

Prior to starting a major decommissioning activity, the plant components will be radiologically surveyed and decontaminated, as required, to minimize worker radiation exposure. Shipping casks and other equipment necessary to conduct decommissioning activities will be designed and procured.

The initial major decommissioning activities will focus on removal, packaging and disposal of piping and components. Following RV and cavity reflood and RV head removal and disposal; the reactor vessel internals will be removed from the reactor vessel and segmented as necessary to separate the GTCC waste which will be placed in storage canisters and modules on the ISFSI designated for that purpose. Using this approach, the internals will be packaged and disposed of independent of the reactor vessel (RV). When the internals segmentation effort is completed, the RV and cavity will be drained and any remaining debris will be removed.

Removal of the reactor vessel follows the removal of the reactor internals. It is likely that the components will be removed by sectioning or segmenting performed remotely. These activities may be

performed in air, rather than underwater, using a control envelope to preclude the spread of contaminated materials.

Additional major decommissioning activities that will be conducted include removal and disposal of the steam generators, pressurizer, spent fuel storage racks, and spent fuel bridge crane. The dismantling of the containment structure will be undertaken as part of the reactor building demolition. As detailed in Section 3 (below) appropriate radiation protection and contamination control measures will be employed to manage these activities.

2. Other Decommissioning Activities

In addition to the major decommissioning activities discussed above, plant components will be removed from the Turbine Building including the turbine generator, condenser, feedwater heaters, moisture separator/reheaters, and miscellaneous system and support equipment. As detailed in Section 3 (below) appropriate radiation protection and contamination control measures will be employed to manage these activities.

3. Decontamination and Dismantlement Activities

The objectives of the decontamination effort are two-fold. The first objective is to reduce radiation levels throughout the facility to minimize personnel radiation exposure during dismantlement. The second objective is to clean as much material as possible to 'unrestricted use' levels, thereby allowing non-radiological demolition and disposal and minimizing the quantities of material that must be disposed of by costly burial as radioactive waste. The second objective will be achieved by decontaminating structural components including steel framing and concrete surfaces. The methods to accomplish this are typically mechanical, requiring the removal of the surface or surface coating and are used regularly in industrial and contaminated sites.

The decontamination and/or dismantlement of contaminated SSCs may be accomplished by: decontamination in place; decontamination and dismantlement; or dismantlement and disposal. A combination of these methods may be utilized to reduce contamination levels, worker radiation exposures, and project costs. Material below the applicable radiological limits may be released for unrestricted disposition (e.g., scrap, recycle, or general disposal). Radioactive contaminated or activated materials will be removed from the site as necessary to allow the site to be released for unrestricted use.

LLRW will be processed in accordance with plant procedures and existing commercial options. Contaminated material will be characterized and segregated for additional onsite decontamination or processing, off-site processing (e.g., disassembly, chemical cleaning, volume reduction, waste treatment), and/or packaged for controlled disposal at a low-level waste disposal facility.

Contaminated concrete and structural steel components will be decontaminated and removed as required to gain access to plant SSCs. After the SSCs are removed and processed as described above,

the remaining contaminated concrete and structural steel components will be decontaminated and/or removed. Contaminated concrete will be packaged and shipped to a low-level waste disposal facility. Contaminated structural steel components may be removed to a processing area for decontamination, volume reduction, and packaging for shipment to processing facility or to a low-level waste disposal facility, as necessary.

Buried and embedded contaminated components (e.g., piping, drains) will be decontaminated in place, or excavated and decontaminated. Appropriate contamination controls will be employed to minimize the spread of contamination and to protect personnel.

4. Radioactive Waste Management

A major component of the total cost of decommissioning SONGS Units 2 and 3 is the cost of safely packaging and disposing of contaminated SSCs, contaminated soil, resins, water, and other plant process liquids. A waste management plan will be developed consistent with regulatory requirements for each waste type. Currently, LLRW Classes B and C may be disposed of at the Waste Control Services (WCS) waste disposal site in Andrews County, Texas. The waste management plan will be based on the evaluation of available methods and strategies for processing, packaging, and transporting radioactive waste in conjunction with the available disposal facility and associated waste acceptance criteria.

Class A LLRW will be disposed at a licensed disposal site. (SONGS has contracted with Energy*Solutions* to use the facility located in Clive, Utah as well as WCS). If other licensed Class B and C LLRW facilities become available in the future, SONGS may choose to use them as well.

5. Removal of Mixed Wastes

Mixed wastes (hazardous and radioactive) generated during decommissioning, if any, will be managed in accordance with applicable Federal and State regulations. If technology, resources, and approved processes are available, the processes will be evaluated to render the mixed waste non-hazardous. Otherwise, mixed wastes from SONGS will be transported by authorized and licensed transporters and shipped to authorized and licensed facilities.

6. Site Characterization

During the decommissioning process, a site characterization will be performed in which radiological, regulated, and hazardous wastes will be identified, categorized, and quantified. Surveys will be conducted to establish the contamination and radiation levels throughout the plant. The information will be used in developing procedures to ensure the contaminated areas are removed and ensure that worker exposure is controlled. Surveys of the selected outdoor areas will also be performed including surveys of soil and groundwater near the site. As decontamination and dismantlement work proceeds, surveys will be conducted to maintain the site characterization current and ensure that decommissioning activities are adjusted accordingly.

7. Groundwater Protection

A groundwater protection program was initiated at SONGS in accordance with NEI 07-07, "Industry Groundwater Protection Initiative, Final Guidance Document," in August 2007 (Reference 11). A site hydrology study was initially completed as part of this initiative and was updated in 2012. Monitoring wells were installed around the plant to monitor for radionuclides. Acceptable levels of contaminants, as defined by the program, have been observed throughout the sampling program implemented as part of this initiative. Appropriate program elements will be maintained during decommissioning.

8. Change to Management and Staffing

With the plant shut down and defueled, plant management and staffing levels have been and continue to be adjusted to reflect the transition from an operating plant to a plant in decommissioning status. Staffing plans are addressed in the DCE.

III. ESTIMATE OF EXPECTED DECOMMISSIONING AND SPENT FUEL MANAGEMENT COSTS

10 CFR 50.82(a)(8)(iii) requires that a site-specific decommissioning cost estimate be prepared, and submitted within two years following permanent cessation of operations. 10 CFR 50.82 (a)(4)(i) requires that the PSDAR contain a site-specific decommissioning cost estimate including the projected costs of managing irradiated fuel.

Energy*Solutions* has prepared a site-specific DCE for SONGS, which also provides projected costs of managing irradiated fuel, as well as non-radiological decommissioning and other site restoration costs,. The site-specific decommissioning cost analysis is being submitted concurrent with the IFMP and this PSDAR and fulfills the requirements of 10 CFR 50.82(a)(4)(i) and 10 CFR 50.82(a)(8)(iii). A summary of the annual costs associated with decommissioning, irradiated fuel management and site restoration are provided in the Irradiated Fuel Management Plan also being concurrently submitted in accordance with 10 CFR 50.54(bb).

The methodology used by Energy*Solutions* to develop the site-specific decommissioning cost analysis follows the approach originally developed by the Atomic Industrial Forum (now Nuclear Energy Institute) in their program to develop a standardized model for decommissioning cost estimates. The results of this program were published as AIF/NESP-036, "A Guideline for Producing Commercial Nuclear Power Plant Decommissioning Cost Estimates," (Reference 7). This document includes a unit cost factor method for estimating direct activity costs, simplifying the estimating process. The unit cost factors used in the study reflect the latest available data at the time of the study concerning worker productivity during decommissioning.

The decommissioning of the SONGS site will be funded from Nuclear Decommissioning Trusts established by each SONGS Participant for each unit. The relative liabilities of each SONGS Participant are detailed in the DCE. Sufficient funds (based on balances and earnings) are projected to be available to complete the planned decommissioning activities.

As discussed in Section IV of the IFMP the CPUC will establish processes for oversight of withdrawals from the nuclear decommissioning trusts by SCE and SDG&E, and designate the specific amounts from the existing fund balances that are available for the three decommissioning cost categories: (1) spent fuel management; (2) site restoration; and (3) license termination. As entities not subject to CPUC jurisdiction, Anaheim and Riverside are not required to obtain CPUC authorization with respect to withdrawals from their respective Nuclear Decommissioning Trusts.

IV. ENVIRONMENTAL IMPACTS

As shown in this section, SCE has evaluated the environmental impacts of decommissioning SONGS Units 2 and 3 to determine if anticipated impacts are bounded by existing environmental impact statements, the NRC's generic decommissioning EIS (GEIS, Reference 6) and the SONGS Final Environmental Statement (FES, Reference 8). As noted in Regulatory Guide 1.185, C.4 "the PSDAR does not need to include the analysis of the specific environmental impacts associated with decommissioning activities....the licensee must ensure that supporting documentation and analyses are available at the reactor site for inspection by the NRC Staff." Such detailed documentation and analyses are contained in the Environmental Impact Evaluation (EIE) and its supporting references as noted in the Developmental References. They are available on-site for NRC review as well as on the SONGScommunity.com website and are summarized below. Both the detailed documentation and analyses and the following summary were reviewed by internal and external subject matter experts, independent third-party reviewers and the Community Engagement Panel discussed in the Introduction to this report.

In the GEIS, the NRC reviewed the environmental impacts resulting from decommissioning on a generic basis, and identified a need for site-specific analyses for: (1) threatened and endangered species and (2) environmental justice. In addition, site-specific analyses are called for whenever decommissioning plans indicate that activities will impact areas beyond the operational portions of a facility. The SONGS FES addresses decommissioning, but does not establish bounding environmental impacts specific to decommissioning. However, the FES' discussion of impacts for construction does describe bounding impacts as it related to potential dewatering during decommissioning.

The NRC, in its GEIS, identified additional activities that are performed in conjunction with decommissioning. These activities are regulated by the NRC but any associated environmental impacts are addressed directly in conjunction with those regulated activities. These activities include those related to the decision to permanently cease operations, irradiated fuel management in wet or dry storage, irradiated fuel transport and disposal, and the treatment, and/or disposal of LLRW. SCE similarly excluded consideration of such activities to remain consistent with the NRC's approach.

A. Environmental Impacts of Decommissioning SONGS

SCE assessed the potential for environmental impacts to each resource area from decommissioning activities using the evaluations in the GEIS as a guide. Like the GEIS, the analysis assumed that operational mitigation measures will be continued and did not rely on the implementation of new

mitigation measures unless specified. Releases to the environment, waste volumes, and other environmental interfaces were estimated in the DCE or other sources referenced in the EIE. This information was then assessed against the potential for impact and the existing environmental conditions at SONGS to identify impacts and determine whether the GEIS and FES remain bounding. The GEIS categorizes significance levels as SMALL (impacts are not detectable or are so minor that they will neither destabilize nor noticeably alter any important attribute of the resource or do not exceed permissible levels in the NRC's regulations), MODERATE (impacts are sufficient to alter noticeably, but not to destabilize, important attributes of the resource), or LARGE (impacts are clearly noticeable, and are sufficient to destabilize important attributes of the resource).

To support the evaluation, SCE established the baseline environmental and societal conditions through site-specific information as well as vicinity and regional data available from local, state, and federal agencies. In addition, the evaluation considered the existing permit conditions and limitations for water and air permits and NRC regulatory requirements, including those focused on occupational dose, public dose, radiological effluents, and LLRW shipping. Federal, state, and local requirements for non-radiological interfaces with the environment were considered. These include regulatory limits on water withdrawal and discharges, air emissions including fugitive dust, noise levels, and protection of avian, terrestrial and aquatic species, protection of cultural resources, disposal of non-radiological waste, and worker health protection.

SCE reviewed the planned decommissioning activities for SONGS Units 2 and 3 and compared these to the decommissioning activities that NRC evaluated in the GEIS. The planned activities fall within the activities that NRC evaluated. While each decommissioning site is unique, no unusual site-specific features or aspects of the planned SONGS Units 2 and 3 decommissioning have been identified. Furthermore, the practices used to accomplish the individual decommissioning tasks will employ conventional methods.

SCE's review confirmed that the anticipated or potential impacts are within the bounds of the generic impacts that the NRC described in the GEIS. There are no applicable bounding impacts for threatened and endangered species and environmental justice. The site-specific analyses determined that the planned SONGS Units 2 and 3 decommissioning activities are not likely to result in significant impacts to threatened and endangered species nor have disproportionate impacts on minority or low-income populations. The following discussions summarize the full Environmental Impact Evaluation focusing on the reasons for reaching this conclusion.

1. Onsite/Offsite Land Use

SCE's decommissioning plans include building demolition and removal within the 84-acre easement hosting the SONGS Units 2 and 3 reactor units and infrastructure. SCE plans to seek an easement lease amendment from the CSLC for the partial removal or abandonment in-place of the SONGS Units 2 and 3 intake and discharge conduits. In addition, the existing rail spur serving the site will most likely be used in support of waste shipments.

The SONGS site is currently used for utility-related industrial land uses, with the majority of the property within the easement having been previously disturbed during construction and operation of the plant. The coastal bluff areas located in the northwest and southeast portions of the 84-acre easement have remained undeveloped in compliance with the California Coastal Commission (CCC) Guarantee Agreement, in which SCE provided assurance that they will be protected and that they will remain in their natural state. It is anticipated that there will be no changes in onsite land use patterns during decommissioning.

The GEIS assessment for land use concluded that the impact would be SMALL for sites that did not require additional land for decommissioning activities. If additional land was needed the impact should be determined on a site-specific basis. Because no additional lands are needed SONGS onsite land use impacts during decommissioning are bounded by the GEIS and are categorized as SMALL.

2. Water Use

SONGS Units 2 and 3 acquires potable water through the South Coast Water District, a member agency of the Municipal Water District of Orange County (MWDOC). The site historically used water from the Pacific Ocean for its condenser cooling and service water cooling functions. The operational demand for cooling and makeup water has been significantly reduced since SONGS Units 2 and 3 permanently ceased operation. Condenser cooling is not required when the plant is not operating and service water cooling demands have been reduced to the extent possible (primarily spent fuel pool cooling). The normal operation demand was previously over 830,000 gpm per unit and is currently approximately 34,000 gpm total for both Units 2 and 3. During the decommissioning period, SONGS intends to continue to reduce cooling water demands with the intent to eliminate such demands on the Pacific Ocean as soon as possible.

The GEIS assessment of water use concluded the impact on water use would be SMALL if the decommissioning did not significantly increase water use. Water uses for decommissioning include staff usage, fuel storage (replacement of evaporative losses, etc.), fuel transfer (washing down transport casks), large component segmentation generally performed underwater, decontamination and dismantlement (if water-jet or similar techniques are employed). Water uses are anticipated to be significantly less than during operation. Thus water use impacts during decommissioning are bounded by the GEIS.

3. Water Quality – Non-Radiological

Major activities that could impact surface and groundwater quality during decommissioning include site excavation, stabilization, decontamination, dismantlement, and dewatering. These activities present the potential of spills, migration of low concentrations of radioactivity or hazardous substances not previously identified, and leaching from subsurface structures.

As discussed in Section 2 above, the site uses water from the Pacific Ocean for its condenser cooling and service water cooling functions. Water used for cooling functions is discharged through the ocean outfalls for Units 2 and 3, and is currently regulated under individual National Pollutant Discharge Elimination System (NPDES) Permits from the San Diego Regional Water Quality Control Board (SDRWQCB). The individual unit permits may be merged into a single NPDES Permit which would also continue to address groundwater dewatering discharges, and multiple minor waste stream discharges from within SONGS Units 2 and 3.

Storm water discharge is regulated and controlled through an industrial storm water general permit issued by the SDRWQCB. This permit requires SONGS to develop, maintain, and implement a storm water pollution prevention plan (SWPPP) for the facility. Storm water-related monitoring plans and reporting protocols will be updated as necessary to address permit requirements and decommissioning activities.

A previous SCE study concluded that no drinking water pathway exists for exposure from SONGS operations. Furthermore, the nearest drinking water well is more than one mile inland. Previous studies indicate that even under extreme pumping conditions, a seaward gradient will exist. Therefore, any dewatering is not expected to result in saltwater intrusion.

The GEIS assessment of water quality impacts concluded the impacts would be SMALL based on compliance with regulatory requirements including the appropriate application of best management practices (BMPs) and controls. SCE will follow standard storm water BMPs as documented in the current Industrial SWPPP and implement the current SPCC plan to minimize the chance of both groundwater and surface water contamination. In the event an unknown area of hazardous substances is identified during sub-grade soil excavation and structures removal, the area will be assessed and controlled. Due to the implementation of BMPs and compliance with permits, the potential impacts of decommissioning on nonradioactive aspects of water quality for both surface water and groundwater are bounded by those addressed in the GEIS.

4. Air Quality

Emission sources in San Diego County are primarily mobile sources (vehicular traffic) and ambient air quality standards are frequently exceeded for ozone and particulate matter due to routine vehicular traffic. Relatively minor stationary sources, such as those planned for use at SONGS, are projected to be a fraction of the average daily emissions permitted by the San Diego Air Pollution Control District (SDAPCD).

The most likely impact of decommissioning on air quality will be due to dust. SCE will employ standard dust control measures during decommissioning in accordance with SDAPCD dust abatement and visible emissions requirements. Air emissions due to commuting workers will actually be less since the work force during all phases of decommissioning is expected to be smaller than the peak number of workers used for construction or refueling outages.

The NRC's GEIS generically determined air quality impacts associated with decommissioning to be SMALL due to the sufficiency of current and commonly used control and mitigation measures. SCE will implement standard mitigation measures to reduce emissions during decommissioning per the requirements of the SDAPCD. Therefore, air quality impacts related to decommissioning of SONGS Units 2 and 3 are bounded by the GEIS.

5. Aquatic Ecology

SCE has characterized the aquatic environment in the vicinity of the SONGS Units 2 and 3 intake and discharge conduits prior to construction of and during the operation of SONGS. There are a variety of habitat types surrounding the SONGS Units 2 and 3 conduits. The marine habitat offshore of SONGS consists of a mixture of sand, cobble, and isolated areas of exposed rock. The area of high marine productivity in the immediate vicinity of the plant site is the shallow sub-tidal zone, approximately 1,300 feet north of SONGS. This area supports a biological community dominated by surfgrass, and feather boa kelp. The San Onofre kelp bed is approximately 650 feet south of SONGS Unit 2 diffusers in a water depth of 40 to 50 feet. The benthic fish community is generally dominated by queenfish; northern anchovy; white croaker and speckled sanddab.

Since ceasing permanent operations at SONGS Units 2 and 3, SCE has reduced ocean water withdrawals and discharge by approximately 96 percent from normal operating flows. The remaining flow is primarily associated with cooling spent fuel while in wet storage. As noted earlier, spent fuel storage and cooling are existing operational activities and is not re-addressed as part of this environmental review. SONGS will continue to comply with its applicable regulatory and permit requirements associated with reduction of impingement and entrainment impacts due to water withdrawals.

SCE sought and obtained an amendment to the CSLC easement lease for Unit 1 which allowed the intake and discharge conduits to remain buried beneath the seafloor. SCE is planning to pursue similar amendments for SONGS Units 2 and 3. If the CSLC approves the amendment to allow SCE to abandon the conduits in place, the environmental impacts are projected to be SMALL with the application of appropriate mitigation measures enumerated in the lease amendment. Complete removal of the conduits, as is currently required by the CSLC lease, is anticipated to have significant adverse environmental impacts. The detailed Environmental Impact Evaluation assumes the CSLC lease is amended. If the CSLC lease is not amended, the environmental impacts from complete removal of the conduits will have to be further addressed. If necessary, SCE will update the PSDAR and initiate other regulatory interactions to address the results of this analysis.

There are no surface water bodies on the SONGS site, but the Pacific Ocean borders the site and vernal pools are found northwest of SONGS Parking Lot 4. Decommissioning activities for SONGS Units 2 and 3 will include the application of common BMPs, compliance with the SONGS storm water permit, and implementation of the storm water pollution prevention plan, which will be updated as necessary to address decommissioning activities. These measures will ensure that any changes in surface water quality will be non-detectable and non-destabilizing.

The NRC determined aquatic ecology impacts to be SMALL when only aquatic resources within a plant's operational areas are disturbed. The potential impacts to aquatic ecology are bounded by the GEIS and no additional mitigation measures beyond those anticipated as conditions of the CSLC easement lease amendment are likely to be warranted.

6. Terrestrial Ecology

The SONGS site is almost entirely paved and developed. However, there are small strips of intact scrub-shrub habitat and ornamental vegetation surrounding the parking lots and between developed areas of the plant. The SONGS site also has undeveloped coastal bluffs that are explicitly protected from development under the CCC Guarantee Agreement. The onsite coastal bluff in the northwest area of SONGS is sparsely vegetated, California desert-thorn scrub habitat. The larger onsite coastal bluff in the southeast area of SONGS is approximately 5 acres and is dominated by California sagebrush scrub vegetation. This bluff is contiguous with the San Onofre bluffs of the San Onofre State Beach, which supports two native vegetation associations (Diegan coastal sage scrub and southern foredune) and small areas of disturbed coastal sage scrub habitat. The coastal bluff areas provide opportunity to support wildlife; however, the light, noise, and frequent human presence due to the proximity of SONGS and the state beach result in a more disturbed habitat than will otherwise be optimal for many species. Avian species are highly mobile and not subject to barriers such as roads and developed areas and may utilize scrub habitat or open surfaces for nesting and temporary perching.

The decommissioning activities will include noise and dust from dismantlement of facilities and heavy equipment traffic, surface runoff, emissions from construction equipment, and the potential for bird interactions with crane booms or other construction equipment. These activities will be conducted in compliance with air quality and noise regulations, and SCE will use avoidance and minimization measures to address potential impacts. Compliance with applicable regulations, air permits, noise restrictions along with the temporary nature of the various decommissioning tasks (e.g., use of cranes) will minimize the impacts to terrestrial species as well as the human community. Decommissioning plans do not currently include the use of explosives, which could disturb terrestrial resources. Should those plans change the environmental impacts will be reevaluated.

SONGS is located within the coastal zone and prior to active dismantlement, SCE will file a coastal development permit application with the CCC. As part of this permitting process, decommissioning activities within the coastal sage habitat areas, coastal bluff, and beach areas will be reviewed by the CCC and United States Fish and Wildlife Service (USFWS) for potential environmental impacts including

the federally listed coastal California gnatcatcher and other protected species and species of concern. Any necessary mitigation measures will be included as conditions of the CCC permit. The removal of various current SONGS features along the perimeter of the developed plant adjacent to and within the natural area could potentially require ground disturbance in unpaved areas. Appropriate avoidance and minimization measures will be used to minimize the impact of any ground disturbance.

With the implementation of appropriate avoidance and minimization measures and compliance with permit conditions as discussed above, decommissioning of SONGS Units 2 and 3 is not anticipated to adversely impact any terrestrial resources and the impacts will be bounded by the GEIS which determined them to be SMALL.

7. Threatened and Endangered Species

Seventeen federally or state protected species utilize habitat within the vicinity (a 6-mile radius) of the SONGS site. These species are listed in Table IV-1, along with their protection status and critical habitat designation. Other species of concern are also addressed in the detailed Environmental Impact Evaluation including both the critically imperiled and imperiled species listed in the California Natural Diversity Data Base and located within one mile of the site but are not otherwise addressed here.

The list includes four federally listed marine turtles. However, none is considered a full-time resident in the vicinity of SONGS and they only migrate through the vicinity. Another federally listed marine reptile, the Hawksbill turtle, sporadically nests in the southern part of the Baja peninsula and foraging sub-adults and juveniles have been sighted along the California coast. Given the SMALL impacts on water use and water quality during decommissioning and the ability of these species to migrate away from the site, these species should not be adversely impacted by decommissioning.

The decommissioning activities will indirectly impact protected species through dust generation from structure demolition, noise from dismantlement of facilities and heavy equipment traffic, surface runoff, emissions from construction equipment, and potential bird interactions with crane booms or other construction equipment. The decommissioning activities will be conducted in compliance with air quality and noise regulations and SCE will use appropriate avoidance and minimization measures. Compliance with applicable regulations, air permits, and noise restrictions related to daylight working along with the temporary nature of the various decommissioning tasks will minimize any such impacts. Decommissioning plans do not currently include the use of explosives, which could disturb protected species. These measures will minimize impacts to protected terrestrial species that inhabit or visit the SONGS site.

Although rare on the site, there has historically been one protected plant species in the vicinity of SONGS, the thread-leaved brodiaea. Decommissioning activities will generally be confined to previously disturbed areas (e.g., paved, high traffic areas). Otherwise, the SCE environmental staff will conduct an environmental assessment per established procedures. The procedure requires an assessment prior to any land disturbance, soil addition, digging, grading, or trenching outside the paved and concreted areas; maintenance activities near surface water, and wetlands and trimming or removal of native plants

other than landscape maintenance. Therefore, adverse impacts on protected plant species are not anticipated.

Decommissioning of SONGS Units 2 and 3 is not anticipated to adversely impact any federally or state-listed species. As discussed above, decommissioning activities will generally be limited to previously disturbed areas on-site, near-shore and off-shore. SCE will employ mitigation measures as required by the regulatory agencies to minimize impacts to the environment and protect listed species. In addition, SCE will implement BMPs and conduct assessments as called for in its environmental protection procedure(s), as well as comply with permit and regulatory requirements to minimize indirect impacts from noise, air emission, dust, and runoff. Therefore, impacts to threatened or endangered species from decommissioning are expected to be SMALL.

Table IV-1

Threatened and Endangered Species Identified within the Vicinity of SONGS

Scientific Name	Common Name	State Status[a]	Federal Status[b]	Critical Habitat within Vicinity
AMPHIBIAN SPECIES				
Anaxyrus californicus	Arroyo toad	—	FE	yes[c]
AVIAN SPECIES				
Charadrius alexandrinus nivosus	Western snowy plover	—	FT	yes[c]
Empidonax traillii extimus	Southwestern willow flycatcher	SE	FE	No
Haliaeetus leucocephalus	Bald eagle	SE	delisted	No
Polioptilacalifornica californica	Coastal California gnatcatcher	—	FT	yes[c]
Vireo bellii pusillus	Least Bell's vireo	SE	FE	yes[c]
FISH SPECIES				
Orcorhynchus mykiss	Steelhead trout	—	FE	yes[c]
INVERTEBRATE SPECIES				
Branchinecta sandiegoensis	San Diego fairy shrimp	—	FE	yes[c]
Streptocephalus woottoni	Riverside fairy shrimp	—	FE	No
MAMMALIAN SPECIES				

Scientific Name	Common Name	State Status[a]	Federal Status[b]	Critical Habitat within Vicinity
Dipodomys stephensi	Stephen's kangaroo rat	ST	FE	No
Perognathus longimembris pacificus	Pacific pocket mouse	—	FE	No
PLANT SPECIES				
Brodiaea filifolia	Thread-leafed brodiaea	SE	FT	yes[c]
REPTILIAN SPECIES				
Caretta caretta	Loggerhead sea turtle	—	FE	No
Chelonia mydas	Green sea turtle	—	FT	No
Dermochelys coriacea	Leatherback sea turtle	—	FE	No
Lepidochelys olivacea	Olive Ridley's turtle	—	FT	No

a. SE = state endangered; ST = state threatened;
b. FE = federally endangered; FT = federally threatened
c. The USFWS has critical habitat delineated within the SONGS site vicinity. However, the designation explicitly excludes Camp Pendleton and thus the SONGS site. Further, the term vicinity includes any area within a 6 mile radius of the site and is not limited to the site itself.

8. Radiological

Decommissioning activities have the potential to contribute to radiological impacts. SONGS Units 2 and 3 may continue to have limited gaseous and liquid radiological effluents until most of the decommissioning activities are complete and the irradiated fuel is transferred to dry storage. SCE is evaluating options to significantly reduce, if not eliminate, routine liquid effluents through the use of self-contained clean-up systems for ongoing systems and activities.

Occupational Dose

The GEIS estimates for the reference pressurized water reactor (PWR) dose is 1,215 person-rem for DECON. In the most recent supplement to the GEIS, the NRC reviewed data available from decommissioning experience subsequent to their initial review (in 1988). Because the range of cumulative occupational doses reported by reactors undergoing decommissioning was similar to the range of estimates for reference plants presented in the 1988 revision of the GEIS, the NRC did not update its estimates for occupational dose.

SCE expects the SONGS dose to be bounded by the referenced PWR dose since: a number of major components which often contribute to area dose rates are relatively new (steam generators and reactor vessel head); and, as a result of SONGS operational dose reduction efforts (i.e., zinc injection). A more detailed estimate will be developed to support evaluation of decontamination scope.

The regulatory standard for worker exposure is a dose limit per worker rather than a cumulative dose. Detailed occupational dose estimates will be performed as part of the work planning process. Such planning will address means to reduce occupational dose where appropriate. SCE remains committed to keeping dose to plant personnel 'As Low as Reasonably Achievable' (ALARA). The activities that have potential radiological impacts will be conducted in a manner to keep doses ALARA and well within regulatory limits.

Public Dose

The NRC generically concluded that reactors undergoing decommissioning could reasonably be expected to have emissions and public doses comparable to or substantially less than the levels experienced during normal operation of those facilities. The Radiological Environmental Monitoring Program (REMP) results demonstrate that the radiological environmental impact of the operation of SONGS Units 2 and 3, and the resulting dose to a member of the general public, is negligible.

SCE will continue to monitor effluents, comply with all applicable regulatory limits, and continue its REMP to assess the impacts to the environment from these effluents.

In summary, SCE estimates that SONGS Units 2 and 3 decommissioning activities will result in occupational and public doses within NRC estimates. Therefore, SONGS' radiological impacts during decommissioning are bounded by the GEIS which determined the radiological impacts to be SMALL.

9. Radiological Accidents

Many activities that occur during decommissioning are similar to activities that commonly take place during maintenance outages at operating plants such as decontamination and equipment removal. Accidents that could occur during these activities may result in injury and local contamination. However, they are not likely to result in contamination off-site.

The limiting design basis accidents (DBAs) applicable to a decommissioning plant are those involving the spent fuel pool. All DBAs and severe accidents involving the reactor are precluded as a result of transfer of spent fuel from the reactor vessels to the pools and ultimately the ISFSI. The environmental impacts of DBAs, including those associated with the spent fuel pool, were evaluated during the initial licensing process and documented in the FES. Furthermore, the impacts of these events are less than previously evaluated due to the time since the fuel was most recently irradiated.

The NRC's GEIS analysis relies in part on the waste confidence rule regarding spent nuclear fuel related severe accidents. The waste confidence GEIS (Reference 9) continues to consider severe accidents involving the spent fuel pool to be a SMALL risk.

Thus, SONGS' radiological accident impacts during decommissioning are bounded by NRC's Decommissioning GEIS which determined such risks to be SMALL.

10. Occupational Issues

SONGS currently has an industrial safety program and safety personnel to promote safe work practices and respond to occupational injuries and illnesses. Equivalent safety programs will continue to be in effect during decommissioning activities.

SONGS has an average occupational injury rate well below that of the heavy construction industry sector and consistent with the power generation and nuclear power industry. Decommissioning activities will be conducted in a manner reflecting personnel safety as a critical element. Therefore, SONGS occupational safety impacts are considered to be bounded by the GEIS which generically determined occupational safety impacts to be SMALL.

11. Cost

Decommissioning costs for SONGS are discussed in the DCE being submitted concurrently.

12. Socioeconomics

The primary socioeconomic impacts of decommissioning are related to staffing changes and decreasing tax revenues. Impacts related to the decision to permanently cease operations are outside the scope of this evaluation. SCE determined the staff reduction impacts from the decision to be minimal. The staff reductions represent 0.04 percent and 0.03 percent of San Diego County's and Orange County's workforces, respectively. Any impacts will be deferred somewhat due to the employment of temporary staff necessary to accomplish the various decommissioning activities.

Similarly, SONGS is located in San Diego County and its property assessment is a relatively small portion of San Diego County's total tax collections. Historically, SONGS' contribution to the county property tax collections has been consistently less than 1 percent. SONGS' tax obligations will be reduced due to decommissioning, but SCE and SONGS will continue to contribute to county tax revenues.

It is anticipated that there will be limited or no changes or impacts to the local community and socioeconomic conditions and less impact than would be expected generically where other nuclear facilities have a higher relative impact on the job market or tax base. Thus, SONGS' impacts are bounded by those considered in the GEIS in which the NRC generically determined socioeconomic impacts to be SMALL.

13. Environmental Justice

Decommissioning activities that may potentially affect identified minority and low-income populations include those related to staffing changes and offsite transportation. However, the assessment of environmental justice also considered other specific issues (e.g., water use, air quality). SCE has determined that no significant offsite impacts will be created by SONGS 2 & 3 decommissioning activities. As generic NRC guidance recognizes, if no significant offsite impacts occur in connection with the proposed action, then no member of the public will be substantially affected. Therefore, there can

be no disproportionately high and adverse impacts on members of the public, including minority and low-income populations. In addition, staffing is not anticipated to be an impact due to the large population and robust job market in the area (see Section 12 above).

The environmental justice evaluations utilize a 50-mile radius around the plant as the potentially impacted area. To complete this evaluation, the 2006–2010 low-income data and 2010 minority population data for California were obtained from the United States Census Bureau (USCB) and processed using ESRI ArcGIS 10.1 software. All census data were downloaded in USCB block group level geography so that the environmental justice evaluations were consistent between the minority and low-income analyses. The evaluations and results are detailed in the EIE which concluded there were no disproportionate impacts.

In its GEIS, the NRC concluded that adverse environmental justice impacts and associated significance of the impacts must be determined on a site-specific basis. Unlike many nuclear sites, SONGS is located in and near relatively large communities with significant other commercial and industrial activities. Thus, the impact of SONGS shutdown is less severe than may otherwise be the case. Further, SCE has determined that no significant offsite environmental impacts will be created by SONGS Units 2 and 3 decommissioning activities. Since no significant offsite impacts occur in connection with the proposed action, no member of the public will be substantially affected. Therefore, it is unlikely for there to be a disproportionately high and adverse impact or effects on specific groups or members of the public, including minority and low-income populations, resulting from the decommissioning of SONGS Units 2 and 3.

14. Cultural Historic and Archeological Resources

No prehistoric or historic archaeological sites or historic sites eligible for listing or listed on the National Register of Historic Places, California Register of Historical Resources, or San Diego County Local Register of Historical Resources are located within the SONGS site lease easement and no traditional cultural properties are known to be present. Two prehistoric archaeological sites and three historic archaeological sites were identified within 0.5 miles of SONGS Units 2 and 3.

All of these areas are outside the operational/decommissioning site. In its GEIS, the NRC concluded that for plants where the disturbance of lands beyond the operational areas is not anticipated, the impacts on cultural, historic, and archeological resources will be SMALL. Since decommissioning activities are confined to the SONGS site, no adverse impacts are anticipated. SONGS' impacts on cultural, historical, and archeological resources during decommissioning fall well within the bounds established by the NRC in the GEIS.

15. Aesthetic Issues

In its GEIS, the NRC stated that removal of structures is generally considered to be a beneficial aesthetic impact and drew the generic conclusion that for all plants, the potential impacts from decommissioning on aesthetics are SMALL and that any mitigation measures are not likely to be beneficial enough to be

warranted. Similarly, the aesthetic impact of final result of decommissioning SONGS Units 2 and 3 will be less than that of the current aesthetic impact of the plant. During dismantlement, any adverse visual intrusion will be temporary and will ultimately serve to reduce the aesthetic impact of the site. Therefore, the impacts of SONGS on aesthetic resources during decommissioning are bounded by the GEIS.

16. Noise

Offsite noise sources that affect the ambient noise environment in the vicinity of SONGS include Interstate-5, the San Diego Northern Railroad, and military operations. During the decommissioning process, the sounds that might be heard at offsite locations include noise from construction vehicles and tools. The timing of noise impacts and the duration or intensity will vary. The nearest sensitive receptors to SONGS are recreational users of San Onofre State Beach where the ambient noise environment can exceed 70 dBA. The more intense decommissioning activities will occur 400 ft or more from the beach access public walkway in front of the SONGS sea wall.

Due to the relatively high ambient noise levels surrounding SONGS, decommissioning activities are not expected to produce noise levels that could impact the activities of humans or threatened and endangered species. In addition, SCE will comply with the local noise regulations for construction sites, which restrict the average sound level at the property boundary to 75 dBA between 7 a.m. and 7 p.m., and any additional agency permit requirements including any lower allowed limits during evenings and overnight. Therefore, noise impacts during decommissioning of SONGS Units 2 and 3 are bounded by the previously issued GEIS, which generically determined the noise impacts associated with decommissioning to be SMALL.

17. Transportation

Transportation impacts are dependent on the number of shipments to and from the facility, the type of shipments, the distance that material is shipped, and the number of workers commuting to and from the site.

Transportation infrastructure within the vicinity of SONGS includes one major north- and south-bound freeway, I-5, an assortment of local and county roads, passenger and cargo rail service (part of the Los Angeles–San Diego corridor), and an existing rail spur serving the SONGS site. The 2011 average annual daily traffic (AADT) count for this portion of I-5 was 132,000 vehicles.

SCE compared the assumptions and analysis inputs used for NRC's analysis with waste volumes estimated for SONGS Units 2 and 3 decommissioning, transport mode, and disposal facility options. Due to the availability of the rail line, a substantial portion of the shipments will likely use that mode of transportation. The NRC indicates use of rail reduces radiological impacts by more than a factor of 10 over truck shipments. Furthermore, disposal facilities available for SONGS Units 2 and 3 radiological wastes are less than half the distance assumed by NRC in its analysis. Therefore the generic impacts bound those associated with SONGS Units 2 and 3.

Furthermore, SCE will comply with all applicable NRC and U.S. Department of Transportation (DOT) regulations, including Federal Railroad Administration regulations and requirements, and will use approved packaging and shipping containers for waste shipment. SCE will also comply with State of California regulations enforced by Caltrans and the California Highway Patrol. The NRC has generically concluded that the radiological impacts of transporting radiological waste from decommissioning will be SMALL and those for SONGS Units 2 and 3 are bounded by the GEIS.

SCE estimated a peak of approximately 560 workers during decommissioning and the vehicular traffic due to commuting will likely exceed the 200 per peak hour threshold, prompting review for potential to impact traffic congestion as required under the local congestion management plan. SCE estimated peak truck traffic due to waste shipments to be approximately 150 per day. The decommissioning traffic associated with SONGS is considered negligible compared to existing traffic volumes and will not be expected to significantly alter congestion on roadways. In addition, this amount of traffic is not expected to significantly deteriorate roadways; therefore the GEIS is bounding and the non-radiological transportation impacts of decommissioning are SMALL.

Offshore activities to remove vertical risers on the intake and discharge conduits will increase marine vessel traffic in the area. It is expected that these activities will not cause either a navigational safety hazard or a substantial delay in the normal movements of commercial or recreational vessels. The environmental impacts review for the Unit 1 conduit disposition indicated that impacts to recreational and commercial transportation will be insignificant.

18. Irreversible and Irretrievable Commitment of Resources

SONGS Units 2 and 3 decommissioning will involve dismantlement and removal of structures and restoration of the property to a state for unrestricted release per NRC regulations in accordance with the criteria for license termination in 10 CFR 20, Subpart E. Furthermore, the property will be returned to the U.S. Navy under negotiated terms of the easement. The activities necessary to decommission SONGS Units 2 and 3 involve a minor irretrievable commitment of consumable materials (including materials for decontamination, solvents, industrial gases, tools, fuel, etc.). The irreversible commitment of such resources is not unique and is bounded by those considered by the NRC in the GEIS which concluded consumption to be minor.

Waste from decommissioning of SONGS Units 2 and 3 will consume space at waste facilities. California has multiple facilities permitted for the storage, treatment, and disposal of hazardous and universal waste. The nonradioactive waste is assumed to be shipped to an out-of-state landfill due to the moratorium on disposal of decommissioned materials at California nonhazardous landfills. The decommissioning of SONGS Units 2 and 3 will result in minor irretrievable or irreversible commitment of resources bounded by the GEIS in which the NRC determined will be SMALL impacts.

B. Environmental Impacts of License Termination – NUREG-1496

The License Termination Plan (LTP) has not yet been developed. As noted earlier, it is required to be submitted at least two years prior to the proposed termination date. In general, the LTP outlines the basis for an administrative/legal activity. No physical work beyond that already addressed is anticipated. Thus, there are no environmental impacts beyond those already addressed that need to be addressed at this point in the process.

C. Discussion of Decommissioning in the FES

Applicable portions of the FES were addressed as noted in each of the topics previously summarized.

D. Additional Considerations

SCE has not identified any unique considerations that need to be further addressed. The previous topic summaries address a sufficiently wide range of issues.

E. Conclusion

SCE has performed an environmental review to evaluate environmental impacts associated with decommissioning activities, confirming that the anticipated or potential impacts are within the bounds of the generic impacts that NRC described in the GEIS. Further, while there are no applicable bounding impacts for threatened and endangered species and environmental justice discussed in the GEIS, the SONGS Units 2 and 3 decommissioning activities are not anticipated to result in significant impacts to threatened and endangered species or disproportionate impacts on minority or low-income populations. This is principally due to the following:

- Planned activities fall within the activities that the NRC evaluated. There are no unique aspects of the plant or decommissioning techniques that will invalidate previously drawn conclusions.
- Methods to be employed to dismantle and decontaminate the site are standard construction-based techniques fully considered in the GEIS.
- SCE will continue to comply with NRC dose limits and conduct activities in accordance with ALARA principles.
- SCE will continue to comply with the SONGS Offsite Dose Calculation Manual, Radiological Effluent Monitoring Program, and the Ground Water Protection Initiative Program during decommissioning. Each will likely be modified somewhat to reflect changes in site configuration, etc.
- SCE will comply with all applicable NRC and DOT regulations, including Federal Railroad Administration regulations and requirements, and use approved packaging and shipping containers for the shipping of radiological waste. SCE will also comply with State of California regulations enforced by Caltrans and the California Highway Patrol.

- SCE will continue to comply with federal, state, and local requirements for non-radiological interfaces with the environment including limitations on water withdrawal and discharges, air emissions including criteria pollutants and fugitive dust, noise levels, protection of avian, terrestrial and aquatic species, cultural resources, disposal of non-radiological waste, and worker health protection.
- SCE will seek and comply with an amendment to its CSLC easement lease to largely abandon the intake and discharge conduits in place.
- SCE will seek and comply with a coastal development permit from the CCC for decommissioning.

San Onofre Nuclear Generating Station, Units 2 and 3
Irradiated Fuel Management Plan

Reference Letter from P.T. Dietrich (SCE) to the U.S. Nuclear Regulatory Commission, dated June 12, 2013; Subject: Certification of Permanent Cessation of Power Operations, San Onofre Nuclear Generating Station, Units 2 and 3

Dear Sir or Madam:

On June 12, 2013, SCE submitted the referenced letter to the U.S. Nuclear Regulatory Commission (NRC) certifying the permanent cessation of operations at San Onofre Nuclear Generating Station (SONGS), Units 2 and 3, in accordance with 10 CFR 50.54(bb) and 10 CFR 50.82(a)(4)(i), Southern California Edison (SCE) is required to submit an Irradiated Fuel Management Plan (IFMP), Site Specific Decommissioning Cost Estimate (DCE) and Post-Shutdown Decommissioning Activities Report (PSDAR) within two years of permanent cessation of operations.

The SONGS, Units 2 and 3 IFMP is attached. The DCE and PSDAR are being concurrently submitted under separate cover letters. The IFMP represents SCE's current plans and is subject to change as the project progresses. In particular, the Independent Spent Fuel Storage Installation location, and storage equipment and vendor(s) have not been selected. The decision making and procurement activities are underway but have not been finalized.

Changes to significant details will be included in subsequent revisions to the IFMP as required by 10 CFR 50.54(bb). Financial assurance information will be provided on an annual basis as required by 10 CFR 50.75(f)(1).

This letter does not contain any new commitments.

If there are any questions or if additional information is needed, please contact me or Ms. Andrea Sterdis at (949) 368-9985.

Sincerely,

SONGS Units 2 and 3 Irradiated Fuel Management Plan

I. Background and Introduction

On June 12, 2013, Southern California Edison (SCE) submitted a letter to the U.S. Nuclear Regulatory Commission (NRC) (Reference 1) certifying the permanent cessation of operations at San Onofre Nuclear Generating Station (SONGS) Units 2 and 3 effective June 7, 2013, in accordance with 10 CFR 50.82(a)(1)(i). All fuel was removed from the SONGS Units 2 and 3 reactor vessels and placed in their respective spent fuel pools as certified in accordance with 10 CFR 50.82(a)(1)(ii) (References 2 and 3).

Pursuant to 10 CFR 50.54(bb), licensees are required to submit a plan for the management of irradiated fuel until title and possession of the fuel is transferred to the Secretary of Energy for its ultimate disposal in a repository. The Irradiated Fuel Management Plan (IFMP) is required to be submitted to the Commission either five years before expiration of the Operating License or within two years following permanent cessation of operations, whichever occurs first. Therefore, the SONGS Units 2 and 3 plans are required to be submitted prior to June 7, 2015, two years following the cessation of operations. This submittal constitutes SCE's IFMP for SONGS Units 2 and 3, submitted on behalf of itself and the other SONGS Participants responsible for the funding of the SONGS decommissioning. The other SONGS Participants are the City of Anaheim, the City of Riverside, and San Diego Gas & Electric Company (SDG&E).

Energy*Solutions*, LLC has prepared a site-specific decommissioning cost estimate (DCE) for SONGS Units 2 and 3 (Reference 15). The DCE identifies the details, schedules, and costs of spent fuel management activities associated with the IFMP, along with license termination and site restoration activities and costs. This DCE is being submitted concurrent with the Post-Shutdown Decommissioning Activities Report (PSDAR, Reference 4) and this plan. The assumptions regarding the United States Department of Energy (US DOE) acceptance of irradiated fuel is consistent with the Energy*Solutions* DCE and is based on testimony filed with the California Public Utility Commission (Reference 13). The SONGS Units 2 and 3 DCE and this IFMP are based on commencement of industry-wide acceptance of spent fuel by US DOE in 2024.

II. Irradiated Fuel Management Strategy

The safe initial interim storage of SONGS Units 2 and 3 irradiated fuel will be "wet storage" in each unit's respective spent fuel pool. The spent fuel pools will be isolated from their normal support systems and those systems replaced by stand-alone cooling and filtration units (also termed a "spent fuel pool island"). Doing so facilitates earlier system abandonment and parallel decommissioning activities.

Subsequently, all irradiated fuel in the SONGS Units 2 and 3 spent fuel pools will be safely transferred to "dry storage" at the common Independent Spent Fuel Storage Installation (ISFSI) located on the SONGS site. Dry storage is also considered interim storage pending transfer to the US DOE.

A total of 1,726 irradiated fuel assemblies have been generated in SONGS Unit 2 and 1,734 irradiated fuel assemblies have been generated in SONGS Unit 3, for a total of 3,460 irradiated fuel assemblies. At present, 792 SONGS Units 2 and 3 irradiated fuel assemblies have already been transferred to the common ISFSI. The remaining 2,668 irradiated fuel assembles will be loaded into Dry Shielded Canisters (DSCs) and transferred to the ISFSI.

The current ISFSI is located inside the Owner Controlled Area. It was constructed to accommodate SONGS Unit 1 irradiated fuel and provides additional capacity for a limited amount of SONGS Units 2 and 3 irradiated fuel.

The ISFSI currently contains 18 DSCs storing Unit 1 fuel and Greater than Class C (GTCC) waste. The ISFSI also contains 33 DSCs which store Units 2 and 3 fuel. All of the fuel on the ISFSI is stored in Transnuclear NUHOMS Model Number-24PT1 or PT4 DSCs.

The major IFMP activity phases, including start and end dates and associated costs for each period are identified in Table 1. The identified Spent Nuclear Fuel (SNF) Periods are developed in and align with the site-specific DCE (Reference 15).

The current plans are to obtain necessary permits for the ISFSI to be expanded to accommodate the remaining inventory of the SONGS Units 2 and 3 spent fuel pools. SONGS plans to commence the movement of irradiated fuel from the Unit 2 and Unit 3 pools to the ISFSI in 2017. SONGS expects to complete the transfer in 2019. Additional DSCs will be procured from one or more of the available dry storage system suppliers beginning in 2014. An additional 47 DSCs will be required for the SONGS Unit 2 irradiated fuel and an additional 44 DSCs will be required for the SONGS Unit 3

irradiated fuel (depending on the capacity of the selected system and the number of DSCs needed to store GTCC waste and other materials). The spent fuel pool inventory is forecast to be transferred to the ISFSI no later than the end of 2019.

The US DOE Standard Contracts for acceptance and disposal of spent nuclear fuel and high level waste contain the basis for the initial ranking of industry-wide spent fuel acceptance obligations based upon the date of permanent removal of the spent nuclear fuel from service ("oldest fuel first" allocation). Those Standard Contracts also contain provisions allowing for "exchanges" of acceptance obligations, and priority for retired units. Given the US DOE's lack of performance, a common assumption for purposes of this fuel management plan is to base acceptance projections upon application of an "oldest fuel first" allocation scheme to a projected start date for repository operations. This plan is based upon a 2024 start date (Reference 13) for US DOE acceptance of spent fuel from the industry and the SONGS Units 2 and 3 positions in the queue. As indicated in Table 3, SCE is therefore assuming all fuel will be removed from the SONGS site as of 2049. Based on this assumption, the ISFSI will be subsequently decommissioned by the 2051 final license termination date.

III. Financial Assurance

The regulations (10 CFR 50.54(bb)) also require that funding adequacy be demonstrated to support the irradiated fuel management plan.

The cost of twelve (12) additional DSCs to be stored on the current ISFSI was funded from sources other than the Nuclear Decommissioning Trusts (NDT) (Reference 5), as are the costs associated with ongoing storage of Unit 1 spent fuel at the GE-Hitachi Nuclear America LLC's Morris Operation ISFSI located in Morris, Illinois. Table 1 includes the costs of procurement and construction of the expanded ISFSI capacity and all loading costs. Operation of the spent fuel pools is modeled as being discontinued in 2019 after all of the fuel has been transferred to dry storage. ISFSI operations continue until the US DOE is able to complete the transfer of the SONGS fuel to a repository or interim storage facility, which is currently assumed to occur by 2049.

SONGS management is committed to providing consistent and up-to-date information to all of its stakeholders and regulators. Aspects of the SONGS Nuclear Decommissioning Trust Fund are regulated by both the California Public Utilities Commission (CPUC) and the NRC. Previous Decommissioning Cost Estimates (DCEs) were updated and submitted to the CPUC as part of the Nuclear Decommissioning Cost Triennial Proceedings (Reference 5). Financial assurance reports including the balances and expenditures for SONGS Unit 1 were supplied to the NRC (as required by 10 CFR

50.82(a)(8)(v)) annually (most recently in Reference 6) and balances for SONGS Units 2 and 3 were submitted on a biennial basis (as required by 10 CFR 50.75(f)(1)) (most recently in Reference 7). Reports regarding ISFSI costs and decommissioning funding assurance for these costs were summarized triennially as required by 10 CFR 72.30(c) (most recently in Reference 8). Going forward, balances and expenditures will be supplied annually to the NRC for all three units and the ISFSI.

An updated site-specific DCE will be concurrently submitted to the NRC. As summarized in Table 1, this plan is based on decommissioning and the termination of the license by 2051, approximately 38 years following the permanent cessation of operations. The summary in Table 1 includes the funds for dry storage through 2049 and final release of the ISFSI in 2051.

Tables 4A and 4B summarize the estimated annual spending for all decommissioning activities (License Termination, Spent Fuel Management, and Site Restoration), and combined NDT current balances in 2014 dollars. Table 2 reflects key tasks addressed by the NRC staff in a recent safety evaluation.

The total of all Nuclear Decommissioning Trust funds balances for SONGS Units 2 and 3 was $3,926 million as of December 31, 2013 (Reference 9). Evaluation of the projected cash flows assuming earnings on existing balances as permitted by NRC regulations demonstrates the adequacy of the existing funds to cover all aspects of decommissioning, including the costs of irradiated fuel management. This demonstrates that the balance in the decommissioning trust is adequate to fund all aspects of decommissioning as well as the costs of irradiated fuel management. As decommissioning proceeds the DCE will be updated as appropriate and annual updates of spending and trust fund balances will be docketed as required.

IV. Regulatory Activities

The IFMP assumes that the SONGS Participants will make withdrawals from their nuclear decommissioning trusts for spent fuel management purposes. The SONGS Participants have collected funds from ratepayers and accumulated funds in the nuclear decommissioning trusts for the purpose of funding three primary categories of costs: (1) License Termination; (2) Spent Fuel Management; and (3) Site Restoration. On November 18, 2013, SCE filed a Tier 3 Advice Letter (Reference 10) with the CPUC to obtain authorization for the use of funds in the near term and to establish processes for further CPUC oversight of withdrawals from the nuclear decommissioning trusts. On February 21, 2014, SDG&E filed a similar letter (Reference 14) with the CPUC. In addition to authorizing and overseeing the withdrawals, the CPUC is expected to

designate the specific amounts from the existing fund balances that are available for License Termination and therefore subject to 10 CFR 50.82(a)(8)(i)(A) and 10 CFR 50.75(h)(2). The fund balances would then be allocated to separate subaccounts within each trust fund and, as such, available for spent fuel management and site restoration, consistent with the requirements of 10 CFR 50.75, 10 CFR 50.82, and 10 CFR 72.30.

To confirm such access, SCE requested (Reference 11) an exemption from 10 CFR 50.75 and 50.82 to authorize the use of trust funds to pay for spent fuel management and site restoration including other transitional costs. The regulations limit the use of the nuclear trust fund to decommissioning costs. This exemption was granted on September 5, 2014 (Reference 12).

The SONGS Participants responsible for decommissioning will periodically review the amount of cash contributions required for the decommissioning fund to ensure that withdrawals do not inhibit the ability of the licensee to complete NRC License Termination, Spent Fuel Management, and Site Restoration. The SONGS Participants will obtain authorization as necessary through the ratemaking processes to provide for further contributions if required.

In accordance with 10 CFR 50.82(a)(8)(vii), SONGS will annually submit to the NRC by March 31st a report on the status of the funding for managing spent fuel. The report will include, current through the end of the previous calendar year, the amount of funds accumulated to cover the cost of managing the spent fuel, the projected cost of managing spent fuel until title to the fuel and possession of the fuel is transferred to the Secretary of Energy, and if the funds accumulated do not cover the projected cost, a plan to provide additional funding assurance using one of the methods allowed by NRC regulations.

3. Letter from Richard C. Brabec (SCE) to the U.S. Nuclear Regulatory Commission dated March 12, 2014; Subject: Access to Decommissioning Trust Funds, San Onofre Nuclear Generating Station Units 2 and 3

4. Letter from Richard C. Brabec (SCE) to the U.S. Nuclear Regulatory Commission dated March 31, 2014; Subject: 10 CFR 50.75(f)(1) Decommissioning Funding Status Report, San Onofre Nuclear Generating Station Units 2 and 3

Dear Sir or Madam:

On June 12, 2013, in accordance with 10 CFR 50.82(a)(1)(i), Southern California Edison (SCE) submitted a letter to the U.S. Nuclear Regulatory Commission (NRC) (Reference 1) certifying the permanent cessation of operations at San Onofre Nuclear Generating Station (SONGS), Units 2 and 3. In accordance with 10 CFR 50.54(bb) and 10 CFR 50.82(a)(4)(i), SCE is required to submit an Irradiated Fuel Management Plan (IFMP), Site Specific Decommissioning Cost Estimate (DCE) and Post-Shutdown Decommissioning Activities Report (PSDAR) within two years of permanent cessation of operations.

The SONGS, Units 2 and 3 DCE is attached. The SONGS, Units 2 and 3 IFMP and PSDAR are being concurrently submitted under separate cover letters. The DCE provides more current estimates of annual cash flow than were previously provided in the Nuclear Decommissioning Trust Fund Exemption Request (References 2 and 3) and annual funding assurance update (Reference 4). Future filings with the California Public Utilities Commission will be based on the SONGS, Units 2 and 3 DCE and subsequent revisions.

Fax: (949) 368-6183
Tom.Palmisano@sce.com

A001
NRR

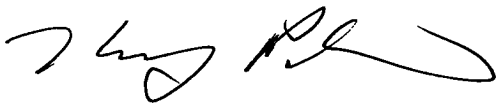
The descriptions of decommissioning activities and phases in the DCE are consistent with those described in the PSDAR. Both the DCE and PSDAR represent SCE's current plans and are subject to change as the project progresses. Much of the third-party contracting activities associated with decommissioning are underway but have not been finalized. As contracts are finalized and SCE progresses through the actual work of the decommissioning project, various risks will be realized or avoided and contingencies adjusted, accordingly.

Changes to significant details will be included in subsequent revisions to the DCE as required by 10 CFR 50.54(bb). Financial assurance information will be provided on an annual basis as required by 10 CFR 50.75(f)(1).

This letter does not contain any new commitments.

If there are any questions or if additional information is needed, please contact me or Ms. Andrea Sterdis at (949) 368-9985.

Sincerely,



Enclosure: San Onofre Nuclear Generating Station Units 2 and 3 Site Specific Decommissioning Cost Estimate

SONGS UNIT-2 AND UNIT-3
DECOMMISSIONING COST ESTIMATE
DESCRIPTION OF REVISION

MAJOR REVISION _____ MINOR REVISION_X____
REVISION NUMBER – 1 EFFECTIVE DATE - 9/5/2014

The revisions contained in this MINOR REVISION to the SONGS Unit-2 and Unit-3 Decommissioning Cost Estimate are minor in nature and do not revise or otherwise impact the content or results of the cost estimate.

ITEM-1

A new Appendix-F is added to the DCE at the request of San Diego Gas & Electric Company (SDG&E) in order to provide information regarding its internal decommissioning costs which it expects to incur and to fund on its own behalf in addition to its 20% share of the Decommissioning Cost Estimate.

ITEM-2

The APPENDICES section of the DCE Table of Contents is revised to include the new APPENDIX-F SDG&E SONGS Decommissioning Costs (100%)

ITEM-3

Within the narrative section of the DCE the various appearances of the term "utility staff" have been revised to include a parenthetic statement "(Licensee)" to clarify that the utility staff means the NRC Licensee.

ITEM-4

On Table 6-1 "Cost and Schedule Summary" the title block for SPENT FUEL is revised to include "(72.30)" since this section also contains cost elements associated with ISFSI decommissioning.

ITEM-5

Added new SDG&E footnote for Table 1-1 referring to Appendix F

1.0 EXECUTIVE SUMMARY

This report presents the 2014 Decommissioning Cost Estimate (DCE) Study of the San Onofre Nuclear Generating Station (SONGS) Units 2 & 3, hereinafter referred to as the 2014 Cost Study. The San Onofre Nuclear Generating Station is operated by the Southern California Edison Company (SCE).

On June 7, 2013, SCE announced its intention to permanently cease power generation operations and shut down SONGS Units 2 & 3. Units 2 & 3 had not produced power since January 9, 2012 and January 31, 2012, respectively. SCE now has the responsibility to decommission the site. In January 2014 SCE contracted with Energy*Solutions* to evaluate decommissioning alternatives and assist in the development of a detailed project schedule and DCE to support the preparation and submittal of a Post Shutdown Decommissioning Activities Report (PSDAR) in accordance with 10 CFR 50.82(a)(4)(i), which requires that a PSDAR be submitted within two years following the permanent cessation of operations.

This study has been performed to furnish an estimate of the costs for: (1) decommissioning SONGS Units 2 & 3 to the extent required to terminate the plant's operating license pursuant to 10 CFR 50.75(c); (2) post-shutdown management of spent fuel until acceptance by the U.S. Department of Energy (DOE) pursuant to 10 CFR 50.54(bb); (3) demolition of uncontaminated structures and restoration of the site in accordance with the United States Department of Navy Grant of Easement (Ref. No. 14); and the California State Lands Commission Easement Lease (Ref. No. 15); and (4) Independent Spent Fuel Storage Installation (ISFSI) decommissioning pursuant to 10 CFR 72.30. This study includes SCE's actual costs incurred in the transitional periods following cessation of permanent operations on June 7, 2013 until December 31, 2013. Costs presented herein commencing on January 1, 2014 are estimated.

SCE's December 2012 testimony to the CPUC provided the basis for the current spent fuel management costs. SCE is continuing to review available information from the DOE to determine if the DOE start date assumption of 2024 requires updating. The DCE will be revised accordingly as new information becomes available.

Accordingly, the costs and schedules for all activities are segregated for regulatory purposes as follows: costs for "License Termination" (10 CFR 50.75(c)); costs for "Spent Fuel Management" (10 CFR 50.54(bb)); costs for "Site Restoration" (clean removal and site restoration) final site conditions; and costs for "ISFSI Decommissioning" (10 CFR 72.30). Energy*Solutions* has established a Work Breakdown Structure (WBS) and cost accounting system to differentiate between these project accounts.

This study analyzes the following technical approach to decommissioning as defined by SCE:

- DECON methodology.
- Permanent cessation of operations on June 7, 2013.
- Termination of spent fuel pool operation six years after permanent shutdown.
- Spent fuel will be stored in Multi-Purpose Canisters (MPCs) at an on-site Independent Spent Fuel Storage Installation (ISFSI).

- A dry transfer facility will not be necessary for transfer of SNF canisters for transport.
- DOE begins accepting spent fuel from the industry in 2024 and completes the removal of all SONGS spent fuel by 2049.
- Decommissioning will be performed by a Decommissioning General Contractor (DGC) with oversight by the SONGS participants.
- Incorporation of Life-of-Plant (LOP) Disposal Rates for Class A Low-Level Radioactive Waste (LLRW).
- Incorporation of disposal rates for Class B and C LLRW based on recent quotes for disposal at the Waste Control Specialists LLC (WCS) site in Andrews County, Texas.

The cost estimate results are provided in Table 1-1. Table 1-1 gives License Termination costs (which correspond to 10 CFR 50.75 (c) requirements); Spent Fuel Management costs (which correspond to 10 CFR 50.54 (bb) requirements); and Site Restoration costs (which correspond to activities such as clean building demolition and site grading and end-state preparation as required under the Site Easement).

Table 1-1
Decommissioning Cost Summary[1][2]
(2014 Dollars in Thousands)

Cost Account	Unit 2	Unit 3	Total
License Termination 50.75(c)	$1,034,230	$1,078,016	**$2,112,246**
Spent Fuel Management 50.54(bb)	$623,209	$652,987	**$1,276,196**
Site Restoration	$423,297	$599,507	**$1,022,804**
Totals	**$2,080,735**	**$2,330,511**	**$4,411,246**

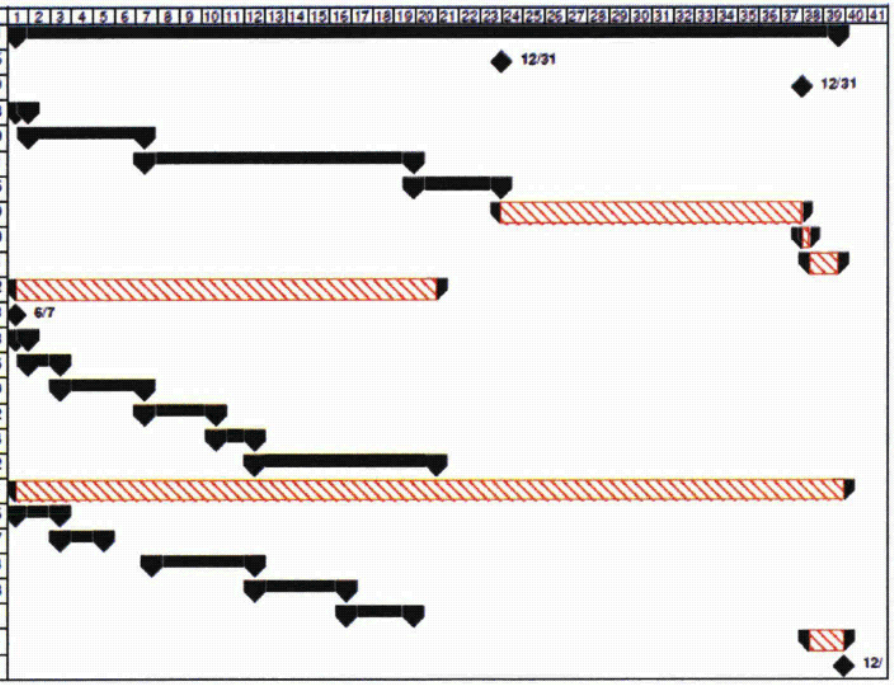
The estimate is based on site-specific plant systems and buildings inventories. These inventories, and Energy*Solutions*' proprietary Unit Cost Factors (UCFs), were used to generate required manhours, activity schedule hours and costs, and waste volume, weight, and classification. Based on the activity schedule hours and a decommissioning activities analysis, a Critical Path Method (CPM) analysis was performed to determine the decommissioning schedules. These schedules reflect the effects of sequenced activity-dependent or distributed decommissioning elements such as planning and preparations, major component removal, building decontamination, and spent fuel shipping. The schedules are divided into project phases (periods) and presented, as noted previously, by cost account "License Termination," "Spent Fuel Management," or "Site Restoration." The summary is shown in Figure 1-1, and may also be found in Section 6.0 of this report.

[1] In addition, the Decommissioning Cost Summary in Table 1-1 does not include separate internal costs that San Diego Gas & Electric Company (SDG&E) has indicated that it expects to incur. SDG&E provides information regarding these costs in Appendix F
[2] Rows and columns may not add correctly due to rounding.

Figure 1-1
Summary Schedule

DECON with Dry Storage, 2013 Shutdown and DOE Acceptance in 2024

Task Name	Start	Finish
Post-Shutdown Spent Fuel Management	06/07/2013	09/08/2051
Spent Fuel Shipping Complete - Unit 1	12/31/2035	12/31/2035
Spent Fuel Shipping Complete - Units 2 & 3	12/31/2049	12/31/2049
SNF Pd 1 - Spent Fuel Management Transition	06/07/2013	12/31/2013
SNF Pd 2 - Spent Fuel Transfer to Dry Storage	1/1/2014	06/01/2019
SNF Pd 3 - Dry Storage During Decommissioning - Units 1, 2 and 3	06/01/2019	12/05/2031
SNF Pd 4 - Dry Storage Only - Units 1, 2 and 3	12/05/2031	12/31/2035
SNF Pd 5 - Dry Storage Only - Units 2 and 3	12/31/2035	12/31/2049
SNF D&D Pd 1 - ISFSI D&D Planning	12/31/2049	05/06/2050
SNF D&D Pd 2 - ISFSI D&D	05/06/2050	09/08/2051
Part 50 License Termination	06/07/2013	12/24/2032
Announcement of Cessation of Operations (June 7, 2013)	06/07/2013	06/07/2013
Decon Pd 1 - Transition to Decommissioning	06/07/2013	12/31/2013
Decon Pd 2 - Decommissioning Planning and Site Modifications	1/1/2014	06/30/2015
Decon Pd 3 - Decommissioning Preparations and Reactor Internals Segmentation	06/30/2015	06/01/2019
Decon Pd 4 - Plant Systems and Large Component Removal	06/01/2019	09/24/2022
Decon Pd 5 - Building Decontamination	09/24/2022	07/13/2024
Decon Pd 6 - License Termination During Demolition	07/13/2024	12/24/2032
Site Restoration	06/07/2013	12/15/2051
SR Pd 1 - Transition to Site Restoration	06/07/2013	06/30/2015
SR Pd 2 - Building Demolition During Decommissioning	06/30/2015	07/11/2017
SR Pd 3 - Subsurface Demolition Engineering and Permitting	10/01/2019	07/13/2024
SR Pd 4 - Building Demolition to 3 Feet Below Grade	07/13/2024	10/14/2028
SR Pd 5 - Subgrade Structure Removal Below -3 Feet	10/14/2028	12/05/2031
SR Pd 6 - Final Site Restoration and Lease Termination	05/06/2050	12/15/2051
Final Easement Termination	12/15/2051	12/15/2051



2.0 INTRODUCTION

2.1 Study Objective

This report presents the 2014 Decommissioning Cost Estimate Study of the San Onofre Nuclear Generating Station (SONGS) Units 2 & 3, hereinafter referred to as the 2014 Cost Study. The San Onofre Nuclear Generating Station is owned by the Southern California Edison Company (SCE), San Diego Gas & Electric Company, and the City of Riverside. A former owner, the City of Anaheim, also has liability for decommissioning. SCE has provided the following information regarding the liability by owner for SONGS decommissioning costs:

Cost Categories	Owners			
	SDG&E	Riverside	Anaheim	SCE
SONGS 1	20%	0%	0%	80%
SONGS 2	20%	1.79%	2.4737%	75.7363%
SONGS 3	20%	1.79%	2.4625%	75.7475%
Common Facilities (Units 2 & 3)	20%	1.79%	2.4681%	75.7419%
SONGS 1 Fuel	20%	0%	0%	80%
SONGS 2/3 Fuel	20%	1.79%	2.3398%	75.8702%
ISFSI Maintenance and D&D	20%	1.6066%	2.2686%	76.1248%
San Diego Switchyard	100%	0%	0%	0%
Edison Switchyard	0%	0%	0%	100%
Interconnection Facilities	50%	0%	0%	50%
Nuclear Fuel Cancellation Charges	20%	1.79%	0%	78.21%

This study has been performed to support the development of a site-specific PSDAR and furnish an estimate of the costs for (1) decommissioning SONGS Units 2 & 3 to the extent required to terminate the plant's operating license, (2) post-shutdown management of spent fuel until acceptance by the U.S. Department of Energy (DOE), (3) demolition of uncontaminated structures and restoration of the site in accordance with the U.S. Department of Navy Grant of Easement (Ref. No. 14), and the California State Lands Commission Easement Lease (Ref. No. 15), and (4) Independent Spent Fuel Storage Installation (ISFSI) decommissioning. This study also includes SCE's actual costs incurred in the transitional periods following cessation of permanent operations until December 31, 2013. Estimated costs begin on January 1, 2014.

The study methodology follows the basic approach originally presented in the Atomic Industrial Forum/National Environmental Studies Project Report AIF/NESP-036, "Guidelines for Producing Commercial Nuclear Power Plant Decommissioning Cost Estimates," (Ref. No. 2). The report was prepared in accordance with Nuclear Regulatory Commission (NRC) Regulatory Guide 1.202, "Standard Format and Content of Decommissioning Cost Estimates for Nuclear Power Reactors," (Ref. No. 3). The estimate is based on compliance with current regulatory requirements and proven decommissioning technologies.

NRC requirements, set forth in Title 10 of the Code of Federal Regulations (CFR), differentiate between the post-shutdown costs associated with the decommissioning of the nuclear plant facility, those associated with storage of spent fuel on-site, and those associated with the decommissioning of the spent fuel storage facility. The Code of Federal Regulations, however, does not address the entire scope of the decommissioning liability for each nuclear facility. 10 CFR 50.75(c) requires funding by the licensee(s) of the facility for the decommissioning program, but specifically excludes the cost of removal and disposal of spent fuel and structures that do not require disposal as radioactive material. 10 CFR 50.75(c) also excludes the cost of site restoration activities that do not involve the removal of residual radioactivity necessary to terminate the NRC license(s). 10 CFR 50.54 (bb) requires funding by the licensee(s) "for the management of all irradiated fuel at the reactor upon expiration of the reactor operating license(s) until title to the irradiated fuel and possession of the fuel is transferred to the Secretary of Energy for its ultimate disposal in a repository." 10 CFR 72.30 requires funding for decommissioning of the on-site spent fuel storage facility after the irradiated fuel is accepted by the DOE.

In addition to the NRC Decommissioning requirements described above, the Site Easements require the demolition and removal of all improvements installed on both the on-shore and off-shore sites, including all substructures regardless of depth, and site restoration to the satisfaction of the Grantors.

This study analyzes the following technical approach to decommissioning as defined by SCE and the co-owners:

- DECON methodology.
- Permanent cessation of operations and commencement of decommissioning planning on June 7, 2013.
- Termination of spent fuel pool operation within six years after permanent shutdown.
- Spent fuel will be stored in transportable Multi-Purpose Canisters (MPCs) at an on-site Independent Spent Fuel Storage Installation (ISFSI).
- A dry transfer facility will not be necessary for transfer of SNF canisters for transport.
- DOE begins accepting spent fuel from the industry in 2024 and completes the removal of all SONGS spent fuel by 2049.
- Decommissioning will be performed by a Decommissioning General Contractor (DGC) with oversight by the SONGS participants.

In addition, this study includes the following assumptions:

- Incorporation of Energy*Solutions*' Life-of-Plant (LOP) Disposal Rates for Class A Low-Level Radioactive Waste (LLRW), (Ref. No. 7).
- Incorporation of disposal rates for Class B and C LLRW based on recent quotes for disposal at the Waste Control Specialists LLC (WCS) site in Andrews County, Texas.

2.2 Regulatory Framework

Provisions of current laws and regulations affecting decommissioning, waste management, and spent fuel management are as follows:

1. NRC regulations require a license for on-site storage of spent fuel. Wet storage in a spent fuel pool is authorized by a facility's 10 CFR Part 50 license. On-site dry storage of spent fuel at an Independent Spent Fuel Storage Installation (ISFSI) is licensed by either: (a) the general license set forth in 10 CFR 72.210, which requires that a Part 50 license be in place; or (b) a site-specific ISFSI license issued pursuant to 10 CFR Part 72.

2. 10 CFR 50.75(c) requires funding by the licensee(s) of the facility for decommissioning.

3. 10 CFR 50.54 (bb) requires the licensee(s), within two years following permanent cessation of operation of the reactor or five years before expiration of the operating license(s), whichever occurs first, to submit written notification to the NRC for its review and preliminary approval of the program by which the licensee intends to manage and provide funding "for the management of all irradiated fuel at the reactor upon expiration of the reactor operating license until title to the irradiated fuel and possession of the fuel is transferred to the Secretary of Energy for its ultimate disposal in a repository."

4. 10 CFR 961 (Ref. No. 4), Appendix E, requires spent fuel to be cooled for at least five years before it can be accepted by DOE as "standard spent fuel."

5. 10 CFR 72.30 requires funding by the licensee(s) for termination of the ISFSI license.

Decommissioning Alternatives

The three basic methods for decommissioning are DECON, SAFSTOR, and ENTOMB, which are summarized as follows:

1. DECON: The equipment, structures, and portions of the facility and site that contain radioactive contaminants are promptly removed or decontaminated to a level that permits termination of the license after cessation of operations.

2. SAFSTOR: The facility is placed in a safe, stable condition and maintained in that state (safe storage). The facility is decontaminated and dismantled at the end of the storage period to levels that permit license termination. NRC regulations require decommissioning to be completed within 60 years of cessation of operation.

3. ENTOMB: Radioactive structures, systems, and components are encased in a structurally long-lived substance, such as concrete. The entombed structure is appropriately maintained and monitored until radioactivity decays to a level that permits termination of the license. Since entombment will exceed the requirement

for decommissioning to be completed within 60 years of cessation of operation, NRC handles entombment requests on a case-by-case basis.

Post-Shutdown Spent Fuel Management Alternatives

The options for long-term post-shutdown spent fuel management currently available to power plant operators are (1) wet storage consisting of continued maintenance and operation of the spent fuel pool, and (2) dry storage consisting of transfer of spent fuel from the fuel pool to on-site dry storage modules after a cooling period or any combination of the two as is the present case at SONGS. Maintaining the spent fuel pool for an extended duration following cessation of operations prevents termination of the Part 50 license and typically has a higher annual maintenance and operating cost than the dry storage alternative. Transfer of spent fuel to an ISFSI requires additional expenditures for purchase and construction of the ISFSI and dismantlement and disposal of the ISFSI following completion of spent fuel transfer to DOE.

The spent fuel shipping schedules furnished by SCE for this study are based on projections that DOE will commence accepting spent fuel from domestic commercial nuclear power plants in 2024, and that the DOE will accept spent fuel at the rate published in DOE's July 2004 Acceptance Priority Ranking & Annual Capacity Report (DOE/RW-0567) (Ref. No. 12). These assumptions are in accordance with SCE testimony to the Public Utilities Commission of the State of California (Ref. No. 17). Additionally, SCE is reviewing available information from the DOE to determine if the DOE start date assumption requires updating. The DCE will be revised accordingly as new information becomes available.

3.0 STUDY METHODOLOGY

3.1 General Description

Energy*Solutions* maintains a proprietary decommissioning cost model based upon the fundamental technical approach established in AIF/NESP-036, "Guidelines for Producing Commercial Nuclear Power Plant Decommissioning Cost Estimates," dated May 1986 (Ref. No. 2). The cost model has been updated frequently in accordance with regulatory requirements and industry experience. The cost model includes elements for estimating distributed and undistributed costs. Distributed costs are activity specific and include planning and preparation costs as well as costs for decontamination, packaging, disposal, and removal of major components and systems. For example, costs for the segmentation, packaging, and disposal of the reactor internals are distributed costs. Undistributed costs, sometimes referred to as collateral costs, are typically time dependent costs such as utility (Licensee) and decommissioning general contractor staff, property taxes, insurance, regulatory fees and permits, energy costs, and security staff.

The methodology for preparing cost estimates for a selected decommissioning alternative requires development of a site-specific detailed work activity sequence based upon the plant inventory. The activity sequence is used to define the labor, material, equipment, energy resources, and duration required for each activity. In the case of major components, individual work sequence activity analyses are performed based on the physical and radiological characteristics of the component, and the packaging, transportation, and disposal options available.

In the case of structures and small components and equipment such as piping, pumps, and tanks, the work durations and costs are calculated based on UCFs. UCFs are economic parameters developed to express costs per unit of work output, piece of equipment, or time. They are developed using decommissioning experience, information on the latest technology applicable to decommissioning, and engineering judgment. The total cost of a specific decommissioning activity can be determined by multiplying the total number of units associated with that activity by the UCF, expressed as $/unit, for that activity. For example, the estimated demolition cost of a non-contaminated concrete structure can be obtained by multiplying the volume of concrete in the structure by the UCF for non-contaminated reinforced concrete demolition, expressed in $/unit volume. Each UCF has associated with it a man-hours/unit and schedule-hours/unit. From these values, total man-hours and total schedule-hours can be estimated for a particular activity.

3.2 Schedule Analysis

After the work activity durations are calculated for all distributed activities, a critical path schedule analysis is performed using MS Project. The schedule accounts for constraints such as spent fuel cooling periods and regulatory reviews. The schedule is typically delineated into phases or time periods (hereinafter referred to as period or periods) that differentiate manpower requirements and undistributed costs.

In order to differentiate between License Termination, Spent Fuel, and Site Restoration elements of the entire decommissioning scope of work, Energy*Solutions* has established a Work Breakdown Structure (WBS) and cost accounting system to treat each element as a subproject.

Accordingly, the overall project schedule is divided into interrelated periods with major milestones defining the beginning and ending of each period. The major milestones also serve as the basis for integrating the periods of the three subprojects.

3.3 Decommissioning Staff

Energy*Solutions* has assumed that the SONGS Units 2 and 3 decommissioning project will be performed in an efficiently planned and executed manner using project personnel experienced in decommissioning. This DCE assumes that the decommissioning will be performed by a highly experienced and qualified DGC, with oversight and management of the decommissioning operations performed by the Licensee staff. It is also assumed that the Utility (Licensee) staff will be supplemented by a professional consulting engineering firm, particularly in the planning and preparation phase.

Energy*Solutions* analyzed the SONGS licensee staff and developed a site-specific staffing plan. The SCE existing salary structure was then used as the basis for calculating Utility (Licensee) staff labor costs. Energy*Solutions* used industry data to develop DGC salary costs.

Staffing levels, for both staffing plans and for each project period, are based on the Atomic Industrial Forum (AIF) guidelines and industry experience. The sizes of the staffs are varied in each period in accordance with the requirements of the work activities. Staffing has been organized into the following departments or functional groups:

- Decommissioning
- Engineering
- Maintenance and Work Control
- Operations
- Oversight and Nuclear Safety
- Radiation Protection and Chemistry
- Regulatory and Emergency Planning
- Safety and Human Performance
- Security Administration
- Security Guard Force
- Site Management and Administration
- Additional Staff for Spent Fuel Shipping
- DGC Staff

3.4 Waste Disposal

Waste management costs comprise a significant portion of the decommissioning cost estimate. Additionally, limited future access to disposal sites licensed for receipt of Class B and C wastes introduces a significant level of uncertainty with respect to the appropriateness of using existing rate structures to estimate disposal costs of these wastes. Energy*Solutions*' approach to estimating waste disposal costs is discussed in the following paragraphs.

Waste Classification

Regulations governing disposal of radioactive waste are stringent in order to ensure control of the waste and preclude adverse impact on public health and safety. At present, LLRW disposal

is controlled by 10 CFR 61, which went into effect in December 1983. This regulation stipulates the criteria for the establishment and operation of shallow-land LLRW burial facilities. Embodied within this new regulation are criteria and classifications for packaging LLRW such that it is acceptable for burial at licensed LLRW disposal sites.

For each waste classification, 10 CFR 61 stipulates specific criteria for physical and chemical properties that the LLRW must meet in order to be accepted at a licensed disposal site. The LLRW disposal criteria of 10 CFR 61 require that LLRW generators determine the proportional amount of a number of specific radioactive isotopes present in each container of disposable LLRW. This requirement for isotopic analysis of each container of disposable LLRW is met by employing a combination of analytical techniques such as computerized analyses based upon scaling factors, sample laboratory analyses, and direct assay methods. Having performed an isotopic analysis of each container of disposable LLRW, the waste must then be classified according to one of the classifications (Class A, B, C, or Greater Than Class C (GTCC)) as defined in 10 CFR 61.

Energy*Solutions*' classification of LLRW resulting from decommissioning activities is based on AIF/NESP-036 (Ref. No. 2), NUREG/CR-0130 (Ref. No. 5), NUREG/CR-0672 (Ref. No. 6), and recent industry experience. The estimated curie content of the reactor vessel and internals at shutdown is derived from NUREG/CR-0130 for Pressurized Water Reactors (PWRs) and NUREG/CR-0672 for Boiling Water Reactors (BWRs), and adjusted for the different mass of components and period of decay.

Packaging

Selection of the type and quantity of containers required for Class B and C wastes is based on the most restrictive of either curie content, dose-rate, container weight limit, or container volume limit. GTCC wastes from segmentation of the reactor vessel internals is packaged in spent fuel canisters. The selection of container type for Class A waste is based on the transportation mode (rail, truck, barge, etc.) and waste form. The quantity of Class A waste containers is determined by the most restrictive of either container weight limit or container volume limit. Large components, such as steam generators, pressurizers, and reactor recirculation pumps, are shipped as their own containers with additional shielding as required.

Container costs are obtained from manufacturers specializing in the design and fabrication of storage containers for nuclear materials. Shielded transport cask and liner costs are obtained from the cask owners and operators.

Transportation

Transportation routes to processing and disposal facilities are determined based on available transportation modes (truck, rail, barge, or combinations). Transportation costs for the selected routes and modes are obtained from vendor quotes or published tariffs whenever possible.

Class A Disposal Options and Rates

In accordance with the existing Life-of-Plant Disposal Agreement (Ref. No. 7), all Class A waste that meets the waste acceptance criteria are to be disposed of at Energy*Solutions'* LLRW

disposal facility in Clive, Utah. All reported waste disposal costs include packaging, transportation, and any applicable surcharges.

Class B and C Disposal Options and Rates

Currently, within the United States, there are only three operational commercial near-surface disposal facilities licensed to accept Class B and C LLRW: the Barnwell facility, operated by Energy*Solutions* in Barnwell, South Carolina; the U.S. Ecology facility in Richland, Washington; and the recently licensed facility in Andrews County, Texas operated by Waste Control Specialists. Barnwell only accepts waste from states within the Atlantic Compact and U.S. Ecology only accepts waste from states within the Northwest and Rocky Mountain Compacts. However, the WCS facility will accept waste from the Texas Compact (comprised of Texas and Vermont) and from non-Compact generators. The Texas Compact Commission on March 23, 2012 approved amendments to rules allowing the import of non-compact generator LLRW for disposal at the WCS Andrews County facility.

Greater Than Class C (GTCC)

Wastes identified as 10 CFR 61 Class A, B, and C may be disposed of at near-surface disposal facilities. Certain components are highly activated and may exceed the radionuclide concentration limitations for 10 CFR 61 Class C waste. In accordance with 10 CFR 61, these components, which are referred to as Greater Than Class C (GTCC) wastes, cannot be disposed of in a near-surface LLRW disposal facility and must be transferred to a geologic repository or a similar site approved by the NRC.

Highly activated sections of the reactor vessel internals will result in GTCC waste. Presently, a facility does not exist for the disposal of wastes exceeding 10 CFR 61 Class C limitations. Energy*Solutions* assumes that the DOE will accept this waste along with spent fuel. Although courts have held that DOE is obligated to accept and dispose of GTCC, issues regarding potential costs remain potentially unsettled. Therefore, Energy*Solutions* conservatively estimates a GTCC waste disposal cost. Energy*Solutions* assumes that the GTCC waste will be packaged in spent fuel canisters and will be shipped to a storage or disposal facility operated by DOE along with the spent fuel. Additionally, Energy*Solutions* assumes shipping costs for GTCC waste to be equivalent to the commercial cost of shipping a Type B licensed, shielded cask such as the CNS 8-120B cask, which is owned and operated by Energy*Solutions*.

LLRW Volume Reduction

Becasue current Class A LLRW disposal rates are significantly lower than LLRW volume reduction rates, Energy*Solutions* does not assume on-site volume reduction techniques such as waste compaction or an aggressive decontamination, survey and release effort.

Non-Radioactive Non-Hazardous Waste Disposal

Energy*Solutions* assumes that recyclable, non-radioactive scrap metal resulting from the decommissioning program will be sold to a scrap metal dealer. However, no cost credit is assumed in the estimate for the value of the scrap metal. Clean (non-contaminated) concrete and demolition debris is assumed to be removed off site to an out of state Class III landfill consistent

with the Governor of the State of California Executive Order D-62-02 (Ref. No. 16). This study includes the costs of installation and operation of Energy*Solutions*' GAmma Radiation Detection and In-container ANalysis or GARDIAN System. The GARDIAN System performs radiological assays of bulk shipping containers. The GARDIAN System is a cost effective and efficient means to ensure all non-radiological waste and recyclable materials arising from the decommissioning and demolition of the SONGS' site comply with all applicable regulatory requirements.

Hazardous and Industrial Waste Disposal

Uncontaminated lead shielding remaining after shutdown was assumed to be removed from its installed locations and shipped offsite by entities having a need for the material. The entities will receive the lead at no charge in return for providing the removal and shipping services. Non-Radioactive contaminated surfaces coated with tightly adhering and undamaged lead based paint will be removed as non-hazardous building demolition debris. All other chemicals and hazardous materials present at shutdown will be removed and properly disposed of during decommissioning.

3.5 Final Status Survey

The cost of performing a final status survey (FSS) is based on NUREG-1575, "Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM)," (Ref. No. 8). Estimates of MARSSIM Class I, II, and III survey designations are based on radiological assumptions regarding contamination resulting from small and large component removal activities. The FSS activity cost calculation includes the in-place remote survey of underground metal and concrete pipe, soil, and groundwater sampling and analysis. Estimated costs for NRC and Oak Ridge Institute for Science and Education (ORISE) verification are also included, and the NRC review period is incorporated into the project schedule.

3.6 Contingency

Contingencies are applied to cost estimates primarily to allow for unknown or unplanned occurrences during the actual program, e.g., increased radioactive waste materials volumes over that expected; equipment breakdowns, weather delays, and labor strikes. This is consistent with the definition provided in the DOE Cost Estimating Guide, DOE G 430.1-1, 3-28-97 (DOE G) (Ref. No. 9). Contingency "covers costs that may result from incomplete design, unforeseen and unpredictable conditions, or uncertainties within the defined project scope. The amount of contingency will depend on the status of design, procurement, and construction; and the complexity and uncertainties of the component parts of the project. Contingency is not to be used to avoid making an accurate assessment of expected costs." Energy*Solutions* determines site-specific contingency factors to be applied to each estimate based on industry practices.

The DOE has established a recommended range of contingencies as a function of completeness of program design, DOE G. The ranges are:

Type of Estimate	Contingency Range as a % of Total Estimate
Planning Phase Estimate	20-30
Budget Estimate	15-25
Title I (Preliminary Design Estimate)	10-20
Title II (Definitive Design Estimate)	5-15

Also, the Pacific Gas & Electric Company (PG&E) Technical Position Paper "Establishing an Appropriate Contingency Factor for Inclusion in the Decommissioning Revenue Requirements" (Ref. No. 13) was developed to review and determine a "conservative contingency factor" to be applied to decommissioning cost estimates. In that study it was determined that "based on an understanding of the level of project definition, and the extent and maturity of estimate input information used to develop decommissioning cost estimates, the 25 percent contingency factor is within the range of industry recognized cost engineering practices."

The contingencies presented in this study are consistent with the values presented in DOE G 430.1-1 for a Planning Phase estimate (Ref. No. 9) and the PG&E study (Ref. No. 13). As directed by SCE, Energy*Solutions* has applied a 25% contingency to all costs in this study, with the exception of following:

2013 and 2014 Actual Expenditures	0%
Department of Navy Easement Payments	15%
Hazardous and Asbestos Wastes	50%
Site Characterization Surveys	15%
Temporary Facilities	15%
Backfill and Compaction	15%

A reactor decommissioning program will be conducted under an NRC-approved Quality Assurance Program which meets the requirements of 10 CFR 50, Appendix B. However, the development of the quality assurance program, the performance of work under that program, and the effort required to ensure compliance with the program, is already included in the detailed cost estimate. Therefore, Energy*Solutions* does not include quality assurance as an element of the contingency allowance. The same is true for contamination. Where radioactive contamination or activated materials are dealt with, the Energy*Solutions* UCFs and associated calculations fully reflect the cost impact of that material, and a separate contingency is not required specifically due to working with contamination.

3.7 Cost Reporting

Total project costs are aggregated from the distributed activity and undistributed costs into the following categories – Labor, Materials and Equipment, Waste Disposal, and Other costs. Other costs include property taxes, insurance, license fees, permits, and energy. Waste Disposal costs are the summation of packaging, transportation, base disposal rate, and any applicable surcharges. Health physics (HP) supplies and small tool costs are calculated as a component of each distributed activity cost and included in the category of Material and Equipment, with the exception that HP supplies for the Utility HP staff are calculated and reported as an undistributed line item. A line item specific contingency is then calculated for each activity cost element.

4.0 SITE SPECIFIC TECHNICAL APPROACH

4.1 Facility Description

The San Onofre Nuclear Generating Station Units 2 & 3 site is located in southern California on the shore of the Pacific Ocean, about 62 miles Southeast of Los Angeles and approximately 51 miles Northwest of San Diego. The station is located entirely within the Camp Pendleton Marine Corps Base. The current Grant of Easement for the site from the United States Department of the Navy is currently scheduled to expire May 12, 2023 (Ref. No. 14). Units 2 & 3 occupy 52.8 acres of the 84 acre site. Approximately 16 acres are occupied by the North Industrial Area (formerly Unit 1), which is where the existing ISFSI is located.

The Nuclear Steam Supply System (NSSS) for both units are identical, with two independent loops, and utilizing pressurized light water cooled reactors (PWRs) supplied by Combustion Engineering, Inc. The construction permit was issued for an initial reactor power of 3,390 MWt with licensed Rated Thermal Power of 3,438 MWt.

The facility currently has an existing ISFSI containing spent fuel that was transferred into MPCs to maintain full core offload capability during operations and to facilitate decommissioning of Unit 1. This study also assumes that the MPCs will be licensed under a 10 CFR Part 72 general license, using the manufacturer's Certificate of Compliance. The 10 CFR Part 50 license will be maintained until decommissioning is complete and all spent fuel has been transferred to DOE.

Appendix A provides a list of the SONGS Unit 2 & 3 systems and structures included in the material inventory for this study.

4.2 Decommissioning Periods

The project periods consist of six License Termination periods, seven Spent Fuel Management periods (two of which are ISFSI decontamination and demolition periods), and six Site Restoration periods. As shown in Figure 1-1 above, the periods for each of these project areas are independent from (do not compete with) the periods for the other project areas. The project periods defined for this site-specific study and the major activities performed during each period are as follows:

License Termination Periods

Decon Pd 1 –Transition to Decommissioning

- Defuel Reactors
- Notification of Permanent Fuel Removal
- Disposition of LLRW Resins

Decon Pd 2 –Decommissioning Planning and Site Modifications

- Preparation of Decommissioning License Documents
- Preparation of NRC Deliverables
- Submit PSDAR to NRC
- Perform Historical Site Assessment and Site Characterization
- Planning, Design, and Implementation of Cold & Dark (Site Repowering)

- Design and Implement Spent Fuel Pool Support System Modifications, Control Room Relocation, and Spent Fuel Security System Modifications

- Select Decommissioning General Contractor (DGC)

Decon Pd 3 – Decommissioning Preparations and Reactor Internal Segmentation

- DGC Mobilization and Planning
- System Decontamination
- Reactor Internals Removal Preparations
- Reactor Internals Segmentation Planning and Implementation
- Purchase Dry Storage Modules for GTCC Waste
- Segment and Package Reactor Internals for Storage in the ISFSI

Decon Pd 4 – Plant Systems and Large Component Removal

- Upgrade Rail Spur on 'Owner Controlled Area' (does not affect spur connecting to CALTRANS).
- Install Large Array Radiation Detection System
- Remove, Package, and Dispose of Non-Essential Systems
- Asbestos and Lead Abatement
- Fuel Pool Closure
- Remove Spent Fuel Racks, Spent Fuel Pool Island Equipment, and Bridge Cranes
- Remove and Dispose of Legacy Class B & C Wastes
- Remove, Package, and Dispose of Essential Systems
- Removal and Disposal of Spent Resins, Filter Media, and Tank Sludge
- Large Component Removal
- Prepare License Termination Plan

Decon Pd 5 – Building Decontamination

- Decon Containment Buildings – Units 2 & 3
- Decon Turbine Buildings – Units 2 & 3
- Decon Fuel Handling Buildings – Units 2 & 3
- Decon Auxiliary Radwaste Building
- Decon Auxiliary Control Building
- Decon Penetration Buildings – Units 2 & 3
- Decon Safety Equipment and Main Steam Isolation Valve Buildings – Units 2 & 3
- Radiological Survey of Structures During Decon

Decon Pd 6 – License Termination During Decommissioning

- Final Status Survey
- ORISE Verification and NRC Approval

Spent Fuel Management Periods

SNF Pd 1 – Spent Fuel Transfer Management Transition

- Implementation of Security Enhancements Required for Reductions in Staff
- Cyber Security Modifications
- Post Fukushima Modifications – Unit 2
- Design and Fabricate Spent Fuel Canisters

SNF Pd 2 – Spent Fuel Transfer to Dry Storage
- Prepare Irradiated Fuel Management Plan
- Select Dry Storage System Canister Design and Vendor
- Design and Construct ISFSI Expansion
- Purchase, Deliver and Load Spent Fuel Canisters and Transfer to ISFSI

SNF Pd 3 – Dry Storage During Decommissioning Units 1, 2, & 3

SNF Pd 4 – Dry Storage Only – Units 1, 2, & 3

SNF Pd 5 – Dry Storage Only – Units 2, & 3

SNF D&D Pd 1 – ISFSI License Termination
- Preparation and NRC Review of License Termination Plan

SNF D&D Pd 2 – ISFSI Demolition
- Verification Survey of Horizontal Storage Modules
- Clean Demolition of ISFSI AHSMs and Pads
- Clean Demolition of ISFSI Support Structures
- Restore ISFSI Site
- Preparation of Final Report on Decommissioning and NRC Review

Site Restoration Periods

SR Pd 1 –Transition to Site Restoration
- Severance Costs from Post-Shutdown Reduction in Staffing
- Phase I and II Environmental Assessment of the Mesa Site
- Disposition of Hazardous Waste at the Mesa Site
- Site Characterization of the Mesa Site

SR Pd 2 –Building Demolition During Decommissioning
- Demolish South Access for Decommissioning, South Yard Facility, and Mesa Structures
- Finish Grade and Re-vegetate Mesa Site
- Mesa Lease Termination

SR Pd 3 – Subsurface Demolition Engineering & Permitting
- Hydrogeologic Investigation and Outfall Conduit Survey
- Subsurface Structure Removal Analyses for Lease Termination Activities
- Final Site Grading and Shoreline Protection Engineering Planning and Design
- Obtain Permits and Approvals

SR Pd 4 – Building Demolition to 3 Feet Below Grade
- Demolition Preparations
- De-Tension and Remove Containment Building Tendons – Units 2 & 3
- Demolish Diesel Generator Buildings – Units 2 & 3
- Demolish Condensate Buildings and Transformer Pads – Units 2 & 3

- Demolish Full Flow Areas and Turbine Buildings – Units 2 & 3
- Demolish Auxiliary Radwaste Building
- Demolish Auxiliary Control Building
- Remove Systems and Demolish Make-up Demineralizer Structures
- Demolish Penetration Buildings – Units 2 & 3
- Demolish Safety Equipment and Main Steam Isolation Valve Buildings – Units 2 & 3
- Demolish Fuel Handling Buildings to 3 Feet Below Grade – Units 2 & 3
- Demolish Containment Buildings to 3 Feet Below Grade – Units 2 & 3
- Demolish Intake and Discharge Structures to 3 Feet Below Grade

SR Pd 5 – Subgrade Structure Removal Below – 3 Feet

- Install Sheet Piling and Excavation Shoring, Dewatering System, and Effluent Treatment and Discharge Controls
- Demolish and Backfill Unit 3 Subsurface Structures
- Demolish and Backfill Unit 2 Subsurface Structures
- Demolish and Backfill Common Subsurface Structures
- Demolish and Backfill Intake Structure Inside Seawall Below -3 Feet
- Remove Off Shore Intake and Outfall Conduits
- Remove Sheet Piling, Excavation Shoring, and Dewatering and Effluent Treatment
- Finish Grading and Re-vegetate Site

SR Pd 6 – Final Site Restoration and Easement Termination

- Obtain Required Permits and Approvals
- Install Dewatering System and Effluent Treatment and Discharge Controls
- Remove and Stockpile Existing Seawall Erosion Protection
- Remove Unit 2 & 3 Seawall and Pedestrian Walkway
- Remove Remaining Intake Structure Beneath Seawall
- Backfill and Compaction of Excavation
- Remove Dewatering System & Effluent Treatment
- Remove Railroad Tracks, Gunite Slope Protection, Access Road, and North Parking Lot
- Finish Grading and Re-vegetate Site

4.3 Decommissioning Staff

Energy*Solutions* developed staffing based on the assumption that decommissioning will be performed by an experienced and qualified DGC, with oversight and management of the decommissioning operations performed by the Utility (Licensee) staff. It is also assumed that the Utility staff will be supplemented by a professional consulting engineering firm, particularly in the planning and preparation phase. The sizes of the Utility (Licensee) and DGC staffs are varied in each period in accordance with the requirements of the work activities. Details on the staff levels, by functional group, during each period are provided in Section 6.0.

4.4 Spent Fuel Management Staff

The largest spent fuel staff is in place while the fuel pool is operational during the spent fuel cooling period and the fuel assemblies are being transferred to dry storage. After all spent fuel

has been removed from the spent fuel pool, the staff is reduced. During spent fuel pool operations and the dry storage period, the full-time spent fuel management staff is supplemented with part-time staff to support fuel movements. Details on the staff levels, by functional group, during each period are provided in Section 6.0.

4.5 Spent Fuel Shipments

The spent fuel shipping schedules are based in part on the DOE's "Acceptance Priority Ranking & Annual Capacity Report," dated July 2004. (Ref. No. 12). The information regarding existing fuel inventory, planned transfers to dry storage and DOE's projected date of 2024 for acceptance of spent fuel is based on information provided by SCE. The spent fuel shipping schedule is provided in Appendix B. The spent fuel shipment schedule is based upon best current information and assumptions, as qualified and described elsewhere in this study, including in Section 2.2 above.

5.0 BASES OF ESTIMATE AND KEY ASSUMPTIONS

The bases of, and key assumptions for, this site-specific decommissioning estimate are presented below:

1. SCE's actual decommissioning expenses incurred from the time of permanent cessation of operations on June 7, 2013 until December 31, 2013 are included in the estimate. All other decommissioning cost data used in this study is current as of 2014. Totals and subtotals have been rounded to significant figures.

2. Energy*Solutions* developed a prompt dismantlement (DECON) project schedule based on a permanent shutdown date of June 7, 2013.

3. The decommissioning will be performed using currently available technologies.

4. DOE currently has no plans, program, or schedule in place for acceptance of utility spent fuel. However, for purposes of this decommissioning cost estimate, certain simplifying assumptions must be made regarding the schedule and rate of DOE performance. Therefore, while DOE's Standard Contract governing the acceptance of SCE's spent fuel allows for alternative removal schedules, including priority for shutdown reactors and exchanges of allocations, for purposes of this estimate DOE acceptance from the industry is assumed to commence in 2024 in accordance with SCE testimony to the Public Utilities Commission of the State of California (Ref. No. 17). The spent fuel shipment schedules are based upon the assumption that the DOE will accept spent fuel at the rate published in DOE's July 2004 Acceptance Priority Ranking & Annual Capacity Report (DOE/RW-0567) (Ref. No. 12). Additionally, SCE is reviewing available information from DOE to determine if the DOE start date assumption requires updating. The DCE will be revised accordingly as new information becomes available.

5. This estimate is based on site-specific building inventories and plant systems, as provided by Energy*Solutions*.

6. All transformers on site following shutdown are assumed to be polychlorinated biphenyl (PCB)-free, therefore, this study does not include costs for disposition of PCB contaminated transformers.

7. Cost for transportation of clean scrap metal to a recycler is included in the estimate; however, no credit is taken for the value of the scrap metal. Concrete debris and all other demolition debris is assumed to be removed from the site and disposed of at an out of state Class III landfill, consistent with the Governor of the State of California Executive Order D-62-02 (Ref. No. 16). The cost of installation and operation of Energy*Solutions*' GARDIAN system for bulk radiological assay of all wastes and recyclable materials leaving the SONGS site is included in the estimate. The purpose of the GARDIAN system is to ensure all materials not intended for disposal at a licensed facility meet all applicable requirements.

8. The estimate is based on final site restoration, in which all existing and proposed structures, with the exception of the switchyard, will be removed. Clean demolition costs are based on the assumption that all site improvements will be removed in their entirety. Clean backfill will be imported and placed to re-establish grade. The entire disturbed area of the site is to be graded, to restore the natural grade to the extent possible, and seeded.

9. Uncontaminated lead shielding remaining is assumed to be removed from its installed locations and shipped offsite by entities having a need for the material. The entities receive the lead at no charge in return for providing the removal and shipping services.

10. Site-specific information regarding contaminated soil was used as a basis for calculation of current costs for their remediation. While no known radiological or chemical remediation is required at the switchyard or the Mesa, those areas will be addressed as part of the Baseline Characterization Survey and Historical Site Assessment. If the studies conclude that radiological or chemical remediation is required at the switchyard or the Mesa, the DCE will be amended. For radiological contamination found at either the switchyard or the Mesa, the DCE will be amended to include all subsequent cost estimates for the remediation, which will be paid for by the SONGS participants in accordance with their cost allocations for the 'Common Facilities'. Chemical remediation of the switchyards will be paid by either SCE or SDG&E owners of the respective switchyards.

11. Costs for hazardous waste disposal, as well as asbestos and lead abatement, are included in this study.

12. All Class A waste is assumed to be disposed of at Energy*Solutions*' facility in Clive, Utah, in accordance with the existing Life-of-Plant Disposal Agreement between Energy*Solutions* and Southern California Edison, dated January 18, 2014 (Ref. No. 7). The following 2014 disposal rates will be applied:

    Demolition Debris and Soil - $57.97/Cubic Foot plus 5% Utah taxes
    Oversized Debris - $111.31/Cubic Foot plus 5% Utah taxes
    Containerized Waste Facility - $214.50/Cubic Foot plus 12% Utah taxes
    Large Components - $289.87/Cubic Foot plus 5% Utah taxes
    Cask Shipments - $44,059/Cask plus 12% Utah taxes

    Class A waste includes Dry Active Waste (DAW) arising from the disposal of contaminated protective clothing and health physics supplies.

13. Class B, C, and GTCC waste disposal costs are based on recent quotes for disposal of activated hardware and resins at the WCS facility. All resins and filter waste is assumed to be Class B.

14. Shipping costs for the Class B and C waste are based on a distance of 1,079 miles one way from SONGS to the WCS site.

15. GTCC is not subject to the same storage and security requirements as spent fuel and therefore is not required to be stored on the ISFSI pad. But for purposes of this estimate and to facilitate decommissioning, GTCC waste generated from the segmentation of the reactor internals is assumed to be packaged in Dry Shielded Canisters (DSCs) and placed in Advanced Horizontal Storage Modules (AHSMs) in the ISFSI to await final disposition at a DOE repository.

16. It is assumed that a total of six DSCs per unit will be required for GTCC waste.

17. Reactor vessel and internals curie estimates were derived from the values for the Reference PWR vessel and internals in NUREG/CR-0130 (Ref. No. 5). These values were adjusted for decay period.

18. The Energy*Solutions* site-specific classification of radioactive wastes for the SONGS Plant identified that the spent fuel assemblies and two components within the reactor vessel (the Core Shroud Assembly and the Lower Core Grid Plate) will exceed Class C limitations.

19. The spent fuel shipments are based upon best current information and assumptions, as qualified and described elsewhere in this study, including in Section 2.2. above.

20. Spent fuel will remain in the spent fuel pool for six years before being transferred to the ISFSI.

21. The costs for ISFSI construction and transfer of spent fuel from Units 2 & 3 to dry storage were developed by SCE and furnished to Energy*Solutions*. Following completion of spent fuel transfers to dry storage the cost of maintenance and operation of the ISFSI is distributed between Units 1, 2 and 3 based on the relative percentages of spent fuel assemblies in storage. The percentages are 10, 45, and 45 for Units 1, 2, and 3, respectively. The exception is that all property taxes are solely the liability of Units 2 & 3. Following completion of SNF Pd 4 – Dry Storage Only Units 1, 2, and 3, all ISFSI maintenance and operating costs are assigned to Units 2 & 3 until the ISFSI D&D. During ISFSI D&D costs are distributed to all three units in the same percentages of 10, 45, and 45.

22. DOE has not committed to accept SCE's canistered spent fuel. But for purposes of this estimate, it is assumed that an SCE-funded dry storage facility will not be necessary.

23. Costs for ISFSI demolition are included in this estimate. SCE assumes that portions of the AHSM concrete will be activated.

24. Energy*Solutions* has assumed that the 10 CFR Part 50 license will be maintained until DOE has taken possession of the spent fuel.

25. SCE's annual ISFSI insurance premiums of $302,000 are assumed to be incurred until all fuel shipments have been completed and the structure is no longer in use.

26. SCE's Emergency Preparedness (FEMA) fees of $500,000 per year and California Office of Emergency Services fees of $2,800,000 per year are applied until the spent fuel pool is empty. These fees were supplied by SCE.

27. SCE's current annual property taxes are assumed to be reduced to a constant $1,500,000 per year. The property taxes are a license termination expense until the completion of decommissioning, and then a spent fuel management expense until completion of the ISFSI D&D.

28. Energy*Solutions* has included the annual NRC 10 CFR 171.15(c)(2) fees, for reactors in decommissioning of $231,000/yr per unit until decommissioning is completed as a license termination expense. Following completion of decommissioning, this expense is continued as a spent fuel management cost for maintenance of the 10 CFR Part 50 license.

29. Energy*Solutions* has included Environmental Permits and Fees of $1,900,000 per year as supplied by SCE.

30. Energy*Solutions* has included NRC inspection fees during each decommissioning period based on the type and level of activities being performed.

31. SONGS annual insurance premiums, in 2014 dollars as supplied by SCE, are as follows:

    Nuclear Property Primary - $4,878,099
    Nuclear Liability - $1,151,075
    Additional Liability, Non-Nuclear - $3,576,519
    Workers' Compensation - $180,335
    Property Insurance - $353,286

    The premium amounts have been adjusted by Energy*Solutions* in accordance with information furnished by SCE to meet the requirements of each period.

32. Site operating expenses expected to be incurred during decommissioning and spent fuel management are included in the estimate. These costs include materials and services, utilities (water, gas, phone), telecommunications equipment, non-process computers, personal computers and tools and equipment. These costs were calculated based on information provided by SCE and adjusted by Energy*Solutions* to match the requirements of each period, based on staffing levels.

33. Site Lease and Easement expenses of $2,300,000 per year until the Mesa lease is terminated are included in the estimate. Following termination of the Mesa lease the site lease and easement expenses are reduced to $299,920 per year. These costs are based on information provided by SCE.

34. Utility (Licensee) staff positions and average direct burdened salary (i.e. total compensation) data in 2014 dollars were supplied by SCE.

35. Severance costs for those employees terminated as a result of SONGS decommissioning, including those costs required under California law are included in the estimate. Severance costs for Reductions-in-Force (RIFs) that occurred immediately after shutdown, and during the course of spent fuel management and decommissioning are assumed to be a site restoration expense and are included in the estimate.

36. Severance costs per employee were provided by SCE.

37. DGC staff salaries, including overhead and profit, were determined by Energy*Solutions* and represent Energy*Solutions*' standard assumptions for these rates.

38. The professional personnel used for the planning and preparation activities, and DGC personnel, are assumed to be paid per diem at the rate of $204/day, based on per diem rates from U.S. General Services Administration (GSA) for Orange County, California.

39. Craft labor rates were taken from the CA Union Craft Rate Sheet, dated January 9, 2014. Craft labor rates for disciplines not provided in the rate sheet have been taken from the 2014 RS Means Labor Rates for the Construction Industry (Ref. No. 10), for Anaheim, CA. Since the skilled laborers are assumed to be supplied by the local union hall, they will not be paid per diem.

40. The security guard force included in this estimate has been sized in accordance with the current Design Basis Threat assessment.

41. This study follows the occupational exposure principles of As Low As Reasonably Achievable (ALARA) through the use of productivity loss factors that incorporate such items as the use of respiratory protection and personnel protective clothing. These factors increase the work duration and cost.

42. The costs of all required safety analyses and safety measures for the protection of the general public, the environment, and decommissioning workers are included in the cost estimates. This reflects the requirements of:

10 CFR 20	Standards for Protection Against Radiation
10 CFR 50	Domestic Licensing of Production and Utilization Facilities
10 CFR 61	Licensing Requirements for Land Disposal of Radioactive Waste
10 CFR 71	Packaging of Radioactive Material for Transport
10 CFR 72	Licensing Requirements for the Independent Storage of Spent Nuclear Fuel and High-Level Radioactive Waste
29 CFR 1910	Occupational Safety and Health Standards

49 CFR 170-189	Department of Transportation Regulations Governing the Transport of Hazardous Materials
Reg. Guide 1.159	Assuring the Availability of Funds for Decommissioning Nuclear Reactors

43. Activity labor costs do not include any allowance for delays between activities, nor is there any cost allowance for craft labor retained on site while waiting for work to become available.

6.0 STUDY RESULTS

This study analyzes the following technical approach to decommissioning as defined by SCE:

- Prompt DECON methodology.
- Permanent cessation of operations and commencement of decommissioning planning on June 7, 2013.
- Termination of spent fuel pool operation six years after permanent shutdown.
- Spent fuel will be stored in MPCs at an on-site ISFSI.
- A dry transfer facility will not be necessary for transfer of SNF for transport.
- Decommissioning will be performed by a DGC with oversight by the SONGS participants.
- LOP Disposal Rates are used for Class A LLRW.
- WCS Texas Disposal Rates are used for Class B and C LLRW.
- DOE begins accepting spent fuel from the industry in 2024.

Spent Fuel Shipping Schedule

The spent fuel shipping schedule is provided in Appendix B. Spent fuel shipments from the industry to DOE will begin in 2024. The spent fuel shipment schedules are based upon best current information and assumptions, as qualified and described elsewhere in this study, including in Section 2.2 above.

Cost and Schedule

Figure 6-1 is a summary project schedule. A detailed schedule is provided in Appendix C. Table 6-1 summarizes the period durations and total costs, including contingency, for License Termination, Spent Fuel, and Site Restoration activities. A detailed cost table is provided in Appendix D, and a table of annual expenditures is provided in Appendix E.

Project Staffing

This scenario is based on the assumption that decommissioning will be performed by an experienced and qualified DGC, with oversight and management of the decommissioning operations performed by the Licensee staff. Utility (Licensee) staffing levels, by organizational department and function, for each period are provided in Table 6-2. The DGC staffing levels, by organizational department and function, for each period are provided in Table 6-3.

LLRW Disposal Volumes

LLRW disposal is a significant element of the decommissioning project. The estimated cubic feet of waste are summarized as follows:

Waste Class	Unit 2	Unit 3	Total
Class A	1,832,961	1,819,680	3,652,641
Class B	7,600	7,600	15,200
Class C	4,095	4,095	8,190
GTCC	941	941	1,882

Waste disposal volumes and costs, itemized by packaging, transportation, surcharges and disposal costs by waste class and facility, are provided in Table 6-4. The waste disposal costs provided in Table 6-4 do not include contingency.

Figure 6-1
Summary Schedule

DECON with Dry Storage, 2013 Shutdown and DOE Acceptance in 2024

Task Name	Start	Finish
Post-Shutdown Spent Fuel Management	06/07/2013	09/08/2051
Spent Fuel Shipping Complete - Unit 1	12/31/2035	12/31/2035
Spent Fuel Shipping Complete - Units 2 & 3	12/31/2049	12/31/2049
SNF Pd 1 - Spent Fuel Management Transition	06/07/2013	12/31/2013
SNF Pd 2 - Spent Fuel Transfer to Dry Storage	1/1/2014	06/01/2019
SNF Pd 3 - Dry Storage During Decommissioning - Units 1, 2 and 3	06/01/2019	12/05/2031
SNF Pd 4 - Dry Storage Only - Units 1, 2 and 3	12/05/2031	12/31/2035
SNF Pd 5 - Dry Storage Only - Units 2 and 3	12/31/2035	12/31/2049
SNF D&D Pd 1 - ISFSI D&D Planning	12/31/2049	05/06/2050
SNF D&D Pd 2 - ISFSI D&D	05/06/2050	09/08/2051
Part 50 License Termination	06/07/2013	12/24/2032
Announcement of Cessation of Operations (June 7, 2013)	06/07/2013	06/07/2013
Decon Pd 1 - Transition to Decommissioning	06/07/2013	12/31/2013
Decon Pd 2 - Decommissioning Planning and Site Modifications	1/1/2014	06/30/2015
Decon Pd 3 - Decommissioning Preparations and Reactor Internals Segmentation	06/30/2015	06/01/2019
Decon Pd 4 - Plant Systems and Large Component Removal	06/01/2019	09/24/2022
Decon Pd 5 - Building Decontamination	09/24/2022	07/13/2024
Decon Pd 6 - License Termination During Demolition	07/13/2024	12/24/2032
Site Restoration	06/07/2013	12/15/2051
SR Pd 1 - Transition to Site Restoration	06/07/2013	06/30/2015
SR Pd 2 - Building Demolition During Decommissioning	06/30/2015	07/11/2017
SR Pd 3 - Subsurface Demolition Engineering and Permitting	10/01/2019	07/13/2024
SR Pd 4 - Building Demolition to 3 Feet Below Grade	07/13/2024	10/14/2028
SR Pd 5 - Subgrade Structure Removal Below -3 Feet	10/14/2028	12/05/2031
SR Pd 6 - Final Site Restoration and Lease Termination	05/06/2050	12/15/2051
Final Easement Termination	12/15/2051	12/15/2051

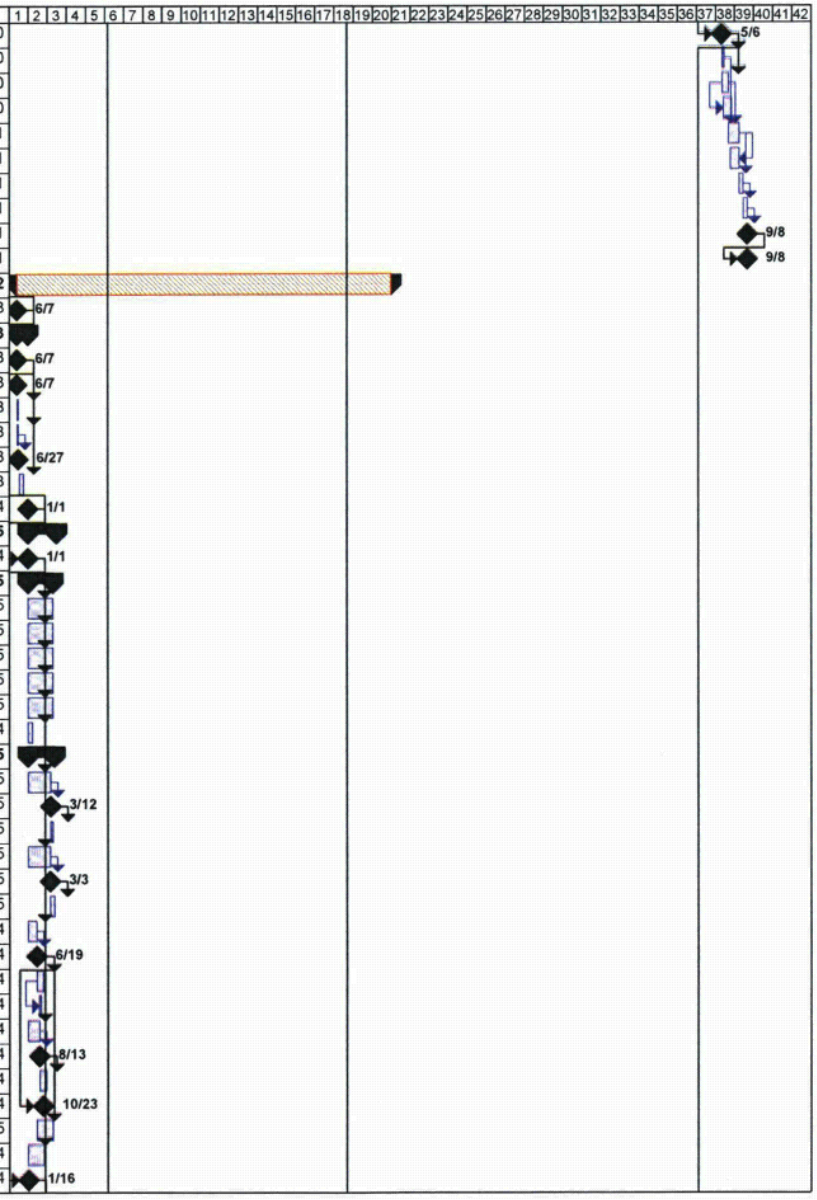
63	Defuel Unit 3 Reactor	15 days	06/07/2013	06/27/2013
64	Defuel Unit 2 Reactor	15 days	06/07/2013	06/27/2013
65	Notification of Permanent Fuel Removal (July 23, 2013)	0 days	06/27/2013	06/27/2013
66	Disposition of Legacy Wastes	60 days	07/19/2013	10/10/2013
67	Decon Pd 1 Ends	0 days	01/01/2014	01/01/2014
68	**Decon Pd 2 - Decommissioning Planning and Site Modifications**	**389 days**	**1/1/2014**	**06/30/2015**
69	Decon Pd 2 Begins	0 wks	01/01/2014	01/01/2014
70	**Preparation of Decommissioning License Documents**	**340 days**	**01/02/2014**	**04/22/2015**
71	Develop Certified Fuel Handler Program	340 days	01/02/2014	04/22/2015
72	Prepare Post-Shutdown QA Plan	340 days	01/02/2014	04/22/2015
73	Prepare Post-Shutdown Security Plan	340 days	01/02/2014	04/22/2015
74	Prepare Post-Shutdown Fire Protection Plan	340 days	01/02/2014	04/22/2015
75	Prepare Defueled Radiation Protection Manual	340 days	01/02/2014	04/22/2015
76	Prepare Preliminary Defueled Technical Specifications	63 days	01/02/2014	03/29/2014
77	**NRC Deliverables**	**364 days**	**01/02/2014**	**05/26/2015**
78	Prepare Defueled Safety Analysis Report (DSAR)	311 days	01/02/2014	03/12/2015
79	Submit DSAR to NRC	0 days	03/12/2015	03/12/2015
80	Implement Technical Specification Modifications	30 days	03/13/2015	04/23/2015
81	Prepare Post-Shutdown Emergency Preparedness Plan	304 days	01/02/2014	03/03/2015
82	Submit Emergency Plan to NRC	0 days	03/03/2015	03/03/2015
83	NRC Review of Emergency Plan	60 days	03/04/2015	05/26/2015
84	Prepare Post-Shutdown Decommissioning Activities Report (PSDAR)	121 days	01/02/2014	06/19/2014
85	Submit PSDAR to NRC	0 days	06/19/2014	06/19/2014
86	NRC Review of PSDAR	90 days	06/20/2014	10/23/2014
87	Public Meeting on PSDAR	30 days	08/01/2014	09/11/2014
88	Prepare Decommissioning Cost Estimate (DCE)	160 days	01/02/2014	08/13/2014
89	Submit DCE to NRC	0 days	08/13/2014	08/13/2014
90	NRC Review of Decommissioning Cost Estimate	90 days	08/14/2014	12/17/2014
91	Commencement of Major Decommisisoning Activities Allowable	0 days	10/23/2014	10/23/2014
92	Respond to NRC quesitons on PSDAR	220 days	06/20/2014	04/23/2015
93	Disposition of Legacy Wastes	220 days	01/02/2014	11/05/2014
94	Contract Award for Historic Site Assessment and Site Characterization	0 wks	01/16/2014	01/16/2014

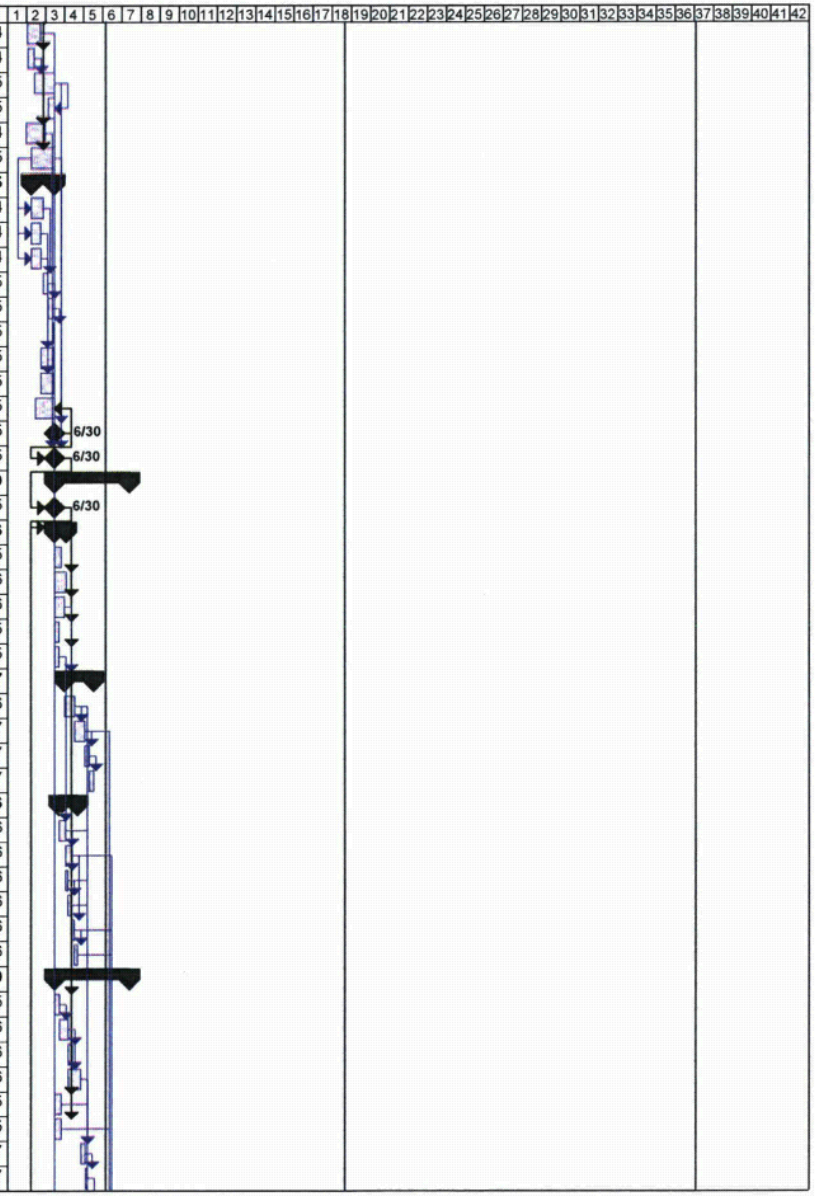


SONGS 2 & 3

Detailed Project Schedule

Prompt DECON, DOE Repository Opens 2024

ID	Task Name	Duration	Start	Finish
95	Perform Historic Site Assessment and Site Characterization	180 days	01/17/2014	09/25/2014
96	Planning and Design For Cold and Dark	90 days	02/01/2014	06/06/2014
97	Implement Cold and Dark (Repower Site)	275 days	06/07/2014	06/26/2015
98	Install 12kV Service Line to Power Temporary Power Ring	90 days	02/21/2015	06/26/2015
99	Drain and De-Energize Non-Essential Systems (DEC Process)	260 days	01/02/2014	12/31/2014
100	Select Decommissioning General Contractor (DGC)	318 days	04/11/2014	06/30/2015
101	**Spent Fuel Pool Isolation**	**318 days**	**04/11/2014**	**06/30/2015**
102	Design Spent Fuel Pool Support System Modifications	160 days	04/11/2014	11/20/2014
103	Design Control Room Relocation	125 days	04/11/2014	10/02/2014
104	Design Spent Fuel Security System Modifications	130 days	04/11/2014	10/09/2014
105	Install Spent Fuel Pool System Modifications - Unit 2	66 days	11/21/2014	02/20/2015
106	Install Spent Fuel Pool System Modifications - Unit 3	66 days	02/21/2015	05/23/2015
107	Spent Fuel Pool Island System Training	10 days	05/26/2015	06/06/2015
108	Implement Control Room Modifications	185 days	10/03/2014	06/18/2015
109	Implement Spent Fuel Pool Security Modifications	180 days	10/10/2014	06/18/2015
110	Transition Project Modifictations	262 days	06/28/2014	06/30/2015
111	DGC Contract Award	0 days	06/30/2015	06/30/2015
112	Decon Pd 2 Ends	0 wks	06/30/2015	06/30/2015
113	**Decon Pd 3 - Decommissioning Preparations and Reactor Internals Segmenta**	**1024 days**	**06/30/2015**	**06/01/2019**
114	Decon Pd 3 Begins	0 days	06/30/2015	06/30/2015
115	**DGC Mobilization and Planning**	**160 days**	**07/01/2015**	**02/09/2016**
116	Prepare Integrated Work Sequence and Schedule for Decommissioning	90 days	07/01/2015	11/03/2015
117	Prepare Detailed Work Procedures for Decommissioning	160 days	07/01/2015	02/09/2016
118	Planning and Design of Primary System Decontamination	135 days	07/01/2015	01/05/2016
119	Planning and Design of Infrastructure Improvements	60 days	07/01/2015	09/22/2015
120	Design Containment Access Modifications	60 days	07/01/2015	09/22/2015
121	**System Decon**	**400 days**	**01/06/2016**	**07/18/2017**
122	Perform Primary System Decon- Unit 2	140 days	01/06/2016	07/19/2016
123	Perform Primary System Decon- Unit 3	140 days	07/20/2016	01/31/2017
124	Hot Spot Decontamination - Unit 2	60 days	02/01/2017	04/25/2017
125	Hot Spot Decontamination - Unit 3	60 days	04/26/2017	07/18/2017
126	**Rx Internals Removal Preparations**	**255 days**	**09/23/2015**	**09/13/2016**
127	Modify Containment Access- Unit 2	90 days	09/23/2015	01/26/2016
128	Modify Containment Access- Unit 3	90 days	01/27/2016	05/31/2016
129	Remove and Dispose of Missle Shields - Unit 2	30 days	01/27/2016	03/08/2016
130	Remove and Dispose of Reactor Head - Unit 2	45 days	03/09/2016	05/10/2016
131	Remove and Dispose of Missle Shields - Unit 3	30 days	06/01/2016	07/12/2016
132	Remove and Dispose of Reactor Head - Unit 3	45 days	07/13/2016	09/13/2016
133	**Reactor Internals Segmentation Planning and Implementation**	**1020 days**	**07/01/2015**	**05/28/2019**
134	Finalize Residual Radiation Inventory (Rx Vessel & Internals)	65 days	07/01/2015	09/29/2015
135	Prepare Activity Specification for Rx Vessel and Internals Segmentation	120 days	09/30/2015	03/15/2016
136	Select Shipping Casks and Obtain Shipping Permits	60 days	03/16/2016	06/07/2016
137	Design, Specify, and Procure Special Items and Materials	175 days	03/16/2016	11/15/2016
138	Purchase Dry Storage Modules for GTCC Waste - Unit 2	90 days	07/01/2015	11/03/2015
139	Purchase Dry Storage Modules for GTCC Waste - Unit 3	90 days	07/01/2015	11/03/2015
140	Test Special Cutting and Handling Equipment and Train Operators	60 days	11/16/2016	02/07/2017
141	Finalize Internals and Vessel Segmenting Details - Unit 2	30 days	02/08/2017	03/21/2017



SONGS 2 & 3

Detailed Project Schedule

Prompt DECON, DOE Repository Opens 2024

ID	Task Name	Duration	Start	Finish
142	Segment, Package and Dispose of Reactor Internals - Unit 2	240 days	03/22/2017	02/20/2018
143	Transfer Internals Segmentation Equipment to Unit 3	60 days	02/21/2018	05/15/2018
144	Finalize Internals and Vessel Segmenting Details - Unit 3	30 days	05/16/2018	06/26/2018
145	Segment, Package and Dispose of Reactor Internals - Unit 3	240 days	06/27/2018	05/28/2019
146	Construct new change rooms, hot laundry, in-plant laydown areas	90 days	01/29/2019	06/01/2019
147	Procure Non-Engineered Standard Equipment	120 days	12/18/2018	06/01/2019
148	Decon Pd 3 Ends	0 wks	06/01/2019	06/01/2019
149	**Decon Pd 4 - Plant Systems and Large Component Removal**	**865 days**	**06/01/2019**	**09/24/2022**
150	Decon Pd 4 Begins	0 days	06/01/2019	06/01/2019
151	Upgrade Rail Spur	120 days	06/04/2019	11/16/2019
152	Install GARDIAN Bulk Assay System	30 days	06/04/2019	07/13/2019
153	**Non Essential System Removal**	**640 days**	**07/16/2019**	**12/25/2021**
154	Scaffolding for Non-Essential System Removal	120 wks	07/16/2019	10/30/2021
155	Asbestos Abatement for Non-Essential Systems Removal - Unit 2	60 wks	07/16/2019	09/05/2020
156	Lead Abatement for Non-Essential Systems Removal - Unit 2	60 wks	07/30/2019	09/19/2020
157	Remove, Package and Dispose of Non-Essential Systems - Unit 2	60 wks	09/10/2019	10/31/2020
158	Asbestos Abatement for Non-Essential Systems - Unit 3	60 wks	09/08/2020	10/30/2021
159	Lead Abatement for Non-Essential Systems - Unit 3	60 wks	09/22/2020	11/13/2021
160	Remove, Package and Dispose of Non-Essential Systems - Unit 3	60 wks	11/03/2020	12/25/2021
161	Remove Underground Diesel Tank - Unit 2	30 days	07/16/2019	08/24/2019
162	Remove Underground Diesel Tank - Unit 3	30 days	08/27/2019	10/05/2019
163	**Fuel Pool Closure**	**300 days**	**06/04/2019**	**07/25/2020**
164	Remove and Dispose of Spent Fuel Storage Racks - Unit 2	90 days	06/04/2019	10/05/2019
165	Remove and Dispose of Spent Fuel Storage Racks - Unit 3	90 days	10/08/2019	02/08/2020
166	Remove and Dispose of Legacy Class B and C Waste - Unit 2	30 days	10/08/2019	11/16/2019
167	Remove and Dispose of Legacy Class B and C Waste - Unit 3	30 days	11/19/2019	12/28/2019
168	Drain Spent Fuel Pool and Process Liquid Waste - Unit 2	24 wks	11/19/2019	05/02/2020
169	Drain Spent Fuel Pool and Process Liquid Waste - Unit 3	24 wks	12/31/2019	06/13/2020
170	Segment, Package and Dispose of Spent Fuel Pool Island Equipment	30 days	06/16/2020	07/25/2020
171	Segment and Dispose of Fuel Pool Bridge Crane - Unit 2	30 days	10/08/2019	11/16/2019
172	Segment and Dispose of Fuel Pool Bridge Crane - Unit 3	30 days	11/19/2019	12/28/2019
173	**Essential Systems Removal**	**180 days**	**06/16/2020**	**02/20/2021**
174	Flush and Drain Essential Systems Following Fuel Pool Closure	30 days	06/16/2020	07/25/2020
175	Scaffolding for Essential System Removal	30 wks	07/28/2020	02/20/2021
176	Asbestos Abatement for Essential Systems	30 wks	07/28/2020	02/20/2021
177	Lead Abatement for Essential Systems Removal	30 wks	07/28/2020	02/20/2021
178	Remove, Package and Dispose of Essential Systems	30 wks	07/28/2020	02/20/2021
179	Removal and Disposal of Spent Resins, Filter Media and Tank Sludge	30 days	01/12/2021	02/20/2021
180	**Large Component Removal**	**865 days**	**06/04/2019**	**09/24/2022**
181	Reactor Vessel Insulation Removal and Disposal - Unit 2	90 days	06/04/2019	10/05/2019
182	Segment, Package and Dispose of Reactor Pressure Vessel - Unit 2	260 days	06/04/2019	05/30/2020
183	Transfer Rx Vessel Segmentation Equipment to Unit 3	45 days	06/02/2020	08/01/2020
184	Procure Replacement Non-Engineered Standard Equipment	30 days	06/02/2020	07/11/2020
185	Reactor Vessel Insulation Removal and Disposal - Unit 3	90 days	08/04/2020	12/05/2020
186	Segment, Package and Dispose of Reactor Pressure Vessel - Unit 3	260 days	08/04/2020	07/31/2021
187	Remove and Dispose of Steam Generators - Unit 2	240 days	06/02/2020	05/01/2021
188	Remove and Dispose of Pressurizer - Unit 2	60 days	05/04/2021	07/24/2021

Detailed Project Schedule

Prompt DECON, DOE Repository Opens 2024

ID	Task Name	Duration	Start	Finish
236	Prepare Site Restoration Demolition Plan and Schedule	120 days	07/01/2015	12/15/2015
237	Obtain Required Permits For Mesa, South Access and South Yard	90 days	12/16/2015	04/19/2016
238	**South Access for Decommissioning**	**150 days**	**04/20/2016**	**11/15/2016**
239	Demolish Service Building (K-10, 20, 30)	60 days	04/20/2016	07/12/2016
240	Demolish South Security Processing Facility (K-70)	30 days	07/13/2016	08/23/2016
241	Demolish Staging Warehouse	30 days	08/24/2016	10/04/2016
242	Demolish Administration Building (K-40/50)	30 days	10/05/2016	11/15/2016
243	**South Yard Facility**	**105 days**	**04/20/2016**	**09/13/2016**
244	Demolish South Yard Area Buildings T-10, 20, 60 and Haz Mat.	90 days	04/20/2016	08/23/2016
245	Demolish REMS Staging Pad	15 days	08/24/2016	09/13/2016
246	**Mesa**	**320 days**	**04/20/2016**	**07/11/2017**
247	Demolish Mesa Buildings	140 days	04/20/2016	11/01/2016
248	Remove Underground Fuel Storage Tanks	30 days	11/02/2016	12/13/2016
249	Demolish Mesa Roads and Parking Lots	60 days	12/14/2016	03/07/2017
250	Finish Grading and Re-vegetate Mesa Site	90 days	03/08/2017	07/11/2017
251	Mesa Area Cleared for Easement Termination	0 days	07/11/2017	07/11/2017
252	SR Pd 2 Ends	0 days	07/11/2017	07/11/2017
253	**SR Pd 3 - Subsurface Demolition Engineering and Permitting**	**1250 days**	**10/01/2019**	**07/13/2024**
254	SR Pd 3 Begins	0 days	10/01/2019	10/01/2019
255	Hydrogeologic Investigation and Outfall Conduit Survey	120 days	10/01/2019	03/14/2020
256	Subsurface Structure Removal Engineering Planning and Design	120 days	03/17/2020	08/29/2020
257	Environmental Impacts Analyses for Lease Termination Activities	700 days	09/01/2020	05/06/2023
258	Final Site Grading and Shoreline Protection Engineering Planning and Design	90 days	05/09/2023	09/09/2023
259	Obtain Required Permits and Approvals	220 days	09/12/2023	07/13/2024
260	SR Pd 3 Ends	0 days	07/13/2024	07/13/2024
261	**SR Pd 4 - Building Demolition to 3 Feet Below Grade**	**1110 days**	**07/13/2024**	**10/14/2028**
262	SR Pd 4 Begins	0 days	07/13/2024	07/13/2024
263	Procure Building Demolition Equipment	1080 days	07/16/2024	09/02/2028
264	**Demolition Preparations**	**80 days**	**07/16/2024**	**11/02/2024**
265	Install Temporary Structures	30 days	07/16/2024	08/24/2024
266	Install Erosion and Sediment Controls	20 days	07/16/2024	08/10/2024
267	Remove Cathodic Protection Trench	60 days	08/13/2024	11/02/2024
268	Remove Protected Area Security Fencing	45 days	08/13/2024	10/12/2024
269	Remove Protected Area Pavement	20 days	08/13/2024	09/07/2024
270	**Unit 3**	**870 days**	**07/16/2024**	**11/13/2027**
271	Detension and Remove Unit 3 Containment Builidng Tendons	240 days	07/16/2024	06/14/2025
272	Demolish Diesel Generator Building - Unit 3	60 days	07/16/2024	10/05/2024
273	Demolish Condensate Building and Transformer Pads - Unit 3	60 days	10/08/2024	12/28/2024
274	Demolish Full Flow Area and Turbine Building - Unit 3	140 days	12/31/2024	07/12/2025
275	Demolish Unit 3 Fuel Handling Building to 3-Feet Below Grade	120 days	06/30/2026	12/12/2026
276	Demolish Penetration Building - Unit 3	60 days	06/30/2026	09/19/2026
277	Demolish Safety Equipmentand MSIV Building - Unit 3	60 days	07/15/2025	10/04/2025
278	Demolish Unit 3 Containment Building to 3-Feet Below Grade	240 days	12/15/2026	11/13/2027
279	**Unit 2**	**1020 days**	**11/19/2024**	**10/14/2028**
280	Detension and Remove Unit 2 Containment Builidng Tendons	240 days	06/17/2025	05/16/2026
281	Demolish Diesel Generator Building - Unit 2	60 days	11/19/2024	02/08/2025
282	Demolish Condensate Building and Transformer Pads - Unit 2	60 days	02/11/2025	05/03/2025

Detailed Project Schedule

Prompt DECON, DOE Repository Opens 2024

ID	Task Name	Duration	Start	Finish
283	Demolish Full Flow Area and Turbine Building - Unit 2	140 days	05/06/2025	11/15/2025
284	Demolish Unit 2 Fuel Handling Building to 3-Feet Below Grade	120 days	12/15/2026	05/29/2027
285	Demolish Penetration Building - Unit 2	60 days	06/01/2027	08/21/2027
286	Demolish Safety Equipment and MSIV Building - Unit 2	60 days	08/24/2027	11/13/2027
287	Demolish Unit 2 Containment Building to 3-Feet Below Grade	240 days	11/16/2027	10/14/2028
288	**Common**	**510 days**	**07/16/2024**	**06/27/2026**
289	Demolish AWS Building	90 days	07/16/2024	11/16/2024
290	Demolish Building L-50	60 days	11/19/2024	02/08/2025
291	Demolish Building B-64/B-65	45 days	07/16/2024	09/14/2024
292	Demolish Building B-62/B-63	45 days	09/17/2024	11/16/2024
293	Demolish Outage Control Center	45 days	02/11/2025	04/12/2025
294	Demolish Building B-49/B-50	45 days	04/15/2025	06/14/2025
295	Demolish Building B-43/B-44	45 days	06/17/2025	08/16/2025
296	Demolish Auxiliary Radwaste Building - Common	160 days	05/06/2025	12/13/2025
297	Demolish Auxiliary Control Building - Common	160 days	11/18/2025	06/27/2026
298	Remove Systems and Demolish Make-Up Demineralizer Structures	120 days	07/16/2024	12/28/2024
299	Install Concrete Plugs in Intake and Discharge Structures	90 days	08/27/2024	12/28/2024
300	Demolish Intake and Discharge Structures to 3-Feet Below Grade	60 days	11/18/2025	02/07/2026
301	SR Pd 4 Ends	0 days	10/14/2028	10/14/2028
302	**SR Pd 5 - Subgrade Structure Removal Below -3 Feet**	**820 days**	**10/14/2028**	**12/05/2031**
303	SR Pd 5 Begins	0 days	10/14/2028	10/14/2028
304	Procure Subsurface Structure Demolition Equipment	520 days	10/17/2028	10/11/2030
305	Install Sheet Piling and Excavation Shoring	120 days	10/17/2028	03/31/2029
306	Install Dewatering System and Effluent Treatment and Discharge Controls	60 days	04/01/2029	06/22/2029
307	**Unit 3 Subsurface Structures**	**480 days**	**06/23/2029**	**04/25/2031**
308	Demolish and Backfill Unit 3 Condensate Storage Area Below -3 Feet	30 days	06/23/2029	08/03/2029
309	Demolish and Backfill Unit 3 Diesel Generator Builidng Below -3 Feet	30 days	08/04/2029	09/14/2029
310	Demolish and Backfill Unit 3 Fuel Handling Building Below -3 Feet	120 days	09/15/2029	03/01/2030
311	Demolish and Backfill Unit 3 Radwaste Building Below -3 Feet	120 days	03/02/2030	08/16/2030
312	Demolish and Backfill Unit 3 Turbine Building Structure Below 9 Ft Elevatior	120 days	06/23/2029	12/07/2029
313	Demolish and Backfill Unit 3 Safety Equipment Building Below -3 Feet	90 days	12/08/2029	04/12/2030
314	Demolish and Backfill Unit 3 Penetration Area Below -3 Feet	60 days	04/13/2030	07/05/2030
315	Demolish and Backfill Unit 3 Full Flow Building Below -3 Feet	60 days	07/06/2030	09/27/2030
316	Demolish and Backfill Unit 3 Containment Building Below -3 Feet	180 days	08/17/2030	04/25/2031
317	**Unit 2 Subsurface Structures**	**480 days**	**06/23/2029**	**04/25/2031**
318	Demolish and Backfill Unit 2 Condensate Storage Area Below -3 Feet	30 days	06/23/2029	08/03/2029
319	Demolish and Backfill Unit 2 Diesel Generator Builidng Below -3 Feet	30 days	08/04/2029	09/14/2029
320	Demolish and Backfill Unit 2 Fuel Handling Building Below -3 Feet	120 days	09/15/2029	03/01/2030
321	Demolish and Backfill Unit 2 Radwaste Building Below -3 Feet	120 days	03/02/2030	08/16/2030
322	Demolish and Backfill Unit 2 Turbine Building Structure Below 9 Ft Elevatior	120 days	06/23/2029	12/07/2029
323	Demolish and Backfill Unit 2 Safety Equipment Building Below -3 Feet	90 days	12/08/2029	04/12/2030
324	Demolish and Backfill Unit 2 Penetration Area Below -3 Feet	60 days	04/13/2030	07/05/2030
325	Demolish and Backfill Unit 2 Full Flow Building Below -3 Feet	60 days	07/06/2030	09/27/2030
326	Demolish and Backfill Unit 2 Containment Building Below -3 Feet	180 days	08/17/2030	04/25/2031
327	**Common Subgrade Structures**	**432 days**	**02/16/2029**	**10/11/2030**
328	Demolish and Backfill Intake Structure Inside Seawall Below -3 Feet	220 days	12/08/2029	10/11/2030
329	Remove Off Shore Intake and Outfall Conduits	432 days	02/16/2029	10/11/2030

Appendix F

SDG&E SONGS Decommissioning Costs (100%)

Appendix F SDG&E SONGS Decommissioning Costs (100%)

San Diego Gas & Electric Company (SDG&E) provides the following information regarding its internal decommissioning costs, which it expects to incur and to fund on its own behalf (100%) in addition to its 20% share of the Decommissioning Cost Estimate.

I. BACKGROUND

As the 20% minority owner, SDG&E is contractually obligated to pay its 20% ownership share of decommissioning expenses for SONGS. These costs, outlined in the DCE, will be incurred by the decommissioning agent and SDG&E will receive invoicing for its proportional share.

II. SDG&E COSTS

Table F-1

SDG&E SONGS DECOMMISSIONING COSTS (1,000's, $2014)

Total Units 2 & 3	SDG&E Labor	Other/ Non-Labor	Total Costs
License Termination	$3,832	$1,047	$4,879
Spent Fuel Management	$2,729	$417	$3,147
Site Restoration	$1,904	$401	$2,305
Total	$8,465	$1,865	$10,330

In addition to SDG&E's 20% share of the costs outlined in the DCE, SDG&E also incurs internal costs related to its SONGS ownership. SDG&E incurs 100% of these Labor and Non-Labor costs related to SDG&E's oversight activities. These costs are apportioned into SCE's DCE categories of License Termination, Spent Fuel Management, and Site Restoration by determining the percentage of costs SCE allocated to each category and multiplying SDG&E's

costs by that same percentage for each category. SDG&E estimates that its total internal costs over the decommissioning period to be $10.33 million (2014$).

a. SDG&E LABOR

The first category, "SDG&E Labor" includes SDG&E staff who provide oversight of SONGS costs and activities. SDG&E's internal staffing efforts are expected to mirror site staffing where the three (3) full-time equivalents ("FTEs") are reduced after 2016 to two (2) FTEs, then to one (1) FTE after 2025, and eventually to zero (0) FTEs after 2032. After 2032, invoicing and oversight activities are anticipated to be minor during this period. Once ISFSI decommissioning is initiated on or around 2049, SDG&E plans to identify one (1) full-time equivalent through 2052.

These costs are shown in Table F-1 under the column heading of "SDG&E Labor" and are apportioned into SCE's categories of License Termination, Spent Fuel Management, and Site Restoration.

b. OTHER/NON-LABOR

The second type of SDG&E-specific costs are "Other/Non-Labor", which consist of outside decommissioning consultants and direct costs related to oversight activities.

To provide oversight of decommissioning activities, SDG&E has retained an external decommissioning consultant who has the expertise SDG&E requires. The external consultant is utilized to a greater extent through 2016 and then the consultant services are tapered off annually through 2025.

SDG&E also incurs direct costs related specifically to SDG&E's oversight activities at SONGS. These costs, which include travel reimbursement, phone services, training, and wireless

communication from SONGS, will coincide with the number of SDG&E SONGS oversight personnel FTEs.

These costs are shown in Table F-1 under the column heading of Other/Non-labor and are apportioned into SCE's categories of License Termination, Spent Fuel Management, and Site Restoration.

III. CONCLUSION

All of SDG&E's internal decommissioning costs presented in Table F-1 are separate and distinct from the costs incurred by the decommissioning agent and invoiced to SDG&E.

SDG&E will seek authority to access its nuclear decommissioning trust funds to pay for its proportional share of SONGS related decommissioning expenses and for its internal decommissioning costs incurred through a Commission-approved advice letter process consistent with the terms of the SDG&E Master Trust Agreement, and relevant rules and regulations of the Internal Revenue Service and the Nuclear Regulatory Commission.

EXHIBIT 4

March 3, 2010

UNITED STATES OF AMERICA
NUCLEAR REGULATORY COMMISSION

Atomic Safety and Licensing Board

Before Administrative Judges:
Thomas S. Moore, Chairman
Paul S. Ryerson
Richard E. Wardwell

In the Matter of	)	Docket No. 63-001
U.S. DEPARTMENT OF ENERGY	)	ASLBP No. 09-892-HLW-CAB04
(High-Level Waste Repository)	)	

U.S. DEPARTMENT OF ENERGY'S MOTION TO WITHDRAW

The United States Department of Energy ("DOE") hereby moves, pursuant to 10 C.F.R. § 2.107, to withdraw its pending license application for a permanent geologic repository at Yucca Mountain, Nevada. DOE asks the Board to dismiss its application with prejudice and to impose no additional terms of withdrawal.

While DOE reaffirms its obligation to take possession and dispose of the nation's spent nuclear fuel and high-level nuclear waste, the Secretary of Energy has decided that a geologic repository at Yucca Mountain is not a workable option for long-term disposition of these materials. Additionally, at the direction of the President, the Secretary has established the Blue Ribbon Commission on America's Nuclear Future, which will conduct a comprehensive review

and consider alternatives for such disposition.[1] And Congress has already appropriated $5 million for the Blue Ribbon Commission to evaluate and recommend such "alternatives." Energy and Water Development and Related Agencies Appropriations Act, 2010, Pub. L. No. 111-85, 123 Stat. 2845, 2864-65 (2009). In accord with those decisions, and to avoid further expenditure of funds on a licensing proceeding for a project that is being terminated, DOE has decided to discontinue the pending application in this docket,[2] and hereby moves to withdraw that application with prejudice.

Under the Nuclear Waste Policy Act of 1982, as amended, 42 U.S.C. §§ 10101 *et seq.* ("NWPA"), this licensing proceeding must be conducted "in accordance with the laws applicable to such applications . . . ." NWPA § 114(d), 42 U.S.C. § 10134(d). Those laws necessarily include the NRC's regulations governing license applications, including, as this Board has already recognized, 10 C.F.R. § 2.107(a). *See* CAB Order (Concerning LSNA Memorandum), ASLBP No. 09-892-HLW-CAB04, at 2 (Dec. 22, 2009) (stating that "the parties are reminded that, pursuant to 10 C.F.R. § 2.107, withdrawal shall be on such terms as the Board may prescribe."). That section provides in relevant part that "[w]ithdrawal of an application after the

---

1 *See* Presidential Memorandum -- Blue Ribbon Commission on America's Nuclear Future (Jan. 29, 2010) ("Presidential Memorandum"), *available at* http://www.whitehouse.gov/the-press-office/presidential-memorandum-blue-ribbon-commission-americas-nuclear-future; Department of Energy Press Release, Secretary Chu Announces Blue Ribbon Commission on America's Nuclear Future (January 29, 2010), *available at* http://www.energy.gov/news/8584.htm; Charter, Blue Ribbon Commission on America's Nuclear Future (filed March 1, 2010), *available at* http://www.energy.gov/news/documents/BRC_Charter.pdf. The Commission will conduct a comprehensive review of policies for managing the back end of the nuclear fuel cycle, including all alternatives for the storage, processing, and disposal of civilian and defense used nuclear fuel and materials derived from nuclear activities. *See id.*

2 This decision was announced in the Administration's Fiscal Year 2011 Budget, which states that "[i]n 2010, the Department will discontinue its application to the Nuclear Regulatory Commission (NRC) for a license to construct a high-level waste geologic repository at Yucca Mountain, Nevada." Budget of the U.S. Government, Fiscal Year 2011: Terminations, Reductions, and Savings, at 62 (Feb. 1, 2010). The Department of Energy's Fiscal Year 2011 Congressional Budget Request similarly states that "in 2010, Department will discontinue its application to the U.S. Nuclear Regulatory Commission for a license to construct a high-level waste geologic repository at Yucca Mountain." Department of Energy, FY 2011 Congressional Budget Request, Vol. 7, at 163 (Feb. 2010).

issuance of a notice of hearing shall be on such terms as the presiding officer may prescribe." 10 C.F.R. § 2.107(a).

Thus, applicable Commission regulations empower this Board to regulate the terms and conditions of withdrawal. *Philadelphia Electric Company* (Fulton Generating Station, Units 1 and 2), ALAB-657, 14 N.R.C. 967, 974 (1981). Any terms imposed for withdrawal must bear a rational relationship to the conduct and legal harm at issue. *Id.* And the record must support any findings concerning the conduct and harm in question to impose a term. *Id.*, citing *LeCompte v. Mr. Chip, Inc.*, 528 F.2d 601, 604-05 (5th Cir. 1976); 5 Moore's Federal Practice ¶ 41.05[1] at 41–58.

A. The Board Should Grant Dismissal With Prejudice

In this instance, the Board should prescribe only one term of withdrawal—that the pending application for a permanent geologic repository at the Yucca Mountain site shall be dismissed with prejudice.[3]

That action will provide finality in ending the Yucca Mountain project for a permanent geologic repository and will enable the Blue Ribbon Commission, as established by the Department and funded by Congress, to focus on alternative methods of meeting the federal government's obligation to take high-level waste and spent nuclear fuel. It is the Secretary of Energy's judgment that scientific and engineering knowledge on issues relevant to disposition of high-level waste and spent nuclear fuel has advanced dramatically over the twenty years since the Yucca Mountain project was initiated. *See also* Presidential Memorandum at 1. Future proposals for the disposition of such materials should thus be based on a comprehensive and

[3] DOE seeks this form of dismissal because it does not intend ever to refile an application to construct a permanent geologic repository for spent nuclear fuel and high-level radioactive waste at Yucca Mountain.

careful evaluation of options supported by that knowledge, as well as other relevant factors, including the ability to secure broad public support, not on an approach that "has not proven effective" over several decades. *Id.*

The Board should defer to the Secretary's judgment that dismissal of the pending application with prejudice is appropriate here. Settled law in this area directs the NRC to defer to the judgment of policymakers within the Executive Branch.[4] And whether the public interest would be served by dismissing this application with prejudice is a matter within the purview of the Secretary.[5] From public statements already made, we of course understand that some will nevertheless argue that dismissing this application is contrary to the NWPA. Although it is impossible to anticipate exactly what parties will argue at this point, at least one litigant seeking to raise these issues in federal court has said the NWPA obligation to file the pending application is inconsistent with the decision to withdraw the application. This is simply wrong.

Nothing in the text of the NWPA strips the Secretary of an applicant's ordinary right to seek dismissal. In fact, the text of the statute cuts sharply in favor of the Secretary's right to seek

---

[4] *U.S. Department Of Energy* (Plutonium Export License), CLI-04-17, 59 N.R.C. 357, 374 (2004) (deferring, upon "balanc[ing] our statutory role in export licensing with the conduct of United States foreign relations, which is the responsibility of the Executive Branch," to Executive Branch determination on an export license application). *See also Private Fuel Storage, L.L.C.* (Independent Spent Fuel Storage Installation), LBP-03-30, 58 N.R.C. 454, 472 (2003) (expressing "considerable doubt" about the NRC's authority to "second-guess" the Bureau of Land Management on an issue relating to recommendations as to the wilderness status of land, and declining an invitation to do so); *see also Environmental Radiation Protection Standards for Nuclear Power Operations, 40 CFR 190*, CLI–81–4, 13 N.R.C. 298, 301 (1981) (deferring to EPA standards for radiation protection: "This agency does not sit as a reviewing court for a sister agency's regulations…."). *See generally Pacific Gas & Electric Company* (Stanislaus Nuclear Project, Unit 1), LBP-83-2 , 17 N.R.C. 45, 52 (1983) ("The law on withdrawal does not require a determination of whether [the applicant's] decision [to withdraw] is sound.").

[5] The Atomic Energy Act ("AEA" or "Act") gives the Secretary broad authority to carry out the Act's purposes, including the authority to direct the Government's "control of the possession, use, and production of atomic energy and special nuclear material, whether owned by the Government or others, so directed as to make the maximum contribution to the common defense and security and the national welfare." AEA § 3(c), 42 U.S.C. § 2013(c). Indeed, as the D.C. Circuit has recognized, the AEA established "a regulatory scheme which is virtually unique in the degree to which broad responsibility is reposed in the administering agency, free of close prescription in its charter as to how it shall proceed in achieving the statutory objectives." *Siegel v. AEC*, 400 F.2d 778, 783 (D.C. Cir. 1968). While *Siegel* concerned directly the branch of the then-Atomic Energy Commission that later became the NRC, its recognition that broad discretion is to be given to the governmental agencies charged with administering the AEA's objectives applies equally to the Department of Energy, the other lineal descendant of the AEC.

dismissal. The statute simply requires that the Secretary "shall submit . . . an application for a construction authorization." NWPA § 114(b), 42 U.S.C. § 10134(b). It neither directs nor circumscribes the Secretary's actions on the application after that submission.[6]

Indeed, far from imposing special limitations on DOE after the submission, the NWPA expressly requires that the application be considered "in accordance with the laws applicable to such applications." NWPA § 114(d), 42 U.S.C. § 10134(d). Those laws include 10 C.F.R. § 2.107, which, as this Board has recognized, authorizes withdrawals on terms the Board prescribes. Congress, when it enacted the NWPA in 1982, could have dictated that special rules applied to this proceeding to prevent withdrawal motions, or could have prescribed duties by DOE with respect to prosecution of the application after filing, but it chose not to do so.

Nor does the structure of the NWPA somehow override the plain textual indication in the statute that ordinary NRC rules govern here or dictate that the Secretary must continue with an application he has decided is contrary to the public interest. The NWPA does not prescribe a step-by-step process that leads inexorably to the opening of a repository at Yucca Mountain. Indeed, even if the NRC granted the pending application today, the Secretary would not have the authority to create an operational repository. That would require further action by DOE, other agencies, and Congress itself, yet none of those actions is either mandated or even mentioned by the NWPA. The NWPA does not require the Secretary to undertake the actions necessary to obtain the license to receive and possess materials that would be necessary to open a repository. 10 C.F.R. §§ 63.3, 63.32(d). Rather, the NWPA refers only to the need for a "construction

---

[6] After filing the application, the only NWPA mandate imposed on the Secretary is a *reporting* requirement to Congress to note the "project decision schedule that portrays the optimum way to attain the operation of the repository, within the time periods specified in this part." NWPA § 114(e)(1), 42 U.S.C. §10134(e)(1).

authorization," NWPA § 114(b), 42 U.S.C. § 10134(b) – and even there, as discussed, it mandates only the submission of an application. To open a facility, moreover, the Department would be required to obtain water rights, rights of way from the Bureau of Land Management for utilities and access roads, and Clean Water Act § 404 permits for repository construction, as well as all the state and federal approvals necessary for an approximately 300-mile rail line, among many other things. None of those actions is mandated by the NWPA. At least as important, as the prior Administration stressed, *Congress* would need to take further action not contained in the NWPA before any such repository could be opened.[7] In short, there are many acts between the filing of the application and the actual use of the repository that the NWPA does not require.

Where, even if the NRC granted the pending application, Congress has not authorized the Secretary to make the Yucca Mountain site operational, or even mandated that he take the many required steps to make it operational, it would be bizarre to read the statute to impose a non-discretionary duty to continue with any particular intermediate step (here, prosecuting the application), absent clear statutory language mandating that result. More generally, it has not been the NRC's practice to require any litigant to maintain a license application that the litigant does not wish to pursue. That deference to an applicant's decisions should apply more strongly where a government official has decided not to pursue a license application because he believes that other courses would better serve the public interest.

Finally, the fact that Congress has approved Yucca Mountain as the site of a repository, *see* Pub. L. No. 107-200, 116 Stat. 735 (2002) ("there hereby is approved the site at Yucca Mountain, Nevada, for a repository, with respect to which a notice of disapproval was submitted

---

7 *See* January 2009 Project Decision Schedule at 1 ("This schedule is predicated upon the enactment of legislation ... [regarding] land withdrawal."). *See also, e.g.*, Nuclear Fuel Management and Disposal Act, S.2589, 109th Congress, 2d Sess. § 3 (2006) (proposed legislation authorizing the withdrawal of lands necessary for the Yucca Mountain repository).

by the Governor of the State of Nevada on April 8, 2002"), means, in the D.C. Circuit's words, simply that the Secretary is "permitted" to seek authority to open such a site and that challenges to the prior process to select that site are moot. *Nuclear Energy Institute, Inc. v. EPA*, 373 F.3d 1251, 1309-10 (D.C. Cir. 2004). It does *not* require the Secretary to continue with an application proceeding if the Secretary decides that action is contrary to the public interest. *See, e.g.,* S. Rep. No. 107-159, at 13 (2002) ("It bears repeating that enactment of the joint resolution will not authorize construction of the repository or allow DOE to put any radioactive waste or spent nuclear fuel in it or even allow DOE to begin transporting waste to it. Enactment of the joint resolution will only allow DOE to take the next step in the process laid out by the Nuclear Waste Policy Act and apply to the NRC for authorization to construct the repository at Yucca Mountain."); H.R. Rep. No. 107-425, at 7 (2002) ("In accordance with the Nuclear Waste Policy Act (NWPA), such approval would allow the Department of Energy (DOE) to apply for a license with the Nuclear Regulatory Commission to construct a nuclear waste storage facility on the approved site.").[8] That conclusion is even more strongly compelled now, in light of Congress's recent decision to provide funding to a Blue Ribbon Commission, whose explicit purpose is to propose "alternatives" for the disposal of high-level waste and spent nuclear fuel.

Even if there were any ambiguity on these points, the Secretary's interpretation of the NWPA would be entitled to deference. *See Chevron, U.S.A., Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837 (1984); *Gen. Elec. Uranium Mgmt. Corp. v. DOE*, 764 F.2d 896, 907 (D.C. Cir. 1985) (applying *Chevron* deference to uphold DOE's interpretation of the NWPA); *see also Skidmore v Swift Co.*, 323 U.S. 65 (1944); *Auer v. Robbins*, 519 U.S. 452 (1977); *Coeur*

[8] *See also* 148 Cong. Rec. 7155 (2002) (Rep. Dingell) (stating that Yucca Mountain Site Approval Act "is just about a step in a process"); *id.* at 7166 (Rep. Norwood) ("The vote today does not lock us in forever and we are not committed forever to Yucca Mountain."); *id.* at 12340 (Sen. Crapo) ("[T]his debate is not about whether to open the Yucca Mountain facility so much as it is about allowing the process of permitting to begin to take place.").

Alaska, Inc. v. Southeastern Alaska Conservation Council, 129 S. Ct. 2458 (2009). Simply put, the text of the NWPA does not specify actions the Secretary can or must take once the application is filed. Accordingly, while some may disagree with the wisdom of the Secretary's underlying policy decision, the Secretary may fill this statutory "gap." The Secretary's interpretation is a reasonable one that should be given great weight and sustained. *See, e.g., Tennessee v. Herrington*, 806 F.2d 642, 653 (6th Cir. 1986) ("[W]e are mindful of the Supreme Court's statement in *Chevron, supra*, that: 'When a challenge to an agency construction of a statutory provision, fairly conceptualized, really centers on the wisdom of the agency's policy, rather than whether it is a reasonable choice within a gap left open by Congress, the challenge must fail.'").

B. No Conditions Are Necessary As to the Licensing Support Network

Finally, there is no reason to impose conditions relating to the Licensing Support Network ("LSN") as a term of withdrawal. As DOE's prior filings with this Board explain, DOE will, at a minimum, maintain the LSN throughout this proceeding, including any appeals, and then archive the LSN materials in accordance with the Federal Records Act and other relevant law. *See* Department of Energy's Answers to the Board's Questions at the January 27, 2010 Case Management Conference (filed Feb. 4, 2010); Department of Energy's Status Report on Its Archiving Plan (filed Feb. 19, 2010). Thus, DOE will retain the full LSN functionality throughout this proceeding, including appeal, and then follow well established legal requirements that already govern DOE's obligations regarding these documents. DOE is also considering whether sound public and fiscal policy, and the goal of preserving the knowledge gained both inside and outside of this proceeding, suggest going even further than those legal

requirements. There is thus no need for this Board to impose additional conditions concerning the preservation of records.

* * *

DOE counsel has communicated with counsel for the other parties commencing on February 24, 2010, in an effort to resolve any issues raised by them prior to filing this Motion, per 10 C.F.R. § 2.323(b). The State of Nevada and the State of California have stated that they agree with the relief requested here. The Nuclear Regulatory Commission Staff has stated that it takes no position at this time. The Nuclear Energy Institute has stated that it does not consent to the relief requested and will file its position in a response. All other parties that have responded have stated that they reserve their positions until they see the final text of the motion.[9]

[9] These parties include: Clark County, Eureka County, Four Counties (Esmeralda, Lavender, Churchill, Mineral), Inyo County, Lincoln County, Native Community Action Council, Nye County, Timbisha Shoshone Tribal Group, White Pine County.

Respectfully submitted,

SCE Selects Robust Underground System to Store San Onofre Used Nuclear Fuel

ROSEMEAD, Calif., Dec. 11, 2014 — Southern California Edison (SCE) has selected Holtec International to expand the San Onofre nuclear plant's storage of used nuclear fuel in a robust underground facility.

The contract with Holtec represents a major step in the decommissioning of the nuclear plant. It sets the stage to transfer San Onofre's used fuel from steel-lined concrete storage pools to steel-and-concrete-encased canisters, with a goal of completing the work by mid-2019.

"After reviewing leading designs with the San Onofre Community Engagement Panel, we concluded this underground design is best suited to safely and securely store used nuclear fuel at San Onofre until the federal government removes the fuel from site, as required," said Chris Thompson, SCE vice president of Decommissioning. "Our decision to move expeditiously to transfer the fuel also reflects feedback from community leaders who prefer dry storage of used nuclear fuel."

Thompson noted the robust Holtec design exceeds California earthquake requirements and protects against hazards such as water, fire or tsunamis.

"I especially want to thank the Community Engagement Panel for its thoughtful questions and enormous time commitment during SCE's evaluation," said Thompson, noting that SCE ultimately focused on cask designs licensed by the Nuclear Regulatory Commission for both storage *and* transport of used nuclear fuel.

While dry storage of nuclear fuel is a proven technology used for almost three decades in the United States, Thompson said SCE will go beyond industry practices by partnering with the Electric Power Research Institute to develop new inspection techniques to monitor cask integrity.

Holtec's HI-STORM UMAX underground storage system features corrosion-resistant, stainless-steel fuel canisters topped with a 24,000-pound steel and concrete lid. The canisters will be encased in a concrete monolith. Holtec is a global supplier and has nuclear fuel storage systems at two other California locations, Humboldt Bay and Diablo Canyon. More information is available in this fact sheet.

Thompson said engineering work begins immediately, followed by fabrication of canisters. Completion of the dry storage project facilitates major dismantlement work SCE plans to complete within 20 years.

SCE announced in June 2013 that it would retire San Onofre Units 2 and 3, and begin preparations to decommission the facility. SCE has established core principles of safety, stewardship and engagement to guide decommissioning. For more information about SCE, visit www.songscommunity.com.

About Southern California Edison
An Edison International (NYSE:EIX) company, Southern California Edison is one of the nation's largest electric utilities, serving a population of nearly 14 million via 4.9 million customer accounts in a 50,000-square-mile service area within Central, Coastal and Southern California.

San Onofre Nuclear Waste Problems

Tom English, Ph.D., Samuel Lawrence Foundation
Subrata Chakraborty, Ph.D., UCSD, Dept. of Chemistry and Biochemistry
Rear Admiral Len Hering Sr. USN (ret)

January 2019

INTRODUCTION

In August 2018, a near-accident during the loading of nuclear waste into dry storage triggered a federal investigation and brought new urgency to the debate of how best to store some of the most dangerous waste known to humankind – spent nuclear fuel. The San Onofre Nuclear Generating Station (S.O.N.G.S.) closed in 2012 after a number of serious failures. Since then, Southern California Edison and its contractor, Holtec International, built a concrete storage vault to hold 3.6 million pounds of nuclear waste in dry storage. That vault is footsteps from the rising Pacific Ocean. In our brief report, we explore the fatal flaws of this location and recommend moving the storage facility to a technically defensible storage facility at a significantly higher elevation with distance from the ocean. We address the inadequacy of the equipment used to move and contain the nuclear waste material. We explore the gouging that occurs when stainless steel canisters are lowered into the storage vault and how gouging compromises the integrity of the containers. Finally, we examine management practices at San Onofre and an apparent lack of supervision, training and protocols. The examination of the perils of S.O.N.G.S. Independent Spent Fuel Storage Installations' poor location, poor technology and poor management, presents an urgent situation for regulators to: order Edison to permanently stop the loading of canisters into dry storage, require Edison to store the waste in canisters that may be inspected, and secure an independent analysis and risk assessment of canister loading procedure.

RATIONALE

Most serious of the issues facing the interim storage of nuclear waste at S.O.N.G.S. include the gouging damage to fully-loaded steel canisters upon downloading into the storage vault. These 54-ton thin-walled steel canisters are loaded with nuclear waste in wet storage – spent fuel pools – and are transported to the on-site concrete storage vault, adjacent to the reactor domes. With the Brinell hardness scale calculations our team demonstrates the depth and width of canister gouges upon downloading into the storage system. The current downloading procedure and on-site storage configuration provides the factors necessary to create gouges in the external steel walls of the canisters: operators have no visibility of the canister during downloading and precise adjustments to canister orientation cannot be made. These gouges remain undetected and unrepaired due to the lack of thorough inspection and monitoring at

the San Onofre Independent Spent Fuel Storage Installations (ISFSIs). The preliminary findings are found in this report.

1. POOR LOCATION

Today, two separate Independent Spent Fuel Storage Installations (ISFSIs) exist at San Onofre. The newest, built by Holtec, is located about 100 feet from the Pacific Ocean on the 85-acre grounds of S.O.N.G.S. The property is part of Marine Corps Base Camp Pendleton and is owned by the Department of the Navy. Two of the nation's busiest transportation corridors -- Interstate 5 and the Los Angeles-San Diego-San Luis Obispo Rail Line -- flank the site. The ISFSIs are clearly visible in Google Earth images and in numerous published photographs. The high accessibility and visibility of the site leaves it extremely vulnerable to an act of malfeasance.

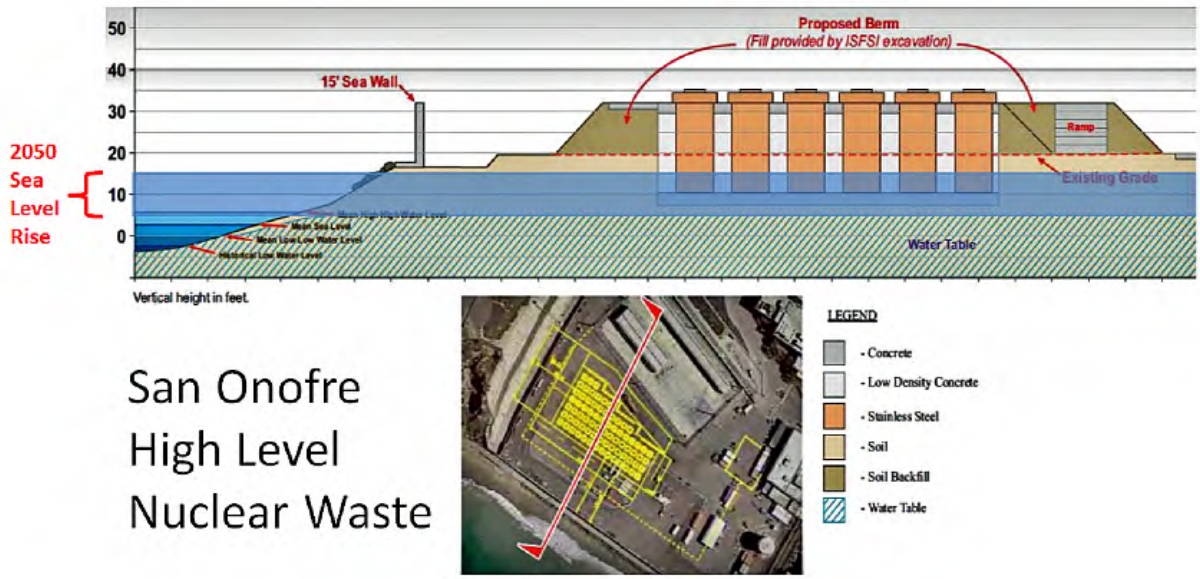

Figure 1. Independent Spent Fuel Storage Installations and Storage Vault.

Forces of nature, exacerbated by sea-level rise, carry further risks. Frequent high humidity and coastal fog make the metal at the site susceptible to short-term corrosion and stress-induced corrosion cracking. Also located at this site is a second, older ISFSI, which contains 51 thin-walled steel canisters that are up to 15 years old.

Numerous reports show that mean high tide level is about 18 inches below the base of the newer, oceanfront ISFSI, which was designed by Holtec. Since this is the mean height, the sea level frequently exceeds this height. Hence, it is likely the present ground water table will leach into the storage vault and result in at least damp storage. Further sea level rise due to climate change will make this problem far worse.

Dr. James Hansen, who managed NASA's climate change program for about 25 years, predicts sea levels could rise up to 10 feet during the next 50 years. At San Onofre, this would cause the bottom seven feet of the Holtec nuclear storage canisters to be submerged in seawater, unintentionally resulting in wet storage. This would invite a crisis similar to that of Fukushima, where spent fuel was exposed to moisture.

A second estimate appears in a comprehensive report by the Working Group of the California Ocean Protection Council Science Advisory Team. Published in 2017, the report shows 75% likelihood sea levels will rise by two feet by 2100. Either of these scenarios envisions that a major portion of the nuclear storage canisters as San Onofre would be submerged in seawater. The combination of the effects of sea-level rise and ground water inundation at the current location would change the Holtec ISFSI to wet storage site, for which it was not designed. Hence, little if anything would be accomplished by moving the waste from the spent-fuel pool to the dry storage ISFSI. The dangers would not be decreased. If anything, the inability to adequately measure and mitigate the impacts of corrosion on the underground nuclear canisters would lead to a significant increase in risk.

All of this can be avoided. If the nuclear waste at the two ISFSIs is transferred into thick-walled casks and then moved to a technically defensible storage facility at higher ground, the problems of ocean water and ground water intrusion can be avoided. As an added benefit, the waste would be easier to secure from an act of malfeasance.

2. POOR TECHNOLOGY

In California, the storage tanks at gas stations must be double-walled; painful experience has shown that single-walled containers can leak gasoline into the groundwater system. With a double-walled fuel tank, if a leak occurs it can be detected and the storage container can be repaired or replaced before any gasoline is released. At San Onofre, we certainly should expect that some kind of leak prevention system would be in place to contain extremely toxic high-level radioactive waste. Additionally, the canisters should be able to be monitored and inspected. The thin-walled canisters at the San Onofre ISFSIs cannot be adequately monitored or inspected. Regulators and Holtec officials have stated that the canisters cannot be inspected from the inside or the outside for cracks or other degradation and that, even if damage could be identified, it would be impossible to fix.

To illustrate the importance of adequate monitoring, we analyze a scenario in which one vent of a canister clogs. We refer to a Holtec non-proprietary safety analysis report[1] that calculates a temperature rise to about 90% of the maximum permissible limit (MPL) in 24 hours. This infers that within the next 12 hours the system will exceed the MPL rating and lead to a meltdown[2].

[1] Table 4.I.9, page 1050, Holtec International Final Safety Analysis Report for the HI-STORM 100 Cask System. USNRC Docket No.: 72-1014, Holtec Report No.: HI-2002444.
[2] S. Alyokhina, Thermal analysis of certain accident conditions of dry spent nuclear fuel storage, Nuclear Engineering and Technology 50 (2018) 717-723.

Through our own statistical analysis,[3] we prove that if the probability of clogging one of the vents during an event is 1%, then the chance that one of the 146 total vents (two vents on each of 73 canisters) will clog in such an event is 78%. This chance reduces to 53% if we reduce the probability of occurrence to .5% from 1%. Tsunamis followed by clogging are dependent events and thus the combined chance of such an event is about 11% during a 30-year period. The sea level rise, the rise of tide levels and the associated rise in the coastal aquifer are all interlinked, as discussed previously. These climate-related phenomena could cause serious damage to the ISFSIs. Therefore, close monitoring and the use of proven thick-walled cask technology for all nuclear waste storage containers is not only necessary but urgent. A mishap could imperil the lives and livelihoods of more than 8 million people who live within 50 miles of the ISFSIs.

2.1 NEAR MISS EVENT

David Fritch, an industrial safety inspector turned whistleblower, remembers August 3, 2018, as a bad day. Fritch worked at San Onofre during a loading failure that left a fully-loaded 54-ton canister of high-level radioactive waste stuck on the lip of a guide ring. Above the 17-foot-tall canister, the slings that attached it to the behemoth loading rig had gone slack.

The canister was, “hanging by about a quarter inch,” Fritch told attendees of the community engagement panel on August 9. “It’s a bad day. That happened, and you haven’t heard about it, and that’s not right. What we have is a canister that could have fallen 18 feet.”

Subsequent investigations revealed that the operators and managers could not see Canister No. 29 as it was being loaded into the storage cavity and became stuck for nearly an hour.

Since the near-accident, regulators have halted further loading of canisters into the seaside storage vault and researchers have explored what could have happened if Canister No. 29 had fallen.

Our own research explores the basic physics of a fully-loaded 54-ton canister in free fall to extrapolate the upper energy involved in the initial impact.

For example, the falling canister could hit the steel-lined concrete floor of the nuclear waste storage facility with explosive energy greater than that of several large sticks of dynamite. The resultant damage to the canister could cause a large radiation release.
At point of contact at the bottom of the storage cavity, damage to the concrete and metal structure could ruin the cooling system. The damage to the concrete would equal that of a fully-loaded 18-wheeler truck, with a gross weight of 80,000 pounds, crashing into reinforced concrete at 23 miles per hour. Our preliminary calculations show the combination of the weight and velocity of the dropped canister exceeds the ISFSIs’ “design criteria for tornado missiles,” by a factor of 4. Future experiments should include drop tests of the actual canisters with non-

[3] Chakraborty and English, 2019, ES&H Risk Estimation from “Interim Storage” of SNF at the Beach: The San Onofre NPP, WM2019 Conference, March 3-7, 2019, Phoenix, Arizona, USA (under review).

radioactive loads that simulate the weight of the spent fuel assemblies and fuel baskets to determine what would happen to the actual canisters.

Southern California Edison is set to move 73 canisters into the seaside storage vault and, at the time of publication, has moved 29. Each nuclear storage canister contains 37 spent fuel assemblies, which generate enormous amounts of heat. The systems are cooled by a simple air duct system, which could have been blocked by the damage caused by the canister's fall. If that had happened, great quantities of water would have been needed to cool the reaction and prevent or control a meltdown. The enveloping water would instantly become radioactive steam, as we saw at Fukushima. In the heavily-populated area surrounding San Onofre, however, radioactive steam could prompt the evacuation of millions of people. What's more, since both the canister and the surrounding structure could be badly damaged, there would be no available way to pull the damaged canister from the storage cavity.

Nuclear Regulatory Commission (NRC) computer simulations show what happens when a nuclear storage canister with slightly thinner walls[4] drops from 19 feet. In the test, a canister falls from a transfer cask onto a storage pedestal. The canister failure rate was 28%. Similar calculations must be performed at San Onofre to determine if that storage system has a similar probability of canister failure. At 28%, that is more than a one-in-four chance of catastrophic failure. Would you fly on an airplane with those odds? Our analysis alone should place the NRC, policymakers and Edison on alert. A more substantial analysis must be completed to examine the potential damage that can be caused by a falling, fully-loaded 54-ton nuclear storage canister.

Continued loading of the nuclear waste into canisters threatens the lives and livelihood of more than 8 million people. Software and computer resources are available by which estimates can be made of the impacts of a dropped canister on both the reinforced concrete and the canister walls. The NRC-approved Holtec technical specifications state that a canister drop of more than 11 inches requires the contents of the canister to be inspected for damage. This specification assumed the canister was in a transfer cask. The impact of an un-casked canister was never analyzed because Holtec and the NRC assumed it could never happen, citing triple-redundancy of the fuel transfer system. But a subsequent NRC inspection revealed that on August 3rd, all three components of this system simultaneously failed. Only the accidental snag of a quarter-inch of the 54-ton canister on the lip of the guide ring prevented a catastrophe.

Our research suggests the entire storage system may need to be redesigned to reduce the probability of canister failure to levels that are acceptable in such a highly-populated area.

[4] Pg. 4-24 Table 12, NUREG-1864 - A Pilot Probabilistic Risk Assessment of a Dry Cask Storage System at a Nuclear Power Plant, March 2007, A. Malliakos, NRC Project Manager

RESULTS

2.2 GOUGES IN DROPPED CANISTER

In their 2007 report, the NRC's analysts did not consider the impact of gouges on the strength of canister walls. There was no need, the analysts and a Holtec official said, as gouges were not important to the system under examination. We disagree. A detailed analysis of gouging is necessary to properly evaluate the damage to Canister No. 29 during the botched loading and to every other canister loaded into the ISFSI.

We established preliminary results of such an analysis using the Brinell hardness scale approach to estimate the depth and width of expected gouges in 316 stainless steel, of which the Holtec canisters at San Onofre is made.

While the canister is stuck, the guide ring gouges the bottom of the canister.

As the canister drops it is gouged on two sides by a combination of the guide ring, the storage cavity wall and the inner diameter of the transfer cask. This gouging absorbs some of the kinetic energy of the canister.

When the canister smashes into the bottom of the cavity, the kinetic energy and momentum from the fall will be dissipated by damage to:

- the ISFSI;
- the canister; and
- the contents of the canister.

The formation process of gouges will exert a force on the canister. This is the force, P, shown in Figure 2.

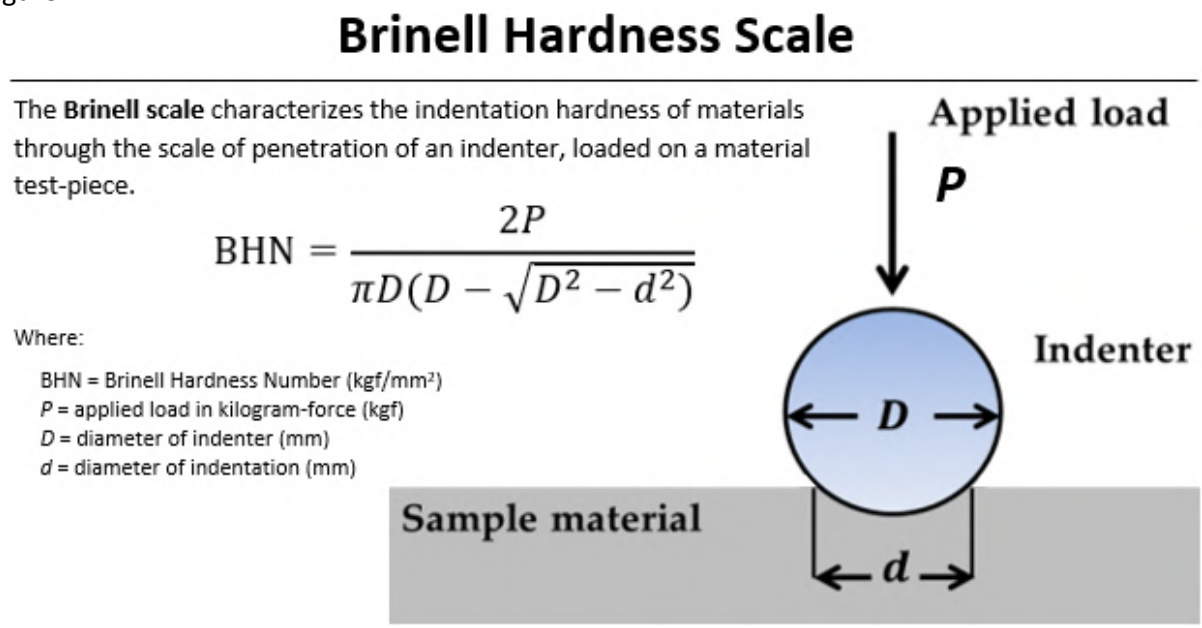

Figure 2. Brinell hardness scale calculation. Credit: *The Samuel Lawrence Foundation*.

In Figure 3, the width of a gouge is shown in relationship to the canister's weight. The expected range of gouge widths is shown in Figure 3. A variety of indenter widths are used as a surrogate for the gouging. The gouging widths range from 2 mm to 16 mm. This is highly significant, since the thickness of the nuclear canisters is 5/8", which is close to 16 mm. We recommend that tests be performed on actual canisters to experimentally determine the accuracy of these predictions.

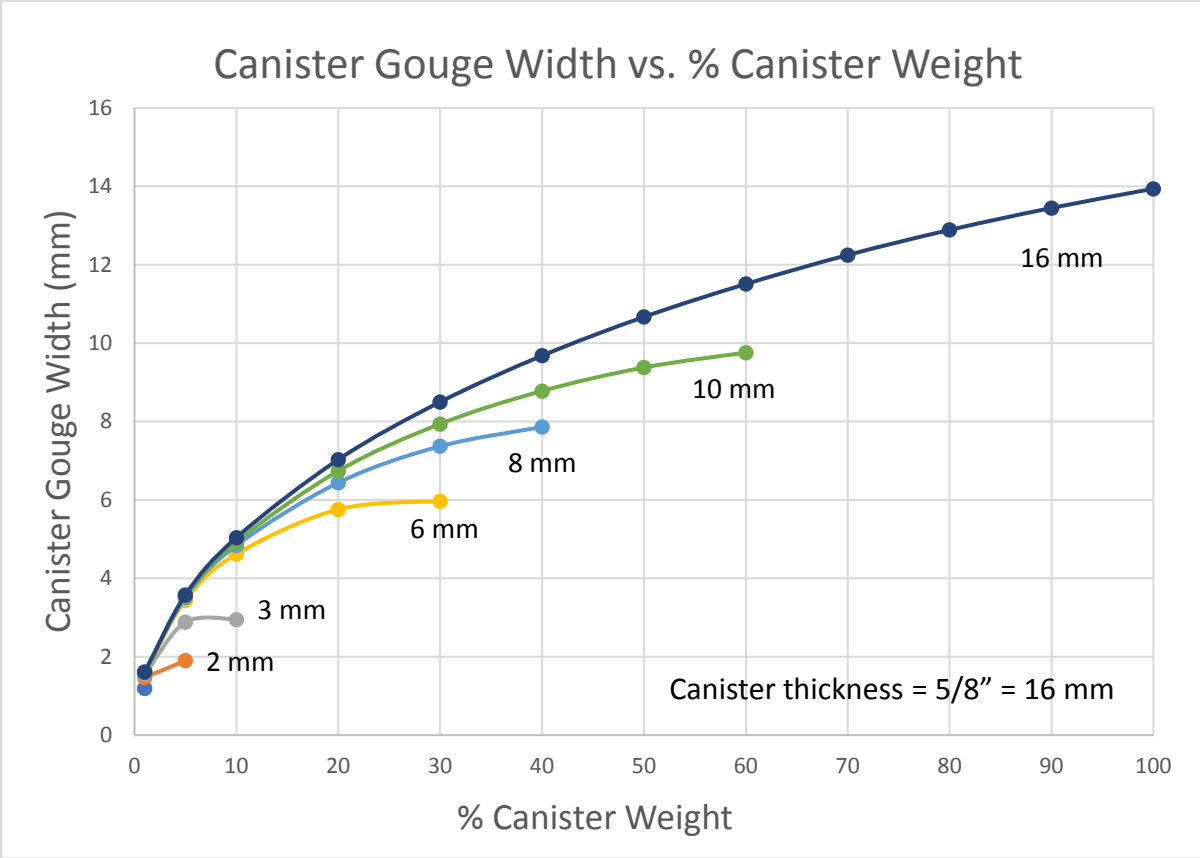

Figure 3. Calculated penetration width of gouge as a function of load for different intender diameter. The hardness number in Brinell scale for stainless steel 316 (BHN) is 217 kgf/mm^2. Saturated zone is eliminated.

The expected range of gouge depths is shown in Figure 4. A variety of indenter depths are used as a surrogate for the gouging. The gouging depths expected to be found range from 1 mm to 4.5 mm. This is highly significant, since 4.5 mm is 28% of the thickness of the nuclear storage canister.

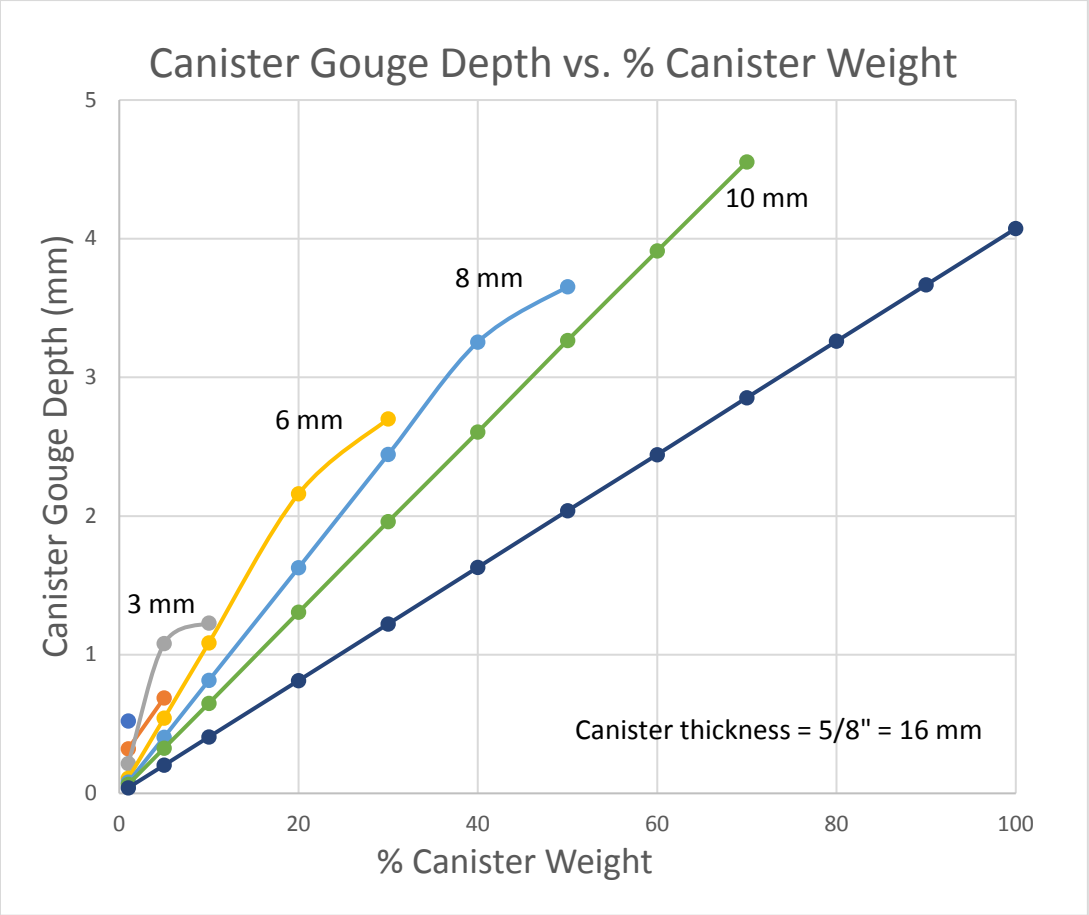

Figure 4. Calculated penetration depth of gouge as a function of load for different intender diameter. The hardness number in Brinell scale for stainless steel 316 (BHN) is 217 kgf/mm^2.

2.3 GOUGES DURING ROUTINE LOADING

Extensive gouging will also occur during routine loading of the nuclear storage canister into the storage cavity. By moving the Vertical Cask Transporter, shown in Figure 5, crude adjustments can be made to the alignment of the canister as it is lowered into the storage cavity. The bulky, tank-like machine travels on steel treads, like those found on earth-moving or military equipment. The transporter is not equipped to make the fine adjustments required to insert the nuclear storage canister into the narrow spacing of the storage cavity without banging the canister against the guide ring. This banging gouges the canister and causes the canister to move side-to-side, similar to a pendulum. An Edison official has referred to this process as “jiggling.” This jiggling process continues for 15 to 30 minutes as the canister is lowered to the bottom of the storage cavity. Each “jiggle” causes the type of gouging shown in Figure 3 and

Figure 4. We expect that this routine loading process produces a multitude of gouges that significantly damage the canister walls, rendering them unsuitable for storage of nuclear waste.

Figure 5. Vertical Cask Transporter during downloading and alignment of a canister. Credit: *San Onofre Special Inspection Webinar Presentation (NRC)*.

We strongly recommend that a sampling of the canisters previously lowered into the storage vault be removed and inspected so the extent of gouging can be experimentally determined. We expect the damage will be so severe that the current ISFSI will need to be replaced.

3. POOR MANAGEMENT

During the late 1970s and early 1980s, Rear Admiral Len Hering, USN (ret) served as a Nuclear Weapons Safety Officer, Handling Officer and Surety Officer. Admiral Hering provides the following assessment of management practices at the S.O.N.G.S. ISFSI.

When it comes to the handling and movement of nuclear material, you would expect that only those specifically qualified and trained for such an important task would be deployed to ensure the safe movement of that material. In the Department of Defense (DOD), strict requirements are in place to make sure this very dangerous material is properly handled, transported and stowed.

The DOD and Navy programs were created and built to make certain nuclear material was secure, safely handled and accounted for. Every person who has any contact with nuclear material is required to have a security clearance. A “two-person rule” is in effect at all times. Personnel at all levels perform countless hours of training, obtain certifications of qualification, and complete rigorous inspection and training events to both prove and assure their proficiency in performing the job they are assigned. All of this is all done before anyone is permitted to even gaze upon a real weapon.

Handling gear and all aspects of the evolution are vigilantly maintained, inspected, weight-tested and inspected again. Cranes and dollies or hoist equipment are tested, placed under extreme loading conditions and prepared for specific tasks. Nothing goes untested. Nothing. We leave nothing to chance and we never hypothetically presume. If it isn’t tested and proven, it isn’t done with the actual material in question.

Ashore, and specifically at S.O.N.G.S, I find that virtually none of the protocols that should be expected for the safe handling of this dangerous material are present. I find that personnel and companies are being hired virtually off the street, no specific qualification standards are present or for that matter even required, training is not specific to the risks of the material involved, and there is no fully-qualified and certified team assembled for this highly-critical operation. They have not been required to conduct dry runs to ensure handling teams are proficient and, more importantly, they have never trained specifically to be ready to execute emergency procedures should the unexpected occur. The manuals are not on site, nor are they being followed to step a team through the evolution of moving the nuclear waste. Team leaders have no specific handling qualifications or training. Even the industrial safety inspectors are not specifically nuclear-certified but are general industrial specialists. No manuals are available for procedural review and, by their own admission, the required number of safety officials are often absent during movement of the nuclear storage canisters. In the Navy, if a near-accident such as the one at S.O.N.G.S is uncovered, the Commanding Officer, Weapons Officer -- and anyone else with a significant position on the team -- are relieved. The ship is then ordered to stand-down while a team of experts off-loads its cargo.

The widely reported incident in which a 54-ton, thin-walled container nearly fell 18 feet while it was being lowered into its silo rocked me to the core. What made things worse was narrative in a follow-up report that stated the canister was left suspended for nearly an hour, held up by a mere guide ring installed in the silo, cables slack and operators clueless. There is no doubt that this incident occurred because those on-scene were completely unqualified, unprepared, untrained and incompetent. This very dangerous operation was being performed as if this crew were moving a simple stack of wood around a construction site when, in actuality, the crew was conducting one of the most dangerous operations in the industrial sector. No one was relieved, fired or held accountable. The investigation being conducted is flawed in that those responsible for this deplorable safety environment are the same people who will feed findings to the investigation.

The handling of nuclear waste at San Onofre and other sites across our country should scare every single American. We have a regulatory agency that has failed to make sure the most basic safety precautions are being applied to one of the most dangerous industrial evolutions of our time. The number of waivers being issued where safety is of concern is staggering.

In the DOD, the reason why there were and continue to be no significant accidents with the handling of nuclear material is because there are no waivers and there are no quick wins. Workers are fully qualified, inspected and certified to handle this very dangerous material. In this case, there is no room for error. One mistake is too many. It is my professional opinion that we need to hit the reset button before a disaster of unparalleled portion occurs.

CONCLUSION

The nuclear waste at San Onofre requires a much better storage configuration and must be moved to a technically defensible storage facility to reduce threats. From a security standpoint, the waste should be moved further away from major transportation corridors. The thin-walled nuclear waste storage canisters are at risk of failure due to gouging when downloaded into the seaside storage vault. Once lowered into the storage system, the canisters cannot be thoroughly inspected, monitored or repaired. A near-accident on August 3rd demonstrated that safety protocols are lacking, and that further study is needed to understand the consequences of dropping a fully-loaded 54-ton canister of nuclear waste. The incident revealed that the loading equipment is imprecise and revealed a pattern of mismanagement in canister loading procedure. A complete analysis of canister loading procedure and comprehensive risk assessment must be conducted by an independent party with absolute transparency. If an accident, natural disaster, negligence, or an act of terrorism were to cause a large-scale release of radiation, the health and safety of 8.4 million people within a 50-mile radius would be put at risk. To secure the nuclear waste properly, we recommend a permanent stop to the loading of nuclear storage canisters into the seaside storage vault, placing spent fuel into reliable canisters that can be monitored, inspected and repaired, and moving these canisters to an acceptable storage facility at a significantly higher elevation.

EXHIBIT 7

EXHIBIT 28

ARTICLE XII.
CONTRACTOR'S WARRANTIES

12.1 WARRANTIES.

(a) Contractor warrants to Company that all Equipment shall be (i) new and of good quality; (ii) free from improper workmanship and Defects; (iii) conform to all applicable requirements of all Applicable Laws and all Applicable Permits; and (iv) be fit for Company's use in the nuclear power industry for the intended purpose. If Contractor accepts the Existing Canisters for use, Contractor warrants that the Existing Canisters shall be free from Defects or improper workmanship to the extent caused by or due to Contractor's acts or omissions.

(b) Contractor warrants to Company that the Work will be performed in a good and workmanlike manner, and that the Work will: (i) conform to and be designed, engineered and constructed in accordance with the Drawings, Scope of Work, all Applicable Laws and Applicable Permits and other terms of the Contract Documents; (ii) conform with, and be designed and engineered according to professional standards and skill, expertise and diligence of design professionals regularly involved in decommissioning projects similar to the Project, and comply with the requirements of the relevant Government Authorities, including the NRC; (iii) be suitable for the use as set forth in the Technical Specification; (iv) be compatible with the spent fuel pools for Units 2 and 3, spent fuel, fuel handling building, the existing ISFSI, Jobsite, and the SONGS site conditions; (v) contain the Equipment, supplies and materials described in the Scope of Work, all installed in accord with the applicable Contract Documents; (vi) in the case of Apparatus be designed, engineered, licensed, fabricated and manufactured using appropriate and approved processes, procedures and materials and to comply with and satisfy all the terms of the Certificate of Compliance issued by the NRC to Contractor as modified or amended as contemplated herein; (vii) in the case of Drawings or documents required hereunder, accurately and completely present information required to be included therein or necessary to avoid misunderstandings of the included content; and (viii) at such times as the NRC issues or amends a Certificate of Compliance with respect to an Apparatus or Existing Canisters, as applicable, the Apparatus or such Existing Canister specifically approved by the NRC to perform functions required by regulation as described in such Certificate of Compliance shall perform its required functions set forth in such Certificate.

(c) Contractor warrants to Company that all of the documents prepared by Contractor for submittal to a Government Authority for review and approval shall be prepared in full compliance with Applicable Laws and in form and substance such that Company shall not be

required to modify or revise such documents due to a failure to include any required information, inaccuracies or the use of inappropriate forms or formats.

(d) Contractor warrants to Company that none of the Work, including the Equipment (but not including the Existing Canisters), the Drawings, Final Plans and the design, engineering and other services rendered by Contractor hereunder, nor the use or ownership thereof by Company in accordance with the licenses granted hereunder, infringes, violates or constitutes a misappropriation of any trade secrets, proprietary rights, intellectual property rights, patents, copyrights or trademarks.

(e) Except as expressly stated herein to the contrary, Contractor warrants that it shall remedy, in accordance with Section 12.2, any Defects in the Work due to faulty design, materials or workmanship which appear within a period commencing upon the date of ISFSI Scope Completion and continuing for the applicable period following the ISFSI Scope Completion Date (as such period may be extended in accordance with the terms hereof, the "Warranty Period"), as follows:

(i) with respect to the MPC-37 canisters, twenty five (25) years;

(ii) with respect to Contractor's Work on Existing Canisters used to store non-fuel waste from the spent fuel pools, twenty five (25) years; provided that the Warranty Period with respect to such Work shall commence on the date that the last of the Existing Canisters containing non-fuel waste are loaded on the ISFSI during Post-ISFSI Scope Work and the related Milestone has been completed;

(iii) with respect to the Contractor's Work on Existing Canisters used to store greater than class "C" radioactive waste from reactor vessel segmentation in the Post-ISFSI Scope Work, twenty five (25) years; provided that the Warranty Period with respect to such Work shall commence on the Final Acceptance Date;

(iv) with respect to the HI-STORM UMAX System, ten (10) years;

(v) with respect to any other Work that is required to be completed in order to achieve ISFSI Scope Completion, including Contractor's Work on any newly assembled AHSM-HS modules that are used by Contractor in the performance of the Work, two (2) years; and

(vi) with respect to any other Work that is completed after the ISFSI Scope Completion Date, two (2) years from the Final Acceptance Date.

Contractor shall bear all costs of corrections and repairs during the Warranty Period. The provisions of this Section 12.1 apply to Work performed by Subcontractors as well as Work performed directly by Contractor. The provisions of this Article XII do not apply to corrective work caused by the acts or omissions of Company or any separate contractor of Company. If and in the event Company notifies Contractor of a Defect within the Warranty Period, Contractor, at Contractor's expense, shall perform all Work necessary to remedy the Defect, and the repair or replacement Work performed by Contractor to accomplish that purpose shall be subject to an additional express warranty from the date the repair or replacement is completed which shall continue for a duration equivalent to the original Warranty Period.

(f) Notwithstanding anything to the contrary herein, the warranties set forth in this Section 12.1 shall not apply with respect to any claims to the extent arising from (i) any use of the Work or components thereof by Company that exceeds the requirements or recommendations in Contractor's operation and maintenance manuals; (ii) the failure of any Equipment or Work to be maintained in accordance with Contractor's written instructions; or (iii) the modification of any Equipment or Work without Contractor's written consent.

(g) THE WARRANTIES OF CONTRACTOR SET FORTH IN THIS AGREEMENT ARE EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES, WHETHER STATUTORY, EXPRESS OR IMPLIED (INCLUDING ALL WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE AND ALL WARRANTIES ARISING FROM COURSE OF DEALING AND USAGE OF TRADE). The foregoing sentence is not intended to disclaim any other obligations of Contractor set forth herein.

12.2 REPAIR OF NONCONFORMING WORK.

(a) If any of the Work is found to contain Defects, or Contractor is otherwise in breach of any of the warranties set forth in Section 12.1 within the Warranty Period, Contractor shall at its sole cost and expense and without reimbursement hereunder correct, reperform, repair or replace such Defect or otherwise cure such breach as promptly as practicable upon being given notice thereof. Subject to Section 12.3, Company shall give notice to Contractor within two (2) Business Days of discovery of such Defect. Company shall provide Contractor with reasonable access to the Project in order to perform such corrective Work and the Parties shall schedule such corrections or replacements as necessary so as to minimize disruptions to any on-going activities at SONGS. Contractor shall bear all costs and expenses associated with correcting any Defect or breach of warranty, including necessary disassembly, transportation, reassembly and retesting, as well as reworking, repair or replacement of such Work, disassembly and reassembly of piping, ducts, machinery, Equipment or other Work as necessary to give access to improper, defective or non-conforming Work and correction, removal or repair of any damage to other work or property that arises from the Defect. If Contractor is obligated to repair, replace or renew any Equipment, item or portion of the Work hereunder, Contractor will undertake a technical analysis of the problem and correct the "root cause" unless Contractor can demonstrate to Company's satisfaction that there is not a risk of the reoccurrence of such problem. Contractor's obligations under this Section 12.2 shall not be impaired or otherwise adversely affected by any actual or possible legal obligation or duty of any Subcontractor to Contractor or Company concerning any Defect or breach of warranty.

(b) If (i) Contractor fails to complete or commence with due diligence to complete the correction of any Defect or cure of any breach of warranty as required herein within twenty (20) days after receipt of written request from Company to perform such obligations, or (ii) a Defect cannot be corrected within twenty (20) days and Contractor fails to provide a correction plan within five (5) Business Days after receipt of Company's written request to perform such obligations or thereafter fails to implement the plan with due diligence following Company's approval of the plan, then Company may correct or cause to be corrected such Defect or cure such breach of warranty and Contractor shall be liable for all reasonable costs, charges, and expenses incurred by Company in connection therewith (including reasonable and necessary consultants' fees), and Contractor shall, within fifteen (15) days after request therefore, pay to

Company an amount equal to such reasonable costs, charges, and expenses. Any such request by Company shall be accompanied by proper documentation evidencing such reasonable costs, charges and expenses. Any amounts not paid when due shall accrue interest at the Reference Rate (established as of the first day of the month in which payment is due) from the date due until paid. Company and Contractor agree to treat (and shall cause each of their respective Affiliates to treat) any payment made to Company pursuant to this Section 12.2(b) as an adjustment to the Contract Price unless a final determination (which shall include execution of an Internal Revenue Service Form 870-AD or successor form) provides otherwise.

(c) If, during the Warranty Period, Contractor shall change, repair or replace any major Equipment item or component, Company, in its reasonable discretion and consistent with Applicable Laws or Applicable Permits, may require Contractor to assist Company in conducting any test required by any Applicable Law or Applicable Permit with respect to the affected Equipment; provided, however, in connection with any such test, appropriate allowance with respect to the performance of such Equipment shall be made for the fact that such Equipment may have operated prior thereto. If after running such test, the results indicate Contractor has not fulfilled any of its warranty obligations and there is a degradation in the performance of the Project and such degradation results from the warranty Work performed in accordance with this Article XII, then Contractor shall repair, correct or replace such affected Equipment and assist Company in re-running such test until the results no longer indicate a degradation in the performance of the Project resulting from the warranty Work performed in accordance with this Article XII. If Contractor cannot reasonably correct such degraded warranted performance condition then the Parties shall negotiate an equitable settlement of Company's damages based on the amount and scope of such deficient warranted performance, or if the amount of such deficient warranted performance is considered by Company to be a material breach of the terms of this Agreement, then Company may declare such breach to be a Contractor Event of Default pursuant to Section 15.1.

12.3 REPAIRS AND TESTING BY COMPANY.

During the Warranty Period, in the event of an emergency and if, in the reasonable judgment of Company, the delay that would result from giving notice to Contractor could cause serious loss or damage which could be prevented by immediate action, any action (including correction of Defects) may be taken by Company or a third party chosen by Company. Company shall give notice to Contractor within two (2) Business Days of discovery, and in the case of a Defect, the reasonable cost of correction shall be paid by Contractor. In the event such action is taken by Company, Contractor shall promptly respond within five (5) Business Days after correction efforts are implemented, and shall assist whenever and wherever possible in making the necessary corrections. All such warranties obtained shall be in addition to, and shall not alter the warranties of, Contractor. Upon Company's request, Contractor shall use all reasonable efforts to cause Subcontractors to honor warranties including filing suit to enforce same.

12.4 SUBCONTRACTORS. Contractor shall, for the protection of Contractor and Company, obtain from the Subcontractors such guarantees and warranties with respect to Work performed and Equipment supplied, used and installed hereunder as are reasonably obtainable, which guarantees and warranties shall equal or exceed those set forth in Section 12.1 and shall be made available and assignable to Company to the full extent of the terms thereof upon the expiration of Contractor's warranty hereunder. Company shall be an express third party

beneficiary of all such guarantees and warranties, provided such third party beneficiary rights shall not be effective unless this Agreement has been terminated. If available, Company may require Contractor to secure additional warranty or extended guarantee protection pursuant to a Change Order issued in accordance with the provisions of Article VI. Upon the earlier of the ISFSI Scope Completion Date or termination of this Agreement, Contractor shall deliver to Company copies of all relevant contracts providing for such guarantees and warranties.

12.5 CONDITIONS OF WARRANTIES. The warranties set forth in this Article XII are subject to the following conditions applicable to the item for which Company claims a breach of warranty exists:

(a) Company shall notify Contractor in writing of any Defect in the Work as soon as reasonably practicable after Company becomes aware of such Defect.

(b) Company shall have the right to continue to use the Equipment, including the Apparatus, as applicable, or any part thereof, which may require warranty correction or repair until such time as Company elects to remove such Equipment, or part thereof, as applicable, from service; provided, however, in such event, Company shall release Contractor from any additional claims for further defects or damage incurred as a result of such continued operation.

(c) Company shall use and maintain the Equipment, including the Apparatus, in accordance with the operation and maintenance procedures agreed upon by the Parties pursuant to this Agreement (these procedures shall be written by Contractor as part of Contractor's Work so as to integrate (where applicable) or replace and supersede (where not applicable) the operations and maintenance procedures required by the original manufacturer for the Existing Equipment and Existing Canisters such that Contractor may not assert that Company's failure to comply with any separate requirements from the existing manufacturer limits the warranty provided herein by Contractor).

(d) Completion of payments by Company shall not relieve Contractor of any of its warranty obligations.

12.6 ASSIGNMENT OF WARRANTIES. Contractor shall assign to Company or obtain for Company's benefit the manufacturer's warranties for all of the Equipment, including the Apparatus and other deliverables, which are provided in connection with the Work, but which are not manufactured by Contractor, including for Work performed under Section 12.3. Such assignment of warranties to Company must also allow Company to further assign such warranties.

12.7 SURVIVAL OF WARRANTIES. The provisions of this Article XII shall survive the expiration or termination of this Agreement.

U.S. NUCLEAR REGULATORY COMMISSION

CERTIFICATE OF COMPLIANCE FOR SPENT FUEL STORAGE CASKS

The U.S. Nuclear Regulatory Commission is issuing this Certificate of Compliance pursuant to Title 10 of the Code of Federal Regulations, Part 72, "Licensing Requirements for Independent Storage of Spent Nuclear Fuel and High-Level Radioactive Waste" (10 CFR Part 72). This certificate is issued in accordance with 10 CFR 72.238, certifying that the storage design and contents described below meet the applicable safety standards set forth in 10 CFR Part 72, Subpart L, and on the basis of the Final Safety Analysis Report (FSAR) of the cask design. This certificate is conditional upon fulfilling the requirements of 10 CFR Part 72, as applicable, and the conditions specified below.

Safety Analysis Report Title

Holtec International
Final Safety Analysis Report for the
HI-STORM UMAX Canister Storage System

This certificate is conditioned upon fulfilling the requirements of 10 CFR Part 72, as applicable, the attached Appendix A (Technical Specifications) and Appendix B (Approved Contents and Design Features), and the conditions specified below:

APPROVED SPENT FUEL STORAGE CASK

Model No.: HI-STORM UMAX Canister Storage System

DESCRIPTION:

The HI-STORM UMAX Canister Storage System consists of the following components: (1) interchangeable multi-purpose canisters (MPCs), which contain the fuel; (2) underground Vertical Ventilated Modules (VVMs), which contains the MPCs during storage; and (3) a transfer cask (HI-TRAC VW), which contains the MPC during loading, unloading and transfer operations. The MPC stores up to 37 pressurized water reactor fuel assemblies or up to 89 boiling water reactor fuel assemblies.

The HI-STORM UMAX Canister Storage System is certified as described in the" UMAX" Final Safety Analysis Report (FSAR) supplemented by the information on the MPCs and transfer cask in the HI-STORM FW FSAR, and in the U. S. Nuclear Regulatory Commission's (NRC) Safety Evaluation Report (SER) accompanying the Certificate of Compliance (CoC).

The MPC is the confinement system for the stored fuel. It is a welded, cylindrical canister with a honeycombed fuel basket, a baseplate, a lid, a closure ring, and the canister shell. All MPC components that may come into contact with spent fuel pool water or the ambient environment are made entirely of stainless steel or passivated aluminum/aluminum alloys. The canister shell, baseplate, lid, vent and drain port cover plates, and closure ring are the main confinement boundary components. All confinement boundary components are made entirely of stainless steel. The honeycombed basket provides criticality control.

DESCRIPTION (continued)

There are two types of MPCs permitted for storage in HI-STORM UMAX VVM: the MPC-37 and MPC-89. The number suffix indicates the maximum number of fuel assemblies permitted to be loaded in the MPC. Both MPC models have the same external diameter.

The HI-TRAC VW transfer cask provides shielding and structural protection of the MPC during loading, unloading, and movement of the MPC from the cask loading area to the VVM. The transfer cask is a multi-walled (carbon steel/lead/carbon steel) cylindrical vessel with a neutron shield jacket attached to the exterior and a retractable bottom lid used during transfer operations.

The HI-STORM UMAX VVM utilizes a storage design identified as an air-cooled vault or caisson. The HI-STORM UMAX VVM relies on vertical ventilation instead of conduction through the fill material around the VVM, as it is essentially a below-grade storage cavity. Air inlets and an air outlet allow air to circulate naturally through the cavity to cool the MPC inside. The subterranean steel structure is seal welded to prevent ingress of any groundwater in the MPC storage cavity from the surrounding subgrade, and it is mounted on a stiff foundation. The surrounding subgrade and a top surface pad provide significant radiation shielding. A loaded MPC is stored within the HI-STORM UMAX VVM in a vertical orientation.

CONDITIONS

1. OPERATING PROCEDURES

Written operating procedures shall be prepared for handling, loading, movement, surveillance, and maintenance. The user's site-specific written operating procedures shall be consistent with the technical basis described in Chapter 9 of the FSAR.

2. ACCEPTANCE TESTS AND MAINTENANCE PROGRAM

Written acceptance tests and a maintenance program shall be prepared consistent with the technical basis described in Chapter 10 of the FSAR. At completion of welding the MPC shell to baseplate, an MPC confinement weld helium leak test shall be performed using a helium mass spectrometer. This test shall include the base metals of the MPC shell and baseplate. A helium leakage test shall also be performed on the base metal of the fabricated MPC lid. The confinement boundary welds leakage rate test shall be performed in accordance with ANSI N14.5 to "leaktight" criterion. If a leakage rate exceeding the acceptance criteria is detected, then the area of leakage shall be determined and the area repaired per ASME Code Section III, Subsection NB, Article NB-4450 requirements. Re-testing shall be performed until the leakage rate acceptance criterion is met.

3. QUALITY ASSURANCE

Activities in the areas of design, purchase, fabrication, assembly, inspection, testing, operation, maintenance, repair, modification of structures, systems and components, and decommissioning that are important-to-safety shall be conducted in accordance with a Commission-approved quality assurance program which satisfies the applicable requirements of 10 CFR Part 72, Subpart G, and which is established, maintained, and executed with regard to the storage system

4. HEAVY LOADS REQUIREMENTS

Each lift of an MPC or a HI-TRAC VW transfer cask must be made in accordance to the existing heavy loads requirements and procedures of the licensed facility at which the lift is made. A plant-specific review of the heavy load handling procedures (under 10 CFR 50.59 or 10 CFR 72.48, as applicable) is required to show operational compliance with existing plant specific heavy loads requirements. Lifting operations outside of structures governed by 10 CFR Part 50 must be in accordance with Section 5.2 of Appendix A.

5. APPROVED CONTENTS

Contents of the HI-STORM UMAX Canister Storage System must meet the fuel specifications given in Appendix B to this certificate.

6. DESIGN FEATURES

Features or characteristics for the site or system must be in accordance with Appendix B to this certificate.

7. CHANGES TO THE CERTIFICATE OF COMPLIANCE

The holder of this certificate who desires to make changes to the certificate, which includes Appendix A (Technical Specifications) and Appendix B (Approved Contents and Design Features), shall submit an application for amendment of the certificate.

8. PRE-OPERATIONAL TESTING AND TRAINING EXERCISE

A dry run training exercise of the loading, closure, handling, unloading, and transfer of the HI-STORM UMAX Canister Storage System shall be conducted by the licensee prior to the first use of the system to load spent fuel assemblies. The training exercise shall not be conducted with spent fuel in the MPC. The dry run may be performed in an alternate step sequence from the actual procedures, but all steps must be performed. The dry run shall include, but is not limited to the following:

a. Moving the MPC and the transfer cask into the spent fuel pool or cask loading pool.

b. Preparation of the HI-STORM UMAX Canister Storage System for fuel loading.

c. Selection and verification of specific fuel assemblies to ensure type conformance.

d. Loading specific assemblies and placing assemblies into the MPC (using a dummy fuel assembly), including appropriate independent verification.

e. Remote installation of the MPC lid and removal of the MPC and transfer cask from the spent fuel pool or cask loading pool.

f. MPC welding, NDE inspections, pressure testing, draining, moisture removal (by vacuum drying or forced helium dehydration, as applicable), and helium backfilling. (A mockup may be used for this dry-run exercise.)

g. Transfer of the MPC from the transfer cask to the VVM.

h. HI-STORM UMAX Canister Storage System unloading, including flooding MPC cavity and removing MPC lid welds. (A mockup may be used for this dry-run exercise.)

Any of the above steps can be omitted if the site has already successfully loaded a Holtec MPC System.

9. AUTHORIZATION

The HI-STORM UMAX Canister Storage System, which is authorized by this certificate, is hereby approved for general use by holders of 10 CFR Part 50 licenses for nuclear reactors at reactor sites under the general license issued pursuant to 10 CFR 72.210, subject to the conditions specified by 10 CFR 72.212, this certificate, and the attached Appendices A and B. The HI-STORM UMAX Canister Storage System may be fabricated and used in accordance with any approved amendment to CoC No. 1040 listed in 10 CFR 72.214. Each of the licensed HI-STORM UMAX Canister Storage System components (i.e., the MPC, overpack, and transfer cask), if fabricated in accordance with any of the approved CoC Amendments, may be used with one another provided an assessment is performed by the CoC holder that demonstrates design compatibility.

APPENDIX A

TECHNICAL SPECIFICATIONS

FOR THE HI-STORM UMAX CANISTER STORAGE SYSTEM

TABLE OF CONTENTS

1.0 USE AND APPLICATION

----------NOTE----------
The defined terms of this section appear in capitalized type and are applicable throughout these Technical Specifications and Bases.

1.1 Definitions

Term	Definition
ACTIONS	ACTIONS shall be that part of a Specification that prescribes Required Actions to be taken under designated Conditions within specified Completion Times.
AMBIENT TEMPERATURE	AMBIENT TEMPERATURE for Short Term Operations (operations involving use of the HI-TRAC, a Lifting device, and/or an on-site transport device) is defined as the 24 hour average of the local temperature as forecast by the National Weather Service.
DAMAGED FUEL ASSEMBLY	DAMAGED FUEL ASSEMBLIES are fuel assemblies with known or suspected cladding defects, as determined by a review of records, greater than pinhole leaks or hairline cracks, empty fuel rod locations that are not filled with dummy fuel rods, missing structural components such as grid spacers, whose structural integrity has been impaired such that geometric rearrangement of fuel or gross failure of the cladding is expected based on engineering evaluations, or that cannot be handled by normal means. Fuel assemblies that cannot be handled by normal means due to fuel cladding damage are considered FUEL DEBRIS.
DAMAGED FUEL CONTAINER (DFC)	DFCs are specially designed enclosures for DAMAGED FUEL ASSEMBLIES or FUEL DEBRIS which permit gaseous and liquid media to escape while minimizing dispersal of gross particulates. DFCs authorized for use in the HI-STORM UMAX System are as follows: 1. Holtec Generic BWR design 2. Holtec Generic PWR design

1.1 Definitions

Term	Definition
FUEL DEBRIS	FUEL DEBRIS is ruptured fuel rods, severed rods, loose fuel pellets, containers or structures that are supporting these loose fuel assembly parts, or fuel assemblies with known or suspected defects which cannot be handled by normal means due to fuel cladding damage.
FUEL BUILDING	The FUEL BUILDING is the site-specific power plant facility, governed by the regulations of 10 CFR Part 50, where the loaded OVERPACK or TRANSFER CASK is transferred to or from the transporter.
GROSSLY BREACHED SPENT FUEL ROD	Spent nuclear fuel rod with a cladding defect that could lead to the release of fuel particulate greater than the average size fuel fragment for that particular assembly. A gross cladding breach may be confirmed by visual examination, through a review of reactor operating records indicating the presence of heavy metal isotopes, or other acceptable inspection means.
LOADING OPERATIONS	LOADING OPERATIONS include all licensed activities on a TRANSFER CASK while it is being loaded with fuel assemblies. LOADING OPERATIONS begin when the first fuel assembly is placed in the MPC and end when the TRANSFER CASK is suspended from or secured on the transporter. LOADING OPERATIONS does not include MPC TRANSFER.
MULTI-PURPOSE CANISTER (MPC)	MPCs are the sealed spent nuclear fuel canisters which consist of a honeycombed fuel basket contained in a cylindrical canister shell which is welded to a baseplate, lid with welded port cover plates, and closure ring. The MPC provides the confinement boundary for the contained radioactive materials.
MPC TRANSFER	MPC TRANSFER begins when the MPC is lifted off the TRANSFER CASK bottom lid and ends when the MPC is supported from beneath by the OVERPACK (or the reverse).
NON-FUEL HARDWARE	NON-FUEL HARDWARE is defined as Burnable Poison Rod Assemblies (BPRAs), Thimble Plug Devices (TPDs), Control Rod Assemblies (CRAs), Axial Power Shaping Rods (APSRs), Wet Annular

1.1 Definitions

Term	Definition
	Burnable Absorbers (WABAs), Rod Cluster Control Assemblies (RCCAs), Control Element Assemblies (CEAs), Neutron Source Assemblies (NSAs), water displacement guide tube plugs, orifice rod assemblies, instrument tube tie rods (ITTRs), vibration suppressor inserts, and components of these devices such as individual rods.
OVERPACK	For the HI-STORM UMAX, the term OVERPACK is synonyms with the term VVM defined below.
PLANAR-AVERAGE INITIAL ENRICHMENT	PLANAR AVERAGE INITIAL ENRICHMENT is the average of the distributed fuel rod initial enrichments within a given axial plane of the assembly lattice.
REPAIRED/RECONSITUTED FUEL ASSEMBLY	Spent nuclear fuel assembly which contains dummy fuel rods that displaces an amount of water greater than or equal to the original fuel rods and/or which contains structural repairs so it can be handled by normal means.
SPENT FUEL STORAGE CASKS (SFSCs)	SFSCs are containers approved for the storage of spent fuel assemblies at the ISFSI. The HI-STORM UMAX SFSC System consists of the OVERPACK and its integral MPC.
STORAGE OPERATIONS	STORAGE OPERATIONS include all licensed activities that are performed at the ISFSI while an SFSC containing spent fuel is situated within the ISFSI perimeter. STORAGE OPERATIONS does not include MPC TRANSFER.
TRANSFER CASK	TRANSFER CASKs are containers designed to contain the MPC during and after loading of spent fuel assemblies, and prior to and during unloading and to transfer the MPC to or from the OVERPACK.
TRANSPORT OPERATIONS	TRANSPORT OPERATIONS include all licensed activities performed on a TRANSFER CASK loaded with one or more fuel assemblies when it is being moved after LOADING OPERATIONS or before UNLOADING OPERATIONS. TRANSPORT OPERATIONS begin when the TRANSFER CASK is first suspended from or secured on the transporter and end when the TRANSFER CASK is at its destination and no longer secured on or suspended from the transporter. TRANSPORT OPERATIONS includes

1.1 Definitions

Term	Definition
	MPC TRANSFER.
VERTICAL VENTILATED MODULE (VVM)	The VVM is a subterranean type overpack which receives and contains the sealed MPC for interim storage at the ISFSI. The VVM supports the MPC in a vertical orientation and provide gamma and neutron shielding and also provides air flow through cooling passages to promote heat transfer from the MPC to the environs.
UNDAMAGED FUEL ASSEMBLY	UNDAMAGED FUEL ASSEMBLIES are: a) fuel assemblies without known or suspected cladding defects greater than pinhole leaks or hairline cracks and which can be handled by normal means; or b) a BWR fuel assembly with an intact channel, a maximum planar average initial of 3.3 wt% U-235, without known or suspected GROSSLY BREACHED SPENT FUEL RODS, and which can be handled by normal means. An UNDAMAGED FUEL ASSEMBLY may be a REPAIRED/RECONSTITUTED FUEL ASSEMBLY.
UNLOADING OPERATIONS	UNLOADING OPERATIONS include all licensed activities on an SFSC to be unloaded of the contained fuel assemblies. UNLOADING OPERATIONS begin when the TRANSFER CASK is no longer suspended from or secured on the transporter and end when the last fuel assembly is removed from the SFSC. UNLOADING OPERATIONS does not include MPC TRANSFER.
ZR	ZR means any zirconium-based fuel cladding or fuel channel material authorized for use in a commercial nuclear power plant reactor.

PURPOSE	The purpose of this section is to explain the meaning of logical connectors. Logical connectors are used in Technical Specifications (TS) to discriminate between, and yet connect, discrete Conditions, Required Actions, Completion Times, Surveillances, and Frequencies. The only logical connectors that appear in TS are AND and OR. The physical arrangement of these connectors constitutes logical conventions with specific meanings.
BACKGROUND	Several levels of logic may be used to state Required Actions. These levels are identified by the placement (or nesting) of the logical connectors and by the number assigned to each Required Action. The first level of logic is identified by the first digit of the number assigned to a Required Action and the placement of the logical connector in the first level of nesting (i.e., left justified with the number of the Required Action). The successive levels of logic are identified by additional digits of the Required Action number and by successive indentions of the logical connectors. When logical connectors are used to state a Condition, Completion Time, Surveillance, or Frequency, only the first level of logic is used, and the logical connector is left justified with the statement of the Condition, Completion Time, Surveillance, or Frequency.

1.0 USE AND APPLICATION

1.2 Logical Connectors

EXAMPLES The following examples illustrate the use of logical connectors.

EXAMPLE 1.2-1

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. LCO not met.	A.1 VERIFY . . . AND A.2 Restore . . .	

In this example the logical connector AND is used to indicate that when in Condition A, both Required Actions A.1 and A.2 must be completed.

(continued)

1.2 Logical Connectors

EXAMPLES (continued)

EXAMPLE 1.2-2

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. LCO not met.	A.1 Stop . . . OR A.2.1 Verify . . . AND A.2.2.1 Reduce . . . OR A.2.2.2 Perform . . . OR A.3 Remove . . .	

This example represents a more complicated use of logical connectors. Required Actions A.1, A.2, and A.3 are alternative choices, only one of which must be performed as indicated by the use of the logical connector OR and the left justified placement. Any one of these three ACTIONS may be chosen. If A.2 is chosen, then both A.2.1 and A.2.2 must be performed as indicated by the logical connector AND. Required Action A.2.2 is met by performing A.2.2.1 or A.2.2.2. The indented position of the logical connector OR indicates that A.2.2.1 and A.2.2.2 are alternative choices, only one of which must be performed.

1.0 USE AND APPLICATION

1.3 Completion Times

PURPOSE	The purpose of this section is to establish the Completion Time convention and to provide guidance for its use.
BACKGROUND	Limiting Conditions for Operation (LCOs) specify the lowest functional capability or performance levels of equipment required for safe operation of the facility. The ACTIONS associated with an LCO state Conditions that typically describe the ways in which the requirements of the LCO can fail to be met. Specified with each stated Condition are Required Action(s) and Completion Times(s).
DESCRIPTION	The Completion Time is the amount of time allowed for completing a Required Action. It is referenced to the time of discovery of a situation (e.g., equipment or variable not within limits) that requires entering an ACTIONS Condition unless otherwise specified, providing the HI-STORM UMAX System is in a specified condition stated in the Applicability of the LCO. Required Actions must be completed prior to the expiration of the specified Completion Time. An ACTIONS Condition remains in effect and the Required Actions apply until the Condition no longer exists or the HI-STORM UMAX System is not within the LCO Applicability. Once a Condition has been entered, subsequent subsystems, components, or variables expressed in the Condition, discovered to be not within limits, will not result in separate entry into the Condition unless specifically stated. The Required Actions of the Condition continue to apply to each additional failure, with Completion Times based on initial entry into the Condition.

(continued)

1.3 Completion Times (continued)

EXAMPLES

The following examples illustrate the use of Completion Times with different types of Conditions and changing Conditions.

EXAMPLE 1.3-1

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
B. Required Action and associated Completion Time not met.	B.1 Perform Action B.1 AND B.2 Perform Action B.2	12 hours 36 hours

Condition B has two Required Actions. Each Required Action has its own separate Completion Time. Each Completion Time is referenced to the time that Condition B is entered.

The Required Actions of Condition B are to complete action B.1 within 12 hours AND complete action B.2 within 36 hours. A total of 12 hours is allowed for completing action B.1 and a total of 36 hours (not 48 hours) is allowed for completing action B.2 from the time that Condition B was entered. If action B.1 is completed within 6 hours, the time allowed for completing action B.2 is the next 30 hours because the total time allowed for completing action B.2 is 36 hours.

(continued)

1.3 Completion Times (continued)

EXAMPLES (continued)

EXAMPLE 1.3-2

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. One system not within limit.	A.1 Restore system to within limit.	7 days
B. Required Action and associated Completion Time not met.	B.1 Complete action B.1. AND B.2 Complete action B.2.	12 hours 36 hours

When a system is determined not to meet the LCO, Condition A is entered. If the system is not restored within 7 days, Condition B is also entered and the Completion Time clocks for Required Actions B.1 and B.2 start. If the system is restored after Condition B is entered, Conditions A and B are exited, and therefore, the Required Actions of Condition B may be terminated.

(continued)

1.3 Completion Times (continued)

EXAMPLES (continued)

EXAMPLE 1.3-3

ACTIONS

----------NOTE----------
Separate Condition entry is allowed for each component.

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. LCO not met.	A.1 Restore compliance with LCO.	4 hours
B. Required Action and associated Completion Time not met.	B.1 Complete action B.1. AND B.2 Complete action B.2.	6 hours 12 hours

The Note above the ACTIONS table is a method of modifying how the Completion Time is tracked. If this method of modifying how the Completion Time is tracked was applicable only to a specific Condition, the Note would appear in that Condition rather than at the top of the ACTIONS Table.

The Note allows Condition A to be entered separately for each component, and Completion Times tracked on a per component basis. When a component is determined to not meet the LCO, Condition A is entered and its Completion Time starts. If subsequent components are determined to not meet the LCO, Condition A is entered for each component and separate Completion Times start and are tracked for each component.

(continued)

1.3 Completion Times (continued)

IMMEDIATE COMPLETION TIME	When "Immediately" is used as a Completion Time, the Required Action should be pursued without delay and in a controlled manner.

1.0 USE AND APPLICATION

1.4 Frequency

PURPOSE	The purpose of this section is to define the proper use and application of Frequency requirements.
DESCRIPTION	Each Surveillance Requirement (SR) has a specified Frequency in which the Surveillance must be met in order to meet the associated Limiting Condition for Operation (LCO). An understanding of the correct application of the specified Frequency is necessary for compliance with the SR. The "specified Frequency" is referred to throughout this section and each of the Specifications of Section 3.0, Surveillance Requirement (SR) Applicability. The "specified Frequency" consists of the requirements of the Frequency column of each SR. Situations where a Surveillance could be required (i.e., its Frequency could expire), but where it is not possible or not desired that it be performed until sometime after the associated LCO is within its Applicability, represent potential SR 3.0.4 conflicts. To avoid these conflicts, the SR (i.e., the Surveillance or the Frequency) is stated such that it is only "required" when it can be and should be performed. With an SR satisfied, SR 3.0.4 imposes no restriction.

(continued)

1.4 Frequency (continued)

EXAMPLES

The following examples illustrate the various ways that Frequencies are specified.

EXAMPLE 1.4-1

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
Verify pressure within limit	12 hours

Example 1.4-1 contains the type of SR most often encountered in the Technical Specifications (TS). The Frequency specifies an interval (12 hours) during which the associated Surveillance must be performed at least one time. Performance of the Surveillance initiates the subsequent interval. Although the Frequency is stated as 12 hours, an extension of the time interval to 1.25 times the interval specified in the Frequency is allowed by SR 3.0.2 for operational flexibility. The measurement of this interval continues at all times, even when the SR is not required to be met per SR 3.0.1 (such as when the equipment or variables are outside specified limits, or the facility is outside the Applicability of the LCO). If the interval specified by SR 3.0.2 is exceeded while the facility is in a condition specified in the Applicability of the LCO, the LCO is not met in accordance with SR 3.0.1.

If the interval as specified by SR 3.0.2 is exceeded while the facility is not in a condition specified in the Applicability of the LCO for which performance of the SR is required, the Surveillance must be performed within the Frequency requirements of SR 3.0.2 prior to entry into the specified condition. Failure to do so would result in a violation of SR 3.0.4

(continued)

1.4 Frequency (continued)

EXAMPLES (continued)

EXAMPLE 1.4-2

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
Verify flow is within limits.	Once within 12 hours prior to starting activity AND 24 hours thereafter

Example 1.4-2 has two Frequencies. The first is a one time performance Frequency, and the second is of the type shown in Example 1.4-1. The logical connector "AND" indicates that both Frequency requirements must be met. Each time the example activity is to be performed, the Surveillance must be performed within 12 hours prior to starting the activity.

The use of "once" indicates a single performance will satisfy the specified Frequency (assuming no other Frequencies are connected by "AND"). This type of Frequency does not qualify for the 25% extension allowed by SR 3.0.2.

"Thereafter" indicates future performances must be established per SR 3.0.2, but only after a specified condition is first met (i.e., the "once" performance in this example). If the specified activity is canceled or not performed, the measurement of both intervals stops. New intervals start upon preparing to restart the specified activity.

2.0

This section is intentionally left blank

3.0 LIMITING CONDITIONS FOR OPERATION (LCO) APPLICABILITY

LCO 3.0.1	LCOs shall be met during specified conditions in the Applicability, except as provided in LCO 3.0.2.
LCO 3.0.2	Upon discovery of a failure to meet an LCO, the Required Actions of the associated Conditions shall be met, except as provided in LCO 3.0.5. If the LCO is met or is no longer applicable prior to expiration of the specified Completion Time(s), completion of the Required Action(s) is not required, unless otherwise stated.
LCO 3.0.3	Not applicable.
LCO 3.0.4	When an LCO is not met, entry into a specified condition in the Applicability shall not be made except when the associated ACTIONS to be entered permit continued operation in the specified condition in the Applicability for an unlimited period of time. This Specification shall not prevent changes in specified conditions in the Applicability that are required to comply with ACTIONS or that are related to the unloading of an SFSC.
LCO 3.0.5	Equipment removed from service or not in service in compliance with ACTIONS may be returned to service under administrative control solely to perform testing required to demonstrate it meets the LCO or that other equipment meets the LCO. This is an exception to LCO 3.0.2 for the system returned to service under administrative control to perform the testing.

3.0 SURVEILLANCE REQUIREMENT (SR) APPLICABILITY

SR 3.0.1	SRs shall be met during the specified conditions in the Applicability for individual LCOs, unless otherwise stated in the SR. Failure to meet a Surveillance, whether such failure is experienced during the performance of the Surveillance or between performances of the Surveillance, shall be failure to meet the LCO. Failure to perform a Surveillance within the specified Frequency shall be failure to meet the LCO except as provided in SR 3.0.3. Surveillances do not have to be performed on equipment or variables outside specified limits.
SR 3.0.2	The specified Frequency for each SR is met if the Surveillance is performed within 1.25 times the interval specified in the Frequency, as measured from the previous performance or as measured from the time a specified condition of the Frequency is met. For Frequencies specified as “once,” the above interval extension does not apply. If a Completion Time requires periodic performance on a “once per...” basis, the above Frequency extension applies to each performance after the initial performance. Exceptions to this Specification are stated in the individual Specifications.
SR 3.0.3	If it is discovered that a Surveillance was not performed within its specified Frequency, then compliance with the requirement to declare the LCO not met may be delayed, from the time of discovery, up to 24 hours or up to the limit of the specified Frequency, whichever is less. This delay period is permitted to allow performance of the Surveillance. If the Surveillance is not performed within the delay period, the LCO must immediately be declared not met, and the applicable Condition(s) must be entered.

(continued)

3.0 SURVEILLANCE REQUIREMENT (SR) APPLICABILITY

SR 3.0.3 (continued)	When the Surveillance is performed within the delay period and the Surveillance is not met, the LCO must immediately be declared not met, and the applicable Condition(s) must be entered.
SR 3.0.4	Entry into a specified condition in the Applicability of an LCO shall not be made unless the LCO's Surveillances have been met within their specified Frequency. This provision shall not prevent entry into specified conditions in the Applicability that are required to comply with Actions or that are related to the unloading of an SFSC.

3.1 SFSC INTEGRITY

3.1.1 Multi-Purpose Canister (MPC)

LCO 3.1.1 The MPC shall be dry and helium filled.

Table 3-1 provides decay heat and burnup limits for forced helium dehydration (FHD) and vacuum drying.

APPLICABILITY: Prior to TRANSPORT OPERATIONS

ACTIONS

----------NOTES----------
Separate Condition entry is allowed for each MPC.

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. MPC cavity vacuum drying pressure or demoisturizer exit gas temperature limit not met.	A.1 Perform an engineering evaluation to determine the quantity of moisture left in the MPC. AND	7 days
	A.2 Develop and initiate corrective actions necessary to return the MPC to compliance with Table 3-1.	30 days

ACTIONS (continued)

B.	MPC helium backfill limit not met.	B.1 Perform an engineering evaluation to determine the impact of helium differential. AND B.2.1 Develop and initiate corrective actions necessary to return the MPC to an analyzed condition by adding helium to or removing helium from the MPC. OR B.2.2 Develop and initiate corrective actions necessary to demonstrate through analysis, using the models and methods from the HI-STORM UMAX FSAR, that all limits for MPC components and contents will be met.	72 hours 14 days
C.	MPC helium leak rate limit for vent and drain port cover plate welds not met.	C.1 Perform an engineering evaluation to determine the impact of increased helium leak rate on heat removal capability and offsite dose. AND C.2 Develop and initiate corrective actions necessary to return the MPC to compliance with SR 3.1.1.3.	24 hours 7 days

D.	Required Actions and associated Completion Times not met.	D.1	Remove all fuel assemblies from the SFSC.	30 days

SURVEILLANCE REQUIREMENTS

SURVEILLANCE		FREQUENCY
SR 3.1.1.1	Verify that the MPC cavity has been dried in accordance with the applicable limits in Table 3-1.	Once, prior to TRANSPORT OPERATIONS
SR 3.1.1.2	Verify MPC helium backfill quantity is within the limit specified in Table 3-2 for the applicable MPC model. Re-performance of this surveillance is not required upon successful completion of Action B.2.2.	Once, prior to TRANSPORT OPERATIONS
SR 3.1.1.3	Verify that the helium leak rate through the MPC vent and drain port cover plates (confinement welds and the base metal)meets the leaktight criteria of ANSI N14.5-1997.	Once, prior to TRANSPORT OPERATIONS

3.1 SFSC INTEGRITY

3.1.2 SFSC Heat Removal System

LCO 3.1.2 The SFSC Heat Removal System shall be operable

---NOTE---
The SFSC Heat Removal System is operable when 50% or more of the inlet vent duct areas are unblocked and available for flow or when air temperature requirements are met.

APPLICABILITY: During STORAGE OPERATIONS.

ACTIONS

---NOTE---
Separate Condition entry is allowed for each SFSC.

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. SFSC Heat Removal System operable, but partially (<50%) blocked.	A.1 Remove blockage.	N/A
B. SFSC Heat Removal System inoperable.	B.1 Restore SFSC Heat Removal System to operable status.	8 hours
C. Required Action B.1 and associated Completion Time not met.	C.1 Measure SFSC dose rates in accordance with the Radiation Protection Program. AND	Immediately and once per 12 hours thereafter
	C.2.1 Restore SFSC Heat Removal System to operable status. OR	24 hours
	C.2.2 Transfer the MPC into a TRANSFER CASK.	24 hours

SURVEILLANCE REQUIREMENTS

	SURVEILLANCE	FREQUENCY
SR 3.1.2	Verify all VVM inlets and outlets duct screen are free of blockage from solid debris or floodwater.	24 hours
	OR	
	For VVMs with installed temperature monitoring equipment, verify that the difference between the average VVM air outlet duct temperature and ISFSI ambient temperature is ≤ 80°F for VVMs containing MPC-37s and ≤ 85°F for VVMs containing MPC-89s.	24 hours

3.1 SFSC INTEGRITY

3.1.3 MPC Cavity Reflooding

LCO 3.1.3 The MPC cavity pressure shall be < 100 psig

----------NOTE----------
The LCO is only applicable to wet UNLOADING OPERATIONS.

APPLICABILITY: UNLOADING OPERATIONS prior to and during re-flooding.

ACTIONS

----------NOTE----------
Separate Condition entry is allowed for each MPC.

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. MPC cavity pressure not within limit.	A.1 Stop re-flooding operations until MPC cavity pressure is within limit. AND A.2 Ensure MPC vent port is not closed or blocked.	Immediately Immediately

SURVEILLANCE REQUIREMENTS

SURVEILLANCE		FREQUENCY
SR 3.1.3.1	Ensure via analysis or direct measurement that MPC cavity pressure is within limit.	Once, prior to MPC re-flooding operations. OR Once every 1 hour thereafter when using direct measurement.

3.2 SFSC RADIATION PROTECTION.

3.2.1 TRANSFER CASK Surface Contamination.

LCO 3.2.1 Removable contamination on the exterior surfaces of the TRANSFER CASK and accessible portions of the MPC shall each not exceed:

a. 1000 dpm/100 cm^2 from beta and gamma sources

b. 20 dpm/100 cm^2 from alpha sources.

APPLICABILITY: During TRANSPORT OPERATIONS.

ACTIONS

----------NOTE----------
Separate Condition entry is allowed for each TRANSFER CASK.

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. TRANSFER CASK or MPC removable surface contamination limits not met.	A.1 Restore removable surface contamination to within limits.	7 days

SURVEILLANCE REQUIREMENTS

SURVEILLANCE		FREQUENCY
SR 3.2.1.1	Verify that the removable contamination on the exterior surfaces of the TRANSFER CASK and accessible portions of the MPC containing fuel is within limits.	Once, prior to TRANSPORT OPERATIONS

3.3 SFSC CRITICALITY CONTROL

3.3.1 Boron Concentration

LCO 3.3.1 The concentration of boron in the water in the MPC shall meet the following limits for the applicable MPC model and the most limiting fuel assembly array/class to be stored in the MPC:

MPC-37: Minimum soluble boron concentration as required by the table below†.

Array/Class	All Undamaged Fuel Assemblies		One or more Damaged Fuel Assemblies or Fuel Debris	
	Maximum Initial Enrichment ≤ 4.0 wt% ^{235}U (ppmb)	Maximum Initial Enrichment 5.0 wt% ^{235}U (ppmb)	Maximum Initial Enrichment ≤ 4.0 wt% ^{235}U (ppmb)	Maximum Initial Enrichment 5.0 wt% ^{235}U (ppmb)
All 14x14 and 16x16A	1000	1500	1300	1800
All 15x15 and 17x17	1500	2000	1800	2300

† For maximum initial enrichments between 4.0 wt% and 5.0 wt% ^{235}U, the minimum soluble boron concentration may be determined by linear interpolation between the minimum soluble boron concentrations at 4.0 wt% and 5.0 wt%.

APPLICABILITY: During PWR fuel LOADING OPERATIONS with fuel and water in the MPC

AND

During PWR fuel UNLOADING OPERATIONS with fuel and water in the MPC.

ACTIONS

----------NOTE----------
Separate Condition entry is allowed for each MPC.

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. Boron concentration not within limit.	A.1 Suspend LOADING OPERATIONS or UNLOADING OPERATIONS. AND A.2 Suspend positive reactivity additions. AND A.3 Initiate action to restore boron concentration to within limit.	Immediately Immediately Immediately

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
----------NOTE---------- This surveillance is only required to be performed if the MPC is submerged in water or if water is to be added to, or recirculated through the MPC. ----------	Once, within 4 hours prior to entering the Applicability of this LCO.
SR 3.3.1.1 Verify boron concentration is within the applicable limit using two independent measurements.	AND Once per 48 hours thereafter.

Table 3-1
MPC Cavity Drying Limits

Fuel Burnup (MWD/MTU)	MPC Type (Note 5)	Cell Heat Load Limits (Note 6)	Method of Moisture Removal (Notes 1 and 2)
All Assemblies ≤ 45,000	MPC-37 (Short Fuel)	Figure 2.3-1, 2.3-2, or 2.3-3 of Appendix B	VDS (Notes 3 and 4) or FHD (Note 4)
	MPC-37 (Standard Fuel)	Figure 2.3-1, 2.3-2, or 2.3-4 of Appendix B	
	MPC-37 (Long Fuel)	Figure 2.3-5, 2.3-6, or 2.3-7 of Appendix B	
	MPC-89	Figure 2.3-10 of Appendix B	
One or more assemblies > 45,000	MPC-37 (Short, Standard and Long Fuel)	Figure 2.3-12 of Appendix B	VDS (Notes 3 and 4) or FHD (Note 4)
	MPC-89	Figure 2.3-13 of Appendix B	
One or more assemblies > 45,000	MPC-37 (Short Fuel)	Figure 2.3-1, 2.3-2, or 2.3-3 of Appendix B	FHD (Note 4)
	MPC-37 (Standard Fuel)	Figure 2.3-1, 2.3-2, or 2.3-4 of Appendix B	
	MPC-37 (Long Fuel)	Figure 2.3-5, 2.3-6, or 2.3-7 of Appendix B	
	MPC-89	Figure 2.3-10 of Appendix B	

Notes:

1. VDS means a vacuum drying system. The acceptance criterion when using a VDS is the MPC cavity pressure shall be ≤ 3 torr for ≥ 30 minutes while the MPC is isolated from the vacuum pump.

2. FHD means a forced helium dehydration system. The acceptance criterion when using an FHD system is the gas temperature exiting the demoisturizer shall be ≤ 21°F for ≥ 30 minutes or the gas dew point exiting the MPC shall be ≤ 22.9°F for ≥ 30 minutes.

3. Vacuum drying of the MPC must be performed with the annular gap between the MPC and the TRANSFER CASK filled with water.

4. Heat load limits are set for each cell; see Appendix B Section 2.3.

5. The fuel assembly lengths loaded in MPC-37 are catalogued as short, standard and long fuel based on the active fuel lengths specified in Appendix B Table 2.1-4.

6. For additional aggregate heat load limits for storage, see Appendix B Table 2.3-1

Table 3-2 MPC Helium Backfill Limits [1]

MPC Type	Helium Backfill Pressure Option	Helium Backfill Pressure Range (psig)
MPC-37	1	≥ 41.0 and ≤ 44.2
	2	≥ 41.0 and ≤ 44.5
	3	≥ 39.0 and ≤ 46.0
MPC-89	1	≥ 42.0 and ≤ 45.2
	2	≥ 39.0 and ≤ 46.0

Note: For Permissible Aggregate Heat Load Limit for each helium backfill pressure option see Appendix B, Table 2.3-1.

1 Helium used for backfill of MPC shall have a purity of ≥ 99.995%. Pressure range is at a reference temperature of 70°F

4.0

4.0

This section is intentionally left blank

5.0 ADMINISTRATIVE CONTROLS AND PROGRAMS

The following programs shall be established, implemented and maintained.

5.1 Radioactive Effluent Control Program

This program implements the requirements of 10 CFR 72.44(d).

a. The HI-STORM UMAX Canister Storage System does not create any radioactive materials or have any radioactive waste treatment systems. Therefore, specific operating procedures for the control of radioactive effluents are not required. Specification 3.1.1, Multi-Purpose Canister (MPC), provides assurance that there are not radioactive effluents from the SFSC.

b. This program includes an environmental monitoring program. Each general license user may incorporate SFSC operations into their environmental monitoring programs for 10 CFR Part 50 operations.

c. An annual report shall be submitted pursuant to 10 CFR 72.44(d)(3).

(continued)

5.0 ADMINISTRATIVE CONTROLS AND PROGRAMS (continued)

5.2 Transport Evaluation Program

a. For lifting of the loaded MPC or TRANSFER CASK using equipment which is integral to a structure governed by 10 CFR Part 50 regulations, 10 CFR 50 requirements apply.

b. This program is not applicable when the TRANSFER CASK is in the FUEL BUILDING or is being handled by equipment providing support from underneath (i.e., on a rail car, heavy haul trailer, air pads, etc...).

c. The TRANSFER CASK when loaded with spent fuel, may be lifted to and carried at any height necessary during TRANSPORT OPERATIONS and MPC TRANSFER, provided the lifting equipment is designed in accordance with items 1, 2, and 3 below.

    1. The metal body and any vertical columns of the lifting equipment shall be designed to comply with stress limits of ASME Section III, Subsection NF, Class 3 for linear structures. All vertical compression loaded primary members shall satisfy the buckling criteria of ASME Section III, Subsection NF.

    2. The horizontal cross beam and any lifting attachments used to connect the load to the lifting equipment shall be designed, fabricated, operated, tested, inspected, and maintained in accordance with applicable sections and guidance of NUREG-0612, Section 5.1. This includes applicable stress limits from ANSI N14.6.

    3. The lifting equipment shall have redundant drop protection features which prevent uncontrolled lowering of the load.

5.0 ADMINISTRATIVE CONTROLS AND PROGRAMS (continued)

5.3 Radiation Protection Program

5.3.1 Each cask user shall ensure that the Part 50 radiation protection program appropriately addresses dry storage cask loading and unloading, as well as ISFSI operations, including transport of the loaded TRANSFER CASK outside of facilities governed by 10 CFR Part 50. The radiation protection program shall include appropriate controls for direct radiation and contamination, ensuring compliance with applicable regulations, and implementing actions to maintain personnel occupational exposures As Low As Reasonably Achievable (ALARA). The actions and criteria to be included in the program are provided below.

5.3.2 As part of its evaluation pursuant to 10 CFR 72.212(b)(2)(i)(C), the licensee shall perform an analysis to confirm that the dose limits of 10 CFR 72.104(a) will be satisfied under the actual site conditions and ISFSI configuration, considering the planned number of casks to be deployed and the cask contents.

5.3.3 Based on the analysis performed pursuant to Section 5.3.2, the licensee shall establish individual cask surface dose rate limits for the TRANSFER CASK and the VVM to be used at the site. Total (neutron plus gamma) dose rate limits shall be established at the following locations:

a. The top of the VVM.
b. The side of the TRANSFER CASK
c. The outlet vents on the VVM

5.3.4 Notwithstanding the limits established in Section 5.3.3, the average of the measured dose rates on a loaded VVM or TRANSFER CASK shall not exceed the following values:

a. 30 mrem/hr (gamma + neutron) on the top of the closure lid of the VVM
b. 3500 mrem/hr (gamma + neutron) on the side of the TRANSFER CASK

5.3.5 The licensee shall measure the TRANSFER CASK and VVM surface neutron and gamma dose rates as described in Section 5.3.8 for comparison against the limits established in Section 5.3.3 or Section 5.3.4, whichever are lower.

5.0 ADMINISTRATIVE CONTROLS AND PROGRAMS (continued)

5.3 Radiation Protection Program (continued)

5.3.6 If the measured surface dose rates exceed the lower of the two limits established in Section 5.3.3 or Section 5.3.4, the licensee shall:

a. Administratively verify that the correct contents were loaded in the correct fuel storage cell locations.
b. Perform a written evaluation to verify whether a VVM at the ISFSI containing the as-loaded MPC will cause the dose limits of 10 CFR 72.104 to be exceeded.
c. Perform a written evaluation within 30 days to determine why the surface dose rate limits were exceeded.

5.3.7 If the evaluation performed pursuant to Section 5.3.6 shows that the dose limits of 10 CFR 72.104 will be exceeded, the MPC shall not be placed into a VVM or the MPC shall be removed from the VVM until appropriate corrective action is taken to ensure the dose limits are not exceeded.

5.3.8 TRANSFER CASK and VVM surface dose rates shall be measured at approximately the following locations:

a. A minimum of four (4) dose rate measurements shall be taken on the top of the VVM. These measurements shall be taken approximately 90 degrees apart around the circumference of the lid, approximately 18 inches radially inward from the edge of the lid.

b. A minimum of four (4) dose rate measurements shall be taken adjacent to the outlet vent duct screen of the VVM, approximately 90 degrees apart.

c. A minimum of four (4) dose rate measurements shall be taken on the side of the TRANSFER CASK approximately at the cask mid-height plane. The measurement locations shall be approximately 90 degrees apart around the circumference of the cask. Dose rates shall be measured between the radial ribs of the water jacket.

5.0 ADMINISTRATIVE CONTROLS AND PROGRAMS (continued)

5.3 Radiation Protection Program (continued)

5.3.9 The “Radiation Protection Space” (RPS) is the prismatic subgrade buffer zone surrounding the VVMs in a loaded ISFSI. The RPS boundary is indicated in the Licensing Drawings in Section 1.5 of the system FSAR. The RPS boundary shall not be encroached upon during any site construction activity. The jurisdictional boundary of the RPS extends down from the top of the ISFSI pad to the elevation of the Bottom surface of the Support Foundation Pad. The ISFSI design shall ensure that there is no significant loss of shielding in the RPS due to a credible accident or an extreme environment event during construction activity involving excavation adjacent to the RPS boundary.

CERTIFICATE OF COMPLIANCE NO. 1040

APPENDIX B

APPROVED CONTENTS AND DESIGN FEATURES

FOR THE HI-STORM UMAX CANISTER STORAGE SYSTEM

TABLE OF CONTENTS

1.0 Definitions

Refer to Appendix A for Definitions.

2.0 APPROVED CONTENTS

2.1 Fuel Specifications and Loading Conditions

2.1.1 Fuel to Be Stored in the HI-STORM UMAX Canister Storage System

a. UNDAMAGED FUEL ASSEMBLIES, DAMAGED FUEL ASSEMBLIES, FUEL DEBRIS, and NON-FUEL HARDWARE meeting the limits specified in Table 2.1-1 and other referenced tables may be stored in the HI-STORM UMAX Canister Storage System.

b. All BWR fuel assemblies may be stored with or without ZR channels.

2.1.2 Fuel Loading

Figures 2.3-1 through 2.3-7 and 2.3-12 define the unique cell numbers for the MPC-37 and MPC-89 models, respectively, and the maximum allowable heat load per fuel assembly for each cell under multiple loading conditions. Fuel assembly decay heat limits are specified in Section 2.3.1. Fuel assemblies shall meet all other applicable limits specified in Tables 2.1-1 through 2.1-3.

2.2 Violations

If any Fuel Specifications or Loading Conditions of 2.1 are violated, the following actions shall be completed:

2.2.1 The affected fuel assemblies shall be placed in a safe condition.

2.2.2 Within 24 hours, notify the NRC Operations Center.

2.2.3 Within 30 days, submit a special report which describes the cause of the violation, and actions taken to restore compliance and prevent recurrence.

Table 2.1-1 (page 1 of 4)
Fuel Assembly Limits

I. MPC MODEL: MPC-37

A. Allowable Contents

1. Uranium oxide PWR UNDAMAGED FUEL ASSEMBLIES, DAMAGED FUEL ASSEMBLIES, and/or FUEL DEBRIS meeting the criteria in Table 2.1-2, with or without NON-FUEL HARDWARE and meeting the following specifications (Note 1):

a. Cladding Type:	ZR
b. Maximum Initial Enrichment:	5.0 wt. % U-235 with soluble boron credit per LCO 3.3.1
c. Post-irradiation Cooling Time and Average Burnup Per Assembly:	Cooling Time ≥ 3 years Assembly Average Burnup ≤ 68.2 GWD/MTU
d. Decay Heat Per Fuel Storage Location:	As specified in Section 2.3
e. Fuel Assembly Length:	≤ 199.2 inches (nominal design including NON-FUEL HARDWARE and DFC)
f. Fuel Assembly Width:	≤ 8.54 inches (nominal design)
g. Fuel Assembly Weight:	≤ 2050 lbs (including NON-FUEL HARDWARE and DFC)

Table 2.1-1 (page 2 of 4)
Fuel Assembly Limits

I. MPC MODEL: MPC-37 (continued)

B. Quantity per MPC: 37 FUEL ASSEMBLIES with up to twelve (12) DAMAGED FUEL ASSEMBLIES or FUEL DEBRIS in DAMAGED FUEL CONTAINERS (DFCs). DFCs may be stored in fuel storage locations 1, 3, 4, 8, 9, 15, 23, 29, 30, 34, 35, and 37 (see Figures 2.3-1 through 2.3-7). The remaining fuel storage locations may be filled with PWR UNDAMAGED FUEL ASSEMBLIES meeting the applicable specifications.

C. One (1) Neutron Source Assembly (NSA) is authorized for loading in the MPC-37.

D. Up to thirty (30) BRPAs are authorized for loading in the MPC-37.

Note 1: Fuel assemblies containing BPRAs, TPDs, WABAs, water displacement guide tube plugs, orifice rod assemblies, or vibration suppressor inserts, with or without ITTRs, may be stored in any fuel storage location. Fuel assemblies containing APSRs, RCCAs, CEAs, CRAs, or NSAs may only be loaded in fuel storage locations 5 through 7, 10 through 14, 17 through 21, 24 through 28, and 31 through 33 (see Figures 2.3-1 through 2.3-7).

Table 2.1-1 (page 3 of 4)
Fuel Assembly Limits

II. MPC MODEL: MPC-89

A. Allowable Contents

1. Uranium oxide BWR UNDAMAGED FUEL ASSEMBLIES, DAMAGED FUEL ASSEMBLIES, and/or FUEL DEBRIS meeting the criteria in Table 2.1-3, with or without channels and meeting the following specifications:

a. Cladding Type:	ZR
b. Maximum PLANAR-AVERAGE INITIAL ENRICHMENT(Note 1):	As specified in Table 2.1-3 for the applicable fuel assembly array/class.
c. Initial Maximum Rod Enrichment	5.0 wt. % U-235
d. Post-irradiation Cooling Time and Average Burnup Per Assembly	
i. Array/Class 8x8F	Cooling time ≥ 10 years and an assembly average burnup ≤ 27.5 GWD/MTU.
ii. All Other Array Classes	Cooling Time ≥ 3 years and an assembly average burnup ≤ 65 GWD/MTU
e. Decay Heat Per Assembly	
i. Array/Class 8x8F	≤ 183.5 Watts
ii. All Other Array Classes	As specified in Section 2.3
f. Fuel Assembly Length	≤ 176.5 inches (nominal design)
g. Fuel Assembly Width	≤ 5.95 inches (nominal design)
h. Fuel Assembly Weight	≤ 850 lbs, including a DFC as well as a channel

Table 2.1-1 (page 4 of 4)
Fuel Assembly Limits

II. MPC MODEL: MPC-89 (continued)

B. Quantity per MPC: 89 FUEL ASSEMBLIES with up to sixteen (16) DAMAGED FUEL ASSEMBLIES or FUEL DEBRIS in DAMAGED FUEL CONTAINERS (DFCs). DFCs may be stored in fuel storage locations 1, 3, 4, 10, 11, 19, 29, 39, 51, 61, 71, 79, 80, 86, 87, and 89 (see Figure 2.3-12). The remaining fuel storage locations may be filled with BWR UNDAMAGED FUEL ASSEMBLIES meeting the applicable specifications.

Note 1: The lowest maximum allowable enrichment of any fuel assembly loaded in an MPC-89, based on fuel array class and fuel classification, is the maximum allowable enrichment for the remainder of the assemblies loaded in that MPC.

NOTES:

1. All dimensions are design nominal values. Maximum and minimum dimensions are specified to bound variations in design nominal values among fuel assemblies within a given array/class.
2. This assembly is known as “QUAD+.” It has four rectangular water cross segments dividing the assembly into four quadrants.
3. For the SPC 9x9-5 fuel assembly, each fuel rod must meet either the 9x9E or the 9x9F set of limits or clad O.D., clad I.D., and pellet diameter.
4. This assembly class contains 74 total rods; 66 full length rods and 8 partial length rods.
5. Square, replacing nine fuel rods.
6. Variable.
7. This assembly contains 92 total fuel rods; 78 full length rods and 14 partial length rods.
8. This assembly class contains 91 total fuel rods; 83 full length rods and 8 partial length rods.
9. One diamond-shaped water rod replacing the four center fuel rods and four rectangular water rods dividing the assembly into four quadrants.
10. These rods may also be sealed at both ends and contain ZR material in lieu of water.
11. Not used.
12. When loading fuel assemblies classified as DAMAGED FUEL, all assemblies in the MPC are limited to 4.0 wt.% U-235.
13. When loading fuel assemblies classified as DAMAGED FUEL, all assemblies in the MPC are limited to 4.6 wt.% U-235.
14. In accordance with the definition of UNDAMAGED FUEL, certain assemblies may be limited to 3.3 wt.% U-235. When loading these fuel assemblies, all assemblies in the MPC are limited to 3.3 wt.% U-235.

Table 2.1-4
CLASSIFICATION OF FUEL ASSEMBLY FOR MPC-37 IN THE HI-STORM UMAX ISFSI

MPC Type	Classification	Nominal Active Fuel Length
MPC-37	Short Fuel	128 inches $\leq$ L < 144 inches
	Standard Fuel	144 inches $\leq$ L < 168 inches
	Long Fuel	L $\geq$ 168 inches

Note 1: L means "nominal active fuel length".

2.3 Decay Heat Limits

This section provides the limits on fuel assembly decay heat for storage in the HI-STORM UMAX Canister Storage System. The method to verify compliance, including examples, is provided in Chapter 13 of the HI-STORM UMAX FSAR.

2.3.1 Fuel Loading Decay Heat Limits

Table 2.3-1 provides the maximum permissible decay heat under long-term storage for MPC-37 and MPC-89. Table 2.3-1 also lists the applicable figures providing the permissible decay heat per fuel storage location, including MPCs using the optional helium backfill pressure ranges permitted in Table 3-2 of Appendix A.

TABLE 2.3-1
PERMISSIBLE HEAT LOAD FOR LONG-TERM STORAGE

MPC Type		Heat Load Chart	Helium Backfill Pressure Option (Notes 1,2)	Permissible Heat Load Per Storage Cell	Permissible Aggregate Heat Load, kW (Note 4)
MPC-37	Short Fuel (Note 3)	1	1	Figure 2.3-1	33.88

	Standard Fuel (Note 3)		3	Figure 2.3-8	34.28
			3	Figure 2.3-12	33.46
	Long Fuel (Note 3)		3	Figure 2.3-9	36.19
			3	Figure 2.3-12	33.46
MPC-89			1	Figure 2.3-10	36.32
			2	Figure 2.3-11	36.72
			2	Figure 2.3-13	34.75

Notes:

1. For helium backfill pressure option pressure ranges see Appendix A, Table 3-2
2. For the details on the use of VDS to dry High Burnup Fuel see Appendix A, Table 3-1
3. See Table 2.1-4 for fuel length data
4. Aggregate heat load is defined as the sum of heat loads of all stored fuel

assemblies. The permissible aggregate heat load is set to 80% of the design basis heat load.

2.3.2 When complying with the maximum fuel storage location decay heat limits, users must account for the decay heat from both the fuel assembly and any NON-FUEL HARDWARE, as applicable for the particular fuel storage location, to ensure the decay heat emitted by all contents in a storage location does not exceed the limit.

		1 0.873	2 0.873	3 0.873

3.0 DESIGN FEATURES

3.1 Site

3.1.1 Site Location

The HI-STORM UMAX Canister Storage System is authorized for general use by 10 CFR Part 50 license holders at various site locations under the provisions of 10 CFR 72, Subpart K.

3.2 Design Features Important for Criticality Control

3.2.1 MPC-37

1. Basket cell ID: 8.92 in. (min. nominal)
2. Basket cell wall thickness: 0.57 in. (min.nominal)
3. B_4C in the Metamic-HT: 10.0 wt % (min. nominal)

3.2.2 MPC-89

1. Basket cell ID: 5.99 in. (min.nominal)
2. Basket cell wall thickness: 0.38 in. (min.nominal)
3. B_4C in the Metamic-HT: 10.0 wt % (min. nominal)

3.2.3 Metamic-HT Test Requirements

1. The weight percentage of the boron carbide must be confirmed to be greater than or equal to 10% in each lot of Al/ B4C powder.

2. The areal density of the B-10 isotope corresponding to the 10% min. weight density in the manufactured Metamic HT panels shall be independently confirmed by the neutron attenuation test method by testing at least one coupon from a randomly selected panel in each lot.

3. If the B- 10 areal density criterion in the tested panel fails to meet the specified minimum, then the manufacturer has the option to reject the entire lot or to test a statistically significant number of panels and perform statistical analysis to show that the minimum areal density in the panels (that comprise the lot) is satisfied with 95% confidence.

4. All test procedures used in demonstrating compliance with the above requirements shall conform to the cask designer's QA program which has been approved by the USNRC under docket number 71-0784.

3.3 Codes and Standards

The American Society of Mechanical Engineers Boiler and Pressure Vessel Code (ASME Code), 2007, is the governing Code for the HI-STORM UMAX system MPC as

clarified in Specification 3.3.1 below, except for Code Sections V and IX. However, the HI-STORM UMAX VVM is structurally qualified per the newer 2010 ASME code. The ASME Code paragraphs applicable to the manufacturing of HI-STORM UMAX VVM and transfer cask are listed in Table 3-2. The latest effective editions of ASME Code Sections V and IX, including addenda, may be used for activities governed by those sections, provided a written reconciliation of the later edition against the applicable edition (including addenda) specified above, is performed by the certificate holder. American Concrete Institute ACI-318 (2005) is the governing Code for both plain concrete and reinforced concrete as clarified in Chapter 3 of the Final Safety Analysis Report for the HI-STORM 100 UMAX System.

3.3.1 Alternatives to Codes, Standards, and Criteria

Table 3-1 lists approved alternatives to the ASME Code for the design of the MPCs of the HI-STORM UMAX Canister Storage System.

3.3.2 Construction/Fabrication Alternatives to Codes, Standards, and Criteria

Proposed alternatives to the ASME Code, Section III, 2007 Edition, including modifications to the alternatives allowed by Specification 3.3.1 may be used on a case-specific basis when authorized by the Director of the Office of Nuclear Material Safety and Safeguards or designee. The request for such alternative should demonstrate that:

1. The proposed alternatives would provide an acceptable level of quality and safety, or
2. Compliance with the specified requirements of the ASME Code, Section III, 2007 Edition, would result in hardship or unusual difficulty without a compensating increase in the level of quality and safety.

Requests for alternatives shall be submitted in accordance with 10 CFR 72.4.

(continued)

3.0 DESIGN FEATURES (continued)

TABLE 3-1
List of ASME Code Alternatives for Multi-Purpose Canisters (MPCs)

MPC Enclosure Vessel	Subsection NCA	General Requirements. Requires preparation of a Design Specification, Design Report, Overpressure Protection Report, Certification of Construction Report, Data Report, and other administrative controls for an ASME Code stamped vessel.	Because the MPC is not an ASME Code stamped vessel, none of the specifications, reports, certificates, or other general requirements specified by NCA are required. In lieu of a Design Specification and Design Report, the HI-STORM FSAR includes the design criteria, service conditions, and load combinations for the design and operation of the MPCs as well as the results of the stress analyses to demonstrate that applicable Code stress limits are met. Additionally, the fabricator is not required to have an ASME-certified QA program. All important-to-safety activities are governed by the NRC-approved Holtec QA program. Because the cask components are not certified to the Code, the terms “Certificate Holder” and “Inspector” are not germane to the manufacturing of NRC-certified cask components. To eliminate ambiguity, the responsibilities assigned to the Certificate Holder in the Code, as applicable, shall be interpreted to apply to the NRC Certificate of Compliance (CoC) holder (and by extension, to the component fabricator) if the requirement must be fulfilled. The Code term “Inspector” means the QA/QC personnel of the CoC holder and its vendors assigned to oversee and inspect the manufacturing process.
MPC Enclosure Vessel	NB-1100	Statement of requirements for Code stamping of components.	MPC Enclosure Vessel is designed and will be fabricated in accordance with ASME Code, Section III, Subsection NB to the maximum practical extent, but Code stamping is not required.

TABLE 3-1
List of ASME Code Alternatives for Multi-Purpose Canisters (MPCs)

MPC basket supports and lift lugs	NB-1130	NB-1132.2(d) requires that the first connecting weld of a non-pressure retaining structural attachment to a component shall be considered part of the component unless the weld is more than 2t from the pressure retaining portion of the component, where t is the nominal thickness of the pressure retaining material. NB-1132.2(e) requires that the first connecting weld of a welded nonstructural attachment to a component shall conform to NB-4430 if the connecting weld is within 2t from the pressure retaining portion of the component.	The lugs that are used exclusively for lifting an empty MPC are welded to the inside of the pressure-retaining MPC shell, but are not designed in accordance with Subsection NB. The lug-to-Enclosure Vessel Weld is required to meet the stress limits of Reg. Guide 3.61 in lieu of Subsection NB of the Code.
MPC Enclosure Vessel	NB-2000	Requires materials to be supplied by ASME-approved material supplier.	Materials will be supplied by Holtec approved suppliers with Certified Material Test Reports (CMTRs) in accordance with NB-2000 requirements.
MPC Enclosure Vessel	NB-3100 NF-3100	Provides requirements for determining design loading conditions, such as pressure, temperature, and mechanical loads.	These requirements are subsumed by the HI-STORM FW FSAR, serving as the Design Specification, which establishes the service conditions and load combinations for the storage system.
MPC Enclosure Vessel	NB-4120	NB-4121.2 and NF-4121.2 provide requirements for repetition of tensile or impact tests for material subjected to heat treatment during fabrication or installation.	In-shop operations of short duration that apply heat to a component, such as plasma cutting of plate stock, welding, machining, and coating are not, unless explicitly stated by the Code, defined as heat treatment operations.

TABLE 3-1
List of ASME Code Alternatives for Multi-Purpose Canisters (MPCs)

MPC Enclosure Vessel	NB-4220	Requires certain forming tolerances to be met for cylindrical, conical, or spherical shells of a vessel.	The cylindricity measurements on the rolled shells are not specifically recorded in the shop travelers, as would be the case for a Code-stamped pressure vessel. Rather, the requirements on inter-component clearances (such as the MPC-to-transfer cask) are guaranteed through fixture-controlled manufacturing. The fabrication specification and shop procedures ensure that all dimensional design objectives, including inter-component annular clearances are satisfied. The dimensions required to be met in fabrication are chosen to meet the functional requirements of the dry storage components. Thus, although the post-forming Code cylindricity requirements are not evaluated for compliance directly, they are indirectly satisfied (actually exceeded) in the final manufactured components.
MPC Enclosure Vessel	NB-4122	Implies that with the exception of studs, bolts, nuts and heat exchanger tubes, CMTRs must be traceable to a specific piece of material in a component.	MPCs are built in lots. Material traceability on raw materials to a heat number and corresponding CMTR is maintained by Holtec through markings on the raw material. Where material is cut or processed, markings are transferred accordingly to assure traceability. As materials are assembled into the lot of MPCs being manufactured, documentation is maintained to identify the heat numbers of materials being used for that item in the multiple MPCs being manufactured under that lot. A specific item within a specific MPC will have a number of heat numbers identified as possibly being used for the item in that particular MPC of which one or more of those heat numbers (and corresponding CMTRS) will have actually been used. All of the heat numbers identified will comply with the requirements for the particular item.
MPC Lid and Closure Ring Welds	NB-4243	Full penetration welds required for Category C Joints (flat head to main shell per NB-3352.3)	MPC lid and closure ring are not full penetration welds. They are welded independently to provide a redundant seal.

TABLE 3-1
List of ASME Code Alternatives for Multi-Purpose Canisters (MPCs)

MPC Closure Ring, Vent and Drain Cover Plate Welds	NB-5230	Radiographic (RT) or ultrasonic (UT) examination required.	Root (if more than one weld pass is required) and final liquid penetrant examination to be performed in accordance with NB-5245. The closure ring provides independent redundant closure for vent and drain cover plates. Vent and drain port cover plate welds are helium leakage tested.
MPC Lid to Shell Weld	NB-5230	Radiographic (RT) or ultrasonic (UT) examination required.	Only progressive liquid penetrant (PT) examination is permitted. PT examination will include the root and final weld layers and each approx. 3/8" of weld depth.
MPC Enclosure Vessel and Lid	NB-6111	All completed pressure retaining systems shall be pressure tested.	The MPC vessel is welded in the field following fuel assembly loading. After the lid to shell weld is completed, the MPC shall then be pressure tested as defined in Chapter 10. Accessibility for leakage inspections precludes a Code compliant pressure test. Since the shell welds of the MPC cannot be checked for leakage during this pressure test, the shop leakage test to 10^{-7} ref cc/sec provides reasonable assurance as to its leak tightness. All MPC enclosure vessel welds (except closure ring and vent/drain cover plate) are inspected by volumetric examination. The MPC lid-to-shell weld shall be verified by progressive PT examination. PT must include the root and final layers and each approximately 3/8 inch of weld depth. The inspection results, including relevant findings (indications) shall be made a permanent part of the user's records by video, photographic, of other means which provide an equivalent record of weld integrity. The video or photographic records should be taken during the final interpretation period described in ASME Section V, Article 6, T-676. The vent/drain cover plate and the closure ring welds are confirmed by liquid penetrant examination. The inspection of the weld must be performed by qualified personnel and shall meet the acceptance requirements of ASME Code Section III, NB-5350.

TABLE 3-1
List of ASME Code Alternatives for Multi-Purpose Canisters (MPCs)

MPC Enclosure Vessel	NB-7000	Vessels are required to have overpressure protection.	No overpressure protection is provided. Function of MPC enclosure vessel is to contain radioactive contents under normal, off-normal, and accident conditions of storage. MPC vessel is designed to withstand maximum internal pressure considering 100% fuel rod failure and maximum accident temperatures.
MPC Enclosure Vessel	NB-8000	States requirements for nameplates, stamping and reports per NCA-8000.	The HI-STORM UMAX system is to be marked and identified in accordance with 10CFR71 and 10CFR72 requirements. Code stamping is not required. QA data package to be in accordance with Holtec approved QA program.

3.0 DESIGN FEATURES (continued)

3.4 Site-Specific Parameters and Analyses

Site-specific parameters and analyses that will require verification by the system user are, as a minimum, as follows:

1. The temperature of 80° F is the maximum average yearly temperature.
2. The allowed temperature extremes, averaged over a 3-day period, shall be greater than -40° F and less than 125° F.
3. The resultant zero period acceleration at the top of the grade and at the elevation of the Support Foundation Pad (SFP) at the host site (computed by the Newmark's rule as the sum of A+0.4*B+0.4*C, where A, B, C denote the free field ZPA's in the three orthogonal directions in decreasing magnitude, i.e., A ≥ B ≥ C) shall be less than or equal to 1.3 and 1.214, respectively.
4. The analyzed flood condition of 15 fps water velocity and a height of 125 feet of water (full submergence of the loaded cask) are not exceeded.
5. The potential for fire and explosion shall be based on site-specific considerations. The user shall demonstrate that the site-specific potential for fire is bounded by the fire conditions analyzed by the Certificate Holder, or an analysis of the site-specific fire considerations shall be performed.
6. The moment and shear capacities of the ISFSI Structures shall meet the structural requirements under the load combinations in Table 3.4-1.
7. Radiation Protection Space (RPS) as defined in Subsection 5.3.9 of Appendix A, is intended to ensure that the subgrade material in and around the lateral space occupied by the VVMs remains essentially intact under all service conditions including during an excavation activity adjacent to the RPS.
8. The SFP for a VVM array established in any one construction campaign shall be of monolithic construction, to the extent practicable, to maximize the physical stability of the underground installation.
9. Excavation activities contiguous to a loaded UMAX ISFSI on the side facing the excavation can occur down to the depth of the bottom surface of the SFP of the loaded ISFSI (i.e. within the area labeled "Space B" in Figure 3-1) considering that there may be minor variations in the depth due to normal construction practices. For excavation activities which are contiguous to the loaded ISFSI (within a distance "W," see Figure 3-1) and below the depth of the bottom surface of the SFP (i.e. within the area labeled "Space D" in Figure 3-1), a site-specific seismic analysis will be performed to demonstrate the stability of the RPS boundary and structural integrity of the ISFSI structure. This analysis shall be submitted to Holtec International to be incorporated in an amendment request for NRC review and approval prior to any excavation taking place.

10. In cases where engineered features (i.e., berms and shield walls) are used to ensure that the requirements of 10CFR72.104(a) are met, such features are to be considered important-to-safety and must be evaluated to determine the applicable quality assurance category.

11. LOADING OPERATIONS, TRANSPORT OPERATIONS, and UNLOADING OPERATIONS shall only be conducted with working area Ambient Temperature $\geq 0^{o}$ F.

12. For those users whose site-specific design basis includes an event or events (e.g., flood) that result in the blockage of any VVM inlet or outlet air ducts for an extended period of time (i.e., longer than the total Completion Time of LCO 3.1.2), an analysis or evaluation may be performed to demonstrate adequate heat removal is available for the duration of the event. Adequate heat removal is defined as fuel cladding temperatures remaining below the short term temperature limit. If the analysis or evaluation is not performed, or if fuel cladding temperature limits are unable to be demonstrated by analysis or evaluation to remain below the short term temperature limit for the duration of the event, provisions shall be established to provide alternate means of cooling to accomplish this objective.

13. Users shall establish procedural and/or mechanical barriers to ensure that during LOADING OPERATIONS and UNLOADING OPERATIONS, either the fuel cladding is covered by water, or the MPC is filled with an inert gas.

14. The entire haul route shall be evaluated to ensure that the route can support the weight of the loaded transfer cask and its conveyance.

15. The loaded transfer cask and its conveyance shall be evaluated to ensure, under the site specific Design Basis Earthquake, that the cask and its conveyance does not tipover or slide off the haul route.

Lower Bound Shear Wave Velocity in the Subgrade below the Support Foundation Pad (Figure 3-1 Space C & D), fps**	≥485
Lower Bound Shear Wave Velocity in the Subgrade laterally surrounding the ISFSI (Figure 3-1 Space B), fps**	≥450

* Applies to Support Foundation Pad and ISFSI Pad.

** Strain compatible effective shear wave velocities shall be computed using the guidance provided in Section 16 of the International Building Code, 2009 Edition. Users must account for potential variability in the subgrade shear wave velocity in accordance with Section 3.7.2 of NUREG-0800.

Notes:

1. A lower average density value may be used in shielding analysis per FSAR Chapter 5 for conservatism.

2. Not required for shielding.

3. This space will typically contain native soil. Not required for shielding.

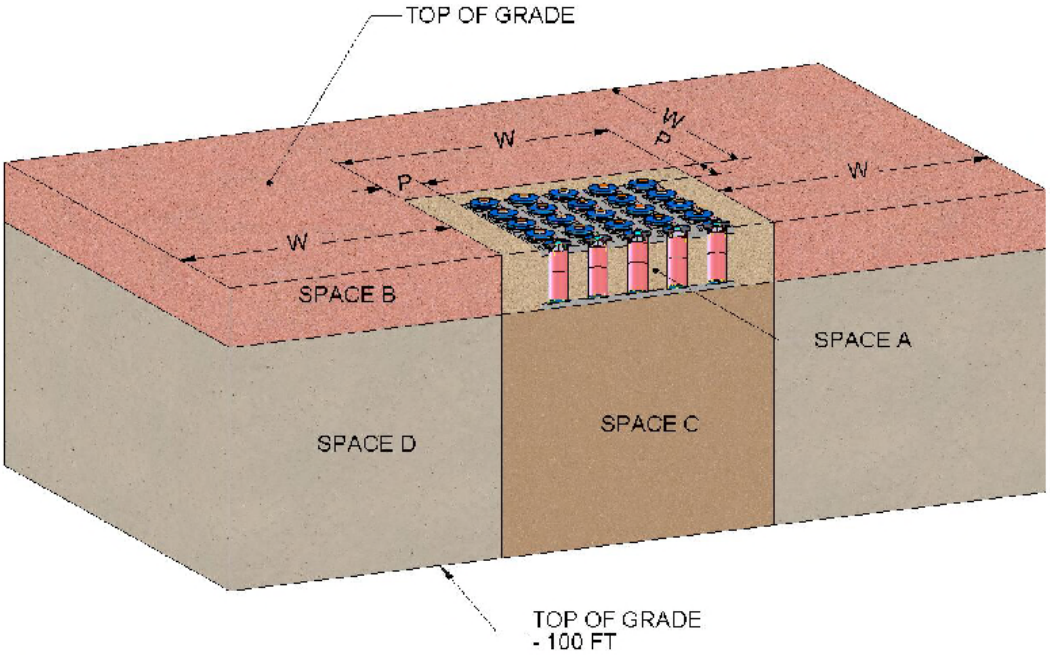

Figure 3-1 - SUBGRADE AND UNDERGRADE SPACE NOMENCLATURE

3.0 DESIGN FEATURES (continued)

3.5 Combustible Gas Monitoring During MPC Lid Welding and Cutting

During MPC lid-to-shell welding and cutting operations, combustible gas monitoring of the space under the MPC lid is required, to ensure that there is no combustible mixture present.

3.6 Periodic Corrosion Inspections for Underground Systems

HI-STORM UMAX VVM ISFSIs not employing an impressed current cathodic protection system shall be subject to visual and UT inspection of at least one representative VVM to check for significant corrosion of the CEC Container Shell and Bottom Plate at an interval not to exceed 20 years. The VVM chosen for inspection is not required to be in use or to have previously contained a loaded MPC. The VVM considered to be most vulnerable to corrosion degradation shall be selected for inspection. If significant corrosion is identified, either an evaluation to demonstrate sufficient continued structural integrity (sufficient for at least the remainder of the licensing period) shall be performed or the affected VVM shall be promptly scheduled for repair or decommissioning. Through wall corrosion shall not be permitted without promptly scheduling for repair or decommissioning. Promptness of repair or decommissioning shall be commensurate with the extent of degradation of the VVM but shall not exceed 3 years from the date of inspection.

If the representative VVM is determined to require repair or decommissioning, the next most vulnerable VVM shall be selected for inspection. This inspection process shall conclude when a VVM is found that does not require repair or decommissioning. Since the last VVM inspected is considered more prone to corrosion than the remaining un-inspected VVMs, the last VVM inspected becomes the representative VVM for the remaining VVMs.

Inspections

Visual Inspection: Visual inspection of the inner surfaces of the CEC Container Shell and Bottom Plate for indications of significant or through wall corrosion (i.e., holes).

UT Inspection: The UT inspection or an equivalent method shall be used to measure CEC shell wall thickness to determine the extent of metal loss from corrosion. A minimum of 16 data points shall be obtained, 4 near the top, 4 near the mid-height and 4 near the bottom of the CEC Container Shell all approximately 0, 90, 180, and 270 degrees apart; and 4 on the CEC Bottom Plate near the CEC Container Shell approximately 0, 90, 180, and 270 degrees apart. Locations where visual inspection has identified potentially significant corrosion shall also receive UT inspection. Locations suspected of significant corrosion may receive further UT inspection to determine the extent of corrosion.

Inspection Criteria

General wall thinning exceeding 1/8” in depth and local pitting exceeding 1/4" in depth are conditions of significant corrosion.

U.S. NUCLEAR REGULATORY COMMISSION

CERTIFICATE OF COMPLIANCE FOR SPENT FUEL STORAGE CASKS

The U.S. Nuclear Regulatory Commission is issuing this Certificate of Compliance pursuant to Title 10 of the *Code of Federal Regulations*, Part 72, "Licensing Requirements for Independent Storage of Spent Nuclear Fuel and High-Level Radioactive Waste" (10 CFR Part 72). This certificate is issued in accordance with 10 CFR 72.238, certifying that the storage design and contents described below meet the applicable safety standards set forth in 10 CFR Part 72, Subpart L, and on the basis of the Final Safety Analysis Report (FSAR) of the cask design. This certificate is conditional upon fulfilling the requirements of 10 CFR Part 72, as applicable, and the conditions specified below.

Safety Analysis Report Title

Holtec International Inc.,
Final Safety Analysis Report for the
HI-STORM 100 Cask System

CONDITIONS

This certificate is conditional upon fulfilling the requirements of 10 CFR Part 72, as applicable, the attached Appendix A (Technical Specifications) and Appendix B (Approved Contents and Design Features) for aboveground systems or the attached Appendix A-100U (Technical Specifications) and Appendix B-100U (Approved Contents and Design Features) for underground systems, and the conditions specified below:

1. CASK

   a. Model No.: HI-STORM 100 Cask System

   The HI-STORM 100 Cask System (the cask) consists of the following components: (1) interchangeable multi-purpose canisters (MPCs), which contain the fuel; (2) a storage overpack (HI-STORM), which contains the MPC during storage; and (3) a transfer cask (HI-TRAC), which contains the MPC during loading, unloading and transfer operations. The cask stores up to 32 pressurized water reactor fuel assemblies or 68 boiling water reactor fuel assemblies.

   b. Description

   The HI-STORM 100 Cask System is certified as described in the Final Safety Analysis Report (FSAR) and in the U.S. Nuclear Regulatory Commission's (NRC) Safety Evaluation Report (SER) accompanying the Certificate of Compliance (CoC). The cask comprises three discrete components: the MPC, the HI-TRAC transfer cask, and the HI-STORM storage overpack.

   The MPC is the confinement system for the stored fuel. It is a welded, cylindrical canister with a honeycombed fuel basket, a baseplate, a lid, a closure ring, and the canister shell. All MPC components that may come into contact with spent fuel pool water or the ambient environment are made entirely of stainless steel or passivated aluminum/aluminum alloys such as the neutron absorbers. The canister shell, baseplate, lid, vent and drain port cover plates, and closure ring are the main confinement boundary components. All confinement boundary components are made entirely of stainless steel. The honeycombed basket, which contains neutron absorbing material, provides criticality control.

NRC FORM 651 (3-1999) 10 CFR 72

U.S. NUCLEAR REGULATORY COMMISSION

CERTIFICATE OF COMPLIANCE FOR SPENT FUEL STORAGE CASKS
Supplemental Sheet

Certificate No. 1014
Amendment No. 11~~0~~
Page 2 of 5

1. b. Description (continued)

There are nine types of MPCs: the MPC-24, MPC-24E, MPC-24EF, MPC-32, MPC-32F, MPC-68, MPC-68F, MPC-68FF, and MPC-68M. The number suffix indicates the maximum number of fuel assemblies permitted to be loaded in the MPC. All nine MPC models have the same external diameter.

The HI-TRAC transfer cask provides shielding and structural protection of the MPC during loading, unloading, and movement of the MPC from the spent fuel pool to the storage overpack. The transfer cask is a multi-walled (carbon steel/lead/carbon steel) cylindrical vessel with a neutron shield jacket attached to the exterior. Two sizes of HI-TRAC transfer casks are available: the 125 ton HI-TRAC and the 100 ton HI-TRAC. The weight designation indicates the approximate weight of a loaded transfer cask during any loading, unloading, or transfer operation. Both transfer cask sizes have identical cavity diameters. The 125 ton HI-TRAC transfer cask has thicker shielding and larger outer dimensions than the 100 ton HI-TRAC transfer cask.

Above Ground Systems

The HI-STORM 100 or 100S storage overpack provides shielding and structural protection of the MPC during storage. The HI-STORM 100S is a variation of the HI-STORM 100 overpack design that includes a modified lid which incorporates the air outlet ducts into the lid, allowing the overpack body to be shortened. The overpack is a heavy-walled steel and concrete, cylindrical vessel. Its side wall consists of plain (un-reinforced) concrete that is enclosed between inner and outer carbon steel shells. The overpack has four air inlets at the bottom and four air outlets at the top to allow air to circulate naturally through the cavity to cool the MPC inside. The inner shell has supports attached to its interior surface to guide the MPC during insertion and removal, provide a medium to absorb impact loads, and allow cooling air to circulate through the overpack. A loaded MPC is stored within the HI-STORM 100 or 100S storage overpack in a vertical orientation. The HI-STORM 100A and 100SA are variants of the HI-STORM 100 family and are outfitted with an extended baseplate and gussets to enable the overpack to be anchored to the concrete storage pad in high seismic applications.

Underground Systems

The HI-STORM 100U System is an underground storage system identified with the HI-STORM 100 Cask System. The HI-STORM 100U storage Vertical Ventilated Module (VVM) utilizes a storage design identified as an air-cooled vault or caisson. The HI-STORM 100U storage VVM relies on vertical ventilation instead of conduction through the soil, as it is essentially a below-grade storage cavity. Air inlets and outlets allow air to circulate naturally through the cavity to cool the MPC inside. The subterranean steel structure is seal welded to prevent ingress of any groundwater from the surrounding subgrade, and it is mounted on a stiff foundation. The surrounding subgrade and a top surface pad provide significant radiation shielding. A loaded MPC is stored within the HI-STORM 100U storage VVM in the vertical orientation.

2. OPERATING PROCEDURES

Written operating procedures shall be prepared for cask handling, loading, movement, surveillance, and maintenance. The user's site-specific written operating procedures shall be consistent with the technical basis described in Chapter 8 of the FSAR.

3. ACCEPTANCE TESTS AND MAINTENANCE PROGRAM

Written cask acceptance tests and maintenance program shall be prepared consistent with the technical basis described in Chapter 9 of the FSAR. At completion of welding the MPC shell to baseplate, an MPC confinement weld helium leak test shall be performed using a helium mass spectrometer. This test shall include the base metals of the MPC shell and baseplate. A helium leak test shall also be performed on the base metal of the fabricated MPC lid. In the field, a helium leak test shall be performed on the vent and drain port confinement welds and cover plate base metal. The confinement boundary leakage rate tests shall be performed in accordance with ANSI N14.5 to "leaktight" criteria. If a leakage rate exceeding the acceptance criteria is detected, then the area of leakage shall be determined and the area repaired per ASME Code Section III, Subsection NB requirements. Re-testing shall be performed until the leakage rate acceptance criterion is met.

4. QUALITY ASSURANCE

Activities in the areas of design, purchase, fabrication, assembly, inspection, testing, operation, maintenance, repair, modification of structures, systems and components, and decommissioning that are important to safety shall be conducted in accordance with a Commission-approved quality assurance program which satisfies the applicable requirements of 10 CFR Part 72, Subpart G, and which is established, maintained, and executed with regard to the cask system.

5. HEAVY LOADS REQUIREMENTS

Each lift of an MPC, a HI-TRAC transfer cask, or any HI-STORM overpack must be made in accordance to the existing heavy loads requirements and procedures of the licensed facility at which the lift is made. A plant-specific review (under 10 CFR 50.59 or 10 CFR 72.48, if applicable) is required to show operational compliance with existing plant specific heavy loads requirements. Lifting operations outside of structures governed by 10 CFR Part 50 must be in accordance with Section 5.5 of Appendix A and Sections 3.4.6 and 3.5 (if applicable) of Appendix B, for above ground systems, section 5.5 of Appendix A-100U for the underground systems.

6. APPROVED CONTENTS

Contents of the HI-STORM 100 Cask System must meet the fuel specifications given in Appendices B for aboveground systems or B-100U for underground systems to this certificate.

7. DESIGN FEATURES

Features or characteristics for the site, cask or ancillary equipment must be in accordance with Appendices B for aboveground systems or B-100U for underground systems to this certificate.

8. CHANGES TO THE CERTIFICATE OF COMPLIANCE

The holder of this certificate who desires to make changes to the certificate, which includes Appendices A and A-100U (Technical Specifications) and Appendices B and B-100U (Approved Contents and Design Features), shall submit an application for amendment of the certificate.

9. SPECIAL REQUIREMENTS FOR FIRST SYSTEMS IN PLACE

a. For the storage configuration, each user of a HI-STORM 100 Cask and HI-STORM 100U Cask with a heat load equal to or greater than 20 kW shall perform a thermal validation test in which the user measures the total air mass flow rate through the cask system using direct measurements of air velocity in the inlet vents. The user shall then perform an analysis of the cask with the taken measurements to demonstrate that the measurements validate the analytic methods described in Chapter 4 of the FSAR. The thermal validation test and analysis results shall be submitted in a letter report to the NRC pursuant to 10 CFR 72.4 within 180 days of the user's loading of the first cask with heat load equal to or greater than 20 kW. To satisfy condition 9(a) for casks of the same system type (i.e., HI-STORM 100 casks, HI-STORM 100U casks), in lieu of additional submittals pursuant to 10 CFR 72.4, users may document in their 72.212 report a previously performed test and analysis submitted by letter report to the NRC that demonstrates validation of the analytic methods described in Chapter 4 of the FSAR.

b. For transfer configuration, each user of the HI-STORM 100 Cask and HI-STORM 100U Cask shall procure, if necessary, a Supplemental Cooling System (SCS) capable of providing the thermal-hydraulic characteristics (coolant temperature at the annulus inlet, coolant temperature located at the annulus outlet, and coolant flow rate) that will ensure that thermal limits (described in Appendix 2.C of the FSAR) are not exceeded during transfer operations. The thermal-hydraulic characteristics of the SCS shall be determined using the analytical methods described in Chapter 4 for the transfer configuration. For the transfer configuration, each first time user shall measure the SCS thermal-hydraulic characteristics to validate the performance of the SCS. The SCS analysis and validation shall be documented in an update to the 72.212 report within 180 days of the user's first transfer operation with the SCS. Condition 9(b) does not apply to the MPC-68M.

Certificate No. 1014
Amendment No. 11~~0~~
Page 4 of 5

10. PRE-OPERATIONAL TESTING AND TRAINING EXERCISE

A dry run training exercise of the loading, closure, handling, unloading, and transfer of the HI-STORM 100 Cask System shall be conducted by the licensee prior to the first use of the system to load spent fuel assemblies. The training exercise shall not be conducted with spent fuel in the MPC. The dry run may be performed in an alternate step sequence from the actual procedures, but all steps must be performed. The dry run shall include, but is not limited to the following:

a. Moving the MPC and the transfer cask into the spent fuel pool or cask loading pool.

b. Preparation of the HI-STORM 100 Cask System for fuel loading.

c. Selection and verification of specific fuel assemblies to ensure type conformance.

d. Loading specific assemblies and placing assemblies into the MPC (using a dummy fuel assembly), including appropriate independent verification.

e. Remote installation of the MPC lid and removal of the MPC and transfer cask from the spent fuel pool or cask loading pool.

f. MPC welding, NDE inspections, pressure testing, draining, moisture removal (by vacuum drying or forced helium dehydration, as applicable), and helium backfilling. (A mockup may be used for this dry-run exercise.)

g. Operation of the HI-STORM 100 SCS or equivalent system, if applicable.

h. Transfer cask upending/downending on the horizontal transfer trailer or other transfer device, as applicable to the site's cask handling arrangement.

i. Transfer of the MPC from the transfer cask to the overpack/VVM.

j. Placement of the HI-STORM 100 Cask System at the ISFSI, for aboveground systems only.

k. HI-STORM 100 Cask System unloading, including flooding MPC cavity, removing MPC lid welds. (A mockup may be used for this dry-run exercise.)

11. The NRC has approved an exemption request by the CoC applicant from the requirements of 10 CFR 72.236(f), to allow a Supplemental Cooling System to provide for decay heat removal in accordance with Section 3.1.4 of Appendices A and A-100U.

12. AUTHORIZATION

The HI-STORM 100 Cask System, which is authorized by this certificate, is hereby approved for general use by holders of 10 CFR Part 50 licenses for nuclear reactors at reactor sites under the general license issued pursuant to 10 CFR 72.210, subject to the conditions specified by 10 CFR 72.212, this certificate, and the attached Appendices A, B, A-100U, and B-100U, as applicable. The HI-STORM 100 Cask System may be fabricated and used in accordance with any approved amendment to CoC No. 1014 listed in 10 CFR 72.214. Each of the licensed HI-STORM 100 System components (i.e., the MPC, overpack, and transfer cask), if fabricated in accordance with any of the approved CoC Amendments, may be used with one another provided an assessment is performed by the CoC holder that demonstrates design compatibility.

EXHIBIT 9

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

July 17, 2015

Mr. Thomas J. Palmisano
Vice President and Chief Nuclear Officer
Southern California Edison Company
San Onofre Nuclear Generating Station
P.O. Box 128
San Clemente, CA 92674-0128

SUBJECT: SAN ONOFRE NUCLEAR GENERATING STATION, UNITS 2 AND 3 - ISSUANCE OF AMENDMENT FOR PERMANENTLY SHUTDOWN AND DEFUELED OPERATING LICENSE AND TECHNICAL SPECIFICATIONS (TAC NOS. MF3774 AND MF3775)

Dear Mr. Palmisano:

The U.S. Nuclear Regulatory Commission has issued the enclosed Amendment No. 230 to Facility Operating License No. NPF-10, and Amendment No. 223 to Facility Operating License No. NPF-15, for the San Onofre Nuclear Generating Station (SONGS), Units 2 and 3, respectively. The amendments consist of changes to the SONGS facility operating licenses and the Technical Specifications (TSs) in response to your application dated March 21, 2014, as supplemented by letters dated October 1, 2014; and February 23, February 25, and March 18, 2015.

The proposed amendments revise the operating licenses and associated TSs to reflect the permanent cessation of reactor operations and the permanently defueled condition of the reactor vessels at SONGS Units 2 and 3. In general, the changes eliminate those TSs applicable in operating MODES; MODES where fuel is emplaced in the reactor vessel, and certain TSs required for movement of irradiated fuel assemblies. Changes were also made to the TS definitions, administrative controls, and related to programs and procedures. The proposed amendments also revise the facility operating licenses to clarify or remove certain conditions no longer relevant and add conditions consistent with other permanently shutdown and defueled reactors. Related Amendment Nos. 227 and 220 for SONGS Units 2 and 3, respectively, were issued on September 30, 2014, to revise and remove certain requirements from Section 5.0, "Administrative Controls," of the SONGS Units 2 and 3 TSs to reflect the permanently shutdown and defueled staffing and training requirements for SONGS Units 2 and 3 operations staff.

T. Palmisano

A copy of the Safety Evaluation is also enclosed. The Notice of Issuance will be included in the Commission's biweekly *Federal Register* notice.

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

SOUTHERN CALIFORNIA EDISON COMPANY

SAN DIEGO GAS AND ELECTRIC COMPANY

THE CITY OF RIVERSIDE, CALIFORNIA

DOCKET NO. 50-361

SAN ONOFRE NUCLEAR GENERATING STATION, UNIT 2

AMENDMENT TO FACILITY OPERATING LICENSE

Amendment No. 230
License No. NPF-10

1. The Nuclear Regulatory Commission (the Commission) has found that:

   A. The application for amendment by Southern California Edison Company, et al. (SCE or the licensee), dated March 21, 2014, as supplemented by letters dated October 1, 2014; and February 23, February 25, and March 18, 2015, complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's regulations set forth in 10 CFR Chapter I;

   B. The facility will operate in conformity with the application, the provisions of the Act, and the rules and regulations of the Commission;

   C. There is reasonable assurance (i) that the activities authorized by this amendment can be conducted without endangering the health and safety of the public, and (ii) that such activities will be conducted in compliance with the Commission's regulations;

   D. The issuance of this amendment will not be inimical to the common defense and security or to the health and safety of the public; and

   E. The issuance of this amendment is in accordance with 10 CFR Part 51 of the Commission's regulations and all applicable requirements have been satisfied.

Enclosure 1

2. Accordingly, Facility Operating License No. NPF-10 is hereby amended to read, as follows, as indicated in the attachment to this license amendment.

Paragraph 2.B.(2) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(2) Southern California Edison Company (SCE), pursuant to Section 103 of the Act and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities", to possess and use the facility at the designated location in San Diego County, California, in accordance with the procedures and limitations set forth in this license;

Paragraph 2.B.(3) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(3) SCE, pursuant to the Act and 10 CFR Part 70, to possess at any time special nuclear material that was used as reactor fuel, in accordance with the limitations for storage, as described in the Final Safety Analysis Report, as supplemented and amended;

Paragraph 2.B.(4) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required; and possess any byproduct, source and special material as sealed neutron sources that was used for reactor startup;

Paragraph 2.C.(1) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(1) Deleted

Paragraph 2.C.(2) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 230, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

Paragraph 2.C.(14) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(14) Deleted

Paragraph 2.C.(27) of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

(27) Deleted

New License Condition 2.C.(28) of Facility Operating License No. NPF-10 is hereby added to read, as follows:

(28) Prior to February 16, 2021, if all spent fuel has not been removed from the Unit 2 spent fuel pool, an aging-management program shall be submitted for NRC approval. The scope of the program shall include those long-lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the spent fuel pool. Once approved, the program shall be described in the Updated Final Safety Analysis Report and shall remain in effect for Unit 2 until such time that all spent fuel has been removed from the Unit 2 spent fuel pool.

Paragraph 2.J of Facility Operating License No. NPF-10 is hereby amended to read, as follows:

J. Deleted

New License Condition 3 of Facility Operating License No. NPF-10 is hereby added to read, as follows:

3. On June 12, 2013, Southern California Edison (SCE) certified that operations at San Onofre Nuclear Generating Station Unit 2 would permanently cease in accordance with 10 CFR 50.82(a)(1)(i). On July 22, 2013, SCE certified that the fuel had been permanently removed from the reactor vessel in accordance with 10 CFR 50.82(a)(1)(ii). As a result, the 10 CFR 50 license no longer authorizes operation of the reactor, or the emplacement or retention of fuel in the reactor vessel.

This license is effective as of the date of issuance and authorizes ownership and possession of San Onofre Nuclear Generating Station Unit 2 until the Commission notifies the licensee in writing that the license is terminated. The licensee shall:

A. Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition; and

B. Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the applicable provisions of the 10 CFR 50 facility license as defined in Section 2 of this license.

3. This license amendment is effective as of the date of its issuance and shall be implemented within 60 days of issuance.

Changes to the Facility
Operating License No. NPF-10
and Technical Specifications

Date of Issuance: July 17, 2015

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

SOUTHERN CALIFORNIA EDISON COMPANY

SAN DIEGO GAS AND ELECTRIC COMPANY

THE CITY OF RIVERSIDE, CALIFORNIA

DOCKET NO. 50-362

SAN ONOFRE NUCLEAR GENERATING STATION, UNIT 3

AMENDMENT TO FACILITY OPERATING LICENSE

Amendment No. 223
License No. NPF-15

1. The Nuclear Regulatory Commission (the Commission) has found that:

   A. The application for amendment by Southern California Edison Company, et al. (SCE or the licensee), dated March 21, 2014, as supplemented by letters dated October 1, 2014; and February 23, February 25, and March 18, 2015, complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's regulations set forth in 10 CFR Chapter I;

   B. The facility will operate in conformity with the application, the provisions of the Act, and the rules and regulations of the Commission;

   C. There is reasonable assurance (i) that the activities authorized by this amendment can be conducted without endangering the health and safety of the public, and (ii) that such activities will be conducted in compliance with the Commission's regulations;

   D. The issuance of this amendment will not be inimical to the common defense and security or to the health and safety of the public; and

   E. The issuance of this amendment is in accordance with 10 CFR Part 51 of the Commission's regulations and all applicable requirements have been satisfied.

Enclosure 2

2. Accordingly, Facility Operating License No. NPF-15 is hereby amended to read, as follows, as indicated in the attachment to this license amendment.

Paragraph 2.B.(2) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(2) Southern California Edison Company (SCE), pursuant to Section 103 of the Act and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities", to possess and use the facility at the designated location in San Diego County, California, in accordance with the procedures and limitations set forth in this license;

Paragraph 2.B.(3) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(3) SCE, pursuant to the Act and 10 CFR Part 70, to possess at any time special nuclear material that was used as reactor fuel, in accordance with the limitations for storage, as described in the Final Safety Analysis Report, as supplemented and amended;

Paragraph 2.B.(4) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required; and possess any byproduct, source and special material as sealed neutron sources that was used for reactor startup;

Paragraph 2.C.(1) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(1) Deleted

Paragraph 2.C.(2) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 223, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

Paragraph 2.C.(12) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(12) Deleted

Paragraph 2.C.(28) of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

(28) Deleted

New License Condition 2.C.(29) of Facility Operating License No. NPF-15 is hereby added to read, as follows:

(29) Prior to February 16, 2021, if all spent fuel has not been removed from the Unit 3 spent fuel pool, an aging-management program shall be submitted for NRC approval. The scope of the program shall include those long-lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the spent fuel pool. Once approved, the program shall be described in the Updated Final Safety Analysis Report and shall remain in effect for Unit 3 until such time that all spent fuel has been removed from the Unit 3 spent fuel pool.

Paragraph 2.J of Facility Operating License No. NPF-15 is hereby amended to read, as follows:

J. Deleted

New License Condition 3 of Facility Operating License No. NPF-15 is hereby added to read, as follows:

3. On June 12, 2013, Southern California Edison (SCE) certified that operations at San Onofre Nuclear Generating Station Unit 3 would permanently cease in accordance with 10 CFR 50.82(a)(1)(i). On June 28, 2013, SCE certified that the fuel had been permanently removed from the reactor vessel in accordance with 10 CFR 50.82(a)(1)(ii). As a result, the 10 CFR 50 license no longer authorizes operation of the reactor, or the emplacement or retention of fuel in the reactor vessel.

This license is effective as of the date of issuance and authorizes ownership and possession of San Onofre Nuclear Generating Station Unit 3 until the Commission notifies the licensee in writing that the license is terminated. The licensee shall:

A. Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition; and

B. Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the applicable provisions of the 10 CFR 50 facility license as defined in Section 2 of this license.

3. This license amendment is effective as of the date of its issuance and shall be implemented within 60 days of issuance.

Facility Operating License No. NPF-10

Revised License Pages

G. The licensees have satisfied the applicable provisions of 10 CFR Part 140, "Financial Protection Requirements and Indemnity Agreements," of the Commission's regulations;

H. The issuance of this license will not be inimical to the common defense and security or to the health and safety of the public;

I. After weighing the environmental, economic, technical, and other benefits of the facility against environmental and other costs and considering available alternatives, the issuance of Facility Operating License No. NPF-10, subject to the condition for protection of the environment set forth herein, is in accordance with 10 CFR Part 51 of the Commission's regulations and all applicable requirements have been satisfied; and

J. The receipt, possession, and use of source, byproduct, and special nuclear material as authorized by this license will be in accordance with the Commission's regulations in 10 CFR Parts 30, 40 and 70.

2. Based on the foregoing findings and the Partial Initial Decision issued by the Atomic Safety and Licensing Board on January 11, 1982, regarding this facility, Facility Operating License No. NPF-10 is hereby issued to the Southern California Edison Company, the San Diego Gas and Electric Company, the City of Riverside, California, and the City of Anaheim, California[1] to read as follows:

A. This license applies to the San Onofre Nuclear Generating Station, Unit 2, a pressurized water nuclear reactor and associated equipment (the facility), owned by the licensees. The facility is located in San Diego County, California, and is described in the Final Safety Analysis Report as supplemented and amended, and the Environmental Report, as supplemented and amended.

B. Subject to the conditions and requirements incorporated herein, the Commission hereby licenses:

(1) Southern California Edison Company, San Diego Gas and Electric Company, the City of Riverside, California, and the City of Anaheim, California[1] to possess the facility at the designated location in San Diego County, California, in accordance with the procedures and limitations set forth in this license;

(2) Southern California Edison Company (SCE), pursuant to Section 103 of the Act and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," to possess and use the facility at the designated location in San Diego County, California in accordance with the procedures and limitations set forth in this license;

---

[1]The City of Anaheim has transferred its ownership interests in the facility, and entitlement to facility output, to Southern California Edison Company, except that it retains its ownership interests in its spent nuclear fuel and the facility's independent spent fuel storage installation located on the facility's site. In addition, the City of Anaheim retains financial responsibility for its spent fuel and for a portion of the facility's decommissioning costs. The City of Anaheim remains a licensee for purposes of its retained interests and liabilities.

(3) SCE, pursuant to the Act and 10 CFR Part 70, to possess at any time special nuclear material that was used as reactor fuel, in accordance with the limitations for storage, as described in the Final Safety Analysis Report, as supplemented and amended;

(4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required; and possess any byproduct, source and special material as sealed neutron sources that was used for reactor startup;

(5) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70 to receive, possess, and use in amounts as required any byproduct, source or special nuclear material without restriction to chemical or physical form, for sample analysis or instrument calibration or associated with radioactive apparatus or components; and

(6) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to possess, but not separate, such byproduct and special nuclear materials as may be produced by the operation of San Onofre Nuclear Generating Station, Units 1 and 2 and by the decommissioning of San Onofre Nuclear Generating Station Unit 1.

C. This license shall be deemed to contain and is subject to the conditions specified in the Commission's regulations set forth in 10 CFR Chapter I and is subject to all applicable provisions of the Act and to the rules, regulations and orders of the Commission now or hereafter in effect; and is subject to the additional conditions specified or incorporated below:

(1) Deleted

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 230, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

(14) Deleted

(15) Turbine Disc Inspection (Section 10.2.2, SER)

Deleted by Amendment No. 185

(16) Radioactive Waste System (Section 11.1, SER, SSER #5)

Deleted by Amendment No. 185

(17) Purge System Monitors (Section 11.3, SER, SSER #5)

Deleted by Amendment No. 185

(18) Initial Test Program (Section 14, SER)

Deleted by Amendment No. 185

(19) NUREG-0737 Conditions (Section 22)

a. Shift Technical Advisor (I.A.1.1, SSER #1)
Deleted by Amendment No. 185

b. Shift Manning (I.A.1.3. SSER #1, SSER #5)
Deleted by Amendment No. 147

c. Independent Safety Engineering Group (1.B.1.2. SSER #1)

Deleted by Amendment No. 185

d. Procedures for Transients and Accidents (I.C.1, SSER #1, SSER #2, SSER #5)

Deleted by Amendment No. 185

6. Training on integrated fire response strategy
7. Spent fuel pool mitigation measures

(c) Actions to minimize release to include consideration of:
1. Water spray scrubbing
2. Dose to onsite responders

(27) Deleted

(28) Prior to February 16, 2021, if all spent fuel has not been removed from the Unit 2 spent fuel pool, an aging-management program shall be submitted for NRC approval. The scope of the program shall include those long-lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the spent fuel pool. Once approved, the program shall be described in the Updated Final Safety Analysis Report and shall remain in effect for Unit 2 until such time that all spent fuel has been removed from the Unit 2 spent fuel pool.

D. Exemptions to certain requirements of Appendices G, H and J to 10 CFR Part 50 are described in the Office of Nuclear Reactor Regulation's Safety Evaluation Report. These exemptions are authorized by law and will not endanger life or property or the common defense and security and are otherwise in the public interest. Therefore, these exemptions are hereby granted. The facility will operate, to the extent authorized herein, in conformity with the application, as amended, the provisions of the Act, and the regulations of the Commission.

E. SCE shall fully implement and maintain in effect all provisions of the Commission- approved physical security, training and qualification, and safeguards contingency plans including amendments made pursuant to provisions of the Miscellaneous Amendments and Search Requirements revisions to 10 CFR 73.55 (51 FR 27817 and 27822) and to the authority of 10 CFR 50.90 and 10 CFR 50.54(p). The combined set of plans, which contain Safeguards Information protected under 10 CFR 73.21 is entitled: "San Onofre Nuclear Generating Station Security, Training and Qualification, and Safeguards Contingency Plan, Revision 2" submitted by letter dated May 15, 2006. SCE shall fully implement and maintain in effect all provisions of the Commission-approved cyber security plan (CSP), including changes made pursuant to the authority of 10 CFR 50.90 and 10 CFR 50.54(p). The SONGS CSP was approved by License Amendment No. 225.

F. This license is subject to the following additional condition for the protection of the environment:

Before engaging in activities that may result in a significant adverse environmental impact that was not evaluated or that is significantly greater than that evaluated in the Final Environmental Statement, SCE shall provide a written notification of such activities to the NRC Office of Nuclear Reactor Regulation and receive written approval from that office before proceeding with such activities.

G. DELETED

H. SCE shall notify the Commission, as soon as possible but not later than one hour, of any accident at this facility which could result in an unplanned release of quantities of fission products in excess of allowable limits for normal operation established by the Commission.

I. SCE shall have and maintain financial protection of such type and in such amounts as the Commission shall require in accordance with Section 170 of the Atomic Energy Act of 1954, as amended, to cover public liability claims.

J. Deleted

*On September 29, 1983, the Safeguards Contingency Plan was made a separate, companion document to the Physical Security Plan pursuant to the authority of 10 CFR 50.54.

3. On June 12, 2013, Southern California Edison (SCE) certified that operations at San Onofre Nuclear Generating Station Unit 2 would permanently cease in accordance with 10 CFR 50.82(a)(1)(i). On July 22, 2013, SCE certified that the fuel had been permanently removed from the reactor vessel in accordance with 10 CFR 50.82(a)(1)(ii). As a result, the 10 CFR 50 license no longer authorizes operation of the reactor, or the emplacement or retention of fuel in the reactor vessel.

   This license is effective as of the date of issuance and authorizes ownership and possession of San Onofre Nuclear Generating Station Unit 2 until the Commission notifies the licensee in writing that the license is terminated. The licensee shall:

   A. Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition; and

   B. Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the applicable provisions of the 10 CFR 50 facility license as defined in Section 2 of this license.

Facility Operating License No. NPF-15

Revised License Pages

F. The licensees have satisfied the applicable provisions of 10 CFR Part 140, "Financial Protection Requirements and Indemnity Agreements," of the Commission's regulations;

G. The issuance of this license will not be inimical to the common defense and security or to the health and safety of the public;

H. After weighing the environmental, economic, technical, and other benefits of the facility against environmental and other costs and considering available alternatives, the issuance of Facility Operating License No. NPF-15, subject to the condition for protection of the environment set forth herein, is in accordance with 10 CFR Part 51 of the Commission's regulations and all applicable requirements have been satisfied; and

I. The receipt, possession, and use of source, byproduct, and special nuclear material as authorized by this license will be in accordance with the Commission's regulations in 10 CFR Parts 30, 40 and 70.

2. Based on the foregoing findings and the Partial Initial Decision issued by the Atomic Safety and Licensing Board on January 11, 1982, and the Initial Decision issued by the Atomic Safety and Licensing Board on May 14, 1982 regarding this facility, Facility Operating License No. NPF-15 is hereby issued to the Southern California Edison Company, the San Diego Gas and Electric Company, the City of Riverside, California, and the City of Anaheim, California[1] to read as follows:

A. This license applies to the San Onofre Nuclear Generating Station, Unit 3, a pressurized water nuclear reactor and associated equipment (the facility), owned by the licensees. The facility is located in San Diego County, California, and is described in the Final Safety Analysis Report, as amended, through Amendment 30, and the Environmental Report, as amended, through Amendment 6.

B. Subject to the conditions and requirements incorporated herein, the Commission hereby licenses:

(1) Southern California Edison Company, San Diego Gas and Electric Company, the City of Riverside, California, and the City of Anaheim, California[1] to possess the facility at the designated location in San Diego County, California, in accordance with the procedures and limitations set forth in this license;

(2) Southern California Edison Company (SCE), pursuant to Section 103 of the Act and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," to possess and use the facility at the designated location in San Diego County, California in accordance with the procedures and limitations set forth in this license;

[1]The City of Anaheim has transferred its ownership interests in the facility, and entitlement to facility output, to Southern California Edison Company, except that it retains its ownership interests in its spent nuclear fuel and the facility's independent spent fuel storage installation located on the facility's site. In addition, the City of Anaheim retains financial responsibility for its spent fuel and for a portion of the facility's decommissioning costs. The City of Anaheim remains a licensee for purposes of its retained interests and liabilities.

(3) SCE, pursuant to the Act and 10 CFR Part 70, to possess at any time special nuclear material that was used as reactor fuel, in accordance with the limitations for storage, as described in the Final Safety Analysis Report, as supplemented and amended;

(4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required; and possess any byproduct, source and special material as sealed neutron sources that was used for reactor startup;

(5) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70 to receive, possess, and use in amounts as required any byproduct, source or special nuclear material without restriction to chemical or physical form, for sample analysis or instrument calibration or associated with radioactive apparatus or components; and

(6) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to possess, but not separate, such byproduct and special nuclear materials as may be produced by the operation of San Onofre Nuclear Generating Station, Units 1 and 3 and by the decommissioning of San Onofre Nuclear Generating Station Unit 1.

C. This license shall be deemed to contain and is subject to the conditions specified in the Commission's regulations set forth in 10 CFR Chapter I and is subject to all applicable provisions of the Act and to the rules, regulations and orders of the Commission now or hereafter in effect; and is subject to the additional conditions specified or incorporated below:

(1) Deleted

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 223, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

(3) Antitrust Conditions

SCE shall comply with the antitrust conditions delineated in Appendix C to this license.

(4) Containment Tendon Surveillance (Section *3.8.1, SER, SSER #5)

f. AFW Pump 48-hour Endurance Test (II.E.1.1, SSER #11)

Deleted by Amendment No. 176

g. Emergency Power Supply for Pressurizer Heaters (II.E.3.1, SSER #1, SSER #5)

Deleted by Amendment No. 176

h. ICC Instrumentation (II.F.2, SSER #1, SSER #2, SSER #4)

Deleted by Amendment No. 176

(27) Mitigation Strategy License Condition

Develop and maintain strategies for addressing large fires and explosions and that include the following key areas:

(a) Fire fighting response strategy with the following elements:
1. Pre-defined coordinated fire response strategy and guidance
2. Assessment of mutual aid fire fighting assets
3. Designated staging areas for equipment and materials
4. Command and control
5. Training of response personnel

(b) Operations to mitigate fuel damage considering the following:
1. Protection and use of personnel assets
2. Communications
3. Minimizing fire spread
4. Procedures for implementing integrated fire response strategy
5. Identification of readily-available pre-staged equipment
6. Training on integrated fire response strategy
7. Spent fuel pool mitigation measures

(c) Actions to minimize release to include consideration of:
1. Water spray scrubbing
2. Dose to onsite responders

(28) Deleted

(29) Prior to February 16, 2021, if all spent fuel has not been removed from the Unit 3 spent fuel pool, an aging-management program shall be submitted for NRC approval. The scope of the program shall include those long-lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the spent fuel pool. Once approved, the program shall be described in the Updated Final Safety Analysis Report and shall remain in effect for Unit 3 until such time that all spent fuel has been removed from the Unit 3 spent fuel pool.

D. Exemptions to certain requirements of Appendices G, H and J to 10 CFR Part 50 are described in the Office of Nuclear Reactor Regulation's Safety Evaluation

J. Deleted

K. Deleted by Amendment No. 176

3. On June 12, 2013, Southern California Edison (SCE) certified that operations at San Onofre Nuclear Generating Station Unit 3 would permanently cease in accordance with 10 CFR 50.82(a)(1)(i). On June 28, 2013, SCE certified that the fuel had been permanently removed from the reactor vessel in accordance with 10 CFR 50.82(a)(1)(ii). As a result, the 10 CFR 50 license no longer authorizes operation of the reactor, or the emplacement or retention of fuel in the reactor vessel.

This license is effective as of the date of issuance and authorizes ownership and possession of San Onofre Nuclear Generating Station Unit 3 until the Commission notifies the licensee in writing that the license is terminated. The licensee shall:

A. Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition; and

B. Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the applicable provisions of the 10 CFR 50 facility license as defined in Section 2 of this license.

TECHNICAL SPECIFICATIONS FOR

SAN ONOFRE NUCLEAR GENERATING STATION UNIT 2 AND UNIT 3

TABLE OF CONTENTS

1.0 USE AND APPLICATION

1.1 Definitions

----------NOTE----------
The defined terms of this section appear in capitalized type and are applicable throughout these Technical Specifications and Bases.

Term	Definition
ACTIONS	ACTIONS shall be that part of a Specification that prescribes Required Actions to be taken under designated Conditions within specified Completion Times.
CERTIFIED FUEL HANDLER	A CERTIFIED FUEL HANDLER is an individual who complies with provisions of the CERTIFIED FUEL HANDLER training program required by TS 5.3.2.
OPERABLE–OPERABILITY	A system, subsystem, train, component, or device shall be OPERABLE when it is capable of performing its specified safety function(s) and when all necessary attendant instrumentation, controls, normal or emergency electrical power, cooling and seal water, lubrication, and other auxiliary equipment that are required for the system, subsystem, train, component, or device to perform its specified safety function(s) are also capable of performing their related support function(s).

1.0 USE AND APPLICATION

1.2 Logical Connectors

PURPOSE

The purpose of this section is to explain the meaning of logical connectors.

Logical connectors are used in Technical Specifications (TS) to discriminate between, and yet connect, discrete Conditions, Required Actions, Completion Times, Surveillances, and Frequencies. The only logical connectors that appear in TS are AND and OR. The physical arrangement of these connectors constitutes logical conventions with specific meanings.

BACKGROUND

Several levels of logic may be used to state Required Actions. These levels are identified by the placement (or nesting) of the logical connectors and by the number assigned to each Required Action. The first level of logic is identified by the first digit of the number assigned to a Required Action and the placement of the logical connector in the first level of nesting (i.e., left justified with the number of the Required Action). The successive levels of logic are identified by additional digits of the Required Action number and by successive indentions of the logical connectors.

When logical connectors are used to state a Condition, Completion Time, Surveillance, or Frequency, only the first level of logic is used, and the logical connector is left justified with the statement of the Condition, Completion Time, Surveillance, or Frequency.

EXAMPLE

The following example illustrates the use of logical connectors.

EXAMPLE 1.2-1

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. LCO not met.	A.1 Verify . . . AND A.2 Restore . . .	

In this example the logical connector AND is used to indicate that when in Condition A, both Required Actions A.1 and A.2 must be completed.

1.0 USE AND APPLICATION

1.3 Completion Times

PURPOSE	The purpose of this section is to establish the Completion Time convention and to provide guidance for its use.
BACKGROUND	Limiting Condition for Operation (LCOs) specify minimum requirements for ensuring safe storage of fuel assemblies. The ACTIONS associated with an LCO state Conditions that typically describe the ways in which the requirements of the LCO can fail to be met. Specified with each stated Condition are Required Action(s) and Completion Time(s).
DESCRIPTION	The Completion Time is the amount of time allowed for completing a Required Action. It is referenced to the time of discovery of a situation (e.g., inoperable equipment or variable not within limits) that requires entering an ACTIONS Condition unless otherwise specified, providing the facility is in a specified condition stated in the Applicability of the LCO. Required Actions must be completed prior to the expiration of the specified Completion Time. An ACTIONS Condition remains in effect and the Required Actions apply until the Condition no longer exists or the facility is not within the LCO Applicability.
EXAMPLE	The following example illustrates the use of Completion Times.

EXAMPLE 1.3-1

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
B. Required Action and associated Completion Time not met.	B.1 Verify . . . AND B.2 Restore . . .	6 hours 36 hours

Condition B has two Required Actions. Each Required Action has its own separate Completion Time. Each Completion Time is referenced to the time that Condition B is entered.

The Required Actions of Condition B are to perform the verification within 6 hours AND perform the restoration within 36 hours. A total of 6 hours is allowed for performing the verification and a total of 36 hours (not 42 hours) is allowed for performing the restoration from the time that Condition B was entered. If verification is performed within 3 hours, the

1.3 Completion Times

EXAMPLE (continued)	
	time allowed for performing the restoration is the next 33 hours because the total time allowed for performing the restoration is 36 hours.
IMMEDIATE COMPLETION TIME	When "Immediately" is used as a Completion Time, the Required Action should be pursued without delay and in a controlled manner.

1.0 USE AND APPLICATION

1.4 Frequency

PURPOSE	The purpose of this section is to define the proper use and application of Frequency requirements.
DESCRIPTION	Each Surveillance Requirement (SR) has a specified Frequency in which the Surveillance must be met in order to meet the associated LCO. An understanding of the correct application of the specified Frequency is necessary for compliance with the SR. The "specified Frequency" is referred to throughout this section and each of the Specifications of Section 3.0, Surveillance Requirement (SR) Applicability. The "specified Frequency" consists of the requirements of the Frequency column of each SR, as well as certain Notes in the Surveillance column that modify performance requirements.
EXAMPLES	The following examples illustrate the various ways that Frequencies are specified. In these examples, the Applicability of the LCO (LCO not shown) occurs whenever any fuel assembly is stored in the fuel storage pool.

EXAMPLE 1.4-1

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
Verify . . .	7 days

Example 1.4-1 contains the type of SR most often encountered in the Technical Specifications (TS). The Frequency specifies an interval (7 days) during which the associated Surveillance must be performed at least one time. Performance of the Surveillance initiates the subsequent interval. Although the Frequency is stated as 7 days, an extension of the time interval to 1.25 times the stated Frequency is allowed by SR 3.0.2 for operational flexibility. The measurement of this interval continues at all times, even when the SR is not required to be met per SR 3.0.1 (such as when the equipment is inoperable, a variable is outside specified limits, or the facility is outside the Applicability of the LCO). If the interval specified by SR 3.0.2 is exceeded while the facility is in a specified condition in the Applicability of the LCO, then SR 3.0.3 becomes applicable.

1.4 Frequency

EXAMPLES (continued)

If the interval as specified by SR 3.0.2 is exceeded while the facility is not in a specified condition in the Applicability of the LCO for which performance of the SR is required, the Surveillance must be performed within the Frequency requirements of SR 3.0.2 prior to entry into the specified condition. Failure to do so would result in a violation of SR 3.0.4.

EXAMPLE 1.4-2

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
Verify . . .	Prior to moving a fuel assembly . . .

Example 1.4-2 illustrates a one time performance Frequency.

This type of Frequency does not qualify for the 25% extension allowed by SR 3.0.2.

3.0 LIMITING CONDITION FOR OPERATION (LCO) APPLICABILITY

LCO 3.0.1	LCOs shall be met during the specified conditions in the Applicability, except as provided in LCO 3.0.2.
LCO 3.0.2	Upon discovery of a failure to meet an LCO, the Required Actions of the associated Conditions shall be met. If the LCO is met or is no longer applicable prior to expiration of the specified Completion Time(s), completion of the Required Action(s) is not required, unless otherwise stated.

3.0 SURVEILLANCE REQUIREMENT (SR) APPLICABILITY

SR 3.0.1	SRs shall be met during the specified conditions in the Applicability for individual LCOs, unless otherwise stated in the SR. Failure to meet a Surveillance, whether such failure is experienced during the performance of the Surveillance or between performances of the Surveillance, shall be failure to meet the LCO. Failure to perform a Surveillance within the specified Frequency shall be failure to meet the LCO except as provided in SR 3.0.3. Surveillances do not have to be performed on inoperable equipment or variables outside specified limits.
SR 3.0.2	The specified Frequency for each SR is met if the Surveillance is performed within 1.25 times the interval specified in the Frequency, as measured from the previous performance or as measured from the time a specified condition of the Frequency is met.
SR 3.0.3	If it is discovered that a Surveillance was not performed within its specified Frequency, then compliance with the requirement to declare the LCO not met may be delayed, from the time of discovery, up to 24 hours or up to the limit of the specified Frequency, whichever is greater. This delay period is permitted to allow performance of the Surveillance. A risk evaluation shall be performed for any Surveillance delayed greater than 24 hours and the risk impact shall be managed. If the Surveillance is not performed within the delay period, the LCO must immediately be declared not met, and the applicable Condition(s) must be entered. The Completion Times of the Required Actions begin immediately upon expiration of the delay period. When the Surveillance is performed within the delay period and the Surveillance is not met, the LCO must immediately be declared not met, and the applicable Condition(s) must be entered. The Completion Times of the Required Actions begin immediately upon failure to meet the Surveillance.
SR 3.0.4	Entry into a specified condition in the Applicability of an LCO shall not be made unless the LCO's Surveillances have been met within their specified Frequency. This provision shall not prevent entry into specified conditions in the Applicability that are required to comply with ACTIONS.

3.1 PLANT SYSTEMS

3.1.1 Fuel Storage Pool Water Level

LCO 3.1.1 The fuel storage pool water level shall be ≥ 23 ft over the top of irradiated fuel assemblies seated in the storage racks.

APPLICABILITY: During movement of fuel assemblies in the fuel storage pool.

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
A. Fuel storage pool water level not within limit.	A.1 Suspend movement of fuel assemblies in fuel storage pool.	Immediately

SURVEILLANCE REQUIREMENTS

SURVEILLANCE		FREQUENCY
SR 3.1.1.1	Verify the fuel storage pool water level is ≥ 23 ft above the top of irradiated fuel assemblies seated in the storage racks.	7 days

3.1 PLANT SYSTEMS

3.1.2 Fuel Storage Pool Boron Concentration

LCO 3.1.2 The fuel storage pool boron concentration shall be ≥ 2000 ppm.

APPLICABILITY: Whenever any fuel assembly is stored in the fuel storage pool.

ACTIONS

CONDITION	REQUIRED ACTION		COMPLETION TIME
A. Fuel storage pool boron concentration not within limit.	A.1	Suspend movement of fuel assemblies in the fuel storage pool.	Immediately
	AND		
	A.2	Initiate action to restore fuel storage pool boron concentration to within limit.	Immediately

SURVEILLANCE REQUIREMENTS

SURVEILLANCE		FREQUENCY
SR 3.1.2.1	Verify the fuel storage pool boron concentration is within limit.	7 days

3.1 PLANT SYSTEMS

3.1.3 Spent Fuel Assembly Storage

LCO 3.1.3 The combination of initial enrichment and burnup of each SONGS 2 and 3 spent fuel assembly stored in Region I shall be within the acceptable burnup domain of Figure 3.1.3-1 or Figure 3.1.3-2 or the fuel assembly shall be stored in accordance with Technical Specification 4.3.1.1.

The combination of initial enrichment and burnup of each SONGS 2 and 3 spent fuel assembly stored in Region II shall be within the acceptable burnup domain of Figure 3.1.3-3 or Figure 3.1.3-4, or the fuel assembly shall be stored in accordance with Technical Specification 4.3.1.1.

Each SONGS 1 uranium dioxide spent fuel assembly stored in Region II shall be stored in accordance with Technical Specification 4.3.1.1.

APPLICABILITY: Whenever any fuel assembly is stored in the fuel storage pool.

ACTIONS

CONDITION	REQUIRED ACTION		COMPLETION TIME
A. Requirements of the LCO not met.	A.1	Initiate action to bring the noncomplying fuel assembly into compliance.	Immediately

SURVEILLANCE REQUIREMENTS

SURVEILLANCE		FREQUENCY
SR 3.1.3.1	Verify by administrative means the initial enrichment, burnup, and cooling time of the fuel assembly are in accordance with LCO 3.1.3, or Design Features 4.3.1.1, or Licensee Controlled Specification (LCS) 4.0.100. Rev 2, dated 09/27/07.	Prior to moving a fuel assembly to any spent fuel pool storage location.

Low Population Zone

4.0 DESIGN FEATURES (continued)

4.3 Fuel Storage

4.3.1 Criticality

4.3.1.1 The spent fuel storage racks are designed and shall be maintained with:

a. Fuel assemblies having a maximum U-235 enrichment of 4.8 weight percent;

b. K_{eff} < 1.0 if fully flooded with unborated water, which includes an allowance for uncertainties as described in Section 9.1 of the UFSAR;

c. K_{eff} ≤ 0.95 if fully flooded with water borated to 1700 ppm, which includes an allowance for uncertainties as described in Section 9.1 of the UFSAR;

d. Three or five Borated stainless steel guide tube inserts (GT-Insert) may be used. When three borated stainless steel guide tube inserts are used, they will be installed in an assembly's center guide tube, the guide tube associated with the serial number, and the diagonally opposite guide tube. Fuel containing GT-Inserts may be placed in either Region I or Region II. However, credit for GT-Inserts is only taken for Region II storage.

A five-finger CEA may be installed in an assembly. Fuel containing a five-finger CEA may be placed in either Region I or Region II. Credit for inserted 5-finger CEAs is taken for both Region I and Region II.

e. A nominal 8.85 inch center to center distance between fuel assemblies placed in Region II;

f. A nominal 10.40 inch center to center distance between fuel assemblies placed in Region I;

g. Prior to using the storage criteria of LCO 3.1.3 and LCS 4.0.100, the following uncertainties will be applied:

(1) The calculated discharge burnup of San Onofre Units 2 and 3 assemblies will be reduced by 6.6%.

(2) The calculated discharge burnup of San Onofre Unit 1 fuel assemblies will be reduced by 10.0%.

4.0 DESIGN FEATURES

4.3 Fuel Storage (continued)

h. Units 2 and 3 fuel assemblies with a burnup in the "acceptable range" of Figure 3.1.3-1 are allowed unrestricted storage in Region I;

i. Units 2 and 3 fuel assemblies with a burnup in the "acceptable range" of Figure 3.1.3-2 are allowed unrestricted storage in the peripheral pool locations with 1 or 2 faces toward the spent fuel pool walls of Region I;

j. Units 2 and 3 fuel assemblies with a burnup in the "acceptable range" of Figure 3.1.3-3 are allowed unrestricted storage in Region II;

k. Units 2 and 3 fuel assemblies with a burnup in the "acceptable range" of Figure 3.1.3-4 are allowed unrestricted storage in the peripheral pool locations with 1 or 2 faces toward the spent fuel pool walls of Region II;

l. Units 2 and 3 fuel assemblies with a burnup in the "unacceptable range" of Figure 3.1.3-1, Figure 3.1.3-2, Figure 3.1.3-3, and Figure 3.1.3-4 will be stored in compliance with Licensee Controlled Specification 4.0.100 Rev. 2, dated 9/27/07; and

m. Each SONGS 1 uranium dioxide spent fuel assembly stored in Region II shall be stored in accordance with Licensee Controlled Specification 4.0.100 Rev. 2, dated 9/27/07.

4.3.2 Drainage

The spent fuel storage pool is designed and shall be maintained to prevent inadvertent draining of the pool below Technical Specification 3.1.1 value (23 feet above the top of irradiated fuel assemblies seated in the storage racks).

4.3.3 Capacity

The spent fuel storage pool is designed and shall be maintained with a storage capacity limited to no more than 1542 fuel assemblies.

5.0 ADMINISTRATIVE CONTROLS

5.1 Responsibility

5.1.1	The corporate officer with direct responsibility for the plant shall be responsible for overall management of the San Onofre Nuclear Generating Station, and all site support functions. He shall delegate in writing the succession to this responsibility during his absence.
5.1.2	The Shift Manager shall be responsible for the ultimate command decision authority for all unit activities which affect the safety of the plant, site personnel, and/or the general public.

5.0 ADMINISTRATIVE CONTROLS

5.2 Organization

5.2.1 Onsite and Offsite Organizations

Onsite and offsite organizations shall be established for plant operation and corporate management, respectively. The onsite and offsite organizations shall include the positions for activities affecting the safety of the nuclear fuel.

a. Lines of authority, responsibility, and communication shall be established and defined for the highest management levels through intermediate levels to and including all operating organization positions. These relationships shall be documented and updated, as appropriate, in the form of organization charts, functional descriptions of departmental responsibilities and relationships, and job descriptions for key personnel positions, or in equivalent forms of documentation. These relationships, including the plant-specific titles of those personnel fulfilling the responsibilities for the positions delineated in these Technical Specifications, are documented in the UFSAR.

b. The corporate officer with direct responsibility for the plant shall be responsible for overall safe handling and storage of nuclear fuel and shall have control over those onsite activities necessary for safe handling and storage of the nuclear fuel.

c. A specified corporate officer (or officers) shall have corporate responsibility for overall plant nuclear safety and shall take any measures needed to ensure acceptable performance of the staff in operating, maintaining, and providing technical support to the plant to ensure safe management of nuclear fuel.

d. The individuals who train CERTIFIED FUEL HANDLERS, and those who carry out radiation protection and quality assurance functions may report to the appropriate onsite manager; however, they shall have sufficient organizational freedom to ensure their ability to perform their assigned functions.

5.2.2 FACILITY STAFF

The facility staff organization shall include the following:

a. Each on duty shift shall be composed of at least the minimum shift crew composition shown in Table 5.2.2-1.

b. At least one person qualified as Emergency Coordinator/Emergency Director shall be in the Control Room when nuclear fuel is stored in the spent fuel pools.

5.2 Organization

5.2.2 FACILITY STAFF (continued)

c. Shift crew composition may be less than the minimum requirement of Table 5.2.2-1 for a period of time not to exceed 2 hours in order to accommodate unexpected absence of on-duty shift crew members provided immediate action is taken to restore the shift crew composition to within the minimum requirements. During such absences, no fuel movement or movement of heavy loads over storage racks containing fuel is permitted.

d. Oversight of fuel handling operations shall be provided by a CERTIFIED FUEL HANDLER.

e. The Shift Manager shall be a CERTIFIED FUEL HANDLER.

f. An individual qualified in radiation protection procedures shall be on site during fuel handling operations or movement of loads over the storage racks containing fuel.

5.2 Organization (continued)

Table 5.2.2-1
Minimum Shift Crew Composition

POSITION	MINIMUM STAFFING
CERTIFIED FUEL HANDLER	1*
Certified Operator	1

Note: The Certified Operator position may be filled by a CERTIFIED FUEL HANDLER.
* May be shared between Units 2 and 3.

5.0 ADMINISTRATIVE CONTROLS

5.3 Facility Staff Qualifications

5.3.1	Each member of the facility staff shall meet or exceed the minimum qualifications of ANSI N18.1-1971 for comparable positions, except: a) the radiation protection manager who shall meet or exceed the qualifications of Regulatory Guide 1.8, September 1975.
5.3.2	An NRC approved training and retraining program for the CERTIFIED FUEL HANDLERS shall be maintained.

5.0 ADMINISTRATIVE CONTROLS

5.4 Technical Specifications (TS) Bases Control

5.4.1 Changes to the Bases of the TS shall be made under appropriate administrative controls.

5.4.2 Changes to the Bases may be made without prior NRC approval provided the changes do not require either of the following:

a. A change in the TS incorporated in the license; or

b. A change to the updated UFSAR or Bases that requires NRC approval pursuant to 10 CFR 50.59.

5.4.3 The Bases Control Program shall contain provisions to ensure that the Bases are maintained consistent with the UFSAR.

5.4.4 Proposed changes that meet the criteria of (a) or (b) above shall be reviewed and approved by the NRC prior to implementation. Changes to the Bases implemented without prior NRC approval shall be provided to the NRC every 24 months.

5.0 ADMINISTRATIVE CONTROLS

5.5 Procedures, Programs, and Manuals

5.5.1 Procedures

5.5.1.1 Scope

Written procedures shall be established, implemented, and maintained covering the following activities:

a. The applicable procedures recommended in Regulatory guide 1.33, Revision 2, Appendix A, February 1978;

b. Deleted.

c. Quality assurance for effluent and environmental monitoring using the guidance in Regulatory Guide 4.15, Revision 1, 1979;

d. Fire Protection Program implementation; and

e. Programs, as specified in Specification 5.5.2.

5.5.2 Programs and Manuals

The following programs and manuals shall be established, implemented, and maintained.

5.5.2.1 Offsite Dose Calculation Manual (ODCM)

a. The ODCM shall contain the methodology and parameters used in the calculation of offsite doses resulting from radioactive gaseous and liquid effluents, in the calculation of gaseous and liquid effluent monitoring alarm and trip setpoints, and in the conduct of the Radiological Environmental Monitoring Program;

b. The ODCM shall also contain the Radioactive Effluent Controls required by Specification 5.5.2.3 and Radiological Environmental Monitoring programs required by the LCS, and descriptions of the information that should be included in the Annual Radiological Environmental Operating Report and the Radioactive Effluent Release Report required by Specification 5.7.1.2 and Specification 5.7.1.3.

5.5.2.1.1 Licensee-initiated changes to the ODCM:

a. Shall be documented and records of reviews performed shall be retained. This documentation shall contain:

5.5 Procedures, Programs, and Manuals

5.5.2.1.1 Licensee-initiated changes to the ODCM (continued):

1. Sufficient information to support the change(s) together with the appropriate analyses or evaluations justifying the change(s);

2. A determination that the change(s) maintain the levels of radioactive effluent control required by 10 CFR 20.106, 40 CFR 190, 10 CFR 50.36a, and 10 CFR 50, Appendix I, and not adversely impact the accuracy or reliability of effluent, dose, or setpoint calculations.

3. Documentation of the fact that the change has been reviewed and found acceptable.

b. Shall become effective upon review and approval by the corporate officer with direct responsibility for the plant or designee.

c. Shall be submitted to the NRC in the form of a complete, legible copy of the entire ODCM as a part of or concurrent with the Radioactive Effluent Release Report for the period of the report in which any change in the ODCM was made. Each change shall be identified by markings in the margin of the affected pages, clearly indicating the area of the page that was changed, and shall indicate the date (i.e., month and year) the change was implemented.

5.5.2.2 Deleted

5.5.2.3 Radioactive Effluent Controls Program

This program conforming to 10 CFR 50.36a provides for the control of radioactive effluents and for maintaining the doses to members of the public from radioactive effluents as low as reasonably achievable. The program shall be contained in the ODCM, shall be implemented by operating procedures, and shall include remedial actions to be taken whenever the program limits are exceeded. The program shall include the following elements:

a. Limitations on the functional capability of radioactive liquid and gaseous monitoring instrumentation including surveillance tests and setpoint determination in accordance with the methodology in the ODCM;

b. Limitations on the concentrations of radioactive material released in liquid effluents to unrestricted areas, conforming to 10 CFR 20, Appendix B, Table II, Column 2;

c. Monitoring, sampling, and analysis of radioactive liquid and gaseous effluents in accordance with 10 CFR 20.106 and with the methodology and parameters in the ODCM;

5.5 Procedures, Programs, and Manuals

5.5.2.3 Radioactive Effluent Controls Program (continued)

d. Limitations on the annual and quarterly doses or dose commitment to a member of the public from radioactive materials in liquid effluents released from each unit to unrestricted areas, conforming to 10 CFR 50, Appendix I;

e. Determination of cumulative and projected dose contributions from radioactive effluents for the current calendar quarter and current calendar year in accordance with the methodology and parameters in the ODCM at least every 31 days;

f. Limitations on the functional capability and use of the liquid and gaseous effluent treatment systems to ensure that appropriate portions of these systems are used to reduce releases of radioactivity when the projected doses in a period of 31 days would exceed 2 percent of the guidelines for the annual dose or dose commitment, conforming to 10 CFR 50, Appendix I;

g. Limitations on the dose rate resulting from radioactive material released in gaseous effluents to areas beyond the site boundary conforming to the dose associated with 10 CFR 20, Appendix B, Table II, Column 1;

h. Limitations on the annual and quarterly air doses resulting from noble gases released in gaseous effluents from each unit to areas beyond the site boundary, conforming to 10 CFR 50, Appendix I;

i. Limitations on the annual and quarterly doses to a member of the public from iodine-131, iodine-133, tritium, and all radionuclides in particulate form with half lives greater than 8 days in gaseous effluents released from each unit to areas beyond the site boundary, conforming to 10 CFR 50, Appendix I; and

j. Limitations on the annual dose or dose commitment to any member of the public due to releases of radioactivity and to radiation from uranium fuel cycle sources, conforming to 40 CFR 190.

5.5.2.4 Deleted

5.5.2.5 Deleted

5.5.2.6 Deleted

5.5 Procedures, Programs, and Manuals (continued)

5.5.2.7 Storage Tank Radioactivity Monitoring Program

This program provides controls for the quantity of radioactivity contained in unprotected outdoor liquid storage tanks. The liquid radwaste quantities shall be determined in accordance with Standard Review Plan, Section 15.7.3, "Postulated Radioactive Release due to Tank Failures".

The program shall include a surveillance program to ensure that the quantity of radioactivity contained in all outdoor liquid radwaste tanks that are not surrounded by liners, dikes, or walls, capable of holding the tanks' contents and that do not have tank overflows and surrounding area drains connected to the Liquid Waste Management System is less than the amount that would result in concentrations less than the limits of 10 CFR Part 20, Appendix B, Table II, Column 2, at the nearest potable water supply and the nearest surface water supply in an unrestricted area, in the event of an uncontrolled release of the tanks' contents.

The provisions of SR 3.0.2 and SR 3.0.3 are applicable to the Storage Tank Radioactivity Monitoring Program surveillance frequencies.

5.0 ADMINISTRATIVE CONTROLS

5.6 Deleted

5.0 ADMINISTRATIVE CONTROLS

5.7 Reporting Requirements

5.7.1 Routine Reports

In addition to the applicable reporting requirements of Title 10, Code of Federal Regulations, the following reports shall be submitted in accordance with 10 CFR 50.4. The reports shall be addressed to the U.S. Nuclear Regulatory Commission, Attention: Document Control Desk, Washington, D.C., with a copy to the Regional Administrator of the Regional Office of the NRC, unless otherwise noted.

5.7.1.1 Deleted

5.7.1.2 Annual Radiological Environmental Operating Report

The Annual Radiological Environmental Operating Report covering the operation of the facility during the previous calendar year shall be submitted by May 15 of each year. The report shall include summaries, interpretations, and analyses of trends of the results of the Radiological Environmental Monitoring Program for the reporting period. The material provided shall be consistent with the objectives outlined in the Offsite Dose Calculation Manual (ODCM), and in 10 CFR 50, Appendix I, Sections IV.B.2, IV.B.3, and IV.C.

The Annual Radiological Environmental Operating Report shall include the results of analyses of all radiological environmental samples and of all environmental radiation measurements taken during the period pursuant to the locations specified in the table and figures in the ODCM, as well as summarized and tabulated results of these analyses and measurements in the format of the table in the Radiological Assessment Branch Technical Position, Revision 1, November 1979. The report shall identify the thermoluminescent dosimeter (TLD) results that represent collocated dosimeters in relation to the NRC TLD program and the exposure period associated with each result. In the event that some individual results are not available for inclusion with the report, the report shall be submitted noting and explaining the reasons for the missing results. The missing data shall be submitted in a supplementary report as soon as possible.

5.7 Reporting Requirements (continued)

5.7.1.3 Radiological Effluent Release Report

The Radioactive Effluent Release Report covering the operation of the facility during the previous calendar year shall be submitted before May 1 of each year. The report shall include a summary of the quantities of radioactive liquid and gaseous effluents released from the facility. The report shall also include a summary of the quantities of solid radioactive waste shipped from the facility directly to the disposal site and quantities of solid radioactive waste shipped from the facility's intermediary processor to the disposal site. The material provided shall be consistent with the objectives outlined in the ODCM and Process Control Program (PCP) and in conformance with 10 CFR 50.36a and 10 CFR 50, Appendix I, Section IV.B.1.

5.0 ADMINISTRATIVE CONTROLS

5.8 High Radiation Area

5.8.1 Each high radiation area as defined 10 CFR 20 shall be barricaded and conspicuously posted as a high radiation area, and entrance thereto shall be controlled by requiring issuance of a Radiation Exposure Permit (REP).

Any individual or group of individuals permitted to enter such areas shall be provided with or accompanied by one or more of the following:

a. A radiation monitoring device that continuously indicates the radiation dose rate in the area,

b. A radiation monitoring device that continuously integrates the radiation dose rate in the area and alarms when a preset integrated dose is received. Entry into such areas with this monitoring device may be made after the dose rates in the area have been determined and personnel have been made knowledgeable of them,

c. An individual qualified in radiation protection procedures with a radiation dose rate monitoring device. This individual is responsible for providing positive radiation protection control over the activities within the area and shall perform periodic radiation surveillance at the frequency specified in the radiation protection procedures or the applicable REP.

5.8.2 In addition, areas that are accessible to personnel and that have radiation levels greater than 1.0 rem (but less than 500 rads at 1 meter) in 1 hour at 30 cm from the radiation source, or from any surface penetrated by the radiation, shall be provided with locked doors to prevent unauthorized entry, and the keys shall be maintained under the administrative control of the shift manager on duty or radiation protection supervisor. Doors shall remain locked except during periods of access by personnel under an approved REP that specifies the dose rates in the immediate work areas and the maximum allowable stay time for individuals in that area. In lieu of a stay time specification on the REP, direct or remote continuous surveillance (such as closed circuit TV cameras) may be made by personnel qualified in radiation protection procedures to provide positive exposure control over the activities being performed within the area.

5.8.3 Individual high radiation areas that are accessible to personnel, that could result in radiation doses greater than 1.0 rem in 1 hour, and that are within large areas where no enclosure exists to enable locking and where no enclosure can be reasonably constructed around the individual area shall be barricaded and conspicuously posted. A flashing light shall be activated as a warning device whenever the dose rate in such an area exceeds or is expected to exceed 1.0 rem in 1 hour at 30 cm from the radiation source or from any surface penetrated by the radiation.

NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

SAFETY EVALUATION BY THE OFFICE OF NUCLEAR REACTOR REGULATION

RELATED TO AMENDMENT NO. 230 TO FACILITY OPERATING LICENSE NO. NPF-10

AND AMENDMENT NO. 223 TO FACILITY OPERATING LICENSE NO. NPF-15

SOUTHERN CALIFORNIA EDISON COMPANY

SAN DIEGO GAS AND ELECTRIC COMPANY

THE CITY OF RIVERSIDE, CALIFORNIA

SAN ONOFRE NUCLEAR GENERATING STATION, UNITS 2 AND 3

DOCKET NOS. 50-361 AND 50-362

1.0 INTRODUCTION

By letter dated June 12, 2013 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML131640201), Southern California Edison (SCE, the licensee) submitted a certification to the U.S. Nuclear Regulatory Commission (NRC) indicating its intention to permanently cease power operations at San Onofre Nuclear Generating Station (SONGS), Units 2 and 3 as of June 7, 2013, pursuant to Title 10 of the *Code of Federal Regulations* (10 CFR) paragraph 50.82(a)(1)(i). By letters dated June 28, 2013 (ADAMS Accession No. ML13183A391), and July 22, 2013 (ADAMS Accession No. ML13204A304), SCE submitted certifications of permanent removal of fuel from the Unit 3 and Unit 2 reactor vessels as of October 5, 2012, and July 18, 2013, respectively, pursuant to 10 CFR 50.82(a)(1)(ii). Upon docketing of these certifications, and pursuant to 10 CFR 50.82(a)(2), the SONGS Units 2 and 3 facility operating licenses no longer authorize operation of the reactors or emplacement or retention of fuel into the reactor vessels. Spent fuel is currently stored onsite in the spent fuel pools (SFPs) and in the onsite independent spent fuel storage installation (ISFSI).

By letter dated March 21, 2014 (ADAMS Accession No. ML14085A141), as supplemented by letters dated October 1, 2014; and February 23, February 25, and March 18, 2015 (ADAMS Accession Nos. ML14280A264, ML15058A030, ML15058A033, and ML15082A017, respectively), SCE submitted a license amendment request consisting of amendment applications to Facility Operating License Nos. NPF-10 and NPF-15 for SONGS Units 2 and 3, respectively. The proposed amendments would revise the facility operating licenses and revise the associated technical specifications (TSs) to reflect the permanent cessation of operations of SONGS Units 2 and 3.

The supplemental letters dated October 1, 2014; and February 23, February 25, and March 18, 2015, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the NRC staff's original proposed no

significant hazards consideration determination as published in the *Federal Register* on September 16, 2014 (79 FR 55513).

As stated above, pursuant to 10 CFR 50.82(a)(2), the 10 CFR Part 50 licenses for SONGS Units 2 and 3 no longer authorize operation of the reactors or emplacement or retention of fuel in the reactor vessels. SONGS Units 2 and 3 have been shut down since January 2012. At the time of the licensee's submittal, the fission product inventory of all spent fuel that is stored in the SONGS Units 2 and 3 spent fuel pools had decayed more than two years since last irradiated in the reactor core. SONGS Unit 1 was permanently shut down in 1993 and is already in the decommissioning phase where above ground structures have been dismantled and the spent fuel is stored in either the SONGS ISFSI or in the GE-Hitachi Morris facility.

The existing SONGS TSs contain limiting conditions for operation (LCOs) that provide for appropriate functional capability of equipment required for safe operation of the facility, including the plant being in a defueled condition. Since the safety function related to safe storage and management of irradiated fuel at an operating plant is similar to the corresponding function at a permanently defueled facility, the existing TSs provide an appropriate level of control. However, the majority of the existing TSs are only applicable when the reactor is in an operational MODE. Since the SONGS Units 2 and 3, Part 50 licenses no longer authorize emplacement or retention of fuel in the reactor vessels, the LCOs (and associated surveillance requirements (SRs)) that do not apply in a defueled condition are being proposed for deletion. The proposed amendments revise the operating licenses and associated TSs to reflect the permanent cessation of reactor operations and the permanently defueled condition of the reactor vessels at SONGS Units 2 and 3. In general, the changes eliminate those TSs applicable in operating MODES; MODES where fuel is emplaced in the reactor vessel, and certain TSs required for movement of irradiated fuel assemblies. Changes were also proposed to TS definitions, administrative controls, and related to programs and procedures. The proposed amendments also revise the facility operating licenses to clarify or remove certain conditions no longer relevant and add conditions consistent with other permanently shutdown and defueled reactors.

Amendment Nos. 227 and 220 for SONGS Units 2 and 3, respectively, were issued by the NRC on September 30, 2014 (ADAMS Accession No. ML14183B240), to revise certain requirements in the permanently shutdown and defueled facility's TSs, Section 5.0, "Administrative Controls," related to responsibilities, organization, and facility staff qualifications that reflect new staffing and training requirements for operating staff. Issuance of the enclosed amendments, in conjunction with the previously issued TS administrative control amendments, completes the revision to the SONGS permanently shutdown and defueled technical specifications. The TSs being proposed for revision by SCE for incorporation into the SONGS Units 2 and 3 facility operating licenses, referred to by SCE as the Permanently Defueled Technical Specifications (PDTS), have been combined into a single TS that applies to both units. The licensee states that the changes to the facility operating licenses and TSs provide an appropriate level of safety, considering the reduced risk of an offsite radiological release from the remaining postulated design-basis accidents (DBAs) associated with a defueled plant, as described in this safety analysis.

2.0 REGULATORY EVALUATION

2.1 Technical Specifications

Section 182a of the Atomic Energy Act requires applicants for nuclear power plant operating licenses to include TSs as part of the application. The NRC's regulatory requirements related to the content of the TSs are contained in 10 CFR 50.36, "Technical specifications." Pursuant to 10 CFR 50.36, each operating license issued by the Commission includes TSs and includes items in the following categories: (1) safety limits, limiting safety systems settings and control settings, (2) LCOs, (3) SRs, (4) design features, (5) administrative controls, (6) decommissioning, (7) initial notification, and (8) written reports.

Section 50.36 of 10 CFR states, in part, that "safety limits for nuclear reactors are limits upon important process variables that are found to be necessary to reasonably protect the integrity of certain of the physical barriers that guard against the uncontrolled release of radioactivity... Limiting safety system settings for nuclear reactors are settings for automatic protective devices related to those variables having significant safety functions."

Section 50.36 of 10 CFR provides four criteria to define the scope of equipment and parameters to be included in the TS LCOs. These criteria were developed for licenses authorizing operation (i.e., operating reactors) and focused on instrumentation to detect degradation of the reactor coolant system (RCS) pressure boundary, process variables and equipment, design features, or operating restrictions that affect the integrity of fission product barriers during DBAs or transients. A fourth criterion refers to the use of operating experience and probabilistic risk assessment to identify and include in the TSs those structures, systems, and components (SSCs) shown to be significant to public health and safety.

SRs are requirements relating to test, calibration, or inspection to assure that the necessary quality of systems and components is maintained, that facility operation will be within safety limits, and that the LCO will be met.

Design features to be included are those features of the facility such as materials of construction and geometric arrangements, which, if altered or modified, would have a significant effect on safety and are not covered in categories described in paragraphs 50.36(c)(1), (2), and (3).

Administrative controls are the provisions relating to organization and management, procedures, recordkeeping, review and audit, and reporting necessary to assure operation of the facility is in a safe manner.

The regulations in 10 CFR 50.36 further state that TSs involving safety limits, limiting safety system settings, and limiting control system settings; LCOs; SRs; design features; and administrative controls for decommissioning facilities will be developed on a case-by-case basis.

A general discussion of the criteria that were used by the NRC staff in its evaluation to ensure that the TS LCOs proposed for deletion are no longer required to be included in the TSs is

provided below. These criteria were also used in the evaluation of the proposed changes to the existing TSs and the proposed new TSs.

Criterion 1 of 10 CFR 50.36(c)(2)(ii)(A) states that TS LCOs must be established for "installed instrumentation that is used to detect, and indicate in the control room, a significant abnormal degradation of the reactor coolant pressure boundary [RCPB]." Since no fuel is present in the reactor, maintenance of the RCS pressure boundary as a fission product barrier is no longer relevant at the SONGS Units 2 and 3 facility, and therefore, this criterion is not applicable.

Criterion 2 of 10 CFR 50.36(c)(2)(ii)(B) states that TS LCOs must be established for a "process variable, design feature, or operating restriction that is an initial condition of a design basis accident or transient analysis that either assumes the failure of or presents a challenge to the integrity of a fission product barrier." The purpose of this criterion is to capture those process variables that have initial values assumed in the DBA and transient analyses, and which are monitored and controlled during power operation. The scope of DBAs applicable to a reactor permanently shutdown and defueled is reduced from those postulated for an operating reactor, and most TSs satisfying Criterion 2 are no longer applicable. The scope of applicable DBAs that apply to SONGS Units 2 and 3 are discussed in more detail in Sections 3.1 through 3.6 of this safety evaluation (SE). There are no transients that continue to apply to the permanently shutdown and defueled reactors.

Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C) states that TS LCOs must be established for a SSC "that is part of the primary success path and which functions or actuates to mitigate a design basis accident or transient that either assumes the failure of or presents a challenge to the integrity of a fission product barrier." The intent of this criterion is to capture into TSs those SSCs that are part of the primary success path of a safety sequence analysis. Also captured by this criterion are those support and actuation systems that are necessary for items in the primary success path to successfully function. The primary success path of a safety sequence analysis consists of the combination and sequences of equipment needed to operate (including consideration of the single failure criterion), so that the plant response to DBAs and transients limits the consequences of these events to within the appropriate acceptance criteria. The scope of applicable DBAs that apply to SONGS Units 2 and 3 are discussed in more detail in Sections 3.1 through 3.6 of this SE. There are no transients that continue to apply to the permanently shutdown and defueled reactors.

Criterion 4 of 10 CFR 50.36(c)(2)(ii)(D) states that TS LCOs must be established for SSCs "which operating experience or probabilistic risk assessment has shown to be significant to public health and safety." The intent of this criterion is that risk insights and operating experience be factored into the establishment of TS LCOs. There are no longer any DBAs at SONGS Units 2 and 3 that can result in a significant offsite radiological risk to public health and safety.

The NRC staff notes that in the course of this evaluation, information contained in DRAFT NUREG-1625, "Proposed Standard Technical Specifications for Permanently Defueled Westinghouse Plants," March 1998 (ADAMS Accession No. ML082330233), was also considered. This draft NUREG provides examples of decommissioning TSs for Westinghouse

pressurized water reactors that the staff has previously found acceptable during TS reviews for permanently shutdown and defueled reactors.

2.2 Radiological Consequences from Design-Basis Accidents

During normal power reactor operations, the forced flow of water through the RCS removes the heat generated by the reactor. The RCS, operating at high temperatures and pressures, transfers this heat through the steam generator (SG) tubes to the secondary system. The most severe postulated accidents for nuclear power plants involve damage to the nuclear reactor core and the release of large quantities of fission products to the RCS and subsequent release of some fission products to the environment. Many of the accident scenarios postulated in the facility safety analysis report involve failures or malfunctions of systems that could affect the reactor core. With the termination of reactor operations and the permanent removal of the fuel from the reactor core, such accidents are no longer possible. Therefore, the postulated accidents involving failure or malfunction of the reactor, RCS, or secondary system are no longer applicable. Postulated accidents that could potentially apply to a permanently shutdown and defueled facility include a fuel handling accident (FHA), an accidental release of waste liquid, an accidental release of waste gas, a spent fuel cask drop accident, and a spent fuel pool boiling event. The potential offsite consequences of these events are affected by the time available for decay of fission products in the fuel and, possibly, the availability of engineered safety features, such as ventilation systems to filter fission products from the accident area atmosphere before they are released outside the facility.

The regulations in 10 CFR 50.67, "Accident source term" state, in part, that:

> (i) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 0.25 Sv [Sievert] (25 rem) total effective dose equivalent (TEDE), (ii) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage), would not receive a radiation dose in excess of 0.25 Sv (25 rem) total effective dose equivalent (TEDE), and (iii) Adequate radiation protection is provided to permit access to and occupancy of the control room under accident conditions without personnel receiving radiation exposures in excess of 0.05 Sv (5 rem) total effective dose equivalent (TEDE) for the duration of the accident.

Appendix A to 10 CFR Part 50, "General Design Criteria (GDC)," Criterion 19--Control room, states, in part:

> A control room shall be provided from which actions can be taken to operate the nuclear power unit safely under normal conditions and to maintain it in a safe condition under accident conditions, including loss-of-coolant accidents. Adequate radiation protection shall be provided to permit access and occupancy of the control room under accident conditions without personnel receiving

> radiation exposures in excess of 5 rem whole body, or its equivalent to any part of the body, for the duration of the accident. Equipment at appropriate locations outside the control room shall be provided (1) with a design capability for prompt hot shutdown of the reactor, including necessary instrumentation and controls to maintain the unit in a safe condition during hot shutdown, and (2) with a potential capability for subsequent cold shutdown of the reactor through the use of suitable procedures.

Regulatory Guide (RG) 1.183, "Alternative Radiological Source Terms for Evaluating Design Basis Accidents at Nuclear Power Reactors," Revision 0, July 2000 (ADAMS Accession No. ML003716792), provides the methodology for analyzing the radiological consequences of several DBAs to show compliance with 10 CFR 50.67 - Accident source term. Regulatory Guide 1.183 provides guidance to licensees on acceptable application of alternate source term (AST) submittals, including acceptable radiological analysis assumptions for use in conjunction with the AST.

NUREG-0800, "Standard Review Plan [SRP] for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR [Light-Water Reactor] Edition," SRP, Section 15.0.1, "Radiological Consequence Analyses Using Alternative Source Terms," Revision 0, July 2000 (ADAMS Accession No. ML003734190), provides review guidance to the NRC staff for the review of alternative source term amendment requests. SRP Section 15.0.1 states that the NRC reviewer should evaluate the proposed change against the guidance in RG 1.183. As provided in RG 1.183, the dose acceptance criteria for an FHA are a TEDE of 6.3 rem at the exclusion area boundary (EAB) for the worst 2 hours, 6.3 rem at the outer boundary of the low population zone (LPZ), and 5 rem in the control room (CR) for the duration of the accident.

SRP 11.0, Branch Technical Position 11-5, "Postulated Radioactive Release Due to a Waste Gas System Leak or Failure," provides guidance to the NRC staff in assessing the analysis of an accidental release from the waste gas system.

The NRC approved implementation of the AST methodology at SONGS Units 2 and 3, by Amendment Nos. 210 and 202, "San Onofre Nuclear Generating Station, Units 2 and 3 – Issuances of Amendments Re: Full-Scope Implementation of an Alternative Source Term (TAC Nos. MC5495 and MC5496)," dated December 29, 2006 (ADAMS Accession No. ML063400359). These license amendments represent full scope implementation of the AST, as described in RG 1.183.

NRC Regulatory Issue Summary (RIS) 2006-04, "Experience with Implementation of Alternative Source Terms," dated March 7, 2006 (ADAMS Accession No. ML053460347), discusses experiences with analyzing an accident involving a release from off-gas or waste systems. As part of full AST implementation, some licensees have included an accident involving a release from their off-gas or waste system. For this type of accident, licensees have proposed acceptance criteria of 500 millirem (mrem) TEDE. The acceptance criterion for this event is that associated with the dose to an individual member of the public, as described in 10 CFR Part 20, "Standards for Protection Against Radiation." When the NRC revised 10 CFR Part 20 to incorporate a TEDE dose, the offsite dose to an individual member of the public was changed

from 500 mrem whole body to 100 mrem TEDE. Therefore, a licensee who chooses to implement AST for an off-gas or waste gas system release, as did SCE, should base its acceptance criteria on 100 mrem TEDE. Licensees may also choose not to implement AST for this accident and continue with their existing analysis and acceptance criteria of 500 mrem whole body.

The U.S. Environmental Protection Agency's (EPA's) "Protective Action Guide (PAG) and Planning Guidance for Radiological Incidents," Draft for Interim Use and Public Comment, issued March 2013 (PAG Manual), provides radiological protection criteria for application to all incidents that would require consideration of protective actions, with the exception of nuclear war. This manual provides recommended numerical PAGs for the principal protective actions available to public officials during a radiological incident.

The Nuclear Energy Institute (NEI) document NEI 99-01, "Development of Emergency Action Levels for Non-Passive Reactors," Revision 6, dated November 2012 (ADAMS Accession No. ML12326A805), provides guidance for the development of emergency action levels (EALs) for reactors in a permanently defueled condition. NEI 99-01, Revision 6, was endorsed by the NRC in a letter dated March 28, 2013 (ADAMS Accession No. ML12346A463). NEI 99-01 states that the accident analysis necessary to adopt the permanently defueled EAL scheme must confirm that the source terms and release motive forces are not sufficient to warrant classification of a site area emergency (SAE) or General Emergency, resulting in the maximum classification level of an Alert during an accident. An SAE would be declared for any event where exposure levels beyond the EAB are expected to exceed 10 percent of the EPA PAGs, which are a projected dose of 1 to 5 rem TEDE in four days for sheltering or evacuation of the public, and a projected dose of 5 rem child thyroid dose from radioactive iodine for administration of prophylactic drugs (potassium iodide). Correspondingly, NEI 99-01 established the SAE classification threshold as 100 mrem TEDE or 500 mrem thyroid committed dose equivalent.

3.0 TECHNICAL EVALUATION

3.1 Design-Basis Accident Analysis

SCE described that, with the permanent cessation of reactor operations and permanent removal of fuel from the reactor vessels for SONGS Units 2 and 3, most of the initial conditions, and most of the accident and transient analyses, that were included in Chapter 15 of the SONGS Updated Final Safety Analysis Report (UFSAR) when Units 2 and 3 were authorized to operate, are no longer possible. Therefore, SCE has updated the SONGS UFSAR to reflect that accidents and transients involving the failure or malfunction of fuel within primary containment, the RCS, or the secondary system are no longer applicable. The only DBA scenarios with the potential to result in a radiological release, as described in the UFSAR that are applicable to the permanently shutdown and defueled SONGS Units 2 and 3, are an FHA in the fuel handling building (FHB), a spent fuel cask drop accident, a SFP boiling accident, a liquid radioactive waste system leak or failure, a radioactive release due to liquid tank failures, and an accidental release of waste gas. Because the waste gas decay tanks have been purged of their contents and analyses of liquid tank failures in SONGS UFSAR Section 15.7.3.3.5 describe that no credible liquid release would exceed 10 CFR Part 20 limits, an accidental release of waste gas

and a liquid tank failure are not relevant at SONGS. The licensee determined that the remaining DBAs would be within relevant regulatory limits, assuming the fuel activity calculated as of August 2013 and without credit for dose consequence mitigation by engineered safety feature (ESF) systems. The NRC staff's technical evaluation of the licensee's analysis of the remaining DBAs at SONGS is provided in Sections 3.2 through 3.6, below.

3.2 Fuel Handling Accident Inside Fuel Building

A revision to the FHA accident analysis was incorporated into the SONGS UFSAR, Section 15.7.3.4, under the provisions of 10 CFR 50.59, "Changes, tests, and experiments," to address the permanently defueled condition. The analysis determined a reasonable time, post-cessation of operations, for movement of fuel from the SFP during which, if an FHA occurs, dose consequences would be within 10 CFR 50.67 and RG 1.183 dose limits. The licensee evaluated the maximum 2-hour TEDE to an individual located at the EAB, and the 30-day TEDE to an individual at the outer boundary of the LPZ and in the CR. The resulting doses in SCE's analyses are less than the RG 1.183 and SRP 15.0.1 dose acceptance criteria, the 10 CFR 50.67 limits, and the EPA PAG levels recommended for protection of the public.

The FHA inside the FHB (FHA-FHB) involves the inadvertent dropping of a fuel assembly during fuel handling operations, and the subsequent rupture of fuel pins in the dropped assembly and any stationary assembly impacted by the dropped assembly. A maximum of 472 fuel rods are assumed to fail, as a result of the drop of a fuel assembly onto the fuel assemblies stored in SFP fuel racks. The fission product inventory in the fuel rod gap of the damaged rods is assumed to be released instantaneously into the SFP. The FHA-FHB dose analysis models 17 months (12,240 hours) of radioactive decay prior to the event. The NRC staff finds that the decay time assumed by the licensee is consistent with RG 1.183, Regulatory Position 3.1, "Fission Product Inventory," which provides that, "For events postulated to occur while the facility is shutdown, e.g., a fuel handling accident, radioactive decay from the time of shutdown may be modeled."

The SFP water level is controlled by current SONGS Units 2 and 3 TS LCO 3.7.16 (renumbered to TS 3.1.1 in the proposed permanently defueled TSs), which limits the movement of irradiated fuel assemblies in the SFP, unless the water level is at least 23 feet over the top of the irradiated fuel assemblies, seated in the storage racks. As such, the licensee assumes that the SFP water level is at least 23 feet over the top of the irradiated fuel assemblies, seated in the storage racks, at the commencement of an FHA-FHB.

Should an FHA occur, fission products released from the damaged fuel are decontaminated by passage through the pool water, with the degree of decontamination dependent upon their physical and chemical forms. The licensee assumed no decontamination for noble gases, a decontamination factor of 200 for radioiodine, and retention of all aerosol and particulate fission products. This is consistent with RG 1.183, Appendix B, Section 2, "Water Depth," which provides that, "If the depth of water above the damaged fuel is 23 feet or greater, the decontamination factors for the elemental and organic species are 500 and 1, respectively, giving an overall effective decontamination factor of 200..."

The radioactive material that escapes from the SFP to the FHB is assumed to be released to the environment over a 2-hour time period. The FHA-FHB dose analysis does not credit the generation of an engineered safety feature actuation system (ESFAS) fuel handling building isolation signal (FHIS). The FHB normal ventilation exhaust is assumed to remain operational throughout the FHA-FHB event. The FHA-FHB AST dose analysis does not model a reduction in the amount of radioactive material available for release from the FHB by the fuel handling building Post-Accident Cleanup Unit (PACU) filter system. Therefore, the licensee assumes the release to the environment is an unfiltered release via the FHB normal ventilation exhaust system through the main plant vent, or as leakage through FHB penetrations. This is consistent with RG 1.183, Appendix B, Section 4.1, which states, "The radioactive material that escapes from the fuel pool to the fuel building is assumed to be released to the environment over a 2-hour time period."

Activity released during the FHA-FHB event is transported by atmospheric dispersion to the CR heating, ventilation and air conditioning (HVAC) intake and to the offsite EAB and LPZ dose receptors. Consistent with RG 1.183, Regulatory Position 5.3, "Meteorology Assumptions," the atmospheric dispersion factor values for the EAB and the LPZ, which were approved by the NRC during initial facility licensing were used by the licensee in performing the AST radiological analyses. The NRC had also approved the use of these meteorology atmospheric dispersion values by Amendment Nos. 210 and 202, dated December 29, 2006 (for SONGS Units 2 and 3, respectively). Consistent with RG 1.183, Regulatory Position 4.1.7, no correction is made for depletion of the effluent plume by deposition on the ground.

The CR dose during a design-basis FHA-FHB, following permanent shutdown of SONGS Units 2 and 3, was based on no credit for the Control Room Emergency Air Cleanup System (CREACUS) and Control Room Isolation Signal (CRIS) and no gamma radiation shine from CREACUS charcoal and high-efficiency particulate air (HEPA) filters. Control room doses are evaluated at various CR unfiltered inflow (including in leakage) flow rates. The flow rates were varied from 500 cubic feet per minute (cfm) to 15,000 cfm, but only the bounding CR dose is reported. The SONGS site-specific 95th percentile meteorology atmospheric dispersion factors for the CR were used.

The licensee concluded that the radiological consequences at the EAB and LPZ and in the CR are within the dose criteria for DBAs specified in 10 CFR 50.67 and SRP Section 15.0.1. The licensee also concluded that the radiological consequences are less than the dose criteria specified in the EPA PAG Manual. The NRC staff reviewed the licensee's evaluation and performed confirmatory calculations. In performing this review, the NRC staff relied upon information provided by the licensee, as well as, NRC staff experience in performing similar reviews. The NRC staff reviewed the methods, parameters, and assumptions that the licensee used in its radiological dose consequence analyses and concludes that they are acceptable because they are consistent with the guidance provided in RG 1.183. Using the FHA-FHB analyses assumptions described above, the NRC staff's confirmatory analyses of the licensee's FHA-FHB yield results for the CR, EAB, and LPZ that are less than the RG 1.183 and SRP 15.0.1 dose acceptance criteria and would not exceed the EPA PAG recommendations at the EAB.

3.3 Spent Fuel Cask Drop Accident

A re-analysis of the spent fuel cask drop accidents specified in the UFSAR, Section 15.7.3.5, was performed with a cask load of up to 32 fuel assemblies and a minimum of 17 months of decay. The spent fuel cask drop event is evaluated based on the potential of the cask drop to cause a release of radioactive material. This includes consideration of the allowed travel paths of the casks, their lift heights, and the items onto which they can be dropped. Even though single-failure-proof cranes are used at SONGS Units 2 and 3 to lift a spent fuel transfer cask out of a cask pool, a drop can be postulated when the cask is placed on the upper shelf (i.e., step) of a cask pool when performing a yoke-lift change-out, prior to the transfer cask being welded closed. The spent fuel cask drop accident considered to bound the radiological consequences of a spent fuel transfer cask drop (due to a seismic event) is from the upper shelf in the cask pool back into the lower portion of the cask pool. During this postulated accident, the transfer cask is not restrained and could fall back into the lower portion of the cask pool if an earthquake occurs. The fuel rods from all 32 fuel assemblies present in a transfer cask are conservatively assumed to rupture on impact with the bottom of the cask pool. All of the radioactive iodine and noble gases present in the gap volumes of the spent fuel rods are assumed to be released from the unwelded transfer cask. As required by the AST Amendment Nos. 210 and 202, dated December 29, 2006 (for SONGS Units 2 and 3, respectively), the new analysis was performed by the licensee using the AST methodology, including TEDE criteria. The NRC staff concludes that the licensee's modelling of decay time is consistent with RG 1.183, Regulatory Position 3.1.

Other than the number of fuel assemblies considered to fail, the radiological consequence analysis model is identical to that of the FHA in the FHA-FHB (see Section 3.2 of this SE). The fission product inventory in the fuel rod gap of the damaged rods is assumed to be released instantaneously into the SFP. The SFP water level is required to be at least 23 feet over the top of the irradiated fuel assemblies seated in the storage racks, as controlled by TSs. Consistent with RG 1.183, Appendix B, Regulatory Position 4.1, the radioactive material that escapes from the SFP to the FHB is released to the environment over a 2-hour time period, ensuring that at least 99.9 percent of the gaseous activity will be released to the environment. Consistent with RG 1.183, Regulatory Position 5.3, the atmospheric dispersion factor values for the EAB and the LPZ that were approved by the NRC during initial facility licensing are used in performing the AST radiological analyses. The NRC had also approved use of these meteorology atmospheric dispersion values by Amendment Nos. 210 and 202 for SONGS Units 2 and 3, respectively. Consistent with RG 1.183, Regulatory Position 4.1.7, no correction is made for depletion of the effluent plume by deposition on the ground.

The licensee concluded that the radiological consequences at the EAB and LPZ and in the CR are within the dose criteria for the DBAs, as specified in 10 CFR 50.67. The licensee also concluded that the radiological consequences are less than the dose criteria specified in the EPA PAG Manual. The NRC staff reviewed the licensee's evaluation and performed confirmatory calculations. In performing this review, the NRC staff relied upon information provided by the licensee and NRC staff experience in performing similar reviews. The NRC staff reviewed the methods, parameters, and assumptions that the licensee used in its radiological dose consequence analyses and concludes that they are acceptable because they are consistent with the guidance provided in RG 1.183. Using the analyses assumptions

described above, the NRC staff's confirmatory analyses yielded results for the CR, EAB, and LPZ that were less than the RG 1.183 dose acceptance criteria and would not have exceeded the EPA PAG recommendations at the EAB.

3.4 Spent Fuel Pool Boiling Accident

The postulated loss of all SFP cooling is assumed to result in SFP boiling and release of a portion of the radionuclide inventory contained in the stored spent fuel assemblies and the SFP water. The re-evaluation of the radiological consequences for the SFP boiling event assumes a minimum of 17 months since the shutdown of SONGS Units 2 and 3. The licensee used the AST methodology in performing this evaluation. The NRC staff concludes that the licensee's modelling of decay time is consistent with RG 1.183, Regulatory Position 3.1.

The radiological consequence analysis does not differentiate between the activity release rates before and after the onset of SFP boiling. Noble gas, iodine and tritium activity present in the failed fuel rod gap spaces of fuel rods, stored within the SFP, is released to the SFP water at the noble gas, iodine, and tritium escape rate coefficients, with the added conservatism of an assumed spiking factor of 100. The noble gas and iodine fuel rod gap fractions are consistent with the AST methodology. The tritium fuel rod gap fraction is assumed to be the same as that for the majority of noble gas and iodine isotopes. Tritium activity present in the SFP water prior to the loss of SFP cooling, is assumed to be released at the SFP boiling rate for the duration of the event. Both before and after the onset of SFP boiling spent fuel noble gases, iodine and tritium gas escaping from the failed fuel rod gap spaces are assumed to be instantaneously released with no hold up or iodine partitioning in the SFP water. The SFP boiling rate is a function of the decay heat load and the heat of vaporization of water.

Following a loss of SFP cooling, activity releases from the spent fuel due to evaporation and boiling disperse to the CR, EAB, and LPZ locations. No credit is taken for activity retention within the FHB. No credit is taken for FHIS or filtration by the FHB PACUs. All activity escaping from the SFP is assumed to be instantaneously released to the environment and atmospherically dispersed to the CR and offsite dose receptors. No credit is taken for CRIS or CREACUS.

The SFP boiling accident consequence analysis uses the identical model used for the FHA-FHB (see Section 3.2 of this SE). Consistent with RG 1.183, Appendix B, Section 4.1, the radioactive material that escapes from the SFP to the FHB is released to the environment over a 2-hour time period, ensuring that at least 99.9 percent of the gaseous activity will be released to the environment. For conservatism, the CR dose is calculated for an individual at the CR outside air intake location.

Consistent with RG 1.183, Regulatory Position 5.3, the atmospheric dispersion factor values for the EAB and the LPZ, which were approved by the NRC during initial facility licensing, are used in performing the AST radiological analyses. The NRC staff had also approved the use of these meteorology atmospheric dispersion values by Amendment Nos. 210 and 202, dated December 29, 2006 (for SONGS Units 2 and 3, respectively). Consistent with RG 1.183,

Regulatory Position 4.1.7, no correction is made for depletion of the effluent plume by deposition on the ground.

The licensee concluded that the radiological consequences at the EAB, LPZ, and CR are within the dose criteria for DBAs, as specified in 10 CFR 50.67. The licensee also concluded that the radiological consequences are less than the dose criteria specified in the EPA PAG Manual. The NRC staff reviewed the licensee's evaluation and performed confirmatory calculations. In performing this review, the NRC staff relied upon information provided by the licensee, as well as NRC staff experience in performing similar reviews. The NRC staff reviewed the methods, parameters, and assumptions that the licensee used in its radiological dose consequence analyses and finds that they are acceptable because they are consistent with the guidance provided in RG 1.183. Using the analyses assumptions described above, the NRC staff's confirmatory analyses yielded results for the CR, EAB, and LPZ that are less than the RG 1.183 dose acceptance criteria and would not exceed the EPA PAG recommendations at the EAB.

3.5 Radioactive Waste System Leak or Failure (Release to Atmosphere) Accident

The radioactive waste system leak or failure (with release to atmosphere) accident analysis (UFSAR Section 15.7.3.2) was revised to calculate the EAB and LPZ doses using the AST methodology. As required by the AST Amendment Nos. 210 and 202 for SONGS Units 2 and 3, respectively, the evaluation includes TEDE dose criteria, and a revised offsite dose acceptance criterion of 100 mrem TEDE, as addressed in NRC RIS 2006-04. The evaluation does not assume any post-shutdown decay time.

Releases from the Liquid Radioactive Waste System considered rupture of: radwaste tanks, refueling water storage tanks, primary ion-exchangers, and the blowdown demineralizer neutralization sump line. The most limiting of these is defined as an unexpected and uncontrolled release of the radioactive liquid stored in a radwaste secondary tank. The radwaste secondary tanks are Seismic Category II, Quality Class III tanks at atmospheric pressure. Rupture of these tanks is considered a limiting fault. A radwaste secondary tank rupture would release the liquid contents into the auxiliary building (radwaste area). It is assumed that all of the radioactive fission gases and iodines are released to the outside atmosphere within 2 hours.

The dose analysis for persons located at the EAB and the LPZ considers the dose consequences of inhalation and submersion in a radioactive cloud, as described in RG 1.183. Activity released during the event is transported by atmospheric dispersion to the offsite EAB and LPZ dose receptors. Consistent with RG 1.183, Regulatory Position 5.3, the atmospheric dispersion factor values for the EAB and the LPZ, which were approved by the NRC during initial facility licensing, are used in performing the AST radiological analyses. The NRC staff had also approved use of these meteorology atmospheric dispersion values by Amendment Nos. 210 and 202 for SONGS Units 2 and 3, respectively. Consistent with RG 1.183, Regulatory Position 4.1.7, no correction is made for depletion of the effluent plume by deposition on the ground.

The licensee concluded that the radiological consequences are less than 100 mrem TEDE offsite dose criterion per RIS 2006-04. The licensee also concluded that the radiological consequences are less than the dose criteria specified in the EPA PAG Manual. The NRC staff reviewed the licensee's evaluation and performed confirmatory calculations. In performing this review, the NRC staff relied upon information provided by the licensee, as well as NRC staff experience in performing similar reviews. The NRC staff reviewed the methods, parameters, and assumptions that the licensee used in its radiological dose consequence analyses and concludes that they are acceptable because they are consistent with the guidance provided in RG 1.183. Using the analyses assumptions described above, the NRC staff's confirmatory analyses yielded results for the EAB, LPZ, and CR that are less than RG 1.183 dose acceptance criteria and are also less than the offisite dose criteria per RIS 2006-04 and would not exceed the EPA PAG recommendations at the EAB.

3.6 Accident Analysis Conclusions

The NRC staff reviewed the assumptions, inputs, and methods used by the licensee to assess the radiological impacts of the proposed changes. The NRC staff finds that the licensee's analyses are acceptable because their analysis methods and assumptions are consistent with the guidance of RG 1.183. The NRC staff compared the doses estimated by the licensee to the applicable criteria and to the results of confirmatory analyses by the staff. The NRC staff finds, with reasonable assurance, that the licensee's estimates of the EAB, LPZ, and CR doses due to postulated DBAs at SONGS will comply with the requirements of 10 CFR 50.67 and the guidance of RG 1.183, and 10 CFR Part 20, as addressed in NRC RIS 2006-04. The NRC staff finds, with respect to the consequences of the remaining DBAs at SONGS, that no CR dose limits will be exceeded and that any offsite radiological release will not exceed the EPA PAGs at the EAB.

3.7 Proposed TS Changes

3.7.1 Section 1.1, Definitions

The licensee proposed deleting the following definitions because they pertain to an operating reactor. Since SONGS Units 2 and 3 are permanently shut down and defueled, the definitions have no relevance and no longer apply:

> AXIAL SHAPE INDEX (ASI) – ASI shall be the power generated in the lower half of the core less the power generated in the upper half of the core, divided by the sum of the power generated in the lower and upper halves of the core.
>
> $$\mathrm{ASI} = \frac{\mathrm{lower-upper}}{\mathrm{lower+upper}}$$
>
> AZIMUTHAL POWER TILT (T_q) - AZIMUTHAL POWER TILT shall be the power asymmetry between azimuthally symmetric fuel assemblies.
>
> CHANNEL CALIBRATION – A CHANNEL CALIBRATION shall be the adjustment, as necessary, of the channel output such that it responds within the

necessary range and accuracy to known values of the parameter that the channel monitors. The CHANNEL CALIBRATION shall encompass the entire channel, including the required sensor, alarm, display, and trip functions, and shall include the CHANNEL FUNCTIONAL TEST. Calibration of instrument channels with resistance temperature detector (RTD) or thermocouple sensors may consist of an inplace cross calibration of the sensing elements and normal calibration of the remaining adjustable devices in the channel. Whenever a sensing element is replaced, the next required inplace cross calibration consists of comparing the other sensing elements with the recently installed sensing element.

The CHANNEL CALIBRATION may be performed by means of any series of sequential, overlapping, or total channel steps so that the entire channel is calibrated.

CHANNEL CHECK – A CHANNEL CHECK shall be the qualitative assessment, by observation, of channel behavior during operation. This determination shall include, where possible, comparison of the channel indication and status to other indications or status derived from independent instrument channels measuring the same parameter.

CHANNEL FUNCTIONAL TEST - A CHANNEL FUNCTIONAL TEST shall be:

a. Analog channels - the injection of a simulated or actual signal into the channel as close to the sensor as practicable to verify OPERABILITY, including required alarms, interlocks, display and trip functions;

b. Bistable channels (e.g., pressure switches and switch contacts) - the injection of a simulated or actual signal into the channel as close to the sensor as practicable to verify OPERABILITY, including required alarm and trip functions; or

c. Digital computer channels - the use of diagnostic programs to test digital computer hardware and the injection of simulated process data into the channel to verify OPERABILITY, including alarm and trip functions.

The CHANNEL FUNCTIONAL TEST may be performed by means of any series of sequential, overlapping, or total channel steps so that the entire channel is tested.

CORE ALTERATION - CORE ALTERATION shall be the movement or manipulation of any fuel, sources, reactivity control components, or other components, excluding control element assemblies (CEAs) withdrawn into the upper guide structure, affecting reactivity, within the reactor vessel with the vessel head removed and fuel in the vessel. Suspension of CORE

ALTERATIONS shall not preclude completion of movement of a component to a safe position.

CORE OPERATING LIMITS REPORT (COLR) - The COLR is the unit specific document that provides cycle specific parameter limits for the current reload cycle. These cycle specific parameter limits shall be determined for each reload cycle in accordance with Specification 5.7.1.5. Plant operation within these limits is addressed in individual Specifications.

DOSE EQUIVALENT I-131 - DOSE EQUIVALENT I-131 shall be that concentration of I-131 (microcuries/gram) that alone would produce the same thyroid dose as the quantity and isotopic mixture of 1-131, 1-132, 1-133, 1-134, and 1-135 actually present. The thyroid dose conversion factors used for this calculation shall be those listed in ICRP-30, Supplement to Part 1, page 192-212, Table titled, "Committed Dose Equivalent in Target Organs or Tissues per Intake of Unit Activity."

Ē- AVERAGE DISINTEGRATION ENERGY - Ē shall be the average (weighted in proportion to the concentration of each radionuclide in the reactor coolant at the time of sampling) of the sum of the average beta and gamma energies per disintegration (in MeV) for isotopes, other than iodines, with half lives > 15 minutes, making up at least 95% of the total noniodine activity in the coolant.

ENGINEERED SAFETY FEATURE (ESF) RESPONSE TIME - The ESF RESPONSE TIME shall be that time interval from when the monitored parameter exceeds its ESF actuation setpoint at the channel sensor until the ESF equipment is capable of performing its safety function (i.e., the valves travel to their required positions, pump discharge pressures reach their required values, etc.). Times shall include diesel generator starting and sequence loading delays, where applicable. The response time may be measured by means of any series of sequential, overlapping, or total steps so that the entire response time is measured. In lieu of measurement, response time may be verified for selected components provided that the components and methodology for verification have been previously reviewed and approved by the NRC.

LEAKAGE – LEAKAGE shall be:

a. Identified LEAKAGE

1. LEAKAGE, such as that from pump seals or valve packing (except reactor coolant pump (RCP) leakoff), that is captured and conducted to collection systems or a sump or collecting tank;

2. LEAKAGE into the containment atmosphere from sources that are both specifically located and known either not to interfere with the

operation of leakage detection systems or not to be pressure boundary LEAKAGE; or

3. Reactor Coolant System (RCS) LEAKAGE through a steam generator to the Secondary System (primary to secondary LEAKAGE).

b. Unidentified LEAKAGE

All LEAKAGE that is not identified LEAKAGE.

c. Pressure Boundary LEAKAGE

LEAKAGE (except primary to secondary LEAKAGE) through a nonisolable fault in an RCS component body, pipe wall, or vessel wall.

MODE – A MODE shall correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning specified in Table 1.1-1 with fuel in the reactor vessel.

PHYSICS TESTS – PHYSICS TESTS shall be those tests performed to measure the fundamental nuclear characteristics of the reactor core and related instrumentation. These tests are:

a. Described in Chapter 14, "Initial Test Program of the SONGS Units 2 and 3 UFSAR;

b. Authorized under the provisions of 10 CFR 50.59; or

c. Otherwise approved by the Nuclear Regulatory Commission.

RCS PRESSURE AND TEMPERATURE LIMITS REPORT (PTLR) - The PTLR is the unit specific document that provides the reactor vessel pressure and temperature limits, including heatup and cooldown rates, for the current reactor vessel fluence period. These pressure and temperature limits shall be determined for each fluence period in accordance with Specification 5.7.1.6.

RATED THERMAL POWER (RTP) – RTP shall be a total reactor core heat transfer rate to the reactor coolant of 3438 MWt.

REACTOR PROTECTION SYSTEM (RPS) RESPONSE TIME - The RPS RESPONSE TIME shall be that time interval from when the monitored parameter exceeds its RPS trip setpoint at the channel sensor until electrical power to the CEAs drive mechanism is interrupted. The response time may be measured by means of any series of sequential, overlapping, or total steps so that the entire

response time is measured. In lieu of measurement, response time may be verified for selected components provided that the components and methodology for verification have been previously reviewed and approved by the NRC.

SHUTDOWN MARGIN (SDM) – SDM shall be the instantaneous amount of reactivity by which the reactor is subcritical or would be subcritical from its present condition assuming:

a. All full length CEAs (shutdown and regulating) are fully inserted except for the single CEA of highest reactivity worth, which is assumed to be fully withdrawn. However, with all CEAs verified fully inserted by two independent means, it is not necessary to account for a stuck CEA in the SDM calculation. With any CEAs not capable of being fully inserted, the reactivity worth of these CEAs must be accounted for in the determination of SDM, and

b. There is no change in part length CEA position.

STAGGERED TEST BASIS - A STAGGERED TEST BASIS shall consist of the testing of one of the systems, subsystems, channels, or other designated components during the interval specified by the Surveillance Frequency, so that all systems, subsystems, channels, or other designated components are tested during *n* Surveillance Frequency intervals, where *n* is the total number of systems, subsystems, channels, or other designated components in the associated function.

THERMAL POWER – THERMAL POWER shall be the total reactor core heat transfer rate to the reactor coolant.

In conjunction with deletion of the term "MODE," TS Table 1.1-1, "MODES," is also being deleted.

The NRC staff examined the TS definitions proposed for deletion and concluded that all the terms listed above are only meaningful to a reactor authorized to operate. Since SONGS Units 2 and 3 are permanently shut down and defueled, the NRC staff finds that the licensee's proposed change to delete these definitions from the TSs is acceptable.

In addition, the licensee proposed adding a definition for CERTIFIED FUEL HANDLER. The licensee proposed to define a certified fuel handler as:

CERTIFIED FUEL HANDLER – A CERTIFIED FUEL HANDLER is an individual who complies with provisions of the CERTIFIED FUEL HANDLER training program required by TS 5.3.2.

TS 5.3.2 states, "An NRC approved training and retraining program for the Certified Fuel Handlers shall be maintained." The NRC staff finds the definition of a Certified Fuel Handler

conforms to the usage contained in the Administrative Controls section of the SONGS Units 2 and 3 permanently defueled TSs and is consistent with the definition in 10 CFR Part 50 and is, therefore, acceptable.

3.7.2 Section 1.2, Logical Connectors

Section 1.2, "Logical Connectors," of the SONGS TSs provides an explanation of the use of logical connectors. Logical connectors are used in TSs to discriminate between, and yet connect, discrete Conditions, Required Actions, Completion Times, Surveillances, and Frequencies. The only logical connectors that appear in TSs are AND and OR. The physical arrangement of these connectors constitutes logical conventions with specific meanings.

The licensee proposed deleting Example 1.2-2 in this section of the SONGS Units 2 and 3 defueled TSs. Example 1.2-2 explains the use of multiple logical connectors and nested connectors in the Required Action section. The licensee states that Example 1.2-1 adequately explains the use of the logical connectors that remain in the proposed defueled TS.

The only logical connector retained in the defueled TS is contained in the Required Action section for renumbered LCO 3.1.2. This use of logical connectors is fully illustrated by Example 1.2-1 in Section 1.2. Therefore, the NRC staff finds that the licensee's proposed change to delete Example 1.2-2 from TS Section 1.2 is acceptable.

3.7.3 Section 1.3, Completion Times

Section 1.3, "Completion Times," of the SONGS TSs establishes the completion time convention throughout the TSs and provides guidance for its use. The licensee has proposed to replace each reference to "operation of the unit" and "unit" with the new terminology, "storage of fuel assemblies" and "facility," respectively, since operation of the unit is no longer permitted and safe storage of fuel assemblies is the primary objective of the permanently defueled TSs. In its February 23, 2015, response to the NRC staff's request for additional information (RAI), the licensee stated that the requirements in the defueled TSs are applicable to the storage of any fuel assembly, and are not limited to the safe storage of irradiated fuel assemblies. In addition, the licensee proposed to delete references to "MODE" to be consistent with the removal of these definitions from TSs and because this term is no longer used in the Required Actions of the subsequent remaining LCOs in the proposed SONGS Units 2 and 3 defueled TSs. The licensee also proposed to delete Examples 1.3-2 through 1.3-7 because these examples refer to activities that no longer pertain to a permanently defueled condition.

The proposed change is shown below, with a strikethrough of the current wording and highlighting of the proposed changes:

> BACKGROUND
>
> Limiting Condition [sic] for Operation (LCOs) specify minimum requirements for ensuring safe ~~operation of the unit~~ storage of fuel assemblies. The ACTIONS associated with an LCO state Conditions that typically describe the ways in which

the requirements of the LCO can fail to be met. Specified with each stated Condition are Required Action(s) and Completion Time(s).

DESCRIPTION

The Completion Time is the amount of time allowed for completing a Required Action. It is referenced to the time of discovery of a situation (e.g., inoperable equipment or variable not within limits) that requires entering an ACTIONS Condition unless otherwise specified, providing the ~~unit~~ facility is in a ~~MODE or~~ specified condition stated in the Applicability of the LCO. Required Actions must be completed prior to the expiration of the specified Completion Time. An ACTIONS Condition remains in effect and the Required Actions apply until the Condition no longer exists or the ~~unit~~ facility is not within the LCO Applicability. ...

The licensee proposed to delete several paragraphs of the Description Section that discuss entry into multiple Conditions, subsequent discovery of additional inoperable equipment, and the effects on the total Completion Times.

The licensee proposed to modify the Example, as follows:

EXAMPLE~~S~~ The following example~~s~~ illustrates the use of Completion Times ~~with different types of Conditions and changing Conditions~~.

EXAMPLE 1.3-1

ACTIONS

CONDITION	REQUIRED ACTION	COMPLETION TIME
B. Required Action and associated Completion Time not met.	B.1 ~~Be in MODE 3~~ Verify...	6 hours
	AND	
	B.2 ~~Be in MODE 5~~ Restore...	36 hours

Condition B has two Required Actions. Each Required Action has its own separate Completion Time. Each Completion Time is referenced to the time that Condition B is entered.

> The Required Actions of Condition B are to ~~be in MODE 3~~ perform the verification within 6 hours AND perform the restoration ~~in MODE 5~~ within 36 hours. A total of 6 hours is allowed for performing the verification ~~reaching MODE 3~~ and a total of 36 hours (not 42 hours) is allowed for performing the restoration ~~reaching MODE 5~~ from the time that Condition B was entered. If verification is performed ~~MODE 3 is reached~~ within 3 hours, the time allowed for ~~reaching MODE 5~~ performing the restoration is the next 33 hours because the total time allowed for performing the restoration ~~reaching MODE 5~~ is 36 hours.

The NRC staff has reviewed the proposed wording changes to the TS 1.3 Completion Times guidance and has determined that they are consistent with the transition from an operating reactor to a permanently shutdown and defueled facility with a primary safety focus of storage of fuel assemblies. The proposed changes also remove references to operating MODES that are no longer permitted following the licensee's submittal of certifications in accordance with 10 CFR 50.82(a)(2).

Examples 1.3-2 through 1.3-7, which are proposed to be deleted, provide an explanation of the time requirements for transitioning into a MODE in which the requirements are not applicable associated with entry in TS 3.0.3, or provide an explanation of more complex arrangements of Required Actions and Completion Times beyond those retained in the defueled TSs. TS 3.0.3 is being deleted as discussed in Section 3.7.6 of this safety evaluation. The NRC staff finds that these examples are no longer necessary to understand and properly implement the remaining Required Actions and Completion Times.

For the reasons discussed above, the NRC staff has determined that the revision to Example 1.3-1 and the deletion of the remaining examples are appropriate. Therefore, the NRC staff finds that the licensee's proposed changes to TS Section 1.3 are acceptable.

3.7.4 Section 1.4, Frequency

Section 1.4, "Frequency," of the SONGS TSs, defines the proper use and application of Frequency requirements throughout the TSs. In this section, the licensee has proposed to delete the final paragraph in the description section. The final paragraph of the TS 1.4 description section discusses notes that modify the frequency of performance of some surveillances and the applicability of operating MODE entry restrictions of SR 3.0.4. None of the surveillances in the proposed TSs contain notes that modify the frequency of performance or the conditions during which the acceptance criteria must be satisfied. Therefore, this paragraph is not applicable to the proposed TS LCOs or SRs and may be deleted. Specifically, the following is being deleted:

> Situations where a Surveillance could be required (i.e., its Frequency could expire), but where it is not possible or not desired that it be performed until sometime after the associated LCO is within its Applicability, represent potential

SR 3.0.4 conflicts. To avoid these conflicts, the SR (i.e., the Surveillance or the Frequency) is stated such that it is only "required" when it can be and should be performed. With an SR satisfied, SR 3.0.4 imposes no restriction.

The licensee proposed replacing the statement introducing the examples from "In these examples, the Applicability of the LCO ...is MODES 1, 2, and 3" with the statement "In these examples, the Applicability of the LCO...occurs whenever any fuel assembly is stored in the fuel storage pool." The reference to MODEs 1, 2, and 3 is no longer meaningful to the permanently shutdown and defueled condition at SONGS Units 2 and 3.

The licensee proposed to modify Examples 1.4-1 and 1.4-2 to be applicable to a facility that is permanently shutdown and defueled and proposed to delete Example 1.4-3, in its entirety.

A summary of the proposed changes is shown below, with a strikethrough of the current wording and highlighting of the proposed changes:

EXAMPLE 1.4-1

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
~~Perform CHANNEL CHECK~~. Verify. . .	~~12 hours~~ 7days

The licensee proposed to modify the discussion of Example 1.4-1 to reflect the 7 day frequency chosen for the example; to replace the word "unit" with the word "facility"; to delete the reference to MODEs; and to delete the reference to Example 1.4-3, which is also being deleted.

EXAMPLE 1.4-2

SURVEILLANCE REQUIREMENTS

SURVEILLANCE	FREQUENCY
~~Verify flow is within limits.~~ Verify...	Prior to moving a fuel assembly. . . ~~Once within 12 hours after~~

SURVEILLANCE	FREQUENCY
	~~≥ 25% RTP~~ ~~AND~~ ~~24 hours thereafter~~

The licensee proposed to revise the discussion of Example 1.4-2, as follows:

> Example 1.4-2 illustrates ~~has two Frequencies. The first is~~ a one time performance Frequency. ~~and the second is of the type shown in Example 1.4-1. The logical connector "AND" indicates that both Frequency requirements must be met. Each time reactor power is increased from a power level < 25% RTP to ≥ 25% RTP, the Surveillance must be performed within 12 hours.~~
>
> ~~The use of "once" indicates a single performance will satisfy the specified Frequency (assuming no other Frequencies are connected by "AND").~~ This type of Frequency does not qualify for the 25% extension allowed by SR 3.0.2. ~~"Thereafter" indicates future performances must be established per SR 3.0.2, but only after a specified condition is first met (i.e., the "once" performance in this example). If reactor power decreases to < 25% RTP, the measurement of both intervals stops. New intervals start upon reactor power reaching 25% RTP~~.

The licensee also proposed to delete Example 1.4-3 because it is not needed in a permanently defueled condition. The example used a reference to operating reactor MODES that are no longer permitted at SONGS Units 2 and 3. Specifically, Example 1.4-3 refers to surveillances to be performed after power is greater than or equal to (≥) 25 percent rated thermal power (% RTP) and discusses MODE entry restrictions.

The licensee stated that the remaining Examples 1.4-1 and 1.4-2 (as revised) are sufficient to explain the application of TS frequency requirements for the permanently defueled SONGS Units 2 and 3, TSs.

The NRC staff has reviewed the proposed changes to TS Section 1.4 and has determined that they are appropriate for a permanently shutdown and defueled reactor. The proposed changes remove references to operating MODES or rated thermal power that are no longer permitted, following certification under the provisions of 10 CFR 50.82(a)(2). The deletion of the surveillance note referring to MODE entry restrictions of SR 3.0.4 is also appropriate since none of the surveillances in the proposed remaining defueled TSs contain notes that modify the

frequency of performance or the conditions during which the acceptance criteria must be satisfied. Therefore, the NRC staff finds that the licensee's proposed changes to TS Section 1.4 are acceptable.

3.7.5 Section 2.0, Safety Limits

Section 2.0, "Safety Limits," of the SONGS TSs, establishes safety limits (SLs), which are limits upon important process variables that are found to be necessary to reasonably protect the integrity of certain of the physical barriers that guard against the uncontrolled release of radioactivity. SLs ensure that specified acceptable fuel design limits are not exceeded during steady state operation, normal operation transients, and anticipated operational occurrences (AOOs). The SL on RCS pressure protects the integrity of the RCS against overpressurization. In the event of fuel cladding failure, fission products are released into the reactor coolant. The RCS then serves as the primary barrier in preventing the release of fission products into the atmosphere.

TS 2.1, "Safety Limits" (SLs), contains two separate specifications:

- TS 2.1.1, Reactor Core SLs; and
- TS 2.1.2, Reactor Coolant System Pressure SL

TS 2.2, "SL Violations," direct actions to be taken if an SL specified in TS 2.1 is violated.

The restrictions of the SLs defined in TS 2.1.1 prevent overheating of the fuel cladding, and possible cladding perforation, which could result in the release of fission products to the reactor coolant. TS 2.1.1 is applicable in MODES 1 and 2. TS 2.1.2 defines requirements on parameters to protect the integrity of the RCS against overpressure. TS 2.1.2 is applicable in MODES 1, 2, 3, 4, and 5.

The licensee proposed to delete the SLs specified in Section 2.0, because they are not applicable to the permanently shutdown and defueled status of the plant. The licensee stated that the SL TSs limit important process variables that are necessary to reasonably protect the integrity of certain physical barriers required for safe operation of the reactor in MODES 1 through 5. However, 10 CFR 50.82(a)(2) prohibits operation of the reactor or placing fuel in the reactor vessel. Therefore, the SL TSs only address specific process variables that are no longer applicable to SONGS Units 2 and 3.

The NRC staff examined the SLs and their TS Bases. There are three SLs in Section 2.0: a minimum limit on the departure from nucleate boiling ratio (DNBR); a maximum limit on the peak fuel centerline temperature to ensure fuel and cladding integrity; and a maximum RCS pressure to ensure RCS integrity. As stated in the "Bases for DNBR," a limit is placed on the DNBR, such that, no fuel clad damage would occur as a result of normal operation and AOOs. A limit is placed on peak fuel centerline temperature, such that, a hot fuel pellet in the core will not experience centerline fuel melting. The TS Bases for the maximum RCS pressure state that RCS integrity is an important barrier in the prevention of an uncontrolled release of fission products. Because SONGS Units 2 and 3 have permanently shut down and defueled, and the

licensee has submitted certifications under the provisions of 10 CFR 50.82(a)(2), placing fuel in the reactor vessel and resuming power operations are no longer authorized, therefore, SLs associated with the RCS are no longer applicable. In this condition, there will be no DNBR or peak fuel centerline temperature to be monitored. Based on these findings, the NRC staff concludes the SLs no longer apply. Since the SLs are no longer applicable, TS 2.2, which specifies the actions to be taken if a SL is violated, is no longer necessary. Therefore, the NRC staff finds the licensee's proposed changes to delete TSs 2.1 and 2.2 is acceptable.

3.7.6 Section 3.0, Limiting Condition for Operation and Surveillance Requirement Applicability

Section 3.0, "Limiting Condition for Operation (LCO) Applicability," and "Surveillance Requirement (SR) Applicability," of the SONGS TSs, contains the general requirements applicable to all LCOs and SRs and applies at all times unless otherwise stated in TSs.

LCO 3.0.1, establishes the applicability statement within each individual TS as the requirement for when the LCO shall be met. The licensee proposed to delete the reference to "MODES" and the reference to LCO 3.0.7. The licensee stated that reference to MODES is no longer relevant since SONGS Units 2 and 3 are permanently shut down and defueled. In addition, the deletion of reference to LCO 3.0.7 conforms to the request to delete this LCO from the SONGS Units 2 and 3 TSs, as discussed below.

LCO 3.0.2 establishes that upon discovery of a failure to meet an LCO, the Required Actions of the associated Conditions shall be met. The licensee proposed to delete the references to LCO 3.0.5 and 3.0.6 to conform to the request to delete TS LCO 3.0.5 and 3.0.6 from the SONGS Units 2 and 3 TSs, as discussed below.

LCO 3.0.3 establishes the Actions that must be implemented when an LCO is not met and the associated Actions are not met, or an associated Action is not provided. LCO 3.0.3 requires placing the unit in a MODE or other specified condition in which the LCO does not apply. The licensee proposed to delete LCO 3.0.3, in its entirety, since it no longer applies. The regulations prohibit operation of the plant or placing fuel in the reactor vessel and references to operating MODES is no longer relevant.

LCO 3.0.4 establishes limitations on changing MODES or other specified conditions in the applicability when an LCO is not met. The licensee proposed to delete LCO 3.0.4 since SONGS Units 2 and 3 are permanently shut down and defueled and references to operating MODES are no longer relevant.

LCO 3.0.5 establishes the allowance for restoring equipment to service under administrative controls when it has been removed from service or declared inoperable to comply with Actions. The licensee proposed to delete LCO 3.0.5, in its entirety. The licensee stated that LCO 3.0.5 is no longer necessary because the proposed defueled TSs do not contain requirements for declaring equipment inoperable or removing equipment from service.

LCO 3.0.6 establishes an exception to LCO 3.0.2 to allow the use of the Safety Function Determination Program. The licensee has proposed to delete that the Safety Function Determination Program, described in TS 5.5.13. The deletion of the Safety Function Determination Program is discussed in Section 3.7.17.4 of this SE. Consequently, the licensee has proposed to delete LCO 3.0.6, in its entirety, to conform the TSs to the proposed deletion of the Safety Function Determination Program.

LCO 3.0.7 pertains to certain reactor physics special tests and operations required to be performed at various times over the life of the unit. The licensee proposed to delete LCO 3.0.7, in its entirety, since reactor physics testing is no longer relevant to a permanently shutdown and defueled facility.

SR 3.0.1 establishes the requirement that SRs must be met during the MODES or other specified conditions in the applicability for which the requirements of the LCO apply, unless otherwise specified in the individual SRs. This specification ensures that surveillances are performed to verify the operability of systems and components, and that variables are within specified limits. The licensee proposed to revise SR 3.0.1 to delete the reference to "MODES" since the reference to "MODES" is no longer relevant for the permanently shutdown and defueled condition at SONGS Units 2 and 3.

SR 3.0.2 permits a 25 percent extension of the interval specified in the Frequency, and establishes the requirements for meeting the specified Frequency for Surveillances and any Required Action with a Completion Time that requires the periodic performance of the Required Action on a "once per..." interval. The licensee proposed to delete the statements that pertain to Frequencies specified as "once" or "once per" and to delete the statement that "[e]xceptions to this Specification are stated in the individual Specifications." The licensee stated that the proposed defueled TSs no longer contain this type of Frequency or Completion Time.

SR 3.0.4 establishes the requirement that all applicable SRs must be met before entry into a MODE or other specified condition in the Applicability. The licensee proposed to delete the reference to "MODE" since SONGS Units 2 and 3 is permanently shut down and defueled and operating MODES are no longer relevant.

The NRC staff has reviewed the proposed changes to TS LCO 3.0.1, SR 3.0.1, and SR 3.0.4 and determined that the changes acceptably removes the reference to "MODE," which is no longer applicable to a permanently shutdown and defueled facility. The staff has also reviewed the change to LCO 3.0.2 and determined that the change acceptably removes the reference to other TS requirements that are being deleted. Therefore, the NRC staff finds that the licensee's proposed changes to these LCOs and SRs are acceptable.

The NRC staff has reviewed the proposed deletion of TS LCOs 3.0.3 and LCO 3.0.4, and has determined that, consistent with the transition to a permanently shutdown and defueled facility, these LCOs are no relevant. Since 10 CFR 50.82(a)(2) prohibits the licensee from operating the plant or placing fuel in the reactor vessel, the references to "MODE," and the discussions about shutting down the unit, are no longer applicable. The NRC staff finds the licensee's

proposed changes to delete these LCOs, reflect the current SONGS Units 2 and 3 plant status, and, therefore, are acceptable.

The NRC staff has reviewed the proposed deletion of TS LCO 3.0.5. The NRC staff agrees that this specification is no longer necessary because the defueled TSs do not contain requirements to declare equipment inoperable or to remove equipment from service. Since LCO 3.0.5 is being deleted, the deletion of reference to LCO 3.0.5 in LCO 3.0.2 is also appropriate. The NRC staff finds this change appropriately reflects the requirements in the defueled TSs.

The NRC staff has reviewed the proposed deletion of TS LCO 3.0.6. The NRC staff agrees that there will not be any systems in the permanently defueled TSs that are interrelated with other systems that have TS LCOs (support and supported systems). As a result, the conditions of LCO 3.0.6 no longer apply. Therefore, the staff finds that it is appropriate to delete LCO 3.0.6. Since LCO 3.0.6 is being deleted, the deletion of reference to LCO 3.0.6 in LCO 3.0.2 is also acceptable.

The NRC staff has reviewed the proposed deletion of TS LCO 3.0.7. The facility operating licenses no longer permit emplacement of fuel in the reactor vessels or operation of the facility, and therefore, no physics testing will be performed in the future. Therefore, the provisions of LCO 3.0.7 are no longer necessary. The NRC staff finds that the deletion of LCO 3.0.7 appropriately reflects the permanently shutdown and defueled status of the facility.

The NRC staff has reviewed the proposed changes to TS SR 3.0.2. The NRC staff agrees that the statements to be deleted are no longer necessary because the defueled TSs do not contain Frequencies and Completion Times of the type described in the statements being deleted. Therefore, the NRC staff finds the proposed changes acceptable.

Based on the above, the NRC staff finds that the licensee's proposed changes to LCO 3.0.1, LCO 3.0.2, LCO 3.0.3, LCO 3.0.4, LCO 3.0.5, LCO 3.0.6, LCO 3.0.7, SR 3.0.1, SR 3.0.2, and SR 3.0.4 are acceptable.

3.7.7 Section 3.1, Reactivity Control Systems

Section 3.1, "Reactivity Control Systems," of SONGS Units 2 and 3 TSs, contain LCOs, Actions, and SRs that provide for appropriate control of process variables, design features, or operating restrictions that are required to protect the integrity of a fission product barrier. The following TSs for SONGS Units 2 and 3 are being proposed for deletion.

TS 3.1.1, "SHUTDOWN MARGIN (SDM) – T_{avg} > 200 °F [degrees Fahrenheit]," specifies the requirements to provide sufficient reactivity margin to ensure that acceptable fuel design limits will not be exceeded for normal shut down and AOOs assuming the highest reactivity worth CEA remains fully withdrawn. TS 3.1.1 is applicable in "MODES 3 and 4."

TS 3.1.2, "SHUTDOWN MARGIN (SDM) - T_{avg} ≤ 200 °F," specifies the requirements to provide sufficient reactivity margin to ensure that acceptable fuel design limits will not be exceeded for

normal shut down and AOOs assuming the highest reactivity worth CEA remains fully withdrawn. TS 3.1.2 is applicable in "MODE 5."

TS 3.1.3, "Reactivity Balance," specifies the requirements for the comparison of the predicted versus measured core reactivity during power operation. The periodic confirmation of core reactivity is necessary to ensure that DBAs and transient safety analyses remain valid. TS 3.1.3 is applicable in "MODES 1 and 2."

TS 3.1.4, "Moderator Temperature Coefficient (MTC)," specifies the requirements to ensure that core overheating and overcooling accidents will not violate the accident analysis assumptions. TS 3.1.4 is applicable in "MODES 1 and 2 with k_{eff} [effective multiplication factor] ≥ 1.0."

TS 3.1.5, "Control Element Assembly (CEA) Alignment," specifies the limits on shutdown and regulating CEA alignments to ensure that the power distribution and reactivity limits defined by the design power peaking and SDM limits are preserved. TS 3.1.5 is applicable in "MODES 1 and 2."

TS 3.1.6, "Shutdown Control Element Assembly (CEA) Insertion Limits," specifies the limits on shutdown CEA insertion to ensure that a sufficient amount of negative reactivity is available to shut down the reactor and maintain the required shutdown margin following a reactor trip. TS 3.1.6 is applicable in "MODE 1, MODE 2 with any regulating CEA not fully inserted."

TS 3.1.7, "Regulating CEA Insertion Limits," specifies the limits on regulating CEA sequence and physical insertion for the function of preserving power distribution, ensuring that the SDM is maintained, ensuring that ejected CEA worth is maintained, and ensuring adequate negative reactivity insertion is available on trip. The overlap between regulating banks provides more uniform rates of reactivity insertion. TS 3.1.7 is applicable in "MODES 1 and 2."

TS 3.1.8, "Part Length Control Element Assembly (CEA) Insertion Limits," specifies the limits on part length CEA insertion for the function of preserving power distribution and ensuring that ejected CEA worth is maintained within limits. TS 3.1.8 is applicable in "MODE 1 > 20% RTP."

TS 3.1.9, "Boration Systems - Operating," establishes the requirements for borated water sources and flow paths to the RCS to ensure that sufficient borated water is available to maintain the reactor subcritical and provide makeup water to account for RCS shrinkage during cooldown to cold shutdown conditions. TS 3.1.9 is applicable in "MODES 1, 2, 3, and 4."

TS 3.1.10, "Boration Systems – Shutdown," establishes the requirements for borated water sources and flow paths to the RCS to ensure that sufficient borated water is available to maintain the reactor subcritical. TS 3.1.10 is applicable in "MODES 5 and 6."

TS 3.1.12, "Special Test Exception (STE) - Low Power Physics Testing," permits the relaxation of existing TS LCOs to allow the performance of PHYSICS TESTS. TS 3.1.12 is applicable in "MODES 2 and 3 during PHYSICS TESTS."

TS 3.1.13, "Special Test Exception (STE) - At Power Physics Testing," permits relaxation of existing TS LCOs to allow the performance of PHYSICS TESTS. TS 3.1.13 is applicable in "MODE 1 during PHYSICS TESTS."

TS 3.1.14, "Special Test Exceptions (STE) - Reactivity Coefficient Testing," permits relaxation of existing TS LCOs to allow the performance of PHYSICS TESTS. TS 3.1.14 is applicable in "MODE 1."

The NRC staff has reviewed the licensee's proposed change to delete the reactivity control system TSs for SONGS Units 2 and 3, and has determined that these TSs are only needed to provide the LCOs and SRs necessary to maintain reactivity parameters of fuel loaded into a reactor vessel within the margins of conditions encountered during normal operations, anticipated occurrences, and for DBAs. The reactivity control systems TSs are only important for a reactor authorized to operate or retain irradiated fuel in the reactor vessel. However, because 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactors or placing fuel in the reactor vessels at SONGS Units 2 and 3, there is no reactor core and the reactivity control systems are no longer relevant.

The NRC staff has also reviewed Section 3.1, the reactivity control systems TSs proposed for deletion (TS 3.1.1, TS 3.1.2, TS 3.1.3, TS 3.1.4, TS 3.1.5, TS 3.1.6, TS 3.1.7, TS 3.1.8, TS 3.1.9, TS 3.1.10, TS 3.1.12, TS 3.1.13, and TS 3.1.14), to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. These TSs indicate MODES for which the TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for permanently shutdown and defueled reactors, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

Therefore, the NRC staff finds that the licensee's proposed change to delete TS Section 3.1, Reactivity Control Systems, is acceptable.

3.7.8 Section 3.2, Power Distribution Limits

Section 3.2, "Power Distribution Limits," of the SONGS Units 2 and 3 TSs, contains LCOs, Required Actions, and SRs that provide for appropriate control of process variables, design features, or operating restrictions that are required to control power distribution in the reactor, and in turn, protect the integrity of a fission product barrier. The following TSs are being proposed for deletion.

TS 3.2.1, "Linear Heat Rate (LHR)," specifies the limits based on correlations between power peaking and certain measured variables used as inputs to the LHR and DNBR operating limits. The limitation on LHR ensures that in the event of a loss-of-coolant accident (LOCA) the peak

temperature of the fuel cladding does not exceed 2200 °F. TS 3.2.1 is applicable in MODE 1 with THERMAL POWER > [greater than] 20% RTP.

TS 3.2.2, "Planar Radial Peaking Factors (F_{xy})," specifies the limits based on correlations between power peaking and certain measured variables used as inputs to the LHR and DNBR operating limits. Limiting of the calculated Planar Radial Peaking Factors to values equal to or greater than the measured Planar Radial Peaking Factors ensures that the calculated limits remain valid. TS 3.2.2 is applicable in "MODE 1 with THERMAL POWER > 20 % RTP."

TS 3.2.3, "AZIMUTHAL POWER TILT (Tq)," specifies the limits based on correlations between power peaking and certain measured variables used as inputs to the LHR and DNBR operating limits. The limitations on the Tq are provided to ensure that design operating margins are maintained. TS 3.2.3 is applicable in "MODE 1 with THERMAL POWER > 20% RTP."

TS 3.2.4, "Departure from Nucleate Boiling Ratio (DNBR)," specifies the limits based on correlations between power peaking and certain measured variables used as inputs to the LHR and DNBR operating limits. Operation of the core with a DNBR at, or above, this limit ensures that an acceptable minimum DNBR is maintained in the event of a loss of flow transient. TS 3.2.4 is applicable in "MODE 1 with THERMAL POWER > 20% RTP."

TS 3.2.5, "AXIAL SHAPE INDEX (ASI)," specifies the limits based on correlations between power peaking and certain measured variables used as inputs to the LHR and DNBR operating limits. The limitation on ASI ensures that the actual ASI value is maintained within the range of values used in the accident analysis. The ASI limits ensure that with T_q at its maximum upper limit, the DNBR does not drop below the DNBR safety limit for AOOs. TS 3.2.5 is applicable in "MODE 1 with THERMAL POWER > 20% RTP."

The NRC staff has reviewed the proposed deletion of the power distribution limits TSs and has determined that these TSs are only needed to provide the LCOs and SRs necessary to maintain reactor power and heat generation within the margins of conditions encountered during normal operation, anticipated occurrences, and for DBAs. The power distribution limits TSs are only important for a reactor authorized to operate. Because 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactors or placing fuel in the reactor vessels at SONGS Units 2 and 3, there is no reactor core generating power and the power distribution limits are no longer relevant.

The NRC staff has also reviewed Section 3.2, power distribution limits TSs proposed for deletion (TS 3.2.1, TS 3.2.2, TS 3.2.3, TS 3.2.4, and TS 3.2.5), to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. These TSs indicate MODES for which the TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for permanently shutdown and defueled reactors, such as SONGS Unit 2 and Unit 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the

reactors or placing fuel in the reactor vessels and SONGS Unit 2 and Unit 3 are no longer in a configuration or a condition under which the TS MODES apply.

Therefore, the NRC staff finds that the licensee's proposed change to delete TS Section 3.2, Power Distribution Limits, is acceptable.

3.7.9 Section 3.3, Instrumentation

Section 3.3, "Instrumentation," of the SONGS Units 2 and 3 TSs, contains the LCOs, Actions, and SRs that provide for appropriate functional capability of sensing and control instrumentation required for the appropriate functional capability of plant equipment, and control of process variables, design features, or operating restrictions required for safe operation of the facility. The following TSs are being proposed for deletion.

TS 3.3.1, "Reactor Protective System (RPS) Instrumentation-Operating," specifies the requirements for the RPS instrumentation system to maintain the SLs during AOOs, and mitigates the consequences of DBAs in MODE 1 and MODE 2 (startup).

TS 3.3.2, "Reactor Protective System (RPS) Instrumentation – Shutdown," specifies the requirements for the RPS instrumentation system to maintain the SLs during all AOOs, and mitigates the consequences of DBAs in MODE 3 (hot standby), MODE 4 (hot shutdown), and MODE 5, when the reactor trip circuit breakers (RTCBs) are closed and the CEA drive system is capable of CEA withdrawal.

TS 3.3.3, Control Element Assembly Calculators (CEACs)," specifies the requirements to ensure the core protection calculators (CPCs) are either informed of individual CEA position within each subgroup, using one or other CEACs, or that appropriate conservatism is included in the CPC calculations to account for anticipated CEA deviations in MODES 1 and 2.

TS 3.3.4, "Reactor Protective System (RPS) Logic and Trip Initiation," specifies the requirements for RPS matrix logic, RPS initiation logic, RTBCs, and manual trip channels to effect automatic trip signals received from RPS instruments and to provide a means to manually trip the reactor in MODES 1 and 2, and in MODES 3, 4, and 5, when the RTCBs are closed and the CEA drive system is capable of CEA withdrawal.

TS 3.3.5, "Engineered Safety Features Actuation System (EFSAS) Instrumentation," specifies the requirements for the ESFAS Instrumentation to ensure ESFAS initiates necessary safety systems, based on the values of selected unit parameters, to protect against violating core design limits and the RCPB during AOOs and ensures acceptable consequences during accidents.

TS 3.3.6, "Engineered Safety Features Actuation System (EFSAS) Logic and Manual Trip," specifies the requirements for ESFAS Matrix Logic, ESFAS Initiation Logic, and Manual Trip channels to effect automatic ESFAS initiation received from ESFAS instruments and to provide a means to manually actuate an ESF system in MODES 1, 2, 3, and 4.

TS 3.3.11, "Post Accident Monitoring Instrumentation (PAMI)," is applicable in MODES 1, 2, and 3, and provides the operability requirements for accident monitoring instruments, which provides information required by the control room operators. The operability of the PAMI ensures there is sufficient information available on selected unit parameters to monitor and assess unit status following an accident.

TS 3.3.12, "Remote Shutdown System," is applicable in MODES 1, 2, and 3, and provides the operability requirements for instrumentation and controls necessary to place and maintain the unit in MODE 3 from a location other than the control room.

TS 3.3.13, "Source Range Monitoring Channels," is applicable in MODES 3, 4, and 5, and provides the operability requirements for source range monitoring instrumentation for indication, alarms, and reactor trips.

The NRC staff has reviewed the proposed deletion of the instrumentation TSs above. TS 3.3.1, TS 3.3.2, TS 3.3.3 and TS 3.3.4, are only necessary to maintain the ability of the RPS to automatically initiate a reactor scram to preserve the integrity of the fuel cladding, preserve the integrity of the primary system barrier, and minimize the energy which must be absorbed, and prevent criticality following a LOCA. TS 3.3.5 and TS 3.3.6 only concern instrumentation designed to mitigate accidents related to reactor operation. TS 3.3.11 and TS 3.3.12 only concern instrumentation to ensure there is sufficient information available on selected unit parameters to monitor and assess unit status following an accident, and allow operators to take manual actions specified in the emergency operating procedures or to remotely shut down the reactor from a location other than the control room. TS 3.3.13 requires monitoring source range count rate level and detects a loss of SDM caused by a boron dilution event (detected as an increase in neutron flux). None of the instrumentation addressed by these TSs is needed by a reactor that has permanently shut down and defueled in accordance with 10 CFR 50.82(a)(2).

The NRC staff also has reviewed the above Section 3.3 instrumentation TSs that are proposed for deletion (TS 3.3.1, TS 3.3.2, TS 3.3.3, TS 3.3.4, TS 3.3.5, TS 3.3.6, TS 3.3.11, TS 3.3.12, and TS 3.3.13), to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. These TSs indicate MODES for which the TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for permanently shutdown and defueled reactors, such as SONGS Unit 2 and Unit 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

Therefore, the NRC staff finds that the licensee's proposed change to delete Section 3.3, instrumentation TS 3.3.1, TS 3.3.2, TS 3.3.3, TS 3.3.4, TS 3.3.5, TS 3.3.6, TS 3.3.11, TS 3.3.12, and TS 3.3.13 is acceptable.

TS 3.3.7, "Diesel Generator (DG) – Undervoltage Start," specifies the loss of voltage start (LOVS) instrumentation functions be operable in MODES 1, 2, 3, 4, and when the associated DG is required to be operable by LCO 3.8.2, AC Sources – Shutdown. TS 3.3.7 is proposed for deletion by the licensee.

TS 3.3.7 provides the LCO and SRs to ensure availability of backup safety-related alternating current (AC) power to the SSCs used to prevent or mitigate postulated accidents resulting in an uncontrolled release of radioactivity of DBAs as analyzed in the SONGS Unit 2 and 3 UFSARs. This TS LCO ensures the operability of instrumentation designed to detect an undervoltage on the safety-related AC electrical busses upon a loss of offsite power and start the emergency diesel generators (EDGs) to supply backup power to the AC busses. Since SONGS Units 2 and 3 are permanently shut down and defueled, SCE has analyzed the remaining DBAs at SONGS Units 2 and 3, and given the significant fuel decay period, found that the radiological consequences will not exceed the EPA's PAGs at the site boundary. The licensee's analysis also demonstrates that the dose consequences, within the CR, of any DBAs are acceptable without relying on SSCs remaining functional for accident mitigation except the passive fuel storage pool structure which will be maintained as a TS for SONGS.) SCE calculated the DBA radiological consequences assuming no credit for control room isolation or recirculation filtration and no credit for any accident mitigation by the auxiliary building ventilation system. Calculated doses at the EAB, LPZ, and CR are within 10 CFR 50.67 and RG 1.183 dose limits. Since the bounding accident analysis for the permanently defueled condition assumed no credit for control room post-accident recirculation system emergency ventilation or filtration for mitigation of radiological releases, the CREACUS is not required (see evaluation of TS 3.7.11 in Section 3.7.13 of this SE). Because CREACUS is not required to function to mitigate a DBA, backup electrical power required to support operation of CREACUS upon a loss of offsite power is unnecessary. Therefore the EDG loss of offsite power start instrumentation is also unnecessary for all postulated DBAs.

The NRC staff determined in Section 3.1 through 3.6 of this SE that with SONGS Units 2 and 3 permanently shut down and defueled and the irradiated fuel having decayed for a significant period, CREACUS is no longer needed or credited in the primary success path of a safety sequence analysis related the remaining DBAs at SONGS Units 2 and 3. Consequently, neither primary nor backup power to support operation of CREACUS is needed. Therefore, actuation instrumentation to start the backup power EDGs is no longer required to satisfy TS Criterion 3 for inclusion in TSs as a support or actuation system that is necessary for items in the primary success path to successfully function. The NRC staff has confirmed that there are no other DBAs analyzed in the SONGS Units 2 and 3 UFSAR that rely on this instrumentation system. Based on the above, the NRC staff finds that the licensee's proposed change to delete TS 3.3.7 is acceptable.

TS 3.3.8, "Containment Purge Isolation Signal (CPIS)," specifies the requirements for instrumentation designed to close the containment purge isolation valves upon a detection of high gaseous radiation in containment. This action isolates the containment atmosphere from the environment to minimize releases of radioactivity in the event of an accident. TS 3.3.8 is applicable in MODES 1, 2, 3, and 4, during core alterations, and during movement of fuel assemblies within containment. TS 3.3.8 is proposed for deletion by the licensee.

This TS indicates MODES for which the TS is applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for permanently shutdown and defueled reactors, such as SONGS Unit 2 and Unit 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply. The staff also reviewed the non-MODE dependent applicability during core alterations, and during movement of fuel assemblies in containment. Because 10 CFR 50.82(a)(2) prohibits operation of the plant or placing fuel in the reactor vessel, the prohibition on placing fuel in the reactor vessel, it also precludes core alterations and the movement of fuel assemblies within containment.

The NRC staff also evaluated the proposed deletion of TS 3.3.8, to ensure that the LCO no longer satisfies the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The staff has determined that TS 3.3.8 only addresses specific plant systems, control of process variables, design features, or operating restrictions associated with the containment and are no longer needed or credited in the primary success path of a safety sequence analysis related the remaining DBAs at SONGS Units 2 and 3. Based on the above, the NRC staff finds that the licensee's proposed change to delete TS 3.3.8 is acceptable.

TS 3.3.9, "Control Room Isolation Signal (CRIS)," specifies the requirements to ensure instrumentation (actuation logic, manual trip, and gaseous radiation monitors) necessary to initiate CREACUS is operable. The CRIS terminates the normal supply of outside air to the CR and initiates actuation of the CREACUS to minimize operator radiation exposure. The radiation monitor actuation of the CREACUS in MODES 5 and 6 and during movement of fuel assemblies is the primary means to ensure control room habitability in the event of an FHA. TS 3.3.9 is applicable in MODES 1, 2, 3, 4, 5, 6, and during movement of fuel assemblies within containment and in the fuel storage pool. TS 3.3.9 is proposed for deletion by the licensee.

This TS indicates MODES for which the TS is applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for permanently shutdown and defueled reactors, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

The NRC staff evaluated the proposed deletion of TS 3.3.9 to ensure that the LCO no longer satisfies the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The NRC staff also reviewed the non-MODE dependent applicability during movement of fuel assemblies within containment and in the fuel storage pool. As detailed in Sections 3.1 through 3.6 of this SE, the remaining accident analyses applicable to the permanently shutdown and defueled reactors of SONGS Units 2 and 3 show that the dose

consequences within the control room are acceptable. Furthermore, the analyses do not rely on the functioning of any SSCs to mitigate the postulated DBAs with the exception of the passive fuel storage pool structure.

The NRC staff evaluated the remaining DBAs that credited the CREACUS, and its support systems, that were previously relied upon to mitigate the CR, EAB or LPZ dose consequences during reactor operation. This includes the FHIS, the FHB PACU filtration system, and the CRIS. As discussed in the basis for deleting CREACUS TS 3.7.11, (see Section 3.7.13 of this SE), the CRIS is no longer required for providing airborne radiological protection for the control room operators in the event of a DBA. Since TS 3.3.9 exists solely to support CREACUS Operability, the elimination of the need for the CREACUS also obviates the need for its support systems. The deletion of the CREACUS TS 3.7.11 eliminates the need for the CRIS TS 3.3.9. Therefore, the NRC staff finds the CRIS isolation signal is no longer required and that the licensee's proposed change to delete TS 3.3.9 is acceptable.

3.7.10 Section 3.4, Reactor Coolant System

The RCS TSs of Section 3.4, "Reactor Coolant System (RCS)," for SONGS Units 2 and 3 contain the LCOs, Actions, and SRs that provides for appropriate control of process variables, design features, or operating restrictions needed for appropriate functional capability of RCS equipment required for safe operation of the facility. The following TSs are being proposed for deletion.

TS 3.4.1, "RCS DNB [Departure from Nucleate Boiling] (Pressure, Temperature, and Flow) Limits," specifies the process variables requirements for maintaining RCS pressure, temperature, and flow rate within limits assumed in the safety analyses. The limits placed on RCS pressure, temperature, and flow rate ensure that the minimum DNBR will be met for each of the analyzed transients. TS 3.4.1 is applicable in MODE 1.

TS 3.4.2, "RCS Minimum Temperature for Criticality," specifies the requirements for RCS loop cold leg temperature (T_c) before the reactor can be made critical and while the reactor is critical. Compliance with the LCO ensures that the reactor will not be made or maintained critical ($k_{eff} > 1.0$) outside a temperature operating range of 522 °F to 558 °F, and to prevent operation in an unanalyzed condition. TS 3.4.2 is applicable in "MODE 1, THERMAL POWER ≤ 30% RTP and $T_c < 535$ °F, and in MODE 2, $K_{eff} \geq 1.0$ and $T_c < 535$ °F."

TS 3.4.3, "RCS Pressure and Temperature (P/T) Limits," specifies that the RCS pressure, RCS temperature and RCS heatup and cooldown rates shall be maintained within the limits as specified in the Pressure - Temperature Limits Report (PTLR). The LCO establishes operating limits that provide a margin to brittle failure of the reactor vessel and piping of the RCPB. TS 3.4.3 is applicable at all times. The purpose for TS LCO 3.4.3 during normal operation of the RCS is to avoid encountering pressure, temperature, and temperature rate of change conditions that might cause undetected flaws to propagate and cause nonductile failure of the RCPB, an unanalyzed condition. The RCS P/T limits in LCO 3.4.3 provide a definition of acceptable operation for prevention of nonductile failure in accordance with 10 CFR Part 50, Appendix G. Although the P/T limits were developed to provide guidance for operation during heatup, or

cooldown, or inservice leak and hydrostatic testing, the applicability of these limits is at all times in keeping with the concern for nonductile failure.

TS 3.4.3.1, "Pressurizer Heatup and Cooldown Limits," requires that the pressurizer heatup and cooldown rates shall be maintained within the specified limits. The pressurizer is designed to withstand the effects of cyclic loads due to system temperature and pressure changes. These cyclic loads are introduced by normal load transients, reactor trips, and startup and shutdown operations. During startup and shutdown, the rates of temperature and pressure changes are limited so that the maximum specified heatup and cooldown rates are consistent with the design assumptions and satisfy the stress limits for cyclic operation. Therefore, TS 3.4.3.1 is applicable at all times.

TS 3.4.4, "RCS Loops - MODES 1 and 2," specifies the requirements to ensure heat removal capability of the RCS loops with the reactor in MODES 1 and 2. The primary function of the RCS is removal of the heat generated in the fuel due to the fission process, and transfer of this heat, via the steam generators (SGs), to the secondary plant. The important aspect for this LCO is the reactor coolant forced flow rate, which is represented by the number of RCS loops in service. TS 3.4.4 is applicable in MODES 1 and 2.

TS 3.4.5, "RCS Loops - MODE 3," specifies the requirements to ensure heat removal capability of the RCS loops with the reactor in MODE 3. In MODE 3, the primary function of the reactor coolant is removal of decay heat and transfer of this heat, via the SGs, to the secondary plant fluid. TS 3.4.5 is applicable in MODE 3.

TS 3.4.6, "RCS Loops - MODE 4," specifies the requirements to ensure heat removal capability of the RCS loops with the reactor in MODE 4. In MODE 4, the primary function of the reactor coolant is the removal of decay heat and the transfer of this heat to the SGs or shutdown cooling (SDC) heat exchangers. TS 3.4.6 is applicable in MODE 4.

TS 3.4.7, "RCS Loops - MODE 5, Loops Filled," specifies the requirements to ensure heat removal capability of the RCS loops with the reactor in MODE 5 with the RCS loops filled with coolant. In MODE 5 with the RCS loops filled, the primary function of the reactor coolant is the removal of decay heat and transfer of this heat to the SGs or SDC heat exchangers. While the principal means for decay heat removal is via the SDC heat exchangers, the SGs are specified as a backup means for redundancy. TS 3.4.7 is applicable in MODE 5 with the RCS loops filled.

TS 3.4.8, "RCS Loops - MODE 5, Loops Not Filled," specifies the requirements to ensure heat removal capability of the RCS loops with the reactor in MODE 5 with the RCS loops not filled with reactor coolant. In MODE 5 with the RCS loops not filled, the primary function of the reactor coolant is the removal of decay heat and transfer of this heat to the SDC heat exchangers. The SGs are not available as a heat sink when the loops are not filled. TS 3.4.8 is applicable in MODE 5 with the RCS loops not filled.

TS 3.4.9, "Pressurizer," specifies the OPERABILITY requirements for the RCS pressurizer. The pressurizer provides a point in the RCS where liquid and vapor are maintained in equilibrium

under saturated conditions for pressure control purposes to prevent bulk boiling in the remainder of the RCS. In MODES 1, 2, and 3, the LCO requirement for a steam bubble is reflected implicitly in the accident analyses. All analyses performed from a critical reactor condition assume the existence of a steam bubble and saturated conditions in the pressurizer. TS 3.4.9 is applicable in MODES 1, 2, and 3.

TS 3.4.10, "Pressurizer Safety Valves," specifies the OPERABILITY and lift setpoint parameters for the pressurizer safety valves. The pressurizer safety valves provide, in conjunction with the reactor protection system, overpressure protection for the RCS. The pressurizer safety valves are designed to prevent the RCS from exceeding the system safety limit of 2750 pounds per square inch absolute (psia) in MODES 1, 2, and 3. In MODES 4, 5, and MODE 6 with the reactor vessel head on, overpressure protection is provided by operating procedures and by meeting the requirements of LCO 3.4.12, Low Temperature Overpressure Protection (LTOP) System. TS 3.4.10 is applicable in MODES 1, 2, and 3.

TS 3.4.12.1, "Low Temperature Overpressure Protection (LTOP) System, RCS Temperature ≤ PTLR Limit," specifies the requirements for controlling RCS pressure at low temperatures so the integrity of the RCPB is not compromised by violating the P/T limits of 10 CFR Part 50, Appendix G. TS LCO 3.4.12.1 provides RCS overpressure protection by minimizing coolant input capability and having adequate pressure relief capacity. In MODES 1, 2, and 3, the pressurizer safety valves will prevent RCS pressure from exceeding limits. In MODE 4 when the temperature of any RCS cold leg is less than or equal to the enable temperature specified in the PTLR, MODE 5, and MODE 6 when the reactor vessel head is on and the RCS is not vented, overpressure prevention falls to the OPERABLE SDC system relief valve or to a depressurized RCS and a sufficient sized RCS vent. When the reactor vessel head is off, overpressurization cannot occur.

TS 3.4.12.2, "Low Temperature Overpressure Protection (LTOP) System, RCS Temperature ≥ PTLR Limit," specifies requirements for controlling RCS pressure at low temperatures so the integrity of the RCPB is not compromised by violating the P/T limits of 10 CFR Part 50, Appendix G. TS LCO 3.4.12.2 provides RCS overpressure protection by having adequate pressure relief capacity. In MODES 1, 2, and 3 the pressurizer safety valves will prevent RCS pressure from exceeding limits. In MODE 4 when the temperature of all RCS cold legs are greater than the enable temperature specified in the PTLR, overpressure prevention falls to the OPERABLE SDC system relief valve or to an OPERABLE pressurizer code safety valve.

TS 3.4.13, "RCS Operational LEAKAGE," specifies the process variable limits and operating restrictions for RCS pressure boundary leakage, unidentified RCS leakage, identified RCS leakage, and primary to secondary leakage. RCS leakage is indicative of material deterioration, possibly of the RCS pressure boundary, which can affect the probability of a design basis event. The primary to secondary leakage limit is based on operating experience with SG tube degradation mechanisms that result in tube leakage. The operational leakage rate criterion in conjunction with the implementation of the Steam Generator Program is an effective measure for minimizing the frequency of steam generator tube ruptures (SGTRs). TS 3.4.13 is applicable in MODES 1, 2, 3, and 4. In MODES 5 and 6, leakage limits are not required because the

reactor coolant pressure is far lower, resulting in lower stresses and reduced potential for leakage.

TS 3.4.14, "RCS Pressure Isolation Valve (PIV) Leakage," specifies the process variable limits and operating restrictions for RCS PIV leakage. The regulations in 10 CFR 50.2, 10 CFR 50.55a(c), and 10 CFR Part 50, Appendix A, GDC 55, discuss RCPB valves, which are normally closed valves in series within the RCPB that separate the high pressure RCS from an attached low pressure system. Although this specification provides a limit on allowable PIV leakage rate, its main purpose is to prevent overpressure failure of the low pressure portions of connecting systems (intersystem LOCA). PIVs are provided to isolate the RCS from the following typically connected systems: SDC system; safety injection system; and the chemical and volume control system. The leakage limit is an indication that the PIVs between the RCS and the connecting systems are degraded or degrading. TS 3.4.14 is applicable in MODES 1, 2, 3, and 4. In MODES 5 and 6, leakage limits are not provided because the lower reactor coolant pressure results in a reduced potential for PIV leakage outside the containment.

TS 3.4.15, "RCS Leakage Detection Instrumentation," specifies the OPERABILITY requirements for RCS leakage detection instrumentation. Leakage detection systems are provided to detect significant RCPB degradation as soon after occurrence as practical to minimize the potential for propagation to a gross failure. Thus, they provide an early indication or warning signal to permit proper evaluation of RCS leakage into the containment area. TS LCO 3.4.15 requires instruments of diverse monitoring principles to be OPERABLE to provide a high degree of confidence that extremely small leaks are detected in time to allow actions to place the plant in a safe condition, when RCS leakage indicates possible RCPB degradation. TS 3.4.15 is applicable in MODES 1, 2, 3, and 4.

TS 3.4.16, "RCS Specific Activity," specifies the process variable limits and operating restrictions for Dose Equivalent 1-131 and gross specific activity. The TS LCO limits on the specific activity of the reactor coolant ensure that the resulting offsite doses meet the appropriate RG 1.183 acceptance criteria following a SGTR accident. TS 3.4.16 is applicable in MODES 1, 2, and MODE 3 with RCS average temperature ≥ 500 degrees F.

TS 3.4.17, "Steam Generator (SG) Tube Integrity," specifies the requirements to ensure the RCPB integrity function of the SG. The SGTR accident is the limiting design basis event for SG tubes and avoiding an SGTR is the basis for this specification. TS 3.4.17 is applicable in MODES 1, 2, 3, and 4.

The licensee proposed to delete all of Section 3.4 of the SONGS Units 2 and 3, RCS TSs, since all except TS 3.4.3, are only applicable to operating reactor MODES and do not apply to a permanently shutdown and defueled reactor. The NRC staff has reviewed these proposed changes and has determined that these TSs are only needed to provide the LCOs and SRs necessary to maintain functionality and integrity of the RCS pressure boundary. These TSs contain requirements for various RCS parameters such as: thermal limitations for heatup and cooldown rates during plant operation in order to operate within the analyzed requirements for stress intensity and fatigue limits for the reactor vessel; pressurization, which established and maintained an equilibrium under saturated conditions for pressure control to prevent bulk boiling

in the remainder of the RCS; coolant chemistry, which included limits on RCS activity to limit potential offsite doses due to postulated events and limits on RCS conductivity, chlorides, and pH to prevent stress-corrosion cracking; coolant leakage, which established primary system leakage limits to allow prompt identification and isolation of leaks before the integrity of the RCS pressure boundary was impaired; safety and relief valves, which specifies operability requirements for the safety and relief valves designed to prevent overpressurization of, and damage to, the primary system boundary; and structural integrity, which addresses the inservice inspection requirements of the primary system boundary components. All of these TSs are related to assuring the integrity of the RCS pressure boundary. The RCS TSs are only important for a reactor authorized to operate or retain irradiated fuel in the reactor vessel. However, because 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactors or placing fuel in the reactor vessels at SONGS Units 2 and 3, the RCS is no longer functional or used in any capacity.

Regarding the applicability of TS 3.4.3 and TS 3.4.3.1 at all times, the NRC staff notes that the RCS and pressurizer are drained and vented, to the extent possible, and consequently there is no longer any concern about exceeding the RCS and pressurizer P/T or cyclic limits. The requirements of 10 CFR Part 50, Appendix G, no longer apply to a permanently shutdown and defueled reactor because the RCPB will no longer be used as a fission product barrier. Therefore, TS 3.4.3 is no longer needed and may be deleted. Similarly, operating the unit within the fatigue analysis performed in accordance with the ASME Code Section III requirements no longer applies. Therefore, TS 3.4.3.1 is no longer needed and may also be deleted.

The NRC staff has also reviewed the RCS TSs proposed for deletion (TS 3.4.1, TS 3.4.2, TS 3.4.3, TS 3.4.3.1, TS 3.4.4, TS 3.4.5, TS 3.4.6, TS 3.4.7, TS 3.4.8, TS 3.4.9, TS 3.4.10, TS 3.4.12.1, TS 3.4.12.2, TS 3.4.13, TS 3.4.14, TS 3.4.15, TS 3.4.16, and TS 3.4.17), to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this SE. The staff notes that these TSs indicate MODES for which these TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for a permanently shutdown and defueled reactor, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2) for SONGS Units 2 and 3, it is prohibited from operating the reactors or placing fuel in the reactor vessels and, therefore, SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply. Furthermore, because irradiated fuel has been permanently removed from the reactor pressure vessels, the RCS is no longer relevant as a fission product barrier.

Therefore, the NRC staff finds that the licensee's proposed change to delete TS Section 3.4, Reactor Coolant System, is acceptable.

3.7.11 Section 3.5, Emergency Core Cooling Systems (ECCS)

Section 3.5 of the SONGS Units 2 and 3 TSs, "Emergency Core Cooling Systems (ECCS)," contains LCOs that provide for appropriate functional capability of ECCS equipment required for

mitigation of DBAs or transients so as to protect the integrity of a fission product barrier. The following TSs are being proposed for deletion.

TS 3.5.1, "Safety Injection Tanks (SITs)," specifies the requirements for the SITs to ensure they are capable of supplying water to the reactor vessel during the blowdown phase of a LOCA, to provide inventory to help accomplish the refill phase that follows thereafter, and to provide RCS makeup for a small-break LOCA. TS 3.5.1 is applicable in MODES 1 and 2, and in MODE 3 with pressurizer pressure ≥ 715 psia.

TS 3.5.2, "ECCS - Operating," specifies the requirements for the ECCS trains so as to provide core cooling and negative reactivity to ensure that the reactor core is protected after a LOCA, CEA ejection accident, loss of secondary coolant accident (including uncontrolled steam release), and SGTR. The ECCS consists of the high pressure safety injection (HPSI) and the low pressure safety injection (LPSI) subsystems. TS 3.5.2 is applicable in MODES 1 and 2, and MODE 3 with pressurizer pressure ≥ 400 psia.

TS 3.5.3, "ECCS - Shutdown," specifies the requirements for ECCS with the reactor in MODE 3 with pressurizer pressure < 400 psia, and in MODE 4. In these MODES, an ECCS train is composed of a single HPSI subsystem. One OPERABLE ECCS train is acceptable without a single failure consideration, based on the stable reactivity condition of the reactor and the limited core cooling requirements.

TS 3.5.4, "Refueling Water Storage Tank (RWST)," specifies the requirements for RWST OPERABILITY. During accident conditions, the RWST provides a source of borated water to the ECCS and containment spray system pumps. As such, it provides containment cooling and depressurization, core cooling, and replacement inventory and is a source of negative reactivity for reactor shutdown. TS 3.5.4 is applicable in MODES 1, 2, 3, and 4 because RWST OPERABILITY requirements are dictated by ECCS and containment spray system OPERABILITY requirements. Since both the ECCS and the containment spray system must be OPERABLE in MODES 1, 2, 3, and 4, the RWST must also be OPERABLE to support their operation.

TS 3.5.5, "Trisodium Phosphate (TSP) Dodecahydrate," specifies the requirements for TSP crystals to be placed in baskets on the floor of the containment building to ensure that iodine, which may be dissolved in the recirculated reactor cooling water following a LOCA, remains in solution. TSP also helps inhibit stress corrosion cracking (SCC) of austenitic stainless steel components in containment during the recirculation phase following an accident. TS 3.5.5 is applicable in MODES 1, 2, and 3, when the RCS is at elevated temperature and pressure, providing an energy potential for a LOCA.

The NRC staff has reviewed the proposed changes to the ECCS TSs and has determined that these TSs are only needed to provide the LCOs and SRs necessary to maintain functionality of the systems that provide emergency cooling to the reactor core and assure the appropriate functional capability ECCS required for mitigation of DBAs when the reactor is in MODES 1 through 4. These TSs includes multiple LCOs addressing the SITs, HPSI and LPSI subsystems; part of the ECCS, designed to provide adequate emergency cooling capability to

the reactor in the event of a LOCA; the RWST, designed to supply borated water to the ECCS during accident conditions; and the TSP baskets to help retain iodine in solution. All of these TSs are related to provide cooling for a reactor vessel core. Since SONGS Units 2 and 3 are permanently shut down and defueled, there are no accidents of any kind that would require emergency core cooling and the accidents that these systems and components were designed to mitigate are no longer possible.

The NRC staff also reviewed the ECCS TSs proposed for deletion (TS 3.5.1, TS 3.5.2, TS 3.5.3, TS 3.5.4, and TS 3.5.5), to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The staff notes that these TSs indicate MODES for which the TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for a permanently shutdown and defueled reactor, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels, and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

Therefore, the NRC staff finds that the licensee's proposed change to delete TS Section 3.5, Emergency Core Cooling Systems, is acceptable.

3.7.12 Section 3.6, Containment Systems

Section 3.6 of SONGS Units 2 and 3 TSs, "Containment Systems," contains the LCOs, Actions, and SRs that provide for appropriate control of process variables, design features, or operating restrictions required to protect the integrity of the containment as a fission product barrier; and appropriate functional capability of ESF equipment required for mitigation of DBAs or transients so as to protect the integrity of containment. The following TSs are being proposed for deletion from this section.

TS 3.6.1, "Containment," specifies the requirements for the containment to ensure it is capable of withstanding the pressures and temperatures of the limiting DBA without exceeding the design leakage rate. The containment steel liner and its penetrations establish the leakage limiting boundary of the containment. This TS provides the operating restrictions required to protect the integrity of the containment as a fission product barrier and limits the leakage of fission product radioactivity from the containment to the environment. TS 3.6.1 is applicable in MODES 1, 2, 3, and 4.

TS 3.6.2, "Containment Air Locks," specifies the requirements for the structural integrity and leak tightness of the containment air locks. As part of the containment pressure boundary, the air lock safety function is related to control of the containment leakage rate resulting from a DBA. Thus, each containment air lock's structural integrity and leak tightness is essential to the successful mitigation of such an event. TS 3.6.2 is applicable in MODES 1, 2, 3, and 4.

TS 3.6.3, "Containment Isolation Valves," specifies the requirements for the isolation capability of the containment via the containment isolation valves. Containment isolation valves form a part of the containment boundary and their OPERABILITY supports leak tightness of the containment. TS 3.6.3 is applicable in MODES 1, 2, 3, and 4.

TS 3.6.4, "Containment Pressure," specifies the limitations on internal containment pressure. Containment internal pressure is an initial condition used in the DBA analyses to establish the maximum peak containment internal pressure. Maintaining containment pressure at less than or equal to the LCO upper pressure limit ensures that, in the event of a DBA, the resultant peak containment accident pressure will remain below the maximum allowed containment internal pressure. Maintaining containment pressure at greater than or equal to the LCO lower pressure limit ensures that the containment will not exceed the design negative differential pressure following the accidental actuation of the Containment Spray System. TS 3.6.4 is applicable in MODES 1, 2, 3, and 4.

TS 3.6.5, "Containment Air Temperature," specifies the limitations on containment average air temperature. Containment average air temperature is an initial condition used in the DBA analyses that establishes the containment environmental qualification operating envelope for both pressure and temperature. During a DBA, with an initial containment average air temperature less than or equal to the LCO temperature limit, the resultant accident temperature profile assures that the containment structural temperature is maintained below its design temperature and that required safety-related equipment will continue to perform its function. TS 3.6.5 is applicable in MODES 1, 2, 3, and 4.

TS 3.6.6.1, "Containment Spray and Cooling Systems," specifies the operability requirements for containment atmosphere cooling to limit post-accident pressure and temperature in containment to less than the design values. Reduction of containment pressure and the iodine removal capability of the spray reduce the release of fission product radioactivity from containment to the environment, in the event of a DBA, to within limits. The containment spray system consists of two separate trains. Each train includes a containment spray pump, spray headers, valves and piping. The RWST supplies borated water to the containment spray system during the injection phase of operation. In the recirculation mode of operation, containment spray pump suction is transferred from the RWST to the containment sump. Two trains of containment cooling, each of sufficient capacity to supply 50 percent of the design cooling requirement, are provided. Two trains with two fan units each are supplied with cooling water from the component cooling water system. All four fans are required to furnish the design cooling capacity. Air is drawn into the coolers through the fans and discharged to the SG compartments and pressurizer compartment. TS 3.6.6.1 is applicable in MODES 1, 2, and 3.

TS 3.6.6.2, "Containment Cooling Systems," specifies the operability requirements for containment atmosphere cooling to limit post-accident pressure and temperature in containment to less than the design values. Reduction of containment pressure reduces the release of fission product radioactivity from containment to the environment, in the event of a DBA, to within limits. Two trains of containment cooling, each of sufficient capacity to supply 50 percent of the design cooling requirement, are provided. Two trains with two fan units each are supplied with cooling water from the component cooling water system. All four fans are required to

furnish the design cooling capacity. Air is drawn into the coolers through the fans and discharged to the SG compartments and pressurizer compartment. TS 3.6.6.2 is applicable in MODE 4, when a DBA could cause a release of radioactive material to containment and an increase in containment pressure and temperature, requiring the operation of the containment cooling trains.

TS 3.6.8, "Containment Dome Air Circulators," specifies the requirements for the containment dome air circulators to reduce the potential for breach of the containment due to a hydrogen oxygen reaction. The dome air circulators accelerate the air mixing process between the upper dome space of the containment atmosphere during LOCA operations. They also prevent any hot spot air pockets during the containment cooling mode and avoid any hydrogen concentration in pocket areas. Two dome air circulator trains are required to be operable. Each train consists of two fans with their own motors and controls and is automatically initiated by a containment cooling actuation signal (CCAS). While each train has two fans, only one operable fan is required for the train to be operable, since each fan can provide the necessary flow rate to adequately mix the containment atmosphere. TS 3.6.8 is applicable in MODES 1 and 2.

The NRC staff has reviewed the licensee's proposed changes for Section 3.6 of the SONGS Units 2 and 3 TSs and has determined that the TSs are only needed to provide the LCOs and SRs necessary to maintain functionality of the containment. These TSs include multiple LCOs addressing containment integrity, which includes: containment pressure, containment air temperature, and containment air locks, which forms part of the containment pressure boundary; and containment isolation valves, designed to isolate the containment in the event of a LOCA to prevent the release of fission products to the atmosphere; containment spray and cooling, which limit post-accident pressure and temperature in containment; and dome air circulators that help reduce the potential hydrogen concentration pockets in containment following a design basis accident. All of these TSs are related to assuring the integrity of the containment as a fission product boundary. The containment TSs are only important for a reactor authorized to operate or retain irradiated fuel in the reactor vessel. However, because 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactors or placing fuel in the reactor vessels at SONGS Units 2 and 3, the containment SSCs are no longer functional or used in any capacity and the associated TSs are no longer meaningful.

The NRC staff also reviewed the containment TSs proposed for deletion (TS 3.6.1, TS 3.6.2, TS 3.6.3, TS 3.6.4, TS 3.6.5, TS 3.6.6.1, TS 3.6.6.2, and TS 3.6.8), to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The staff notes that these TSs indicate MODES for which the TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for a permanently shutdown and defueled reactor, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels, and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

Therefore, the NRC staff finds that the licensee's proposed change to delete TS Section 3.6, Containment Systems, is acceptable.

3.7.13 Section 3.7, Plant Systems

Section 3.7 of the SONGS Units 2 and 3 TSs, "Plant Systems," contains the LCOs, Actions, and SRs that provide for appropriate functional capability of balance-of-plant equipment required for safe operation of the facility. This section contains operability requirements related to the steam generators, feedwater system, cooling water, ventilation, and spent fuel storage.

The licensee proposed deletion of the following LCOs in Section 3.7 of the SONGS Units 2 and 3 TSs:

TS 3.7.1, "Main Steam Safety Valves (MSSVs)," specifies the requirements for the MSSVs to ensure they are capable of providing overpressure protection for the secondary system. The MSSVs also provide protection against overpressurizing the RCPB by providing a heat sink for the removal of energy from the RCS, if the preferred heat sink provided by the condenser and circulating water system, is not available. TS 3.7.1 is applicable in MODES 1, 2, and 3.

TS 3.7.2, "Main Steam Isolation Valves (MSIVs)," specifies the requirements for the MSIVs to ensure that they are capable of isolating steam flow from the secondary side of the SGs following a high energy line break (HELB). MSIV closure terminates flow from the unaffected (intact) steam generator. One MSIV is located in each main steam line outside, but close to, containment. The MSIVs are downstream from the MSSVs, atmospheric dump valves, and auxiliary feedwater pump turbine steam supplies to prevent them from being isolated from the SGs by MSIV closure. Closing the MSIVs isolates each SG from the other, and isolates the turbine, steam bypass system, and other auxiliary steam supplies from the steam generators. TS 3.7.2 is applicable in MODES 1, 2, and 3 except when all MSIVs are closed and deactivated.

TS 3.7.3, "Main Feedwater Isolation Valves (MFIVs)," specifies the requirements for MFIVs. The MFIVs isolate main feedwater (MFW) flow to the secondary side of the steam generators following a HELB. Closure of the MFIVs terminates flow to the steam generators, terminating the event for feedwater line breaks (FWLBs) occurring upstream of the MFIVs. The consequences of events occurring in the main steam lines or in the MFW lines downstream of the MFIVs will be mitigated by their closure. Closure of the MFIVs effectively terminates the addition of feedwater to an affected steam generator, limiting the mass and energy release for steam line breaks (SLBs) or FWLBs inside containment, and reducing the cooldown effects for SLBs. TS 3.7.3 is applicable in MODES 1, 2, and 3 except when MFIV is closed and deactivated.

TS 3.7.4, "Atmospheric Dump Valves (ADVs)," specifies the requirements for providing a method for cooling the unit to shutdown cooling system entry conditions, should the preferred heat sink via the steam bypass system to the condenser not be available. This is done in conjunction with the auxiliary feedwater (AFW) system providing cooling water from the condensate storage tank (CST). TS 3.7.4 is applicable in MODES 1, 2, and 3, and in MODE 4 when steam generator is relied upon for heat removal.

TS 3.7.5, "Auxiliary Feedwater (AFW) System," specifies the requirements to ensure that the AFW system automatically supplies feedwater to the steam generators to remove decay heat from the RCS upon the loss of normal feedwater supply. TS 3.7.5 is applicable in MODES 1, 2, and 3, and in MODE 4 when steam generator is relied upon for heat removal.

TS 3.7.6, "Condensate Storage Tank (CST T-121 and T-120)," specifies the requirements to ensure a safety grade source of water to the SGs for removing decay and sensible heat from the RCS. The CSTs provide a passive flow of water, by gravity, to the AFW System. TS 3.7.6 is applicable in MODES 1, 2, and 3, and in MODE 4 when steam generator is relied upon for heat removal.

TS 3.7.7, "Component Cooling Water (CCW) System," specifies the requirements to ensure that the CCW system provides a heat sink for the removal of process and operating heat from safety-related components during a DBA or transient. During normal operation, the CCW system also provides this function for various nonessential components. The CCW System serves as a barrier to the release of radioactive byproducts between potentially radioactive systems and the salt water cooling system, and thus to the environment. TS 3.7.7 is applicable in MODES 1, 2, 3, and 4.

TS 3.7.7.1, "Component Cooling Water (CCW) Safety Related Makeup System," specifies the requirements to ensure a safety-related CCW makeup system is available to maintain the water inventory in the CCW trains during a 7-day post-accident period. The safety-related makeup system is designed to supply water to the CCW trains following loss of normal CCW makeup from the nuclear service water system. For this purpose, sufficient water inventory is contained in the single primary plant makeup (PPMU) storage tank for both CCW trains. From the PPMU tank, water is transferred to the CCW return heads by two safety-related pumps. TS 3.7.7.1 is applicable in MODES 1, 2, 3, and 4.

TS 3.7.8, "Salt Water Cooling (SWC) System," specifies the requirements to ensure that the SWC system provides a heat sink for the removal of process and operating heat from safety-related components during a DBA or transient. During normal operation, and a normal shutdown, the SWC system also provides this function for various safety-related and nonsafety-related components. The safety-related function is covered by TS 3.7.8. TS 3.7.8 is applicable in MODES 1, 2, 3, and 4.

TS 3.7.10, "Emergency Chilled Water (ECW)," specifies the requirements to ensure that the ECW system provides a heat sink for the removal of process and operating heat from selected safety-related air handling systems during a DBA or transient. The design basis of the ECW system is to remove the post-accident heat load from ESF spaces following a DBA coincident with a loss of offsite power. Each train provides chilled water to the HVAC units at the design temperature and flow rate. TS 3.7.10 is applicable in MODES 1, 2, 3, and 4.

TS 3.7.19, "Secondary Specific Activity," specifies the limit on secondary coolant specific activity during power operation to minimize releases to the environment because of normal operation, AOOs, and accidents. The accident analysis of the main steam line break (MSLB) assumes an

initial secondary coolant specific activity used for determining the radiological consequences of the postulated accident. The accident analysis, based on this and other assumptions, shows that the radiological consequences of an MSLB do not exceed the TEDE limit. TS 3.7.19 is applicable in MODES 1, 2, 3, and 4.

The NRC staff has reviewed the proposed changes to TSs 3.7.1 through TS 3.7.10, and TS 3.7.19 and has determined that these TSs are only necessary to assure the operability of certain plant systems during reactor operation. These TSs involve: MSSVs, which provide overpressure protection for the secondary system; MSIVs, which isolate steam flow from the secondary side of the steam generator following a MSLB; MFIVs, which isolate main feedwater flow to the secondary side of the steam generators following a HELB; ADVs, which provide a method for cooling the unit should the condenser not be available; AFW system, which supplies feedwater to the steam generators upon the loss of the normal feedwater supply; CSTs, which provide the preferred source of water to the steam generators for removing decay and sensible heat from the RCS; CCW system, CCW safety-related makeup system, and the SWC system, which provide a heat sink for the removal of process and operating heat from safety-related components during a DBA or transient to the ultimate heat sink; the ECW system that removes heat from ESF spaces through safety-related air handling systems; and secondary specific activity, which specifies a limit on secondary coolant specific activity during power operation.

The above TSs were intended to protect the fuel in the reactor from potential operational transients and accidents. However, 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactor or placing fuel in the reactor vessel. Consequently, there are no longer any transient or accident conditions that these systems and components protect against or mitigate. Therefore, the NRC staff finds the deletion of 3.7.1 through 3.7.10, as detailed above, is acceptable. TS 3.7.19 provides the operational limits on secondary coolant specific activity limiting the potential radiological consequences of an accident that could release pressurized steam from the SGs. Since 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactor or placing fuel in the reactor vessel, there is no source of heat available to pressurize the SGs and no source of activity. Therefore, the NRC staff finds the deletion of TS 3.7.19 is acceptable.

The NRC staff has also reviewed Section 3.7 of the SONGS Units 2 and 3, TS 3.7.1, TS 3.7.2, TS 3.7.3, TS 3.7.4, TS 3.7.5, TS 3.7.6, TS 3.7.7, TS 3.7.7.1, TS 3.7.8, TS 3.7.10, and TS 3.7.19 proposed for deletion to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The staff notes that these TSs indicate MODES for which the TSs are applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for permanently shutdown and defueled reactors, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

Therefore, based on the evaluation above, the NRC staff finds that the licensee's proposed change to delete Plant Systems TS 3.7.1, TS 3.7.2, TS 3.7.3, TS 3.7.4, TS 3.7.5, TS 3.7.6, TS 3.7.7, TS 3.7.7.1, TS 3.7.8, TS 3.7.10 and 3.7.19, is acceptable.

TS 3.7.11, "Control Room Emergency Air Cleanup System (CREACUS)," specifies the requirements to ensure that the CREACUS provides a protected environment from which operators can control SONGS Units 2 and 3, following an uncontrolled release of radioactivity, hazardous chemicals, or smoke. The CREACUS consists of two independent, redundant trains that recirculate and filter the air in the control room envelope (CRE) and a CRE boundary that limits the inleakage of unfiltered air. Each CREACUS train consists of an emergency air conditioning unit, emergency ventilation air supply unit, emergency isolation dampers, and cooling coils and two cabinet coolers. Each emergency air conditioning unit includes a prefilter, a high efficiency particulate air (HEPA) filter, an activated carbon adsorber section for removal of gaseous activity (principally iodines), and a fan. A second bank of HEPA filters follows the adsorber section to collect carbon fines. Ductwork, motor-operated dampers, doors, barriers, and instrumentation also form part of the system. Upon receipt of the actuating signal, normal air supply to the CRE is isolated and the stream of ventilation air is recirculated through the system's filter trains. The prefilters remove any large particles in the air to prevent excessive loading of the HEPA filters and charcoal adsorbers.

There are two CREACUS operational modes. Emergency mode is an operational mode when the control room is isolated to protect operational personnel from radioactive exposure through the duration of a DBA. Isolation mode is an operational mode when the CRE is isolated to protect operational personnel from toxic gases and smoke. Actuation of the CREACUS places the system into either of two separate states of operation, depending on the initiation signal. Actuation of the system to either the emergency mode or isolation mode of CREACUS operation closes the unfiltered-outside-air intake and unfiltered exhaust dampers and aligns the system for recirculation of air within the CRE through the redundant trains of HEPA and charcoal filters. The emergency mode also initiates pressurization of the CRE. Outside air is added to the air being recirculated from the CRE. Pressurization of the CRE minimizes infiltration of unfiltered air through the CRE boundary from all the surrounding areas adjacent to the CRE boundary. The CRE supply and the outside air supply of the normal control room HVAC are monitored by radiation and toxic-gas detectors, respectively. One detector output above the setpoint will cause actuation of the emergency mode or isolation mode as required. The actions of the isolation mode are more restrictive, and will override the actions of the emergency mode of operation. TS 3.7.11 is applicable in MODES 1, 2, 3, 4, 5, and 6 and during movement of fuel assemblies in the containment or fuel storage pool.

When SONGS Units 2 and 3 were authorized to operate, the CREACUS provided a protected environment from which operators could control the units following postulated accidents involving an uncontrolled release of radioactivity, including an FHA. Prior to SONGS Units 2 and 3 permanently shutting down and defueling, the TSs for the CREACUS provided the LCOs and SRs necessary to maintain the control room environment following an accident. Specifically, during irradiated fuel movement, the CREACUS provided a protected environment from which operators can control the unit following a postulated uncontrolled release of radioactivity from an FHA. CRE will remain habitable during and following a DBA. In MODES 5

and 6, the CREACUS is required to cope with the release from a rupture of a waste gas tank. During movement of fuel assemblies, the CREACUS must be operable to cope with the release from an FHA.

The licensee provided information on the toxic gases isolation of CREACUS in Section 3.2.10.2.3 of the licensee's permanently defueled technical specification amendment request. Specifically, per the NRC's SE associated with the issuance of SONGS License Amendment Nos. 127 and 116 for Units 2 and 3, respectively dated February 9, 1996 (ADAMS Accession No. ML021990684), the toxic gas isolation of CREACUS is not relied on to prevent or mitigate a design basis accident or transient because the plant design includes other means to safely shut down the plant if the control room becomes uninhabitable. As such, the toxic gas isolation instrumentation was relocated from the TS and placed in the Licensee Controlled Specifications with an applicability of MODES 1, 2, 3, 4, 5, and 6. Since an NRC SE has already accepted the removal of toxic gas isolation of CREACUS from the TSs, a new NRC staff determination is not required. The staff concludes that automatic toxic gas isolation of CREACUS is not required during movement of fuel assemblies in the fuel storage pool at the permanently defueled SONGS Units 2 and 3.

With the termination of reactor operations at SONGS Units 2 and 3 and the permanent removal of the fuel from the reactor core in each unit, the postulated accidents involving failure or malfunction of the reactor, RCS, or secondary system are no longer applicable. While there are no transients that continue to apply to SONGS Units 2 and 3, there are still postulated DBAs. As discussed in Sections 3.1 through 3.6 of this SE, the remaining DBAs applicable to the defueled reactors of SONGS Units 2 and 3 show that the dose consequences are acceptable without relying on SSCs remaining functional for accident mitigation during and following the event, with the exception of the SFP structure.

The NRC staff evaluated these accident analyses and confirmed that no ESF system is used to mitigate the CR, EAB, or LPZ dose consequences. This includes no credit for the FHIS, the PACU filtration system, the CRIS and the CREACUS. Since SONGS Units 2 and 3 are permanently shutdown and defueled, and greater than 17 months of decay time has elapsed since permanent shut down, the remaining DBAs applicable to the facility demonstrate that the dose consequences within the CR are acceptable without relying on SSCs remaining functional for accident mitigation, including an FHA in the FHB. (The one exception to this is the continued function of the passive fuel storage pool structure, which will be maintained as a TS for SONGS Units 2 and 3.)

In summary, the radiological consequences of the remaining DBAs for SONGS Units 2 and 3 assume no credit for CR isolation or recirculation filtration and no credit for any accident mitigation by the FHB ventilation system. Calculated doses at the EAB, LPZ, and CR are within 10 CFR Part 50.67 limits, and RG 1.183 dose limits. Since the DBA accident analysis for SONGS Units 2 and 3 assumed no credit for control room post-accident recirculation system emergency ventilation or filtration, the CREACUS is no longer required. Therefore, isolation of the CRE via the CRIS and CREACUS is not necessary for any of the postulated DBAs. As noted before, the intent of Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C) is to capture into TSs those SSCs that are part of the primary success path of a safety sequence analysis. With SONGS

Units 2 and 3 permanently shutdown and defueled, and the irradiated fuel having decayed for a minimum period of 17 months, the CREACUS is no longer needed or credited in the primary success path of a safety sequence analysis related to an accident. Since the radiological consequences of the accident analyses are within the appropriate acceptance criteria without credit for the CREACUS, the NRC staff finds that the licensee's proposed change to delete TS 3.7.11, is acceptable.

The licensee intends to retain TS 3.7.16, TS 3.7.17, and TS 3.7.18 but revise these TSs to delete the REQUIRED ACTIONS note that states that LCO 3.0.3 is not applicable. LCO 3.0.3 is being deleted from the SONGS Units 2 and 3 TSs and removal of a reference to TS 3.0.3 is a conforming change. In addition, with the deletion of all TSs in Section 3.1 through 3.6, the licensee also proposes to renumber these TSs to 3.1.1 to 3.1.3, respectively

TS 3.7.16, "Fuel Storage Pool Water Level," specifies the requirements to ensure that the minimum water level in the SFP meets the assumptions of iodine decontamination factors following an FHA. The water also provides shielding during the movement of spent fuel. This TS is applicable during movement of irradiated fuel assemblies in the SFP. The licensee has proposed to retain this TS in the permanently defueled TSs essentially unchanged. The Note in Required Action A.1 (LCO 3.0.3 is not applicable), is being deleted to conform to the deletion of TS LCO 3.0.3. The licensee has also proposed to renumber this TS as 3.1.1, based on the proposed deletion of all the preceding TSs.

Criterion 2 of 10 CFR 50.36(c)(2)(ii)(B) states that TS LCOs must be established for a "process variable, design feature, or operating restriction that is an initial condition of a design basis accident or transient analysis that either assumes the failure of or presents a challenge to the integrity of a fission product barrier." The purpose of this criterion is to capture those process variables that have initial values assumed in the DBA. TS 3.7.16, "Fuel Storage Pool Water Level," specifies the TS required LCOs and SRs that ensure the minimum water level in the SFP meets the assumptions of iodine decontamination factors following an FHA or cask drop accident.

SCE's analysis of the postulated FHA or cask drop accident assumes that there is at least 23 feet of water between the top of the damaged fuel assemblies and the fuel pool surface. The gap activity in the damaged rods is assumed to be instantaneously released into the SFP. Radionuclides in the gap release are assumed to be filtered by the 23 feet of water before emerging from the SFP. The activity exhaust rate from the auxiliary building is established to complete the release in 2 hours, as required by RG 1.183, but does not credit the auxiliary building ventilation for any mitigation of the release.

Since the 23-foot water level of the SFP is an initial condition of the FHA and the cask drop DBA, it satisfies Criterion 2 for inclusion in TSs and is being retained for SONGS Units 2 and 3 in their permanently shutdown and defueled condition. The amendment request by SCE does not involve any change to the technical language in the TS. The discussion in this evaluation of the SFP water level TS is provided only for completeness since the SFP water level is an important initial condition in the FHA and cask drop accident analysis and will continue to be part of the SONGS TSs.

TS 3.7.17, "Fuel Storage Pool Boron Concentration," specifies the requirements to ensure that the SFP boron concentration is > 2000 parts per million (ppm). The specified concentration of dissolved boron in the SFP preserves the assumptions used in the analyses of the potential critical accident scenarios as described in the criticality analysis of record, which is that a minimum of 2000 ppm of boron is needed to ensure that criticality does not occur during the worst case fuel loading accident. This concentration of dissolved boron is the minimum required for fuel assembly storage and movement within the spent fuel pool. This TS is applicable whenever fuel assemblies are stored in the spent fuel pool. This TS is being retained in the permanently defueled TS essentially unchanged. The Note in Required Action A.1 (LCO 3.0.3 is not applicable), is being deleted to conform to the deletion of TS LCO 3.0.3. The licensee has also proposed to renumber this TS as 3.1.2, based on the proposed deletion of all the preceding TSs.

TS 3.7.18, "Spent Fuel Assembly Storage," specifies the restrictions on the placement of fuel assemblies within the SFP, in accordance with Figure 3.1.3-1 through Figure 3.1.3-4 in the accompanying LCO, to ensure the keff of the SFP will always remain < 0.95, assuming the pool to be flooded with unborated water. This TS applies whenever any fuel assembly is stored in the spent fuel pool. TS 3.7.18 is being retained in the permanently defueled TS essentially unchanged. The Note in Required Action A.1 (LCO 3.0.3 is not applicable), is being deleted to conform to the deletion of TS LCO 3.0.3. The licensee has also proposed to renumber this TS as 3.1.3, based on the proposed deletion of all the preceding TSs.

The NRC staff reviewed the proposed deletion of the reference to LCO 3.0.3 in the Required Actions Note in TS 3.7.16, TS 3.7.17, and TS 3.7.18. The staff finds that deletion of the Note, "LCO 3.0.3 is not applicable," in each of these TSs is appropriate and the conforming change to the deletion of TS LCO 3.0.3, as discussed in Section 3.7.6 of this SE. Therefore, the staff finds that the licensee's proposed change to delete the reference to LCO 3.0.3 in TS 3.7.16, TS 3.7.17, and TS 3.7.18 (renumber as TS 3.1.1, TS 3.1.2, and TS 3.1.3, respectively – see below), is acceptable.

The NRC staff also reviewed the proposed change to renumber TS 3.7.16, 3.7.17, and TS 3.7.18, to TS 3.1.1, TS 3.1.2, and TS 3.1.3, respectively, and found the change to be editorial and conforming to the overall changes to the TSs. Therefore, the NRC staff finds that the licensee's proposed renumbering of the TSs is acceptable.

3.7.14 Section 3.8, Electrical Power Systems

The licensee proposed to delete SONGS Units 2 and 3 electrical power systems TS 3.8.1, TS 3.8.4, TS 3.8.7, and TS 3.8.9, since these TSs are MODE dependent and only applicable to an operating reactor. Therefore, these TSs do not apply to the permanently shutdown and defueled condition of SONGS Units 2 and 3.

TS 3.8.1, "AC [Alternating Current] Sources - Operating," specifies the requirements to ensure that the offsite power sources (normal preferred and alternate preferred power sources), and the standby power sources (Train A and Train B DGs), provide sufficient capacity, capability, redundancy, and reliability to ensure the availability of necessary power to ESF systems so that

the fuel, RCS, and containment design limits are not exceeded. TS 3.8.1 is applicable in MODES 1, 2, 3, and 4.

TS 3.8.4, "DC [Direct Current] Sources - Operating," specifies the requirements to ensure that the DC electrical power subsystems (with each subsystem consisting of one battery, the *required battery charger, and the corresponding control equipment and interconnecting cabling* supplying power to the associated bus within the subsystem) are required to be OPERABLE to ensure the availability of the required power to shut down the reactor and maintain it in a safe condition after an AOO or postulated DBA. TS 3.8.4 is applicable in MODES 1, 2, 3, and 4.

TS 3.8.7, "Inverters - Operating," specifies the requirements to ensure that required inverters are OPERABLE such that the redundancy incorporated into the design of the RPS and ESFAS instrumentation and controls is maintained. These requirements include the required capacity, capability, redundancy, and reliability to ensure the availability of necessary power to the RPS and ESFAS instrumentation and controls so that the fuel, RCS, and containment design limits are not exceeded. TS 3.8.7 is applicable in MODES 1, 2, 3, and 4.

TS 3.8.9, "Distribution Systems - Operating," specifies the requirements to ensure availability of AC, DC, and AC instrument bus electrical power for the systems *required to shut down the* reactor and maintain it in a safe condition after an AOO or a postulated DBA. The AC, DC, and AC vital electrical power distribution systems are designed to provide sufficient capacity, *capability, redundancy, and reliability to ensure the availability of necessary power to ESF* systems so that the fuel, RCS, and containment design limits are not exceeded. TS 3.8.9 is applicable in MODES 1, 2, 3, and 4.

The NRC staff has reviewed the SONGS Units 2 and 3 electrical power systems LCOs in TS 3.8.1, TS 3.8.4, TS 3.8.7, and TS 3.8.9, which have been proposed for deletion, to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The staff notes that these TSs indicate MODES for which the TS is applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for the permanently shutdown and defueled reactors, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), *it is prohibited from operating the reactors or placing fuel in the reactor vessels.* Therefore, SONGS Units 2 and 3 are no longer in a configuration or a condition under which these TS MODES apply. Based on the above, the staff finds the deletion of TS 3.8.1, TS 3.8.4, TS 3.8.7, and TS 3.8.9 from TS Section 3.8, Electrical Systems, is acceptable.

The licensee has also proposed to delete SONGS Units 2 and 3 electrical power systems TS 3.8.2, TS 3.8.3, TS 3.8.5, TS 3.8.6, TS 3.8.8, and TS 3.8.10, based on the MODE dependent applicably of these TSs. However, these TSs are also directly applicable during the movement of irradiated fuel assemblies or are support systems for TSs required during the movement of irradiated fuel assemblies. The following evaluations of these electrical power systems TSs assess the licensee's justification as to why these TSs do not apply to the

permanently shutdown and defueled condition of SONGS Units 2 and 3 during movement of irradiated fuel assemblies.

TS 3.8.2, "AC Sources - Shutdown," specifies the requirements to ensure that the offsite power sources (normal preferred and alternate preferred power sources), and the standby power sources (Train A and Train B DGs), provide sufficient capacity, capability, redundancy, and reliability to ensure the availability of necessary power to ESF systems so that the fuel, RCS, and containment design limits are not exceeded. TS 3.8.2 is applicable during MODES 5 and 6 and during movement of fuel assemblies in containment or in the fuel storage pool.

TS 3.8.3, "Diesel Fuel Oil, Lube Oil, and Starting Air," provides for proper operation of the DGs, by specifying the parameters and ensuring there will be sufficient quantity and proper quality of the fuel oil, lube oil, and starting air systems. Stored diesel fuel oil is required to have sufficient supply for 7 days of rated load operation for each DG. It is also required to meet specific standards for quality. Additionally, sufficient lubricating oil supply must be available to ensure the capability to operate each DG at rated load for 7 days. Lastly, each DG is equipped with two air start systems, which have adequate capacity for five successive start attempts on the DG without recharging the air start receivers. TS 3.8.3 is applicable whenever the DGs are required to be operable.

TS 3.8.5, "DC Sources Shutdown," specifies the requirements to ensure availability of the DC electrical power system and subsystems (with each subsystem consisting of one battery, required battery charger, and the corresponding control equipment and interconnecting cabling supplying power to the associated bus within the subsystem), in order to provide normal and emergency DC electrical power for the DGs, emergency auxiliaries, and control and switching. TS 3.8.5 is applicable during MODES 5 and 6 and during movement of fuel assemblies in containment or in the fuel storage pool.

TS 3.8.6, "Battery Parameters," specifies the requirements to ensure the limits on battery float current as well as electrolyte temperature, level, and float voltage for the DC power subsystem batteries. Battery parameters are required solely for the support of the associated DC electrical power subsystems (per TS 3.8.4 and TS 3.8.5). Therefore, battery parameter limits are only required (and TS 3.8.6 is only applicable) when the DC electrical power source is required to be operable.

TS 3.8.8, "Inverters – Shutdown," specifies the requirements to ensure stability and reliability of the preferred source of power for the 120 Volt AC vital buses. The inverters can be powered from an internal AC source/rectifier or from the station battery. The inverter provides an uninterruptible power source for the safety-related instrumentation and controls. TS 3.8.8 is applicable during MODES 5 and 6 and during movement of fuel assemblies within containment or in the fuel storage pool.

TS 3.8.10, "Distribution Systems - Shutdown," specifies the requirements for the onsite AC, DC, and AC instrument bus electrical power distribution systems. The TS specifies sufficient capacity, capability, redundancy, and reliability of the distribution system to ensure the availability of necessary power to ESF systems so that the fuel, RCS, and containment design

limits are not exceeded. TS 3.8.10 is applicable during MODES 5 and 6 and during movement of fuel assemblies within containment or in the fuel storage pool.

The SONGS Unit 2 and 3 TS Basis documents indicates that the shutdown electrical power systems TS 3.8.2, TS 3.8.3, TS 3.8.5, TS 3.8.6, TS 3.8.8, and TS 3.8.10 provide assurance that:

a. The units can be maintained in the shutdown or refueling condition for extended periods;

b. Sufficient instrumentation and control capability is available for monitoring and maintaining the units status; and

c Adequate AC electrical power is provided to mitigate events postulated during shut down, such as an FHA.

The NRC staff has reviewed the SONGS Units 2 and 3 shutdown electrical power systems TSs (TS 3.8.2, TS 3.8.3, TS 3.8.5, TS 3.8.6, TS 3.8.8, and TS 3.8.10), which have been proposed for deletion, to ensure that these LCOs no longer satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The staff notes that these TSs indicate MODES for which the TS is applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for the permanently shutdown and defueled reactors, such as SONGS Units 2 and 3, has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactors or placing fuel in the reactor vessels and SONGS Units 2 and 3 is no longer in a configuration or a condition under which these TS MODES apply. Based on the above, the NRC staff finds that the licensee's proposed change to delete TS 3.8.2, TS 3.8.3, TS 3.8.5, TS 3.8.6, TS 3.8.8, and TS 3.8.10, from TS Section 3.8, Electrical Systems, for MODES 5 and 6, is acceptable.

The NRC staff also reviewed the non-MODE dependent applicability during movement of fuel assemblies within containment and in the fuel storage pool. Because 10 CFR 50.82(a)(2) prohibits operation of the plant or placing fuel in the reactor vessel, the prohibition on placing fuel in the reactor vessel, it also precludes core alterations and the movement of fuel assemblies within containment. Therefore, these TSs are no longer needed during movement of fuel assemblies within containment.

As detailed in Sections 3.1 through 3.6 of this SE, the remaining accident analyses applicable to the permanently shutdown and defueled reactors of SONGS Units 2 and 3 show that the dose consequences within the control room are acceptable without relying on SSCs remaining functional for accident mitigation during any of the remaining DBAs, including FHAs. (The one exception to this is the continued function of the passive fuel storage pool structure, which will be maintained as a TS for SONGS).

For TS 3.8.2, AC Sources – Shutdown, the FHA is the applicable DBA related to the TS requirement for functional capability of AC sources (offsite power and DGs) during the TS

specified condition of during movement of fuel assemblies in the fuel storage pool. Because the FHA analysis, and the other DBAs identified for SONGS Units 2 and 3, do not rely on normal or emergency power for accident mitigation (including any need for providing airborne radiological protection), the AC sources are not required during movement of fuel assemblies in the fuel storage pool for mitigation of a potential FHA or any of the other DBAs. Specifically, the accident analyses show that the dose consequences are acceptable without relying on any SSCs to remain functional during and following the postulated events, with the exception of the SFP support structure. Therefore, during movement of fuel assemblies in the fuel storage pool, there are no systems that function or actuate and are credited as part of the initial conditions of an analysis or as part of the primary success path for mitigation of the DBA. As such, the requirement for AC sources is no longer necessary because there are no design-basis events that rely on AC sources for mitigation. Consequently, AC sources no longer meet the requirements of Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C) and can be removed from TSs. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 3.8.2, during movement of fuel assemblies in the fuel storage pool, is acceptable.

The NRC staff has reviewed the need for TS 3.8.3, Diesel Fuel Oil, Lube Oil, and Starting Air, during movement of fuel assemblies in the fuel storage pool. Since TS 3.8.3 exists solely to support the DG requirements of TS 3.8.1 and TS 3.8.2, the deletion of these TSs is consistent with the elimination of the need for DGs and also eliminates the need for the DG support systems. The NRC staff has determined that the requirement for DGs and associated supporting TSs are no longer necessary because the remaining DBAs for SONGS Units 2 and 3 do not rely on the DGs for mitigation. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 3.8.3, during movement of fuel assemblies in the fuel storage pool, is acceptable.

The NRC staff has reviewed the need for TS 3.8.5, DC Sources – Shutdown, during movement of fuel assemblies in the fuel storage pool. Because the FHA analysis, and the other DBAs identified for SONGS Units 2 and 3, do not rely on safety-related DC sources of electrical power for accident mitigation (including any need for providing airborne radiological protection), the DC sources are not required during movement of fuel assemblies in the fuel storage pool for mitigation of a potential FHA or any of the other DBAs. Specifically, the accident analyses show that the dose consequences are acceptable without relying on any SSCs to remain functional during and following the postulated events. Therefore, during movement of fuel assemblies in the fuel storage pool, there are no systems that function or actuate and are credited as part of the initial conditions of an analysis or as part of the primary success path for mitigation of the DBA. As such, the requirement for DC sources is no longer necessary because there are no design-basis events that rely on DC sources for mitigation. Consequently, DC sources no longer meet the requirements of Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C) and can be removed from TSs. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 3.8.5, during movement of fuel assemblies in the fuel storage pool, is acceptable.

The NRC staff has reviewed the need for TS 3.8.6, Battery Parameters, during movement of fuel assemblies in the fuel storage pool. Since TS 3.8.6 exists solely to support the DC source requirements of TS 3.8.4 and TS 3.8.5, the deletion of these TSs is consistent with the elimination of the need for DC sources and also obviates the need for the battery support

systems. The staff has determined that the requirement for DC sources and associated supporting TSs are no longer necessary because the remaining DBAs for SONGS Units 2 and 3 do not rely on the DC sources for mitigation. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 3.8.6, battery parameters, during movement of fuel assemblies in the fuel storage pool, is acceptable.

The NRC staff has reviewed the need for TS 3.8.8, Inverters – Shutdown, during movement of fuel assemblies in the fuel storage pool. Because the FHA analysis, and the other DBAs identified for SONGS Units 2 and 3 do not rely on inverters or the safety-related 120 Volt AC electrical power for accident mitigation (including any need for providing airborne radiological protection), the inverters are not required during movement of fuel assemblies in the fuel storage pool for mitigation of a potential FHA or any of the other DBAs. Specifically, the accident analyses show that the dose consequences are acceptable without relying on any SSCs to remain functional during and following the postulated events, with the exception of the SFP support structure. Therefore, during movement of fuel assemblies in the fuel storage pool, there are no systems that function or actuate and are credited as part of the initial conditions of an analysis or as part of the primary success path for mitigation of the DBA. As such, the requirement for inverters is no longer necessary because there are no design-basis events that rely on inverters for mitigation. Consequently, inverters no longer meet the requirements of Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C) and can be removed from TSs. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 3.8.8, during movement of fuel assemblies in the fuel storage pool, is acceptable.

The NRC staff has reviewed the need for TS 3.8.10, Distribution System – Shutdown, during movement of fuel assemblies in the fuel storage pool. Because the FHA analysis, and the other DBAs identified for SONGS Units 2 and 3, do not rely on the safety-related AC, DC and AC instrument bus electrical distribution systems for accident mitigation (including any need for providing airborne radiological protection), these safety-related distributions systems are not required during movement of fuel assemblies in the fuel storage pool for mitigation of a potential FHA or any of the other DBAs. Specifically, the accident analyses show that the dose consequences are acceptable without relying on any SSCs to remain functional during and following the postulated events, with the exception of the SFP support structure. Therefore, during movement of fuel assemblies in the fuel storage pool, there are no systems that function or actuate and are credited as part of the initial conditions of an analysis or as part of the primary success path for mitigation of the DBA. As such, the requirement for safety-related AC, DC and AC instrument bus electrical distribution systems is no longer necessary because there are no design-basis events that rely on safety-related AC, DC and AC instrument bus electrical distribution systems for mitigation. Consequently, AC, DC and AC instrument bus electrical distribution systems no longer meet the requirements of Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C) and can be removed from TSs. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 3.8.10, during movement of fuel assemblies in the fuel storage pool, is acceptable.

3.7.15 Section 3.9, Refueling Operations

Section 3.9 of the SONGS Units 2 and 3 TSs, "Refueling Operations," contains the LCOs, Actions, and SRs related to refueling operations. This section contains the following LCOs:

TS 3.9.1, "Boron Concentration," places limits on the boron concentrations of the RCS and the refueling canal to ensure that the reactor remains subcritical during refueling. Refueling boron concentration is the soluble boron concentration in the coolant in each of these volumes, which have direct access to the reactor core during refueling. The boron concentration limits required by TS LCO 3.9.1 are specified in the COLR. The boron concentration limit specified in the COLR will maintain a k_{eff} of < 0.95 during fuel handling operations with CEAs and fuel assemblies assumed to be in the most adverse configuration (least negative reactivity) allowed by unit procedures. TS 3.9.1 is applicable in MODE 6.

TS 3.9.2, "Nuclear Instrumentation," requires that two source range monitors (SRMs) to be OPERABLE to ensure that redundant monitoring capability is available to detect changes in core reactivity. The SRMs are required to provide a signal to alert the operator to unexpected changes in core reactivity such as by a boron dilution event or an improperly loaded fuel assembly. TS 3.9.2 is applicable in MODE 6.

TS 3.9.3, "Containment Penetrations," specifies the requirements for containment closure during the conduct of CORE ALTERATIONS and movement of fuel assemblies within containment. The containment penetrations included within TS 3.9.3 are the equipment hatch, personnel airlock doors, and penetrations that provide direct access from the containment atmosphere to the outside atmosphere. TS 3.9.3 limits the consequences of an FHA involving handling fuel within containment by limiting the potential escape paths for fission product radioactivity released within containment. TS 3.9.3 is applicable during CORE ALTERATIONS and during the movement of fuel assemblies within containment.

TS 3.9.4, "Shutdown Cooling (SDC) and Coolant Circulation - High Water Level," specifies requirements for the SDC system in MODE 6 to remove decay heat and sensible heat from the RCS, to provide mixing of borated coolant, to provide sufficient coolant circulation to minimize the effects of a boron dilution accident, and to prevent boron stratification. One loop of the SDC system is required to be OPERABLE and in operation in MODE 6, with the water level > 20 feet above the top of the reactor vessel flange. Only one SDC loop is required to be OPERABLE, because the volume of water above the reactor vessel flange provides backup decay heat removal capability. TS 3.9.4 is applicable in MODE 6, with the water level > 20 feet above the top of the reactor vessel flange.

TS 3.9.5, "Shutdown Cooling (SDC) and Coolant Circulation - Low Water Level," also specifies requirements for the SDC system in MODE 6 to remove decay heat and sensible heat from the RCS, to provide mixing of borated coolant, to provide sufficient coolant circulation to minimize the effects of a boron dilution accident, and to prevent boron stratification. However, with the water level < 20 feet above the top of the reactor vessel flange, both SDC loops must be OPERABLE. Additionally, one loop of SDC must be in operation. TS 3.9.5 is applicable in MODE 6 with the water level < 20 feet above the top of the reactor vessel flange.

TS 3.9.6, "Refueling Water Level," specifies a minimum water level of 23 feet above the top of the reactor vessel flange during movement of fuel assemblies or CEAs within the reactor pressure vessel, and during movement of fuel assemblies within containment. A minimum refueling cavity water level of 23 feet above the top of the reactor vessel flange is required to ensure that the radiological consequences of a postulated FHA inside containment are within acceptable limits. The requirements of TS LCO 3.9.6, in conjunction with a minimum decay time of 72 hours prior to fuel movement, ensures that the release of fission product radioactivity, subsequent to an FHA, results in doses that are well within the guideline values specified in Regulatory Guide 1.183. TS 3.9.6 is only applicable during movement of fuel assemblies or CEAs within the reactor pressure vessel, and during movement of fuel assemblies within containment.

The licensee proposed to delete Section 3.9 of the SONGS Units 2 and 3 TSs LCOs, since they are only applicable to an operating reactor and do not apply to the permanently shutdown and defueled condition of SONGS Units 2 and 3.

The NRC staff has reviewed the proposed changes and has determined that Section 3.9 TSs are only needed to provide the LCOs and SRs necessary to maintain functionality of plant systems required for refueling operations. These TSs involve: boron concentration, which places limits on the boron concentrations of the RCS and the fuel transfer canal during refueling; nuclear instrumentation, which monitors the core reactivity condition during refueling operations; containment penetrations, which specifies requirements for containment closure during the conduct of refueling operations; residual heat removal and coolant circulation – high and low water level, which removes decay heat and sensible heat from the RCS, provides mixing of borated coolant, and prevents boron stratification; and refueling cavity water level, which specifies a minimum water level of 23 feet above the top of the reactor vessel flange during movement of irradiated fuel assemblies within containment. However, 10 CFR 50.82(a)(2) prohibits the licensee from operating the plant or placing fuel in the reactor vessel. Therefore, refueling operations are no longer permitted at SONGS Units 2 and 3, and the LCOs in Section 3.9 TSs are no longer relevant.

The NRC staff has also reviewed the refueling operations TSs proposed for deletion to ensure that these LCOs were no longer required to satisfy the 10 CFR 50.36 criteria for inclusion in TSs, as described in Section 2.1 of this evaluation. The NRC staff notes that these TSs indicate MODES for which each TS is applicable. MODES, as defined in TSs, correspond to any one inclusive combination of core reactivity condition, power level, average reactor coolant temperature, and reactor vessel head closure bolt tensioning with fuel in the reactor vessel. The reference to MODES for a permanently shutdown and defueled reactor has no meaning and is not relevant. Because SCE has submitted certifications pursuant to 10 CFR 50.82(a)(2), it is prohibited from operating the reactor or placing fuel in the reactor vessel and SONGS Units 2 and 3 are no longer in a configuration or a condition under which the TS MODES apply.

Based on the above, the NRC staff finds that the licensee's proposed change to delete TS Section 3.9, Refueling Operations, is acceptable.

3.7.16 Section 4.0, Design Features

TS 4.1, "Site" provides a description regarding the location of SONGS. The licensee has proposed to retain this TS section in the permanently defueled SONGS Units 2 and 3 TSs with no changes.

TS 4.2, "Reactor Core," provides a general description of the number of and design material requirements for the fuel and control element assemblies used in the reactor core. The licensee has proposed to delete the design feature descriptions for fuel and control element assemblies, since they are only applicable to an operating reactor and do not apply to the permanently shutdown and defueled condition of SONGS Units 2 and 3.

The NRC staff has reviewed the proposed changes to delete the reactor core fuel and control element assemblies design features from SONGS Units 2 and 3 TSs. Since 10 CFR 50.82(a)(2) prohibits the licensee from operating the reactors or placing fuel in the reactor vessels, the design features related to the reactor core fuel assemblies and control rods are no longer relevant at SONGS Units 2 and 3. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 4.2, reactor core design features, is acceptable.

TS 4.3, "Fuel Storage," provides a description and the requirements regarding prevention of criticality of spent fuel, prevention of SFP drainage and spent fuel capacity limitations. This TS section is being retained in the permanently defueled TSs, with the exception of TS 4.3.1.2, which is the design and maintenance of the new fuel storage racks as discussed below. The licensee has also made editorial changes to the TS references in this section to conform to the proposed renumbering of certain retained TSs.

TS 4.3.1.2 has been proposed to be deleted because new fuel is no longer stored onsite and License Condition 2.B.(3) is being revised to no longer allow receipt of new fuel. The NRC staff has reviewed the proposed changes to remove the new fuel storage rack design features from the TSs. Since the licensee currently has no new fuel stored onsite and since the facility license will no longer allow new fuel to be stored onsite, the requirements for new fuel storage racks are no longer applicable.

Based on the above, the NRC staff finds the proposed changes to delete the new fuel storage rack design features from SONGS Units 2 and 3 TS 4.3.1.2 to be acceptable. The staff also reviewed the proposed renumbering of references in TS 4.3.1, Criticality, and determined that the changes to be conforming and editorial in nature. Therefore, the NRC staff finds that the licensee's proposed changes to TS 4.3, Fuel Storage, is acceptable.

3.7.17 Section 5.2, Organization and Section 5.3, Facility Staff Qualifications

SONGS Units 2 and 3 permanently defueled TS 5.1, "Responsibility"; TS 5.2, "Organization"; and TS 5.3, "Facility Staff Qualifications," were previously approved by the NRC staff in License Amendment Nos. 227 and 220 for SONGS Units 2 and 3, respectively, dated September 30, 2014 (ADAMS Accession No. ML14183B240).

The licensee has proposed several additional changes to TS 5.2, Organization, and TS 5.3, Facility Staff Qualification that were not included in Amendment Nos. 227 and 220. The first change is to capitalize the position of CERTIFIED FUEL HANDLER, consistent with its use as a defined term in TS 1.0, Definitions.

The NRC staff reviewed the proposed change to capitalize the position of CERTIFIED FUEL HANDLER where it is used in TS 5.2 and TS 5.3 and concludes the change is editorial in nature such that the current intent of the affected TS requirements is unchanged. Therefore, the staff finds that the licensee's proposed change to capitalize CERTIFIED FUEL HANDLER in TS 5.2 and TS 5.3, is acceptable.

The licensee has also proposed a change to Facility Staff TS 5.2.2.c (note that this was originally TS 5.2.2.b but was renumbered to TS 5.2.2.c by Amendment Nos. 227 and 220), to clarify that during unexpected absences of on-duty shift crew members, no fuel movement or movement of heavy loads over storage racks containing fuel is permitted. Specifically;

Facility Staff TS 5.2.2.c currently states:

> c. Shift crew composition may be less than the minimum requirement of Table 5.2.2-1 for a period of time not to exceed 2 hours in order to accommodate unexpected absence of on-duty shift crew members provided immediate action is taken to restore the shift crew composition to within the minimum requirements.

Revised Facility Staff TS 5.2.2.c would state:

> c. Shift crew composition may be less than the minimum requirement of Table 5.2.2-1 for a period of time not to exceed 2 hours in order to accommodate unexpected absence of on-duty shift crew members provided immediate action is taken to restore the shift crew composition to within the minimum requirements. During such absences, no fuel movement or movement of heavy loads over storage racks containing fuel is permitted.

The NRC staff has reviewed the proposed revision to TS 5.2.2.c restricting fuel movement or movement of heavy loads over storage racks containing fuel when an unexpected absence of the on-duty shift crew results in a minimum crew composition less than specified in TSs. The staff finds that additional restriction on fuel movement and heavy loads prudent considering the reduced staffing levels at a permanently shutdown and defueled reactor facility. Therefore, the NRC staff finds that the proposed licensee change to TS 5.2.2.c, is acceptable.

The licensee has also proposed a change to Facility Staff Qualifications TS 5.3.1 to delete the qualification requirements for multi-discipline supervisors. SCE states that it will no longer be utilizing the position of multi-discipline supervisor. Specifically;

Facility Staff Qualifications TS 5.3.1 currently states:

5.3.1 Each member of the facility staff shall meet or exceed the minimum qualifications of ANSI N18.1-1971 for comparable positions, except a) the radiation protection manager, who shall meet or exceed the qualifications of Regulatory Guide 1.8, September 1975, and b) multi-discipline supervisors who shall meet or exceed the qualifications listed below.

a. Education: Minimum of a high school diploma or equivalent.

b. Experience: Minimum of four years of related technical experience which shall include three years power plant experience of which one year is at a nuclear plant.

c. Training: Complete the multi-discipline supervisor training program.

Revised Facility Staff Qualifications TS 5.3.1 would state:

5.3.1 Each member of the facility staff shall meet or exceed the minimum qualifications of ANSI N18.1-1971 for comparable positions, except a) the radiation protection manager, who shall meet or exceed the qualifications of Regulatory Guide 1.8, September 1975.

The NRC Staff has reviewed the proposed deletion of the qualifications for multi-discipline supervisors from the SONGS Units 2 and 3 TSs and concluded that the qualifications are not necessary since the licensee no longer utilizes multi-discipline supervisors. Therefore, the NRC staff finds that the licensee's proposed change to TS 5.3.1, is acceptable.

3.7.17.1 Section 5.4, Technical Specification (TS) Bases Control

SONGS Units 2 and 3, TS 5.4, "Technical Specifications (TS) Bases Control," is a program that provides the requirements for changing the TS Bases without prior NRC approval. TS 5.4 will remain applicable with the reactor permanently shutdown and defueled. As such, it is being retained and revised, as follows, to reflect a permanently defueled condition.

Currently, the licensee is required to submit changes to the TS Bases to the NRC, which have been implemented without prior NRC approval, within 6 months following every Unit 3 refueling, not to exceed 24 months. The licensee has proposed to revise TS 5.4.4 to be consistent with the submittal of UFSAR updates for the permanently shutdown and defueled status of SONGS Units 2 and 3. The TS Bases changes (that do not require NRC approval) will be submitted to the NRC for information and/or review every 24 months consistent with the UFSAR updates.

The NRC staff has reviewed the proposed change to TS 5.4.4 that aligns the submittal of changes to the TS Bases to every 24 months consistent with the submittal of the UFSAR changes. The NRC staff has determined that the proposed revision to the frequency of submitting the TS Bases Control changes to NRC is administrative in nature. The revised TS

5.4.4 continues to meet the minimum frequency of the original TS. In addition, the change is consistent with the requirements of 10 CFR 50.71(e) for providing UFSAR updates to the NRC for a permanently shutdown and defueled reactor (i.e., every 24 months). Therefore, the NRC staff finds that the licensee's proposed change to TS 5.4.4, is acceptable.

3.7.17.2 Section 5.5.1, Procedures

TS 5.5.1, "Procedures," addresses procedures, programs and manuals required by the SONGS Units 2 and 3 TSs. The licensee proposes to delete that following procedures from the permanently defueled technical specifications:

TS 5.5.1.1, "Scope," requires that written procedures be established, implemented, and maintained covering certain activities. The licensee has proposed to delete TS 5.5.1.1, paragraphs b and f.

TS 5.5.1.1, paragraph b., currently states:

> The emergency operating procedures required to implement the requirements of NUREG-0737 and NUREG-0737, Supplement 1, as stated in Generic Letter 82-33;

NUREG-0737, "Clarification of TMI Action Plan Requirements," November 1980 (ADAMS Accession No. ML051400209), and NUREG-0737, Supplement 1, "Clarification of TMI Action Plan Requirements: Requirements for Emergency Response Capability," January 1983 (ADAMS Accession No. ML102560009), as stated in Generic Letter 82-33, "Supplement 1 to NUREG-0737 - Emergency Response Capabilities," dated December 17, 1982 (ADAMS Accession No. ML031080548), incorporated into one document all Three Mile Island (TMI)-related items approved for implementation by the Commission at that time. This included the use of human factored, function oriented, emergency operating procedures to improve human reliability and the ability to mitigate the consequences of a broad range of initiating events for operating reactors, and subsequent multiple failures or operator errors, without the need to diagnose specific events.

The licensee has proposed to delete the requirement of TS 5.5.1.1.b. because the emergency operating procedures discussed therein only pertain to accidents and events resulting from reactor operation. The licensee stated that the referenced procedures are no longer required for a permanently shutdown and defueled reactor.

The NRC staff reviewed the proposed deletion of TS 5.5.1.1.b. and determined that NUREG-0737, as supplemented, implemented programmatic changes to the way reactor operators are trained, instrumentation information is presented, and procedures are structured, using human factors and a function oriented approach to address operating events and accidents. These accidents, and the associated emergency operating procedures to detect, respond to, and mitigate such accidents, concerned malfunctions of the reactor and its supporting systems are not relevant to a permanently shutdown and defueled reactor, which is

no longer authorized to operate or place fuel in the reactor vessel. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.1.1.b., is acceptable.

TS 5.5.1.1.f., concerns the modification of the core protection calculator (CPC) addressable constants. Software modifications to constants, algorithms, or fuel cycle specific data shall be performed in accordance with the most recent version of "CPC Protection Algorithm Software Change Procedure," (CEN-39(A)-P). The licensee has proposed to delete TS 5.5.1.1.f. because the CPC is no longer required. The CPCs are one of two systems that monitor core power distribution online and derive the LHR and DNBR parameters and associated RPS trips. The TSs that rely on the CPC are TS 3.3.1 RPS Instrumentation - Operating and TS 3.3.3 Control Element Assembly Calculators, and are only applicable in MODES 1 and 2.

The NRC staff has determined that the instrumentation-related TS 3.3.1 and TS 3.3.3 that reference the CPC, as discussed in the Section 3.7.9 of this SE, are no longer required based on the permanent shutdown and defueled condition of SONGS Units 2 and 3. The CPC is part of the RPS to protect the reactor core from damage. Since SONGS Units 2 and 3 are not authorized to operate or emplace fuel in the reactor vessel, protection of the reactor core is no longer relevant, and a control procedure for the modification of the CPC, as required in TS 5.5.1.1.f., is unnecessary. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.1.1.f., is acceptable.

3.7.17.3 Section 5.5.2, Programs and Manuals

TS 5.5.2.4, "Component Cyclic or Transient Limit Program," controls to track cyclic and transient occurrences to ensure that RCS components are monitored for fatigue evaluation based on a conservative estimate of the magnitude and frequency of the temperature and pressure transients resulting from normal operation, normal and abnormal load transients and accident conditions. The licensee proposes to delete this program since the RCS components monitored by this program are no longer used at SONGS Units 2 and 3 considering its permanently shutdown and defueled status.

The NRC staff has determined that deletion of the Component Cyclic or Transient Limit Program from TSs is consistent with the transition to a permanently shutdown and defueled facility. Since, in accordance with 10 CFR 50.82(a)(2), the licensee is prohibited from operating the plant or placing fuel in the reactor vessel, the RCS and reactor support systems are no longer in use. Consequently, the component cyclic or transient limit program is not relevant at SONGS Units 2 and 3 since the components monitored by the program are permanently out of service. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.4, appropriately reflects the change in plant status, and is acceptable.

TS 5.5.2.5, "Reactor Coolant Pump Flywheel Inspection Program," provides for the inspection of the reactor coolant pump flywheels. The licensee proposed to delete this program since the reactor coolant pump flywheel is a component only used in support of reactor operation. Inspection of the reactor coolant pump flywheel is not relevant to SONGS Units 2 and 3 since the licensee is no longer authorized to operate the reactor or emplace fuel in the reactor vessel.

The NRC staff has determined that deletion of the Reactor Coolant Pump Flywheel Inspection Program from TSs is consistent with the transition to a permanently shutdown and defueled facility. Since, in accordance with 10 CFR 50.82(a)(2), the licensee is prohibited from operating the plant or placing fuel in the reactor vessel, reactor coolant pumps are no longer used in support of any function at the facility. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.5, appropriately reflects the change in plant status, and is acceptable.

TS 5.5.2.6, "Secondary Water Chemistry Program," provides controls for monitoring secondary water chemistry to inhibit SG tube degradation and low pressure turbine disc stress corrosion cracking. The licensee proposed to delete this program because the components that the program was established to protect, using water chemistry control, are associated with reactor operation. With the licensee's decision to cease reactor operations, these components are no longer in operation and do not need protection from degradation or stress corrosion cracking.

The NRC staff has determined that the deletion of the Secondary Water Chemistry Program is consistent with the transition to a permanently shutdown and defueled facility. Since, in accordance with 10 CFR 50.82(a)(2), the licensee is prohibited from operating the plant or placing fuel in the reactor vessel, the SGs and turbine are no longer used in support of any function at the facility. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.6, appropriately reflects the change in plant status, and is acceptable.

TS 5.5.2.7, "Explosive Gas and Storage Tank Radioactivity Monitoring Program," provides controls for potentially explosive gas mixtures in the gaseous radwaste system, and the quantity of radioactivity contained in unprotected outdoor liquid storage tanks. The licensee has proposed to revise the explosive gas and storage tank radioactivity monitoring program to be consistent with the permanently shutdown and defueled condition of the SONGS Units 2 and 3 facility. Paragraphs a. and b. of the program are being deleted because these portions of the explosive gas and storage tank radioactivity monitoring program pertain only to reactor support systems that are no longer needed due to SONGS permanently shutdown and defueled condition. Specifically, there will no longer be any source of explosive or radioactive gases generated from reactor operation. In addition, the licensee states that the gaseous radwaste system and the waste gas decay tank have been vented and removed from service. As such, references to potentially explosive gas mixtures and methods for determining gaseous radioactivity have been deleted. The licensee has proposed to retain the storage tank radioactivity monitoring program as modified below:

TS 5.5.2.7 Storage Tank Radioactivity Monitoring Program

This program provides controls for the quantity of radioactivity contained in unprotected outdoor liquid storage tanks. The liquid radwaste quantities shall be determined in accordance with the

Standard Review Plan, Section 15.7.3, "Postulated Radioactive Release due to Tank Failures."

The program shall include a surveillance program to ensure that the quantity of radioactivity contained in all outdoor liquid radwaste tanks that are not surrounded by liners, dikes, or walls, capable of holding the tanks' contents and do not have tank overflows and surrounding area drains connected to the Liquid Waste Management System is less than the amount that would result in concentrations less than the limits of 10 CFR Part 20, Appendix B, Table II, Column 2, at the nearest potable water supply and the nearest surface water supply in an unrestricted area, in the event of an uncontrolled release of the tanks' contents.

The provisions of SR 3.0.2 and SR 3.0.3 are applicable to the Storage Tank Radioactivity Monitoring Program surveillance frequencies.

The NRC staff has reviewed the proposed revision to the Storage Tank Radioactivity Monitoring Program. The staff finds the proposed changes prudent given the uncertainty in how future radwaste generated by flushing and cutting of radioactive systems will be stored and processed. Therefore, the NRC staff finds that the licensee's proposed change to TS 5.5.2.7, Storage Tank Radioactivity Monitoring Program, is acceptable.

TS 5.5.2.8, "Primary Coolant Sources Outside Containment Program," was established to minimize leakage from portions of systems outside containment that could contain highly radioactive fluids during a serious transient or accident. The licensee proposed to delete this program since primary coolant systems have been drained at SONGS Units 2 and 3 and there are no longer any transient or accident conditions associated with primary coolant sources given the permanently shutdown and defueled condition of the plant.

The NRC staff has determined that deletion of TS 5.5.2.8, "Primary Coolant Sources Outside Containment Program," is consistent with the transition to a permanently shutdown and defueled facility. Since the licensee has certified its permanent cessation of operations and defueling in accordance with 10 CFR 50.82(a)(2), the licensee is prohibited from operating the reactors or placing fuel in the reactor vessels. Consequently, there are no DBAs involving reactor operation or refueling and there can no longer be any transients or accidents involving primary coolant outside of containment. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.8, appropriately reflects the change in plant status, and is acceptable.

TS 5.5.2.9, "Pre-Stressed Concrete Containment Tendon Surveillance Program," provides controls for monitoring any tendon degradation in the pre-stressed concrete containment. The licensee has proposed to delete this program because the status of the containment is not relevant to the permanently shutdown and defueled reactors at SONGS Units 2 and 3.

The NRC staff considers that TS 5.5.2.9, "Pre-Stressed Concrete Containment Tendon Surveillance Program," is only applicable to a reactor authorized to operate or retain irradiated fuel in the reactor vessel. Pursuant to the licensee's certifications under 10 CFR 50.82(a)(2), the license is prohibited from operating the reactors or placing fuel in the reactor vessels at SONGS Units 2 and 3. Consequently, there are no DBAs involving reactor operation or refueling and no reliance on the containment to mitigate operating reactor DBAs. Thus, the staff has determined that containment tendon surveillance program TS is no longer applicable. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.9, is acceptable.

TS 5.5.2.10, "Inservice Inspection and Testing Program," establishes the controls for periodic inspection and testing of the American Society of Mechanical Engineers (ASME) Code Class 1, 2, and 3 pumps and valves in accordance with the ASME Operation and Maintenance Code. These code classes protect equipment relied upon to prevent and mitigate DBAs. The licensee proposed to delete this program since there is no longer any ASME Code Class 1, 2 or 3 pumps and valves, or Code Class CC or MC components in the SONGS Units 2 and 3 inservice inspection and testing program that continue to operate and perform a specific function in mitigating the consequences of a reactor accident due to the permanently shutdown and defueled status of the plants.

Because the licensee is prohibited from operating the plant or placing fuel in the reactor vessel, in accordance with 10 CFR 50.82(a)(2), there are no longer any ASME Code class pumps and valves that remain in operation and are to be relied upon to mitigate a DBA. As such, the inservice inspection and testing program is no longer relevant to SONGS Units 2 and 3, given the permanently shutdown and defueled status of these facilities. The NRC staff also notes that the licensee shall continue to monitor the performance and condition of all SSCs associated with the storage, control, or maintenance of spent fuel in in a safe condition and with reasonable assurance that these SSCs are capable of fulfilling their intended functions, pursuant to 10 CFR 50.65, ""Requirements for monitoring the effectiveness of maintenance at nuclear power plants." Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.10, Inservice Inspection and Testing Program, appropriately reflects the change in plant status, and is acceptable.

TS 5.5.2.11, "Steam Generator (SG) Program," ensures that the SG tube integrity is maintained. The licensee proposed to delete this program since SONGS Units 2 and 3 are permanently defueled and not authorized to operate; therefore, the SGs are no longer functional and the SG tubes will not be subjected to the temperature and pressure effects that the SG program was put in place to protect against.

The NRC staff has determined that the SG program is only relevant to an operating reactor where the SGs are used for removing heat associated with reactor operation. Since the licensee has certified its permanent cessation of operations and defueling in accordance with 10 CFR 50.82(a)(2), the licensee is prohibited from operating the reactors or placing fuel in the reactor vessels. Consequently, the SGs are no longer used in support of any function at the facility. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.11, appropriately reflects the change in plant status, and is acceptable.

TS 5.5.2.12, "Ventilation Filter Testing Program (VFTP)," establishes the required testing and frequency of the CREACUS high efficiency particulate filters and charcoal adsorbers utilized by the system.

The VFTP is being deleted because it pertains only to reactor support systems that does not apply in a permanently defueled condition. As noted, in part, by the licensee in its license amendment request, dated March 21, 2014, "[t]he accident analysis applicable to the permanently defueled condition does not rely on ventilation filters for accident mitigation."

The NRC staff has determined that reference to the VFTP only appears in SONGS Units 2 and 3 TSs in three places: TS 5.5.2.12; TS 3.7.11 "Control Room Emergency Air Cleanup System (CREACUS)" (SR 3.7.11.2 and SR 3.7.11.4); and TS 5.5.2.16.d of the "Control Room Envelope Habitability Program." The VFTP is used to confirm the function and operability of the CREACUS. The NRC staff has evaluated CREACUS in Section 3.7.13 (TS 3.7.11) and found that CREACUS is no longer required in the SONGS TSs per Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C). Since TS 5.5.2.12 "Ventilation Filter Testing Program" only exists to support the SRs of TS 3.7.11 (i.e. SR 3.7.11.2 and SR 3.7.11.4, respectively) and since the NRC approves that deletion of TS 3.7.11, the NRC staff finds the licensee's proposed change to delete TS 5.5.2.12, is acceptable.

TS 5.5.2.13, "Diesel Fuel Oil Testing Program," pertains to the testing of both new and stored fuel oil used to supply the EDGs. The accident analyses applicable to the permanently shutdown and defueled condition at SONGS no longer rely on EDGs for accident mitigation. The requirement for EDGs, which are supported by the fuel oil being tested per this program, has been proposed for deletion from the TSs.

The NRC staff has reviewed the proposed changes against the requirements in 10 CFR 50.36 and Chapter 15 of the SONGS UFSAR and concluded that the EDG fuel oil and lube oil system are not required. These support systems to the EDGs are not required because there are no active systems or associated support systems credited as part of the initial conditions of an analysis or as part of the primary success path for mitigation of the FHA DBA. The staff confirmed that there are no other DBAs that rely on EDGs or the EDG support systems. In addition, the NRC staff approves the deletion of TS 3.8.3, "Diesel Fuel Oil, Lube Oil, and Starting Air," in Section 3.7.14 of this SE. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.13, the diesel fuel oil testing program, is acceptable.

TS 5.5.2.15, "Containment Leakage Rate Testing Program," is being proposed for deletion because the containment leakage rate testing program pertains only to verifying the operability of the containment systems. The need for containment or the associated required TSs does not apply in a permanently shutdown and defueled condition. The requirements for containment systems (i.e. TS 3.6.1, TS 3.6.2, TS 3.6.3, TS 3.6.4, TS 3.6.5, TS 3.6.6.1, TS 3.6.6.2, TS 3.6.8 and TS 3.9.3) are being deleted, as described in Section 3.7.12 of this SE.

Primary containment integrity and isolation are only required for post-accident conditions from power operations. However, 10 CFR 50.82(a)(2) prohibits the licensee from operating the plant

or placing fuel in the reactor vessel. Therefore TS 3.6.1, TS 3.6.2, TS 3.6.3, TS 3.6.4, TS 3.6.5, TS 3.6.6.1, TS 3.6.6.2, TS 3.6.8 and TS 3.9.3, which address primary containment integrity and isolation during power operations and refueling operations, are no longer applicable. The program specified TS 5.5.2.15 requires the implementation of containment leakage rate testing in accordance with 10 CFR Part 50 Appendix J, Option B, "Performance-Based Requirements." The TS 5.5.2.15 program is no longer needed since 10 CFR 50.54(o) excludes permanently defueled units from the requirements of 10 CFR Part 50 Appendix J, "Primary Reactor Containment Leakage Testing for Water-Cooled Power Reactors." Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.15, Containment Leakage Rate Testing Program, is acceptable.

TS 5.5.2.16, "Control Room Envelope Habitability Program," ensures that adequate radiation protection is provided to permit access and occupancy of the CRE under DBA conditions without personnel receiving radiations exposures above limits. The licensee has proposed this program for deletion because the CRE is not required for providing airborne radiological protection for the control room operators for the remaining DBAs at SONGS Units 2 and 3 based on the permanently shutdown and defueled status of the facility.

The NRC staff evaluated the remaining accident analyses at SONGS Units 2 and 3 and confirmed that no ESF system is credited in the mitigation of the CR, EAB, or LPZ dose consequences, as detailed in Sections 3.2 through 3.6 of this SE. This includes no credit for the FHIS, the fuel handling building PACU filtration system, the CRIS and the CREACUS. The evaluation of the DBAs applicable to the permanently shutdown and defueled facility demonstrate that the dose consequences within the CRE are acceptable without relying on SSCs remaining functional for accident mitigation, including FHAs. (The one exception to this is the continued function of the passive fuel storage pool structure, which will be maintained as a TS for SONGS.)

Reference to the "Control Room Envelope Habitability Program" only appears in the current SONGS Units 2 and 3 TSs in two places: TS 5.5.2.16, "Control Room Envelope Habitability Program" and TS 3.7.11, "Control Room Emergency Air Cleanup System (CREACUS)" (SR 3.7.11.4).

The NRC staff previously determined in its evaluation of TS 3.7.11, "CREACUS," Section 3.7.13 of this SE, that CREACUS no longer satisfies Criterion 3 of 10 CFR 50.36(c)(2)(ii)(C). Consequently, the NRC staff has approved the deletion of TS 3.7.11 for SONGS Units 2 and 3. Since the Control Room Envelope Habitability Program only exists to support a surveillance requirement of TS 3.7.11 (i.e. SR 3.7.11.4) and since TS 3.7.11 will be deleted, the NRC staff finds that the licensee's proposed change to delete TS 5.5.2.16, Control Room Envelope Habitability Program, is acceptable.

TS 5.5.2.17, "Battery Monitoring and Maintenance Program," provides controls for safety-related battery maintenance. The licensee proposes deletion of this program consistent with the deletion of the corresponding TS for DC electrical systems and associated batteries. The licensee states that the SONGS accident analyses do not rely on batteries for any accident mitigation.

The NRC staff has reviewed the proposed changes against the requirements in 10 CFR 50.36 and Chapter 15 of the SONGS UFSAR and concluded that the DC electrical distribution system batteries are not required. The support systems to the DC electrical distribution system, including the batteries, are not required because there are no active systems or associated support systems credited as part of the initial conditions of an analysis or as part of the primary success path for mitigation of the remaining DBAs at SONGS Units 2 and 3. In addition, the NRC staff has approved the deletion of TS 3.8.6, "Battery Parameters," in Section 3.7.14 of this SE. Therefore, the NRC staff finds that the licensee's proposed change to delete the TS 5.5.2.17, the battery monitoring and maintenance program, is acceptable.

3.7.17.4 Section 5.6, Safety Function Determination Program (SFDP)

The SONGS Units 2 and 3, "Safety Function Determination Program (SFDP)," as detailed in TS 5.6.1, TS 5.6.2, TS 5.6.3 and TS 5.6.4, ensures that a loss of safety function is detected and appropriate actions taken. Upon failure to meet two or more LCOs at the same time, an evaluation shall be made to determine if loss of safety function exists. The program implements the requirements of LCO 3.0.6. LCO 3.0.6 directs an evaluation in accordance with the SFDP to determine if a loss of safety function exists based on the status of redundant TS safety systems and associated support systems (systems that support the functionality of the safety system) to ensure the appropriate required actions are taken to maintain overall reactor safety. There are no active SSCs at SONGS Units 2 and 3 that are required for accident mitigation with the permanent cessation of reactor operations and the permanent removal of the fuel from the reactor vessels, as discussed in the evaluation of the remaining DBAs in Sections 3.2 through 3.6 of this SE. Therefore, the requirements of the SFDP, which directs cross-train checks of multiple and redundant safety systems, no longer apply.

Based on the permanently shutdown and defueled status of SONGS Units 2 and 3, all specifications for the active systems from the defueled TSs have been proposed for deletion by this licensing action. Consequently, the SFDP is no longer meaningful. In addition, the SFDP is invoked by LCO 3.0.6, which is being deleted in its entirety, as discussed in Section 3.7.6 of this SE. Therefore, the NRC staff finds that the licensee's proposed change to delete TS Section 5.6, Safety Function Determination Program, is acceptable.

3.7.17.5 Section 5.7, Reporting Requirements

TS 5.7.1.1, "Annual Reports," requires a Reactor Coolant System Specific Activity Report in accordance with TS 5.7.1.1.b. The report gathered data on reactor conditions when the I-131 or gross specific activity of the reactor coolant exceeded limits specified in TS 3.4.16. The licensee has proposed to delete SONGS Units 2 and 3, TS 5.7.1.1.b, "Reactor Coolant System Specific Activity Report," since it is not applicable to a permanently shutdown and defueled reactor.

The NRC staff has reviewed the proposed deletion of TS 5.7.1.1 concerning the Reactor Coolant Specific Activity Report. The facility RCSs have been drained and the activity of the RCS is no longer relevant to the SONGS Units 2 and 3 in their permanently shutdown and

defueled status. In addition, as noted above, TS 5.7.1.1.b only exists to analyze data related to the exceedance of limits specified in TS 3.4.16. Since RCS activity is not meaningful for SONGS and TS 3.4.16 will be deleted, the NRC staff finds that the licensee's proposed change to delete TS 5.7.1.1, is acceptable.

TS 5.7.1.2, "Annual Radiological Environmental Operating Report," covers summaries, interpretations, and analyses of trends related to the radiological environmental monitoring program, for each unit, during the previous calendar year.

The licensee has proposed to revise the TS description by replacing applicability of the report to the "facility" rather than to each 'unit." In addition, the licensee is deleting a Note indicating "a single submittal may be made for a multiple unit station." This note is no longer necessary since the SONGS facility is no longer treated as a multiunit site for the purposes of the annual radiological environmental operating report.

The NRC staff reviewed the proposed revision to TS 5.7.1.2 and concludes that changing the word "unit" to "facility" and the deletion of the multiple unit station note is a clarifying change that is editorial in nature such that the current intent of the requirement is unchanged. Therefore, the NRC staff finds that the licensee's proposed change to TS 5.7.1.2, Annual Radiological Environmental Operating Report, is acceptable.

TS 5.7.1.3, "Radioactive Effluent Release Report," covers "...the operation of the unit during the previous calendar year...." In addition, the report shall summarize the "...effluents released from the unit," and "... radioactive waste shipped from the unit directly..." and "... radioactive waste shipped from the unit's intermediary processor..."

The licensee proposed to revise the TS description by replacing "unit" with "facility" such that the description will state "... the operation of the facility during the previous calendar year ..." and, effluents "... released from the facility" and "... radioactive waste shipped from the facility directly ..." and "... radioactive waste shipped from the facility's intermediary processor...." In addition, the licensee is deleting a Note indicating "a single submittal may be made for a multiple unit station." This note is no longer necessary since the SONGS facility is no longer treated as a multiunit site for the purposes of the radioactive effluent release report.

The NRC staff reviewed the proposed revision to TS 5.7.1.3 and concludes that changing the word "unit" to facility" and the deletion of the multiple unit station note is a clarifying change that is editorial in nature such that the current intent of the requirement is unchanged. Therefore, the NRC staff finds that the licensee's proposed change to TS 5.7.1.3, Radioactive Effluent Release Report, is acceptable.

TS 5.7.1.5, "Core Operating Limits Report (COLR)," establishes the core operating limits prior to each reload cycle. The licensee proposed to delete this program since it is prohibited from reloading fuel into the SONGS Units 2 and 3 reactor core and the safety limits established by this report no longer apply.

The NRC staff has determined that the proposed deletion of the COLR would appropriately reflect the permanently shutdown and defueled condition of the facility. The COLR only applies to reactors authorized to operate. Since the licensee is prohibited from operating the SONGS reactors or placing fuel in the reactor vessels, the COLR is no longer necessary. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.7.1.5, is acceptable.

TS 5.7.1.6, "Reactor Coolant System (RCS) Pressure and Temperature Limits Report (PTLR)," documents the pressure and temperature limits for heatup, cooldown, heatup and cooldown rates, low temperature operation, criticality, and hydrostatic testing as referenced in the following TSs:

- TS 3.4.3 RCS Pressure and Temperature (P/T) Limits
- TS 3.4.6 RCS Loops – Mode 4
- TS 3.4.7 RCS Loops – Mode 5, Loops Filled
- TS 3.4.12.1 Low Temperature Overpressure Protection (LTOP) System, RCS Temperature≤PTLR Limit
- TS 3.4.12.2 Low Temperature Overpressure Protection (LTOP) System, RCS Temperature>PTLR Limit

The licensee proposes to delete this program since the RCS is no longer used at SONGS Units 2 and 3 in its permanently shutdown and defueled status.

The NRC staff has determined that deletion of the Reactor Coolant System Pressure and Temperature Limits Report from TSs is consistent with the transition to a permanently shutdown and defueled facility. Since, in accordance with 10 CFR 50.82(a)(2), the licensee is prohibited from operating the reactors or placing fuel in the reactor vessels, the RCS and reactor support systems are no longer in use. Consequently, the RCS PTLR is not relevant at SONGS Units 2 and 3 since the RCS is no longer functional. The staff notes that the change is consistent with the deletion of the Section 3.4 RCS TSs that reference the PTLR as discussed in Section 3.7.10 of this SE. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.7.1.6, appropriately reflects the change in the SONGS plant status, and is acceptable.

TS 5.7.1.7, "Hazardous Cargo Traffic Report," requires that SCE monitors the hazardous cargo traffic on Interstate Highway 5 and the railroad line near SONGS and submits the results to the NRC Regional Administrator once every 3 years. This reporting requirement addressed potential changes in use characteristics of these transportation routes over the life of the facility. In the enclosure to the license amendment request dated March 21, 2014, SCE proposed to delete this reporting requirement from the TSs. In the supplement dated February 23, 2015, SCE stated that it would continue to perform the hazardous traffic report in accordance with a licensee-controlled documents.

The requirements of 10 CFR 50.36(c)(5) state that Administrative Controls TSs should include reporting necessary to assure operation of the facility in a safe manner. The reporting requirements included in Section 5.6 of NUREG-1432, "Standard Technical Specifications – Combustion Engineering Plants," Volume 1 (ADAMS Accession No. ML12102A165), include only those reports specified in the LCOs and those required by regulation. The Hazardous

Cargo Traffic Report does not directly relate to operation of the facility in a safe manner. Rather, it helps identify changes in the site environs that should be periodically assessed to ensure that the scope of events considered in the design-basis remains adequate. Consequently, the report does not significantly contribute to assuring operation in a safe manner. Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.7.1.7, Hazardous Cargo Traffic Report, and implement a similar reporting requirement in a licensee controlled document, is acceptable.

TS 5.7.2, "Special Reports," provides a description and requirements regarding reports related to inspections, tests, and maintenance activities as directed in other SONGS TSs. The listed Special Reports pertain to 1) a pre-planned alternate method of monitoring post-accident instrumentation functions, 2) abnormal degradation of the containment structure detected during tests required by the Pre-Stressed Concrete Containment Tendon Surveillance Program, and 3) a report, following entry into MODE 4, concerning inspections performed in accordance with the SG program. The licensee states that these reports are being deleted because they do not apply in a permanently defueled condition.

The NRC staff concludes that the TS required special report information on inspections, tests, and maintenance activities for safety-related instrumentation, containment, and SGs, apply to SSCs that are no longer relevant at a permanently shutdown and defueled SONGS reactors. In addition, the NRC has approved the deletion of the associated TSs for the SSC that are subject to these special reports from the SONGS Unit 2 and 3 permanently defueled TSs. Specifically:

(1) the special report for a pre-planned alternate method of monitoring post-accident instrumentation functions is no longer necessary since the post-accident monitoring instrumentation in TS 3.3.11 is being deleted from the SONGS defueled TSs, as discussed in Section 3.7.9 of this SE.

(2) the special report on abnormal degradation of the containment structure detected during tests required by the Pre-Stressed Concrete Containment Tendon Surveillance Program is no longer necessary since the tendon surveillance program in TS 5.5.2.9 is being deleted from the SONGS defueled TSs, as discussed in Section 3.7.17.3 of this SE.

(3) the special report, following entry into MODE 4, concerning inspections performed in accordance with the SG program is no longer necessary since the SG program in TS 5.5.2.11 is being deleted from the SONGS defueled TSs, as discussed in Section 3.7.17.3 of this SE.

Therefore, the NRC staff finds that the licensee's proposed change to delete TS 5.7.2, Special Reports, is acceptable.

3.8 Changes to Facility Operating License

In SCE's March 21, 2014, license amendment request, as supplemented by a letters dated February 25, 2015, and March 18, 2015, the licensee proposed to remove, modify, and add, several facility operating license conditions, based on the permanently shutdown and defueled status of SONGS Units 2 and 3.

3.8.1 Changes to License Condition 2.B.(2)

Currently License Condition 2.B.(2), for SONGS Units 2 and 3, reads:

> (2) Southern California Edison Company (SCE), pursuant to Section 103 of the Act and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," to possess, use, and operate the facility at the designated location in San Diego County, California, in accordance with the procedures and limitations set forth in this license.

The licensee is proposing to strike reference in the license condition to "...operate..." the facility.

The revised License Condition 2.B.(2) will read, as follows:

> (2) Southern California Edison Company (SCE), pursuant to Section 103 of the Act and 10 CFR Part 50, "Domestic Licensing of Production and Utilization Facilities," to possess and use the facility at the designated location in San Diego County, California, in accordance with the procedures and limitations set forth in this license.

Pursuant to 10 CFR 50.82(a)(2), as a result of the 10 CFR 50.82(a)(1)(i) and 10 CFR 50.82(a)(1)(ii) certifications submitted by the licensee, the 10 CFR Part 50 licenses for SONGS Units 2 and 3 no longer authorize operation of the reactors. As such, reference to operation of the facility in License Condition 2.B.(2) is inconsistent with the limitation imposed on the licensee by 10 CFR 50.82(a)(2). Therefore, the NRC staff finds the licensee's proposed change to License Condition 2.B.(2) provides consistency with 10 CFR 50.82(a)(2) and, is acceptable.

3.8.2 Changes to License Condition 2.B.(3)

Currently License Condition 2.B.(3), for SONGS Units 2 and 3, reads:

> (3) SCE, pursuant to the Act and 10 CFR Part 70, to receive, possess, and use at any time special nuclear material as reactor fuel, in accordance with the limitations for storage and amounts required for reactor operation, as described in the Final Safety Analysis Report, as supplemented and amended;

The licensee is proposing to revise this license condition to read, as follows:

> (3) SCE, pursuant to the Act and 10 CFR Part 70, to possess at any time special nuclear material that was used as reactor fuel, in accordance with the limitations for storage, as described in the Final Safety Analysis Report, as supplemented and amended;

The licensee states the proposed revision to this license condition is consistent with the restrictions of 10 CFR 50.82(a)(2) that no longer authorizes operation or emplacement of fuel in the reactor vessels at SONGS Units 2 and 3.

The proposed change removes the authorization for receipt and use of special nuclear material (SNM) as reactor fuel and eliminates the reference to use of the SNM for reactor operations. The proposed change also limits the possession of SNM pursuant to the license condition as being "that was used" as reactor fuel. Pursuant to 10 CFR 50.82(a)(2) the 10 CFR Part 50 licenses for SONGS Units 2 and 3 no longer authorize operation of the reactors. As such, the licensee has no need to receive SNM in the form of reactor fuel and cannot use SNM as reactor fuel for reactor operations. The continued authorization to possess SNM "that was used" as reactor fuel is necessary as the licensee currently possesses the reactor fuel that was used for the past operations of the reactor. Based on the above, the NRC staff finds the licensee's proposed change to License Condition 2.B.(3) is consistent with the permanently shutdown status of SONGS Units 2 and 3 and is, therefore, acceptable.

3.8.3 Changes to License Condition 2.B.(4)

Currently License Condition 2.B.(4), for SONGS Units 2 and 3, reads:

> (4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed neutron sources for reactor startup, sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required;

The licensee is proposing to revise this license condition to read, as follows:

> (4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required; and possess any byproduct, source and special material as sealed neutron sources that was used for reactor startup;

The licensee states the proposed revision to this license condition is consistent with the restrictions of 10 CFR 50.82(a)(2) that no longer authorizes operation or emplacement of fuel in the reactor vessels at SONGS Units 2 and 3. The proposed changes remove the authorization for receipt and use of byproduct, source, and SNM as sealed neutron sources for reactor startup but retains authorization to possess such sources previously used for reactor startup. The deletion of the authorization to receive and use sources for reactor startup is consistent with the fact that SONGS Units 2 and 3 are no longer authorized to operate and the continued authorization to possess neutron sources that were used for reactor startup is consistent with the safe storage of byproduct, source, and SNM. As such, the NRC staff finds that the licensee's proposed change to License Condition 2.B.(4), is consistent with the permanently shutdown status of the facilities and is, therefore, acceptable.

3.8.4 Changes to License Condition 2.C.(1)

Current License Condition 2.C.(1), for SONGS Units 2 and 3, reads:

> Maximum Power Level
>
> (1) Southern California Edison Company (SCE) is authorized to operate the facility at reactor core power levels not in excess of full power (3438 megawatts thermal).

The licensee is proposing to delete this license condition, which will read:

> (1) Deleted

The licensee states that this license condition can be deleted because SONGS Units 2 and 3 are permanently shut down and defueled in accordance with 10 CFR 50.82(a)(2) and therefore power operation is no longer authorized.

The NRC staff has reviewed the proposed deletion of License Condition 2.C.(1) and determined that power operation is no longer authorized at SONGS Units 2 and 3 based on the licensee's 10 CFR 50.82(a)(2) certifications of being permanently shutdown and defueled. The licensee is not authorized to operate the SONGS Units 2 and 3 at any power. Therefore, the NRC staff finds the licensee's proposed change to delete License Condition 2.C.(1) is appropriate and, is acceptable.

3.8.5 Changes to License Condition 2.C.(14) [Unit 2] and License Condition 2.C.(12) [Unit 3]

Current License Condition 2.C.(14) for SONGS Units 2 and License Condition 2.C.(12) for SONGS Unit 3, read:

> Fire Protection (Section 9.5.1, SER, SSER #4, SSER #5, Section 1.12, SSER #5; SE dated November 15, 1982; Revision 1 to Updated Fire Hazards Analysis Evaluation dated June 29, 1988)
>
> SCE shall implement and maintain in effect all provisions of the approved fire protection program. This program shall be (1) as described in the Updated Fire Hazards Analysis through Revision 3 as revised by letters to the NRC dated May 31, July 22. and November 20, 1987 and January 21, February 22, and April 21, 1988; and (2) as approved in the NRC staff's Safety Evaluation Report (SER) (NUREG-0712) dated February 1981; Supplements 4 and 5 to the SER, dated January 1982 and February 1982, respectively; and the safety evaluation dated November 15, 1982; as supplemented and amended by the Updated Fire Hazards Analysis Evaluation for San Onofre 2 and 3, Revision 1 dated June 29, 1988. SCE may make changes to the approved fire protection program without prior approval of the Commission

only if those changes would not adversely affect the ability to achieve and maintain safe shutdown in the event of a fire.

The licensee is proposing to delete License Condition 2.C.(14) for SONGS Unit 2 and delete License Condition 2.C.(12) for SONGS Unit 3, which will read:

Unit 2

(14) Deleted

Unit 3

(12) Deleted

The licensee states that this license condition is based on maintaining an operational fire protection program in accordance with 10 CFR 50.48, "Fire protection," with the ability to achieve and maintain safe shutdown of the reactor in the event of a fire and is no longer applicable at SONGS Units 2 and 3. However, many of the elements that are applicable for the operating plant fire protection program continue to be applicable during plant decommissioning. During the decommissioning process, a fire protection program is required by 10 CFR 50.48(f) to address the potential for fires that could result in a radiological hazard. However, the regulation is applicable regardless of whether a requirement for a fire protection program is included in the facility license. Therefore, a license condition requiring such a program for a permanently shutdown and defueled plant is not needed.

The NRC staff finds that License Conditions 2.C.(14) and 2.C.(12), "Fire Protection," for SONGS Units 2 and 3, respectively, are based on maintaining fire protection programs that provides reasonable assurance that the ability to achieve and maintain safe shutdown in the event of a fire in accordance with 10 CFR 50.48. Achieving and maintaining safe shutdown in the event of a fire is no longer applicable to the decommissioned fire protection programs at SONGS Units 2 and 3, since units are permanently shutdown and the fuel has been removed from the reactors. However, elements of the fire protection program continue during decommissioning to address fire events that could result in radiological hazards. The regulation in 10 CFR 50.48(f) requires SONGS Units 2 and 3 to address the potential for fires, which could result in a radiological hazard. The licensee has proposed that the rule is sufficient to ensure that a program is maintained and therefore having a license condition that also requires fire protection programs for the permanently shutdown and defueled units is redundant. Basis on the evaluation above, the NRC staff concludes that reliance on 10 CFR 50.48(f) is appropriate and the fire protection license condition is no longer necessary. Therefore, the NRC staff finds that the licensee's proposed change to delete License Condition 2.C.(14) for SONGS Units 2, and License Condition 2.C.(12) for SONGS Unit 3, is acceptable.

3.8.6 Changes to License Condition 2.C.(27) [Unit 2] and License Condition 2.C.(28) [Unit 3]

Current License Condition 2.C.(27) for SONGS Unit 2, and License Condition 2.C.(28) for SONGS Unit 3, read:

> Upon implementation of Amendment No. 214 [Unit 2 and Amendment No. 206, Unit 3] adopting TSTF 448, Revision 3, the determination of control room envelope (CRE) unfiltered air inleakage as required by SR 3.7.11.4 in accordance with TS 5.5.2.16.c(i), the assessment of CRE habitability as required by Specification 5.5.2.16.c(ii), and the measurement of CRE pressure as required by Specification 5.5.2.16.d, shall be considered met. Following implementation:
>
> (a) The first performance of SR 3.7.11.4, in accordance with Specification 5.5.2.16.c(i) shall be within the specified frequency of 6 years, plus the 18-month allowance of SR 3.0.2, as measured from May 18, 2004, the date of the most recent successful tracer gas test, as stated in the September 17, 2004 letter response to Generic Letter 2003-01, or within the next 18 months if the time period since the most recent successful tracer gas test is greater than 6 years.
>
> (b) The first performance of the periodic assessment of CRE habitability, Specification 5.5.2.16.c(ii), shall be within 3 years, plus the 9-month allowance of SR 3.0.2, as measured from May 18, 2004, the date of the most recent successful tracer gas test, as stated in the September 17, 2004, letter response to Generic Letter 2003-01, or within the next 9 month if the time period since the most recent successful tracer gas is greater than 3 years.
>
> (c) The first performance of the periodic measurement of CRE pressure, Specification 5.5.2.16.d, shall be within 6 months.

The licensee is proposing to delete License Condition 2.C.(27) for SONGS Unit 2 and License Condition 2.C.(28) for SONGS Unit 3, which will read:

> Unit 2
>
> (27) Deleted
>
> Unit 3
>
> (28) Deleted

The NRC staff evaluated the remaining accident analyses at SONGS Units 2 and 3 and confirmed that no ESF system is used to mitigate the CR, EAB, or LPZ dose consequences, as

detailed in Sections 3.2 through 3.6 of this SE. This includes no credit for the FHIS, the fuel handling building PACU filtration system, the CRIS and the CREACUS. Since SONGS Units 2 and 3 are permanently shut down and defueled, and greater than 17 months of decay time has elapsed since permanent shut down, the remaining DBAs applicable to the facility demonstrate that the dose consequences within the CRE are acceptable without relying on SSCs remaining functional for accident mitigation, with the exception of the passive fuel storage pool structure. In addition, the staff has determined that related CREACUS TS 3.7.11, and the Control Room Envelope Habitability Program TS 5.5.2.16, are no longer needed, as discussed in Sections 3.7.13 and 3.7.17.3, respectively, of this SE. Based on the discussion above, the NRC staff finds that the licensee's proposed change to delete of SONGS Unit 2 License Condition 2.C.(27), and SONGS Unit 3 License Condition 2.C.(28), is acceptable.

3.8.7 New License Condition 2.C.(28) [Unit 2] and License Condition 2.C.(29) [Unit 3]

By letter dated February 25, 2015 (ADAMS Accession No. ML15058A033), the licensee responded to an RAI from the NRC staff regarding the actions that will be taken by SCE to provide reasonable assurance that the passive, long-lived structures and components in the SFP, the fire protection system, and the radiation protection system, will be maintained in a safe condition beyond the normal licensed operating period of 40 years, pursuant to the provisions of 10 CFR 50.51(b). The NRC staff asked the licensee to identify and list the long-live, passive structures and components. In addition, the staff requested a summary of actions that will be taken to monitor and maintain the long-lived, passive structures and components. One of the staff's concerns involved the aging of neutron absorbing materials used for criticality control in SFPs.

SCE responded to the specific concern on the use of neutron absorbing materials in the SFP racks at SONGS. SCE noted that the SONGS SFP racks do contain Boraflex, a neutron-absorbing material. However, no credit is taken in SONGS accident analyses or licensing basis for the existence of the Boraflex. In addition, the NRC previously evaluated and approved borated stainless steel rods that may be placed in fuel assembly guide tubes (GTs) for reactivity control. This feature has not been implemented. If implemented in the future, SONGS will institute a surveillance program where, at 5-year intervals, 1 percent of the GT-Inserts will be inspected for any material degradation. The allowance for GT-Inserts and the commitment to the associated inspection program are described in Section 2.3.3.1.2.4.2 of the SE for Amendment Nos. 213 and 205 for SONGS Units 2 and 3, respectively (ADAMS Accession No. ML072550175).

The licensee stated that its current plans are to have all the spent fuel currently stored in the SFPs transferred to the dry cask storage ISFSI before the operating license for either SONGS Units 2 or 3 expires. However, SCE stated it will develop a list of long-lived, passive structures and components if unforeseen circumstances threaten to extend the period of fuel storage in the SFP beyond the current licensed period. SCE will develop the list and an associated aging-management program for those components if all of the spent fuel has not been removed from the SFP by February 16, 2021.

The expiration date of the Unit 2 operating license (that is, the end of the initial 40-year period of operation) is February 16, 2022. The expiration date of the Unit 3 operating license is November 15, 2022. All spent fuel onsite is expected to be moved to the ISFSI approximately 3 years prior to the expiration of the initial 40-year period of operation for both Units 2 and 3. Therefore, for the Units 2 and 3 SFPs, there is no anticipated need for long-lived, passive structures and components beyond the 40-year period of operation for Units 2 and 3, nor is there an anticipated need to monitor or maintain such structures and components beyond the licensed 40-year period of operation. Should the transition of fuel to the ISFSI be delayed by unforeseen events, it is possible that spent fuel could remain in the SFPs beyond the expiration of the 40-year operating period. Therefore, SCE proposed new license conditions for SONGS Units 2 and 3.

New License Condition 2.C.(28) for SONGS Unit 2, and License Condition 2.C.(29) for SONGS Unit 3, will read:

Unit 2

(28) Prior to February 16, 2021, if all spent fuel has not been removed from the Unit 2 spent fuel pool, an aging-management program shall be submitted for NRC approval. The scope of the program shall include those long-lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the spent fuel pool. Once approved, the program shall be described in the Updated Final Safety Analysis Report and shall remain in effect for Unit 2 until such time that all spent fuel has been removed from the Unit 2 spent fuel pool.

Unit 3

(29) Prior to February 16, 2021, if all spent fuel has not been removed from the Unit 3 spent fuel pool, an aging-management program shall be submitted for NRC approval. The scope of the program shall include those long-lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the spent fuel pool. Once approved, the program shall be described in the Updated Final Safety Analysis Report and shall remain in effect for Unit 3 until such time that all spent fuel has been removed from the Unit 3 spent fuel pool.

The NRC staff has evaluated the licensee's proposed response to the maintenance of long-lived passive structures and components considering the following applicable NRC regulations:

The regulation in 10 CFR Part 50, Appendix A, General Design Criteria (GDC) 62, "Prevention of criticality in fuel storage and handling," requires the prevention of criticality by physical systems or processes, preferably by use of geometrically safe configurations.

The regulations in 10 CFR 50.51(b) require licensees that have provided certifications for permanent cessation of power operations and permanent removal of fuel in accordance with 10 CFR 50.82(a)(1)(i) and 10 CFR 50.82(a)(1)(ii) to take actions necessary to decommission and decontaminate the facility and continue to maintain the facility in a safe condition.

The regulations in 10 CFR 50.65, "Requirements for monitoring the effectiveness of maintenance at nuclear power plants," require licensees to monitor performance or condition of SSCs to ensure they are capable of fulfilling their intended function. The scope of the monitoring specified in 10 CFR 50.65(a)(1) applies to safety-related SSCs as stated in 10 CFR 50.65(b)(1) and to nonsafety-related SSCs whose failure could prevent safety-related SSCs from fulfilling their intended function as stated in 10 CFR 50.65(b)(2)(ii).

The regulations in 10 CFR 50.68 specify requirements for the prevention of criticality accidents and mitigating the radiological consequences of a criticality accident.

The licensee has proposed aging management related license conditions for both SONGS Units 2 and 3, contingent that all remaining fuel will be removed from the SFP by February 16, 2021. If by this time the fuel is not removed from the SFP, the license condition will require that the licensee submit an aging management program for NRC approval. The scope of the program shall include those long lived, passive structures and components that are needed to provide reasonable assurance of the safe condition of the spent fuel in the SFP. Once approved, the program shall be described in the UFSAR and shall remain in effect until such time that all spent fuel has been removed from the SFP. The NRC staff notes that the proposed changes do not affect the design or use of the existing fuel racks, and therefore no criticality analysis was made in association with the changes. The proposed changes also keep intact the systems for the SFP needed to keep the fuel in a subcritical condition. The staff has reviewed the licensee's response to the staff's aging-management concerns and the proposed license conditions to address the concerns. Given that the licensee expects to have all fuel removed from the SONGS SFPs prior to the expiration of the original operating license, the NRC staff has concluded that the proposed new License Condition 2.C.(28) for SONGS Unit 2 and License Condition 2.C.(29) for SONGS Unit 3, adequately address the staff's concerns regarding the maintenance of passive, long-lived structures and components in a safe condition beyond the normal licensed operating period of 40 years, and therefore, finds that the new license conditions are acceptable.

3.8.8 Deletion of License Condition 2.J and Proposed New License Condition 3

Current License Condition 2.J, reads:

Unit 2

J. This license is effective as of the date of issuance and shall expire at midnight on February 16, 2022.

Unit 3

J. This license is effective as of the date of issuance and shall expire at midnight on November 15, 2022.

Revised License Condition 2.J would state for SONGS Units 2 and 3, will read:

J. Deleted

SCE stated that this license condition can be deleted because SONGS Units 2 and 3 have permanently ceased operation. 10 CFR 50.82(a)(2) prohibits operation of the SONGS Units 2 and 3 reactor since the certifications described therein have been docketed. SCE has proposed that this license condition be replaced by new License Condition 3, which conforms to 10 CFR 50.51, "Continuation of license," in that the license authorizes ownership and possession of SONGS Units 2 and 3 until the Commission notifies the licensee in writing that the license is terminated. The proposed new license condition for SONGS Units 2 and 3, to be used in place of License Condition 2.J., will be License Condition 3.

New License Condition 3 for SONGS Unit 2, will read:

3 On June 12, 2013, Southern California Edison (SCE) certified that operations at San Onofre Nuclear Generating Station Unit 2 would permanently cease in accordance with 10 CFR 50.82(a)(1)(i). On July 22, 2013, SCE certified that the fuel had been permanently removed from the reactor vessel in accordance with 10 CFR 50.82(a)(1)(ii). As a result, the 10 CFR 50 license no longer authorizes operation of the reactor, or the emplacement or retention of fuel in the reactor vessel.

This license is effective as of the date of issuance and authorizes ownership and possession of San Onofre Nuclear Generating Station Unit 2 until the Commission notifies the licensee in writing that the license is terminated. The licensee shall:

A. Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition; and

B. Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the applicable provisions of the 10 CFR 50 facility license as defined in Section 2 of this license.

New License Condition 3 for SONGS Units 3, will read:

3. On June 12, 2013, Southern California Edison (SCE) certified that operations at San Onofre Nuclear Generating Station Unit 3 would permanently cease in accordance with 10 CFR 50.82(a)(1)(i). On June 28, 2013, SCE certified that the fuel had been permanently removed from the reactor vessel in accordance with 10 CFR 50.82(a)(1)(ii). As a result, the 10 CFR 50 license no longer authorizes operation of the reactor, or the emplacement or retention of fuel in the reactor vessel.

   This license is effective as of the date of issuance and authorizes ownership and possession of San Onofre Nuclear Generating Station Unit 3 until the Commission notifies the licensee in writing that the license is terminated. The licensee shall:

   A. Take actions necessary to decommission the plant and continue to maintain the facility, including, where applicable, the storage, control and maintenance of the spent fuel, in a safe condition; and

   B. Conduct activities in accordance with all other restrictions applicable to the facility in accordance with the NRC regulations and the applicable provisions of the 10 CFR 50 facility license as defined in Section 2 of this license.

The NRC staff has reviewed the proposed deletion of Licensee Condition 2.J and the proposed new License Condition 3 and determined that License Condition 2.J, which documented the date of the expiration of the license, is no longer meaningful for the permanently shutdown condition of the plant in the process of decommissioning. The proposed new License Condition 3 documents the current condition of the plant and summarizes the actions and requirements applicable to the facility by regulation. The proposed License Condition 3 is consistent with the regulatory requirements applicable to the facility in the permanently shutdown and defueled condition, and consistent with a previously issued license conditions for the permanently shutdown and defueled Millstone Unit 1 and the Kewaunee Power Station. Based on the above, the NRC staff finds that the proposed license condition changes are acceptable.

4.0 STATE CONSULTATION

In accordance with the Commission's regulations, the California State official was notified on May 28, 2015, of the proposed issuance of the amendments. The State official had no comments.

5.0 ENVIRONMENTAL CONSIDERATION

The amendments change a requirement with respect to installation or use of a facility component located within the restricted area as defined in 10 CFR Part 20 and changes surveillance requirements. The NRC staff has determined that the amendments involve no significant increase in the amounts, and no significant change in the types, of any effluents that may be released offsite, and that there is no significant increase in individual or cumulative occupational radiation exposure. The Commission has previously issued a proposed finding that the amendments involve no significant hazards consideration, and there has been no public comment on such finding as published in the *Federal Register* on September 16, 2014 (79 FR 55513). The amendments also relates to changes in recordkeeping, reporting, or administrative procedures or requirements. Accordingly, the amendments meet the eligibility criteria for categorical exclusion set forth in 10 CFR 51.22(c)(9) and 10 CFR 51.22(c)(10). Pursuant to 10 CFR 51.22(b), no environmental impact statement or environmental assessment need be prepared in connection with the issuance of the amendments.

6.0 CONCLUSION

The NRC staff has concluded, based on the considerations discussed above, that: (1) there is reasonable assurance that the health and safety of the public will not be endangered by operation in the proposed manner, (2) there is reasonable assurance that such activities will be conducted in compliance with the Commission's regulations, and (3) the issuance of the amendment will not be inimical to the common defense and security or to the health and safety of the public.

EXHIBIT 10

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

November , 2017

Mr. Thomas J. Palmisano
Vice President and Chief Nuclear Officer
Southern California Edison Company
San Onofre Nuclear Generating Station
P.O. Box 128
San Clemente, CA 92674-0128

SUBJECT: SAN ONOFRE NUCLEAR GENERATING STATION, UNITS 1, 2, AND 3 - ISSUANCE OF AMENDMENTS TO REVISE THE PERMANENTLY DEFUELED EMERGENCY PLAN (CAC NOS. L53160, L53161, and L53162)

Dear Mr. Palmisano:

The U.S. Nuclear Regulatory Commission (NRC) has issued the enclosed Amendment No. 168 to Facility Operating License No. DPR-13, Amendment No. 236 to Facility Operating License No. NPF-10, and Amendment No. 229 to Facility Operating License No. NPF-15 for the San Onofre Nuclear Generating Station (SONGS), Units 2 and 3, respectively. The amendments consist of changes to the Permanently Defueled Emergency Plan (PDEP) in response to your application dated December 15, 2016 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML16355A015), as supplemented by letter dated May 5, 2017 (ADAMS Accession No. ML17160A324). The proposed changes more fully reflect the status of the facility, as well as the reduced scope of potential radiological accidents once all spent fuel has been moved to dry cask storage within the onsite independent spent fuel storage installation (ISFSI), an activity which is currently scheduled for completion in 2019.

The proposed changes replace the SONGS PDEP and associated Emergency Action Level (EAL) Bases Manual (hereafter referred to as the EAL scheme) with an ISFSI-Only Emergency Plan (IOEP) and associated EAL scheme. The NRC staff determined that the proposed SONGS IOEP and associated EAL changes continue to meet the standards in Title 10 of the *Code of Federal Regulations* (10 CFR), Section 50.47, “Emergency plans,” and the requirements in Appendix E, “Emergency Planning and Preparedness for Production and Utilization Facilities,” of 10 CFR Part 50, as exempted. As such, the SONGS IOEP and associated EAL changes provides reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency.

The NRC staff has determined that its documented safety evaluation does not contain Sensitive Security-Related Information (SUNSI) pursuant to 10 CFR 2.390, “Public inspections, exemptions, requests for withholding.” In accordance with 10 CFR 2.390 of the NRC's "Agency Rules of Practice and Procedure," a copy of this letter will be available electronically for public inspection in the NRC Public Document Room or from the Publicly Available Records component of ADAMS. ADAMS is accessible from the NRC Web site at http://www.nrc.gov/reading-rm/adams.html.

A copy of the related Safety Evaluation is provided in Enclosure 4. The Notice of Issuance will be included in the Commission's next biweekly *Federal Register* notice. If you have any questions, please contact me at 301 -415-3178, or via e-mail at marlayna.vaaler@nrc.gov.

Sincerely,

Marlayna G. Vaaler, Project Manager
Reactor Decommissioning Branch
Division of Decommissioning, Uranium Recovery
and Waste Programs
Office of Nuclear Material Safety and Safeguards

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

SOUTHERN CALIFORNIA EDISON COMPANY

SAN DIEGO GAS AND ELECTRIC COMPANY

DOCKET NO. 50-206

SAN ONOFRE NUCLEAR GENERATING STATION, UNIT 1

AMENDMENT TO FACILITY OPERATING LICENSE

Amendment No. 168
License No. DPR-13

1. The Nuclear Regulatory Commission (the Commission or the NRC) has found that:

   A. The application for a license amendment filed by the Southern California Edison Company and the San Diego Gas and Electric Company (the licensee), dated December 15, 2016, as supplemented by letter dated May 5, 2017, complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and applicable portions of the Commission's regulations set forth in 10 CFR Chapter I, and all required notifications to other agencies or bodies have been duly made;

   B. Construction of San Onofre Nuclear Generating Station, Unit 1 (the facility) has been completed in conformity with Construction Permit No. CPPR-13 and the application, as amended, the provisions of the Act, and the regulations of the Commission;

   C. The facility will operate in conformity with the application, as amended, the provisions of the Act, and the applicable rules and regulations of the Commission;

   D. There is reasonable assurance (i) that the activities authorized by this amended license can be conducted without endangering the health and safety of the public, and (ii) that such activities will be conducted in compliance with applicable portions of the Commission's regulations set forth in 10 CFR Chapter I;

   E. The licensee is technically qualified to engage in the activities authorized by this license in accordance with the Commission's regulations set forth in 10 CFR Chapter I;

Enclosure 1

F. The licensee has satisfied the applicable provisions of 10 CFR Part 140, "Financial Protection Requirements and Indemnity Agreements," of the Commission's regulations;

G. The issuance of this license will not be inimical to the common defense and security or to the health and safety of the public;

H. The issuance of this license is in accordance with 10 CFR Part 51, "Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions," of the Commission's regulations and all applicable requirements have been satisfied; and

I. The possession of source, byproduct, and special nuclear material as authorized by this license will be in accordance with the Commission's regulations in 10 CFR Parts 30, 40, and 70.

2. Accordingly, the license is amended by changes to paragraph 2.C(2) of Facility Operating License No. DPR-13, and is hereby amended to read as follows:

(2) Technical Specifications and Environmental Protection Plan

The Technical Specifications contained in Appendix A, as revised through Amendment No. 168, are hereby incorporated in the license. Southern California Edison Company shall maintain the facility in accordance with the Technical Specifications.

3. This license amendment is effective as of the date of its issuance and shall be implemented within 60 days following SCE's submittal of a written certification to the NRC that all spent nuclear fuel assemblies have been transferred out of the spent fuel pools and placed in storage within the onsite ISFSI.

chemical or physical form, for sample analysis or instrument calibration or associated with radioactive apparatus or components; and

(5) Pursuant to the Act and 10 CFR Parts 30, 40, and 70, to possess, but not separate, such byproduct and special nuclear materials as may be produced by the operation of the facility.

C. This license shall be deemed to contain and is subject to the conditions specified in the Act and the applicable provisions of the Commission's regulations set forth in 10 CFR Chapter I and is subject to all applicable provisions of the rules, regulations, and orders of the Commission now or hereafter in effect; and is subject to the additional conditions specified or incorporated below:

(1) Maximum Power Level

The licensee is not authorized to operate the facility as a nuclear reactor.

(2) Technical Specifications and Environmental Protection Plan

The Technical Specifications contained in Appendix A, as revised through Amendment No. 168, are hereby incorporated in the license. Southern California Edison Company shall maintain the facility in accordance with the Technical.

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

SOUTHERN CALIFORNIA EDISON COMPANY

SAN DIEGO GAS AND ELECTRIC COMPANY

THE CITY OF RIVERSIDE, CALIFORNIA

DOCKET NO. 50-361

SAN ONOFRE NUCLEAR GENERATING STATION, UNIT 2

AMENDMENT TO FACILITY OPERATING LICENSE

Amendment No. 236
License No. NPF-10

1. The Nuclear Regulatory Commission (the Commission) has found that:

   A. The application for amendment by Southern California Edison Company, et al. (SCE or the licensee), dated December 15, 2016, as supplemented by letter dated May 5, 2017, complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's regulations set forth in 10 CFR Chapter I;

   B. The facility will operate in conformity with the application, as supplemented, the provisions of the Act, and the rules and regulations of the Commission;

   C. There is reasonable assurance (i) that the activities authorized by this amendment can be conducted without endangering the health and safety of the public, and (ii) that such activities will be conducted in compliance with the Commission's regulations;

   D. The issuance of this amendment will not be inimical to the common defense and security or to the health and safety of the public; and

   E. The issuance of this amendment is in accordance with 10 CFR Part 51, "Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions," of the Commission's regulations and all applicable requirements have been satisfied.

Enclosure 2

2. Accordingly, the license is amended by changes to paragraph 2.C(2) of Facility Operating License No. NPF-10, and is hereby amended to read as follows:

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 236, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

3. This license amendment is effective as of the date of its issuance and shall be implemented within 60 days following SCE's submittal of a written certification to the NRC that all spent nuclear fuel assemblies have been transferred out of the spent fuel pools and placed in storage within the onsite ISFSI.

DOCKET NO. 50-362

SAN ONOFRE NUCLEAR GENERATING STATION, UNIT 3

AMENDMENT TO FACILITY OPERATING LICENSE

Amendment No. 229
License No. NPF-15

1. The Nuclear Regulatory Commission (the Commission) has found that:

   A. The application for amendment by Southern California Edison Company, et al. (SCE or the licensee), dated December 15, 2016, as supplemented by letter dated May 5, 2017, complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's regulations set forth in 10 CFR Chapter I;

   B. The facility will operate in conformity with the application, as supplemented, the provisions of the Act, and the rules and regulations of the Commission;

   C. There is reasonable assurance (i) that the activities authorized by this amendment can be conducted without endangering the health and safety of the public, and (ii) that such activities will be conducted in compliance with the Commission's regulations;

   D. The issuance of this amendment will not be inimical to the common defense and security or to the health and safety of the public; and

   E. The issuance of this amendment is in accordance with 10 CFR Part 51, "Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions," of the Commission's regulations and all applicable requirements have been satisfied.

Enclosure 3

2. Accordingly, the license is amended by changes to paragraph 2.C(2) of Facility Operating License No. NPF-15, and is hereby amended to read as follows:

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 229, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

3. This license amendment is effective as of the date of its issuance and shall be implemented within 60 days following SCE's submittal of a written certification to the NRC that all spent nuclear fuel assemblies have been transferred out of the spent fuel pools and placed in storage within the onsite ISFSI.

(3) SCE, pursuant to the Act and 10 CFR Part 70, to possess at any time special nuclear material that was used as reactor fuel, in accordance with the limitations for storage, as described in the Final Safety Analysis Report, as supplemented and amended;

(4) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to receive, possess, and use at any time any byproduct, source and special nuclear material as sealed sources for reactor instrumentation and radiation monitoring equipment calibration, and as fission detectors in amounts as required; and possess any byproduct, source and special material as sealed neutron sources that was used for reactor startup;

(5) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70 to receive, possess, and use in amounts as required any byproduct, source or special nuclear material without restriction to chemical or physical form, for sample analysis or instrument calibration or associated with radioactive apparatus or components; and

(6) SCE, pursuant to the Act and 10 CFR Parts 30, 40, and 70, to possess, but not separate, such byproduct and special nuclear materials as may be produced by the operation of San Onofre Nuclear Generating Station, Units 1 and 2 and by the decommissioning of San Onofre Nuclear Generating Station Unit 1.

C. This license shall be deemed to contain and is subject to the conditions specified in the Commission's regulations set forth in 10 CFR Chapter I and is subject to all applicable provisions of the Act and to the rules, regulations and orders of the Commission now or hereafter in effect; and is subject to the additional conditions specified or incorporated below:

(1) Deleted

(2) Technical Specifications

The Technical Specifications contained in Appendix A and the Environmental Protection Plan contained in Appendix B, as revised through Amendment No. 229, are hereby incorporated in the license. Southern California Edison Company shall operate the facility in accordance with the Technical Specifications and the Environmental Protection Plan.

SAN ONOFRE NUCLEAR GENERATING STATION, UNITS 1, 2, AND 3

DOCKET NOS. 50-206, 50-361, AND 50-362

1.0 INTRODUCTION

The San Onofre Nuclear Generating Station (SONGS), Units 1, 2 and 3, are decommissioning nuclear power reactor units located in San Diego County, California, approximately 62 miles southeast of Los Angeles, and approximately 51 miles northwest of San Diego, on an 84 acre site located entirely within the Camp Pendleton Marine Corps Base. The licensee, Southern California Edison (SCE), is the holder of Facility Operating License Nos. DPR-13 (Unit 1), NPF-10 (Unit 2) and NPF-15 (Unit 3), which were issued pursuant to the Atomic Energy Act of 1954, as amended, and Part 50, "Domestic Licensing of Production and Utilization Facilities," of Title 10 of the *Code of Federal Regulations* (10 CFR).

SONGS, Unit 1, was granted its provisional operating license by the U.S. Nuclear Regulatory Commission (NRC) on January 1, 1968 (Reference 1), and ceased operation on November 30, 1992 (Reference 2). The licensee completed defueling on March 6, 1993 (Reference 3), and maintained the unit in SAFSTOR until June 1999, when it initiated active decommissioning and dismantlement, or DECON (Reference 4). On December 28, 1993 (Reference 5), the NRC approved the Permanently Defueled Technical Specifications for SONGS, Unit 1. SCE submitted the proposed Decommissioning Plan for SONGS, Unit 1, on November 3, 1994 (Reference 6). As a result of the 1996 revision to the regulations in 10 CFR 50.82, "Termination of license," the NRC replaced the requirement for a decommissioning plan with a requirement for a Post Shutdown Decommissioning Activities Report (PSDAR). On August 28, 1996, the SONGS, Unit 1, Decommissioning Plan became the

SONGS 1 PSDAR (61 FR 67079; December 19, 1996). On December 15, 1998 (Reference 7), SCE submitted an update to the PSDAR to the NRC, as required by 10 CFR 50.82(a)(7), in order to begin planning for the dismantlement and decommissioning of SONGS, Unit 1. Dismantlement of SONGS, Unit 1, is essentially complete and most of the structures and equipment have been removed and sent to a nuclear waste disposal facility. All of the SONGS, Unit 1, fuel is being stored in the onsite independent spent fuel storage installation (ISFSI).

By letter dated June 12, 2013 (Reference 8), SCE submitted a certification to the NRC indicating its intention to permanently cease power operations at SONGS, Units 2 and 3, as of June 7, 2013, pursuant to 10 CFR 50.82(a)(1)(i). By letters dated June 28, 2013 (Reference 9), and July 22, 2013 (Reference 10), SCE submitted certifications of permanent removal of fuel from the Unit 3 and Unit 2 reactor vessels as of October 5, 2012, and July 18, 2013, respectively, pursuant to 10 CFR 50.82(a)(1)(ii). Upon docketing of these certifications, and pursuant to 10 CFR 50.82(a)(2), the SONGS, Units 2 and 3, facility operating licenses no longer authorize operation of the reactors or emplacement or retention of fuel into the reactor vessels.

By application dated December 15, 2016 (Reference 11), as supplemented by letter dated May 5, 2017 (Reference 12), the licensee requested changes to the SONGS Permanently Defueled Emergency Plan (PDEP) pursuant to 10 CFR 50.54(q), “Emergency plans.” The proposed changes replace the SONGS PDEP and associated Emergency Action Level (EAL) Bases Manual (hereafter referred to as the EAL scheme) with an ISFSI-Only Emergency Plan (IOEP) and associated EAL scheme. The NRC staff determined that the proposed SONGS IOEP and associated EAL changes continue to meet the standards in 10 CFR 50.47, “Emergency plans,” and the requirements in Appendix E, “Emergency Planning and Preparedness for Production and Utilization Facilities,” of 10 CFR Part 50, as exempted. As such, the SONGS IOEP and associated EAL changes provides reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency.

The proposed changes more fully reflect the decommissioning status of the facility, as well as the reduced scope of potential radiological accidents once all spent fuel has been moved to dry cask storage within the onsite ISFSI, an activity which is currently scheduled for completion in 2019. The supplement to the current application, dated May 5, 2017, provided additional information that clarified the application, did not expand the scope of the application as originally noticed, and did not change the staff's original proposed no significant hazards consideration determination as published in the *Federal Register* on February 14, 2017 (82 FR 10601).

2.0 REGULATORY EVALUATION

This safety evaluation assesses the acceptability of the proposed SONGS ISFSI-Only IOEP and associated EAL scheme. This plan would replace the current SONGS PDEP and associated EAL scheme after all of the SONGS, Units 2 and 3, spent fuel has been transferred from the spent fuel pools (SFPs) to the expanded onsite ISFSI. The regulatory requirements, as exempted by letter dated June 4, 2015 (Reference 13), and associated guidance on which the NRC based its acceptance and evaluation are as follows:

2.1 NRC Regulations

- 10 CFR 50.47(b)(1), as exempted, states, in part: "... each principal response organization has staff to respond and to augment its initial response on a continuous basis;"

- 10 CFR 50.47(b)(2) states, in part: "... adequate staffing to provide initial facility accident response in key functional areas is maintained at all times, timely augmentation of response capabilities is available ...;"

- 10 CFR 50.47(b)(4), as exempted, states, in part: "A standard emergency classification and action level scheme, the bases of which include facility system and effluent parameters, is in use by the nuclear facility licensee…;"

- 10 CFR Part 50, Appendix E, Section IV.A, as exempted, states, in part: "The organization for coping with radiological emergencies shall be described, including definition of authorities, responsibilities, and duties of individuals assigned to the licensee's emergency organization…;"

- 10 CFR Part 50, Appendix E, Section IV.C.1, as exempted, states, in part: "The emergency classes defined shall include (1) notification of unusual events, (2) alert…;"

- 10 CFR 72.32, "Emergency Plan," Section (a)(3), states: "A classification system for classifying accidents as 'Alerts';" and

- 10 CFR 72.32(a)(7) states, in part: "A brief description of the responsibilities of licensee personnel should an accident occur…."

2.2 Regulatory Guidance

- Revision 1 to NUREG-0654/FEMA-REP-1, "Criteria for Preparation and Evaluation of Radiological Emergency Response Plans and Preparedness in Support of Nuclear Power Plants" (Reference 14), provides a common reference and guidance source for nuclear facility operators to develop radiological emergency response plans.

- Office of Nuclear Security and Incident Response / Division of Preparedness and Response (NSIR/DPR) Interim Staff Guidance (ISG) – 2, "Emergency Planning Exemption Requests for Decommissioning Nuclear Power Plants" (Reference 15), provides guidance for the review of permanently defueled emergency plans for power reactor sites undergoing decommissioning.

- Office of Nuclear Materials Safety and Safeguards / Spent Fuel Project Office (NMSS/SFPO) ISG – 16, "Emergency Planning" (Reference 16), provides emergency plan review guidance applicable to facilities licensed pursuant to the regulatory requirements found at 10 CFR Part 72, "Licensing Requirements for the Independent Storage of Spent Nuclear Fuel, High-Level Radioactive Waste, and Reactor-Related Greater Than Class C Waste."

- Nuclear Energy Institute (NEI) document NEI 99-01, Revision 6, "Development of Emergency Action Levels for Non-Passive Reactors" (Reference 17), endorsed by the NRC in a letter dated March 28, 2013 (Reference 18), as generic (non-plant-specific) EAL scheme development guidance.

3.0 TECHNICAL EVALUATION

The NRC staff has reviewed the licensee's regulatory and technical analyses in support of its proposed emergency plan changes, as described in the application dated December 15, 2016, as supplemented by letter dated May 5, 2017. The technical evaluation is detailed below.

3.1 Background

SONGS, Unit 1, has been permanently shutdown since November 30, 1992, and the final removal of fuel from its reactor vessel was completed on March 6, 1993. SONGS, Units 2 and 3, have been shutdown since January 2012, and SCE submitted certifications of permanent removal of fuel from the Unit 3 and Unit 2 reactor vessels as of October 5, 2012, and July 18, 2013, respectively. SONGS is authorized to possess and store irradiated nuclear fuel at the permanently shutdown and defueled SONGS facility. The spent fuel from SONGS, Unit 1, is stored in the onsite ISFSI and at the General Electric-Hitachi Nuclear Energy Americas, LLC, Morris Operation facility (Docket No. 72-01) located in Morris, Illinois. After the SONGS, Units 2 and 3, reactors were shutdown, all fuel assemblies were removed from the reactor vessels and placed in the SONGS SFPs.

By letter dated March 31, 2014 (Reference 19), as supplemented by letters dated September 9, 2014 (Reference 20), October 2, 2014 (Reference 21), October 7, 2014 (Reference 22), October 27, 2014 (Reference 23), November 3, 2014 (Reference 24), and December 15, 2014 (Reference 25), SCE requested exemptions for SONGS from (1) certain planning standards in 10 CFR 50.47(b) regarding onsite and offsite radiological emergency plans for nuclear power reactors; (2) certain requirements in 10 CFR 50.47(c)(2) that require establishment of plume exposure and ingestion pathway emergency planning zones for nuclear power reactors, and (3) certain requirements in 10 CFR Part 50, Appendix E, Section IV, regarding the content of emergency plans. The NRC approved the requested exemptions in a letter dated June 4, 2015 (Reference 13).

By letters dated June 5, 2015, the NRC issued Amendment No. 166 to Facility Operating License No. DPR-13, Amendment No. 228 to Facility Operating License No. NPF-10, and Amendment No. 221 to Facility Operating License No. NPF-15 for SONGS, Units 1, 2 and 3, respectively, and the ISFSI, for changes to the EAL scheme (Reference 26), and Amendment No. 167 to Facility Operating License No. DPR-13, Amendment No. 229 to Facility Operating License No. NPF-10, and Amendment No. 222 to Facility Operating License No. NPF-15 for SONGS, Units 1, 2, and 3, respectively, and the ISFSI, for changes to the emergency plan (Reference 27). The PDEP and EAL scheme were fully implemented on July 8, 2015 (Reference 28), in accordance with the above-referenced license amendments.

3.2 Proposed Changes

In its application dated December 15, 2016 (Reference 11), as supplemented by letter dated May 5, 2017 (Reference 12), SCE requested that the NRC review and approve a proposed IOEP, including a proposed ISFSI-Only EAL scheme, that is based on NEI 99-01, Revision 6 (Reference 17). The proposed amendments would replace the existing SONGS PDEP and associated EAL scheme, which currently reflect spent fuel from SONGS, Units 1, 2, and 3, being stored in the SFPs and onsite ISFSI. The major changes that SCE is requesting are: (1) removal of the various emergency actions related to the SFPs; (2) removal of non-ISFSI related emergency event types; (3) replacing the "Shift Manager" title with the "ISFSI Shift Supervisor (ISS)" title as the position that assumes the Emergency Director's responsibilities; and (4) a revision to the SONGS Emergency Response Organization (ERO).

The proposed changes modify the scope of onsite emergency preparedness requirements to reflect the reduced potential radiological accidents with all spent fuel in dry cask storage within the ISFSI. The off-normal events and accidents addressed in the SONGS IOEP are related to the dry storage of spent nuclear fuel at the ISFSI, and include only off-normal, accident, natural phenomena, and hypothetical events and consequences affecting the SONGS ISFSI.

Under the previous facility condition with spent fuel stored within the SONGS SFPs, the most severe postulated beyond-design-basis accident involved a highly unlikely sequence of events that cause a heat-up of the spent fuel, postulated to occur without heat transfer, such that the zircaloy fuel cladding reaches ignition temperature. While highly improbable, the resultant zircaloy fire could lead to the release of large quantities of fission products to the atmosphere. However, after removal of the spent fuel from the SONGS SFPs, the age and configuration of spent fuel stored in dry cask storage precludes the possibility of such a zircaloy fire scenario. After all the spent fuel is transferred to dry cask storage within the SONGS ISFSI, the number and severity of potential radiological accidents is significantly less than when spent fuel was stored in the SFPs. For these reasons, the potential radiological consequences of accidents possible at SONGS after all spent fuel is transferred to the ISFSI are further reduced.

There continues to be no need for formal offsite radiological emergency preparedness (REP) plans under 44 CFR Part 350 at SONGS because no design-basis accident or reasonably credible beyond-design-basis accident can result in radioactive releases that exceed the U.S. Environmental Protection Agency (EPA) Early Phase Protective Action Guides (PAGs) (Reference 29) beyond the exclusion area boundary.

3.3 Evaluation

The NRC staff reviewed the changes from the current SONGS PDEP to the proposed IOEP and ISFSI-Only EAL scheme, including the licensee's evaluation of the changes, to verify that the proposed IOEP and EAL scheme continue to meet the standards contained in 10 CFR 50.47(b) and the requirements of Appendix E to 10 CFR Part 50, as exempted, applicable to the approved 10 CFR Part 50 emergency plan for the long-term defueled conditions at SONGS. The NRC staff also performed a review to ensure that the proposed IOEP would be consistent with the requirements of 10 CFR 72.32 for an ISFSI not located on the site of an operating nuclear power reactor. Although the requirements of 10 CFR 72.32 do not apply to a 10 CFR

Part 50 licensee, such as SONGS, the NRC uses these regulations as guidance to promote consistency between specifically licensed and generally licensed ISFSIs.

3.3.1 *ISFSI EALs and Removal of SFP Initiating Conditions and EALs*

The initiating conditions (ICs) and EALs associated with the emergency classification levels in the current PDEP are based on Appendix C to NEI 99-01, Revision 6 (Reference 17), which addresses a nuclear power reactor that has permanently ceased operations and transferred spent fuel from the reactor vessel to the SFPs (permanently defueled). After all spent fuel has been removed from the SFPs and placed in dry cask storage within the ISFSI, the ICs and EALs in Appendix C to NEI 99-01 that are associated with the SFPs at a decommissioning facility are no longer required. Additionally, certain ICs and EALs whose primary function is not associated with the SFPs are no longer required when administrative controls are established to limit source term accumulation and the offsite consequences of uncontrolled effluent releases.

Examples of administrative controls for radiological source term accumulation limits and methods to control the accidental dispersal of the radiological source are:

- Limits on radioactive materials collected on filter media and resins (dose rate limit);
- Limits on surface or fixed contamination on work areas that may create airborne radioactive material (activity limits), and
- Limiting dispersal mechanisms that may cause a fire (e.g., limits on combustible material loading, use of a fire watch to preclude fires, etc.) or placement of a berm around a radioactive liquid storage tank.

Other ICs proposed for deletion include those associated with the mitigative strategies contained in certain SCE license conditions, as well as response procedures for potential or actual aircraft attacks. These will be eliminated after all spent fuel is removed from the SFPs and stored in the onsite SONGS ISFSI. The ICs listed in Table 1 below are being deleted, either partially or in their entirety as indicated, from the PDEP and EAL scheme for SONGS. The ICs being deleted are either associated only with SFP operation or are ICs for which administrative controls to limit possible effluent releases have been established.

Table 1: Initiating Conditions to be Deleted or Modified

ALERT	UNUSUAL EVENT
PD-AA1 (all EALs) Release of gaseous or liquid radioactivity resulting in offsite dose greater than 10 millirems (mrem) total effective dose equivalent (TEDE) or 50 mrem committed dose equivalent (CDE).	**PD-AU1 (all EALs)** Release of gaseous or liquid radioactivity greater than 2 times the Offsite Dose Calculation Manual (ODCM) limit for 60 minutes or longer.

PD-AA2 (all EALs) UNPLANNED rise in plant radiation levels that impedes plant access required to maintain spent fuel integrity.	**PD-AU2 (all EALs)** UNPLANNED rise in plant radiation levels.
PD-HA1* HOSTILE ACTION within the Vehicle Barrier System (VBS) boundary ~~or airborne attack threat within 30 minutes~~.	**PD-SU1 (all EALs)** UNPLANNED spent fuel pool temperature rise.
PD-HA1.2 A validated notification from the NRC of an aircraft attack threat within 30 minutes of the site.	**PD-HU1.3** A validated notification from the NRC providing information of an aircraft attack threat.
	PD-HU2 (all EALs)** Hazardous event affecting SAFETY SYSTEM equipment necessary for spent fuel cooling.

* Only the strike-through portion is being deleted.

** For an ISFSI-only facility, the condition addressed by PD-HU2 remains fully addressed by IC EU1.1 (which is being retained in the SONGS emergency plan).

The currently existing SONGS ICs and EALs not listed in Table 1 are being retained. The EAL ICs being deleted include all ICs associated with the categories of abnormal radioactivity release and system malfunction. These two categories apply only to SFP operation. The EAL ICs being retained in the SONGS IOEP are appropriate to address the condition of an ISFSI-only facility (i.e., no fuel stored in the spent fuel pools).

The SONGS ICs and EALs to be retained are listed in Table 2, and include one new EAL being proposed in IC E-HU1, “Damage to a loaded cask CONFINEMENT BOUNDARY,” which bounds the deleted ICs. In addition, the new EAL E-HU1.2 provides threshold values for the AREVA ISFSI and the new HOLTEC ISFSI at SONGS, based on the generic AREVA and HOLTEC Technical Specification values provided in the respective Certificates of Compliance.

Table 2: Initiating Conditions to be Maintained or Added

ALERT	UNUSUAL EVENT
Independent Spent Fuel Storage Installation (ISFSI)	
PD-HA1 HOSTILE ACTION within the VBS boundary.	**PD-HU1** Confirmed SECURITY CONDITION or threat.

PD-HA1.1 A HOSTILE ACTION is occurring or has occurred within the VBS boundary as reported by the SSS [Security Shift Supervisor].	**PD-HU1.1** A SECURITY CONDITION that does not involve a HOSTILE ACTION as reported by the SSS. **PD-HU1.2** Notification of a credible security threat directed at the site.
PD-HA3 Other conditions exist which in the judgement of the ISS/ED [Emergency Director] warrant declaration of an ALERT. **PD-HA3.1** Other conditions exist which in the judgment of the ISS/ED indicate that events are in progress or have occurred which involve an actual or potential substantial degradation of the level of safety of the ISFSI or a security event that involves probable life threatening risk to site personnel or damage to ISFSI equipment because of HOSTILE ACTION. Any releases are expected to be limited to small fractions of the EPA Protective Action Guide exposure levels.	**PD-HU3** Other conditions exist which in the judgment of the ISS/ED warrant declaration of an UNUSUAL EVENT. **PD-HU3.1** Other conditions exist which in the judgment of the ISS/ED indicate that events are in progress or have occurred which indicate a potential degradation of the level of safety of the ISFSI or indicate a security threat to the ISFSI has been initiated. No releases of radioactive material requiring offsite response or monitoring are expected unless further degradation occurs.
	E-HU1 Damage to a loaded canister CONFINEMENT BOUNDARY. **E-HU1.1** Damage to a loaded Transnuclear canister CONFINEMENT BOUNDARY as indicated by dose rates greater than EITHER of the following: • 520 milliroentgen per hour (mR/hr) (gamma) 3 feet from the surface at the top centerline. • 190 mR/hr (gamma) 3 feet from the surface of the neutron shield at the mid-height centerline. **E-HU1.2** Damage to a loaded Holtec canister CONFINEMENT BOUNDARY as indicated by dose rates greater than EITHER of the following: • 60 mR/hr (gamma + neutron) on the top of the closure lid of a VVM [Vertical Ventilated Module], measured in accordance with the EAL Technical Basis.

	• 7000 mR/hr (gamma + neutron) on the side of a TRANSFER CASK, measured in accordance with the EAL Technical Basis.

The most severe beyond-design-basis accident postulated for SONGS with spent fuel stored within the SFPs involved a highly unlikely sequence of events that cause heat-up of the spent fuel, postulated to occur without heat transfer, such that the zircaloy fuel cladding reaches ignition temperature. Because this limiting, beyond-design-basis scenario is no longer possible due to the transfer of spent fuel from the SFPs to dry cask storage in the onsite ISFSI, SCE assessed the following design-basis accidents associated with the performance of decommissioning activities with all irradiated fuel stored in the SONGS ISFSI: (1) cask drop accident (fuel related accident); (2) radioactive material handling accident (non-fuel related), and (3) accidents initiated by external events. For design-basis accident scenarios (1) and (2), the results of the assessment indicate that the projected radiological doses at the exclusion area boundary are less than the EPA PAGs. The effects of external events, such as fires, floods, wind (including tornados), earthquakes, lightning, and physical security breaches on the SONGS ISFSI that could affect the confinement boundary of the ISFSI remain unchanged from the effects that were considered under the existing PDEP.

As discussed in the June 4, 2015, exemption from certain emergency preparedness requirements (Reference 13), an analysis of the potential radiological impacts of a design-basis accident at SONGS in a permanently defueled condition indicated that any releases beyond the exclusion area boundary were below the EPA PAG exposure levels. The basis for these exemptions has not changed and remains in effect for the proposed emergency plan changes.

Because of the very low risk of consequences to public health and safety resulting from the postulated accidents related to the SONGS ISFSI, no potential emergencies are classified as higher than an Alert, in accordance with the requirements of 10 CFR Part 50, Appendix E, Section IV.C.1, as exempted. Classification of emergencies as no higher than an Alert also maintains consistency with the regulations in 10 CFR 72.32(a)(3), “Classification of accidents.”

Based on the NRC staff’s review of the SONGS IOEP and associated EAL scheme, as described above, the NRC staff concludes that the planning standard of 10 CFR 50.47(b)(4), as exempted, pertaining to a standard emergency classification and action level scheme, is addressed in an acceptable manner in the SONGS IOEP, considering the permanently shutdown and defueled status of the facility, and the proposed transfer of all remaining spent fuel from the SONGS SFPs to the ISFSI by 2019.

3.3.2 *SONGS Emergency Response Organization Revision*

The existing SONGS PDEP provides for two (2) ERO augmented positions – a Duty ERO Coordinator and a Radiation Control Coordinator. The proposed SONGS IOEP would replace these positions with a Resource Manager. The Resource Manager will assist in assessing the event and coordinating required resources, including public information interface. The Resource Manager will be in contact with the Emergency Director within two hours of classification of an Unusual Event or an Alert. The Resource Manager does not need to physically report to SONGS to perform their responsibilities. In addition, SCE proposes that, for

a declared emergency involving radiological consequences (E-HU1), a minimum of one person trained in radiological monitoring and assessment will report to the SONGS ISFSI within four hours of the emergency declaration. Supplemental personnel shall report at the discretion of the Emergency Director and/or Resource Manager.

In its evaluation of the proposed changes to the SONGS ERO, the NRC staff considered the accident analyses referenced in the previous section related to the deletion of EALs, either partially or in their entirety, as indicated, as they relate to SFP operation. Specifically, the NRC staff considered the postulated accidents that could occur with all spent fuel moved into the SONGS ISFSI, which pose a very low risk to public health and safety. The staff notes that SCE also continues to commit to maintain the appropriate level of augmented response to an emergency, to include an event involving radiological consequences.

In the Statement of Considerations for the Final Rule for Emergency Planning Licensing Requirements for Independent Spent Fuel Storage Facilities and Monitored Retrievable Storage Facilities (MRS) (60 FR 32430; June 22, 1995), the Commission stated, in part:

> For there to be a significant environmental impact resulting from an accident involving the dry storage of spent nuclear fuel, a significant amount of the radioactive material contained within a cask must escape its packaging and enter the biosphere. There are two primary factors that protect the public health and safety from this event. The first is the design requirements for the cask that are imposed by regulation.
>
> These general design criteria place an upper bound on the energy a cask can absorb before the fuel is damaged. No credible dynamic events have been identified that could impart such significant amounts of energy to a storage cask after that cask is placed at the ISFSI.
>
> Additionally, there is a second factor which does not rely upon the cask itself but considers the age of the spent fuel and the lack of dispersal mechanisms. There exists no significant dispersal mechanism for the radioactive material contained within a storage cask.
>
> . . .
>
> Based on the design limitations, the majority of spent fuel is cooled greater than 5 years. At this age, spent fuel has a heat generation rate that is too low to cause significant particulate dispersal in the unlikely event of a cask confinement boundary failure.

Although the SONGS spent fuel analysis has not been able to identify any design-basis accident that would result in a failure of the confinement barrier for the dry storage casks or the irradiated fuel itself, the SONGS IOEP nonetheless requires augmentation of one person trained in radiological monitoring and assessment, who will report to the station within four hours of the emergency declaration for an event involving radiological consequences.

The proposed SONGS IOEP also provides that additional personnel resources may be directed to report to the plant to provide support, as needed, to assess radiological conditions, support maintenance and repair activities, develop and implement corrective action plans, and assist with recovery actions. The supplemental personnel are available from SONGS staff and SCE, and can also be requested from various contractors.

Based on the NRC staff's review of the SONGS IOEP, as described above, the NRC staff concludes that the planning standard of 10 CFR 50.47(b)(2), pertaining to timely augmentation of response capabilities, is addressed in an acceptable manner in the SONGS IOEP, considering the permanently shutdown and defueled status of the facility, and the proposed transfer of all remaining spent fuel from the SFPs to the ISFSI by 2019.

3.3.3 *Replacement of the "Shift Manager" Title with the "ISFSI Shift Supervisor" Title*

SCE revised Section 2.1, "On-Shift Positions," in the SONGS IOEP to reassign the following Emergency Director responsibilities from the Shift Manager to the ISFSI Shift Supervisor:

- Event classification and emergency declaration;
- Decision to notify offsite agencies;
- Authorization for the use of EPA-400 emergency exposure controls (emergency worker dose limits that exceed 10 CFR Part 20 occupational exposure limits);
- Management of available station resources;
- Initiation of assessment and mitigative / corrective actions;
- Initiation of onsite protective actions;
- Decision to call for offsite law enforcement, firefighting, or ambulance assistance;
- Augmentation of the emergency response organization as deemed necessary;
- Notification of SCE corporate officers and the SCE corporate communications department, and
- Notification of offsite agencies (State and local government agencies, Marine Corps Base Camp Pendleton and the NRC).

The NRC staff evaluation verified that the retitled position of ISFSI Shift Supervisor is on-shift at the SONGS site 24-hours a day / 7 days a week, and also serves as the senior management position during off-hours. This position assumes overall command and control of event response as the Emergency Director, and is responsible for monitoring conditions and approving all onsite activities. The SONGS IOEP clearly identifies non-delegable responsibilities, along with other designated tasks, for the ISFSI Shift Supervisor. The NRC staff considers this retitling activity to be an administrative change that will not impact the timing or performance of existing emergency response duties.

Based on the NRC staff's review of the SONGS IOEP, as described above, the NRC staff concludes that the requirements of 10 CFR Part 50, Appendix E, Section IV.A, as exempted, pertaining to responsibilities and duties of individuals assigned to the licensee's emergency organization, are addressed in a satisfactory manner, considering the permanently shutdown and defueled status of the facility, and the proposed transfer of all remaining spent fuel from the SONGS SFPs to the ISFSI by 2019.

4.0 ENVIRONMENTAL CONSIDERATION

The amendments include changes to requirements with respect to installation or use of a facility component located within the protected area and changes to recordkeeping, reporting, or administrative procedures or requirements. The NRC staff has determined that the amendments involve no significant increase in the amounts, and no significant change in the types, of any effluents that may be released offsite, and that there is no significant increase in individual or cumulative occupational radiation exposure. The Commission has previously issued a proposed finding that the amendments involve no significant hazards consideration, and there have been no public comment on such finding, which was published in the *Federal Register* on February 14, 2017 (82 FR 10601). Accordingly, the amendments meet the eligibility criteria for categorical exclusions set forth in 10 CFR 51.22(c)(9) and 10 CFR 51.22(c)(10)(ii). Pursuant to 10 CFR 51.22(b), no environmental impact statement or environmental assessment need be prepared in connection with the issuance of the amendments.

5.0 STATE CONSULTATION

On November 5, 2017, the NRC staff notified the California State officials, Mr. Ira Schneider, Senior Health Physicist, Medical, Academic and Pharmacy Licensing, Radiologic Health Branch, California Department of Public Health; and Mr. Robert Weisenmiller, California State Liaison Officer, Commissioner, California Energy Commission, regarding the proposed change to approve the SONGS IOEP and associated EAL scheme to reflect the transfer of all spent fuel into dry cas storage at the onsite ISFSI. The California State officials responded on XXXXX XX, 2017, and XXXXX XX, 2017, with no comments.

6.0 CONCLUSION

Based on the its review of the proposed SONGS IOEP and associated EAL scheme, the NRC staff finds that the proposed changes continue to meet the standards in 10 CFR 50.47(b) and the requirements in Appendix E of 10 CFR Part 50, as exempted. The staff finds continued reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency at the SONGS facility. In addition, the NRC staff concludes that the SONGS IOEP will be consistent with the emergency planning requirements in 10 CFR Part 72 for an ISFSI not located on the site of an operating reactor. Therefore, the NRC staff concludes that the licensee's proposed changes to the SONGS IOEP and associated EAL scheme in its letter dated December 15, 2016, as supplemented by letter dated May 5, 2017, are acceptable.

The NRC staff has concluded, based on the considerations discussed above, that: (1) there is reasonable assurance that the health and safety of the public will not be endangered by operation in the proposed manner, (2) there continues to be reasonable assurance that such activities will be conducted in compliance with the Commission's regulations, and (3) the issuance of the amendments will not be inimical to the common defense and security or to the health and safety of the public.

NUCLEAR REGULATORY COMMISSION

[Docket Nos. 50-206, 50-361, and 50-362; NRC-2018-0004]

Southern California Edison Company

San Onofre Nuclear Generating Station, Units 1, 2, and 3

AGENCY: Nuclear Regulatory Commission.

ACTION: Exemption; issuance.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is issuing an exemption from the requirement to maintain a specified level of onsite property damage insurance in response to an October 22, 2015, request from the Southern California Edison Company (the licensee). Specifically, the licensee requested that the San Onofre Nuclear Generating Station, Units 1, 2, and 3, be granted an exemption to permit the licensee to reduce its onsite property damage insurance from $1.06 billion to $50 million.

ADDRESSES: Please refer to Docket ID **NRC-2018-0004** when contacting the NRC about the availability of information regarding this document. You may obtain publicly-available information related to this document using any of the following methods:

- **Federal Rulemaking Web Site:** Go to http://www.regulations.gov and search for Docket ID **NRC-2018-0004**. Address questions about NRC dockets to Carol Gallagher; telephone: 301-415-3463; e-mail: Carol.Gallagher@nrc.gov. For technical questions, contact the individual listed in the FOR FURTHER INFORMATION CONTACT section of this document.

- **NRC's Agencywide Documents Access and Management System (ADAMS):** You may obtain publicly available documents online in the ADAMS Public Documents collection at http://www.nrc.gov/reading-rm/adams.html. To begin the search, select "ADAMS Public Documents" and then select "Begin Web-based ADAMS Search." For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1-800-397-4209, 301-415-4737, or by e-mail to pdr.resource@nrc.gov. The ADAMS accession number for each document referenced (if it is available in ADAMS) is provided the first time that it is mentioned in this document.
- **NRC's PDR:** You may examine and purchase copies of public documents at the NRC's PDR, Room O1-F21, One White Flint North, 11555 Rockville Pike, Rockville, Maryland 20852.

SUPPLEMENTARY INFORMATION:

I. Background

The San Onofre Nuclear Generating Station, Units 1, 2, and 3 (SONGS), operated by the Southern California Edison Company (SCE) is located approximately 4 miles south of San Clemente, California. The SONGS, Unit 1, Docket No. 50-206, was a Westinghouse 456 megawatt electric (MWe) pressurized water reactor which was granted Facility Operating License No. DPR-13 on January 1, 1968 (ADAMS Accession

No. ML13309A138), and ceased operation on November 30, 1992 (ADAMS Accession No. ML13319B040). The licensee completed defueling on March 6, 1993 (ADAMS Accession No. ML13319B055), and maintained the unit in SAFSTOR until June 1999, when it initiated decommissioning (ADAMS Accession No. ML13319B111). On December 28, 1993 (ADAMS Accession No. ML13319B059), the NRC approved the Permanently Defueled Technical Specifications for SONGS, Unit 1.

The SCE submitted the proposed Decommissioning Plan for SONGS, Unit 1, on November 3, 1994 (ADAMS Accession No. ML13319B073). As a result of the 1996 revision to the regulations in section 50.82 of title 10 of the *Code of Federal Regulations* (10 CFR), the NRC replaced the requirement for a decommissioning plan with a requirement for a Post Shutdown Decommissioning Activities Report (PSDAR). On August 28, 1996, the SONGS, Unit 1, Decommissioning Plan became the SONGS 1 PSDAR (61 FR 67079; December 19, 1996). On December 15, 1998 (ADAMS Accession No. ML13184A353), SCE submitted an update to the PSDAR to the NRC, as required by 10 CFR 50.82(a)(7), in order to begin planning for the dismantlement and decommissioning of SONGS, Unit 1.

The SONGS, Units 2 and 3, Docket Nos. 50-361 and 50-362, are Combustion Engineering 1127 MWe pressurized water reactors, which were granted Facility Operating Licenses NPF-10 on February 16, 1982, and NPF-15 on November 15, 1982, respectively. In June 2013, pursuant to 10 CFR 50.82(a)(1)(i), the licensee certified to the NRC that as of June 7, 2013, operations had ceased at SONGS, Units 2 and 3 (ADAMS Accession No. ML131640201). The licensee subsequently certified, pursuant to 10 CFR 50.82(a)(1)(ii), that all fuel had been removed from the reactor vessels of both units, and committed to maintaining the units in a permanently defueled status (ADAMS Accession Nos. ML13204A304 and ML13183A391 for Unit 2 and Unit 3, respectively).

Therefore, pursuant to 10 CFR 50.82(a)(2), SCE's 10 CFR part 50 licenses no longer authorize operation of SONGS or emplacement or retention of fuel into the reactor vessels. The licensee is still authorized to possess and store irradiated nuclear fuel. Irradiated fuel is currently being stored onsite in spent fuel pools (SFPs) and in dry casks at an Independent Spent Fuel Storage Installation (ISFSI).

The PSDAR for SONGS, Units 2 and 3, was submitted on September 23, 2014 (ADAMS Accession No. ML14272A121), and the associated public meeting was held on October 27, 2014, in Carlsbad, California (ADAMS Accession No. ML14352A063). The NRC confirmed its review of the SONGS, Units 2 and 3, PSDAR and addressed public comments in a letter dated August 20, 2015 (ADAMS Accession No. ML15204A383). On July 17, 2015, the NRC approved the Permanently Defueled Technical Specifications for SONGS, Units 2 and 3 (ADAMS Accession No. ML15139A390).

II. Request/Action

Pursuant to 10 CFR 50.12, "Specific exemptions," SCE requested an exemption from 10 CFR 50.54(w)(1), by letter dated October 22, 2015 (ADAMS Accession No. ML15299A220). The exemption from the requirements of 10 CFR 50.54(w)(1) would permit the licensee to reduce the required level of onsite property damage insurance from $1.06 billion to $50 million.

The regulation at 10 CFR 50.54(w)(1) requires each licensee to have and maintain onsite property damage insurance to stabilize and decontaminate the reactor and reactor site in the event of an accident. The onsite insurance coverage must be either $1.06 billion or whatever amount of insurance is generally available from private sources (whichever is less).

The licensee states that the risk of an incident at a permanently shutdown and defueled reactor is much less than the risk from an operating power reactor. In addition, since reactor operation is no longer authorized at SONGS, there are no events that would require the stabilization of reactor conditions after an accident. Similarly, the risk of an accident that that would result in significant onsite contamination at SONGS is also much lower than the risk of such an event at operating reactors. Therefore, SCE is requesting an exemption from 10 CFR 50.54(w)(1) to reduce its onsite property damage insurance from $1.06 billion to $50 million, commensurate with the reduced risk of an incident at the permanently shutdown and defueled SONGS site.

III. Discussion

Under 10 CFR 50.12, the Commission may, upon application by any interested person or upon its own initiative, grant exemptions from the requirements of 10 CFR part 50 when (1) the exemptions are authorized by law, will not present an undue risk to public health or safety, and are consistent with the common defense and security; and (2) any of the special circumstances listed in 10 CFR 50.12(a)(2) are present.

The financial protection limits of 10 CFR 50.54(w)(1) were established after the Three Mile Island accident out of concern that licensees may be unable to financially cover onsite cleanup costs in the event of a major nuclear accident. The specified $1.06 billion coverage amount requirement was developed based on an analysis of an accident at a nuclear reactor operating at power, resulting in a large fission product release and requiring significant resource expenditures to stabilize the reactor and ultimately decontaminate and cleanup the site.

These cost estimates were developed based on the spectrum of postulated accidents for an operating nuclear reactor. Those costs were derived from the

consequences of a release of radioactive material from the reactor. Although the risk of an accident at an operating reactor is very low, the consequences onsite and offsite can be significant. In an operating plant, the high temperature and pressure of the reactor coolant system (RCS), as well as the inventory of relatively short-lived radionuclides, contribute to both the risk and consequences of an accident. With the permanent cessation of reactor operations at SONGS and the permanent removal of the fuel from the reactor cores, such accidents are no longer possible. As a result, the reactors, RCS, and supporting systems no longer operate and have no function related to the storage of the irradiated fuel. Therefore, postulated accidents involving failure or malfunction of the reactors, RCS, or supporting systems are no longer applicable.

As described in the PSDAR, SONGS, Unit 1, is being returned to a condition suitable for unrestricted use. According to SCE, there are no structures, systems, or components (SSCs) classified as safety-related remaining at SONGS, Unit 1. Plant dismantlement is complete and nearly all of the SSCs have been shipped offsite for disposal. Only the spent fuel, reactor vessel, and the below-grade portions of some buildings remain onsite. The principal remaining decommissioning activities are soil remediation, compaction, and grading. This is to be completed in conjunction with the future decommissioning of the ISFSI subsequent to shipment offsite of the SONGS stored spent fuel.

The licensee also stated that decommissioning of SONGS, Units 2 and 3, has begun and the nuclear reactors and essentially all associated SSCs in the nuclear steam supply system and balance of plant that supported the generation of power have been retired in place and are being prepared for removal. The SSCs that remain operable are associated with the SFPs and the spent fuel building, are needed to meet other regulatory requirements, or are needed to support other site facilities (e.g., radioactive

waste handling, ventilation and air conditioning, etc.). No remaining active SSCs are classified as safety-related.

During reactor decommissioning, the largest radiological risks are associated with the storage of spent fuel onsite. In its October 22, 2015, exemption request, SCE discusses both design-basis and beyond design-basis events involving irradiated fuel stored in the SFPs. The licensee determined that there are no possible design-basis events at SONGS that could result in an offsite radiological release exceeding the limits established by the U.S. Environmental Protection Agency's (EPA) early-phase Protective Action Guidelines (PAGs) of 1 rem (roentgen equivalent man) at the exclusion area boundary, as a way to demonstrate that any possible radiological releases would be minimal and not require precautionary protective actions (e.g., sheltering in place or evacuation). The staff evaluated the radiological consequences associated with various decommissioning activities, and design basis accidents at SONGS, in consideration of SONGS's permanently shut down and defueled status. The possible design-basis accident scenarios at SONGS have greatly reduced radiological consequences. Based on its review, the staff concluded that no reasonably conceivable design-basis accident exists that could cause an offsite release greater than the EPA PAGs.

The only incident that might lead to a significant radiological release at a decommissioning reactor is a zirconium fire. The zirconium fire scenario is a postulated, but highly unlikely, beyond design-basis accident scenario that involves loss of water inventory from the SFP, resulting in a significant heat-up of the spent fuel, and culminating in substantial zirconium cladding oxidation and fuel damage. The probability of a zirconium fire scenario is related to the decay heat of the irradiated fuel stored in the SFP. Therefore, the risks from a zirconium fire scenario continue to decrease as a function of the time that SONGS has been permanently shut down. The licensee

provided a detailed analysis of hypothetical beyond-design-basis accidents that could result in a radiological release at SONGS in its March 31, 2014, submittal to the NRC (ADAMS Accession No. ML14092A332), as supplemented by letters dated September 9, October 2, October 7, October 27, November 3, and December 15, 2014 (ADAMS Accession Nos. ML14258A003, ML14280A265, ML14287A228, ML14303A257, ML14309A195, and ML14351A078, respectively). One of these beyond design-basis accidents involves a complete loss of SFP water inventory, where cooling of the spent fuel would be primarily accomplished by natural circulation of air through the uncovered spent fuel assemblies. The licensee's analysis of this accident shows that by August 31, 2014, air-cooling of the spent fuel assemblies will be sufficient to keep the fuel within a safe temperature range indefinitely without fuel damage or offsite radiological release.

The Commission has previously authorized a lesser amount of onsite financial protection, based on this analysis of the zirconium fire risk. In SECY-96-256, "Changes to Financial Protection Requirements for Permanently Shutdown Nuclear Power Reactors, 10 CFR 50.54(w)(1) and 10 CFR 140.11," dated December 17, 1996 (ADAMS Accession No. ML15062A483), the staff recommended changes to the power reactor financial protection regulations that would allow licensees to lower onsite insurance levels to $50 million upon demonstration that the fuel stored in the SFP can be air-cooled. In its Staff Requirements Memorandum to SECY-96-256, dated January 28, 1997 (ADAMS Accession No. ML15062A454), the Commission supported the staff's recommendation that, among other things, would allow permanently shutdown power reactor licensees to reduce commercial onsite property damage insurance coverage to $50 million when the licensee was able to demonstrate the technical criterion that the spent fuel could be air-cooled if the spent fuel pool was drained of water. The staff has used this technical criterion to grant similar exemptions to other decommissioning

reactors (e.g., Maine Yankee Atomic Power Station, published in the *Federal Register* on January 19, 1999 (64 FR 2920); and Zion Nuclear Power Station, published in the *Federal Register* on December 28, 1999 (64 FR 72700)). These prior exemptions were based on these licensees demonstrating that the SFP could be air-cooled, consistent with the technical criterion discussed above.

In SECY-00-0145, "Integrated Rulemaking Plan for Nuclear Power Plant Decommissioning," dated June 28, 2000, and SECY-01-0100, "Policy Issues Related to Safeguards, Insurance, and Emergency Preparedness Regulations at Decommissioning Nuclear Power Plants Storing Fuel in the Spent Fuel Pool," dated June 4, 2001 (ADAMS Accession Nos. ML003721626 and ML011450420, respectively), the NRC staff discussed additional information concerning SFP zirconium fire risks at decommissioning reactors and associated implications for onsite property damage insurance. Providing an analysis of when the spent fuel stored in the SFP is capable of air-cooling is one measure that can be used to demonstrate that the probability of a zirconium fire is exceedingly low. However, the staff has more recently used an additional analysis that bounds an incomplete drain down of the SFP water, or some other catastrophic event (such as a complete drainage of the SFP with rearrangement of spent fuel rack geometry and/or the addition of rubble to the SFP). The analysis postulates that decay heat transfer from the spent fuel via conduction, convection, or radiation would be impeded. This analysis is often referred to as an adiabatic heatup.

The licensee's analyses referenced in its exemption request demonstrates that under conditions where the SFP water inventory has drained completely and only air-cooling of the stored irradiated fuel is available, there is reasonable assurance that after August 2014, the SONGS spent fuel will remain at temperatures far below those associated with a significant radiological release. However, a portion of the air-cooling

analyses credits operation of the normal fuel building ventilation systems because the fuel building structures are robust and offer little potential for natural air exchange with the environment for cooling. Because the normal fuel building ventilation could become unavailable during an initiating event that would lead to complete SFP drainage (i.e., a seismic event), the NRC staff also relied upon the additional time that the fuel in the SONGS SFPs has had to cool since the plant was permanently shutdown in June 2013 during its evaluation of the licensee's exemption request. As discussed in the staff response to a question in SECY-00-0145, "the staff believes that full insurance coverage must be maintained for 5 years or until a licensee can show by analysis that its spent fuel pool is no longer vulnerable to such [a zirconium] fire."

Although the official certifications for permanent cessation of power operations and permanent removal of fuel from the reactor vessel were not submitted until June 2013, the staff notes that SONGS was in an extended outage to address steam generator issues, and neither SONGS, Units 2 nor 3, have produced power since January 2012. This additional storage time for the fuel in the SONGS SFPs has allowed it to cool for greater than the 5 years suggested in SECY-00-0145, which supports the conclusion that zirconium fire risks from the irradiated fuel stored in the SFPs is of negligible concern and exemption from the requested requirements is warranted.

In addition to the air-cooling scenario, the licensee's adiabatic heat-up analyses demonstrate that as of October 12, 2014, there would be at least 17 hours after the loss of all means of cooling (both air and/or water), before the spent fuel cladding would reach a temperature where the potential for a significant offsite radiological release could occur. The licensee states that for this loss of all cooling scenario, 10 hours is sufficient

time for personnel to respond with additional resources, equipment, and capability to restore cooling to the SFPs, even after a non-credible, catastrophic event.

As provided in SCE's letters dated October 7 and December 15, 2014, the licensee furnished information concerning its makeup strategies, in the event of a loss of SFP coolant inventory. The multiple strategies for providing makeup to the SFPs include: using existing plant systems for inventory makeup; an internal strategy that relies on installed fire water pumps and service water or fire water storage tanks; or an external strategy that uses portable pumps to initiate makeup flow into the SFPs through a seismic standpipe and standard fire hoses routed to the SFPs or to a spray nozzle. These strategies will be maintained by a license condition until such time as all fuel has been moved to dry storage in an onsite ISFSI. The licensee states that the equipment needed to perform these actions are located onsite, and that the external makeup strategy (using portable pumps) is capable of being deployed within 2 hours. The licensee also stated that, considering the very low-probability of beyond design-basis accidents affecting the SFPs, these diverse strategies provide defense-in-depth and time to mitigate and prevent a zirconium fire, using makeup or spray into the SFPs before the onset of zirconium cladding rapid oxidation.

In the safety evaluation of the licensee's request for exemptions from certain emergency planning requirements dated June 4, 2015 (ADAMS Accession No. ML15082A204), the NRC staff assessed the SCE accident analyses associated with the radiological risks from a zirconium fire at the permanently shutdown and defueled SONGS site. The NRC staff has confirmed that under conditions where cooling air flow can develop, suitably conservative calculations indicate that by the end of August 2014, the fuel would remain at temperatures where the cladding would be undamaged for an unlimited period. The staff also finds that the additional cooling time provided

for the fuel between January 2012 and the issuance of this exemption provides reasonable assurance that zirconium fire risks from the irradiated fuel stored in the SFPs is of negligible concern. For the very unlikely beyond design-basis accident scenario, where the SFP coolant inventory is lost in such a manner that all methods of heat removal from the spent fuel are no longer available, there will be a minimum of 10 hours from the initiation of the accident until the cladding reaches a temperature where offsite radiological release might occur. The staff finds that 10 hours is sufficient time to support deployment of mitigation equipment, consistent with plant conditions, to prevent the zirconium cladding from reaching a point of rapid oxidation.

The staff's basis as to why it considers $50 million to be an adequate level of onsite property damage insurance for a decommissioning reactor, once the spent fuel in the SFP is no longer susceptible to a zirconium fire, is provided in SECY-96-256. The staff has postulated that there is still a potential for other radiological incidents at a decommissioning reactor that could result in significant onsite contamination besides a zirconium fire. In SECY-96-256, the NRC staff cited the rupture of a large (~450,000 gallon) liquid radioactive waste storage tank containing slightly radioactive water, causing soil contamination and potential groundwater contamination, as the most costly postulated event to decontaminate and remediate (other than a SFP zirconium fire). The postulated large liquid radwaste storage tank rupture event was determined to have a bounding onsite cleanup cost of approximately $50 million.

The NRC staff has determined that the licensee's proposed reduction in onsite property damage insurance coverage to a level of $50 million is consistent with SECY-96-256 and subsequent insurance considerations, resulting from additional zirconium fire risks, as discussed in SECY-00-0145 and SECY-01-0100. In addition, the NRC staff notes that similar exemptions have been granted to other permanently shutdown and

defueled power reactors, upon demonstration that the criterion of the zirconium fire risks from the irradiated fuel stored in the SFP is of negligible concern. As previously stated, the staff concluded that as of October 12, 2014, sufficient irradiated fuel decay time has elapsed at SONGS to decrease the probability of an onsite radiological release from a postulated zirconium fire accident to negligible levels. In addition, the licensee's proposal to reduce onsite insurance to a level of $50 million is consistent with the maximum estimated cleanup costs for the recovery from the rupture of a large liquid radwaste storage tank. Finally, the staff notes that in accordance with the SONGS PSDAR, all spent fuel will be removed from the SFPs and moved into dry storage at an onsite independent spent fuel storage installation (ISFSI) by the end of 2019, and the probability of an initiating event that would threaten pool integrity occurring before that time is extremely low, which further supports the conclusion that the zirconium fire risk is negligible.

The Exemption is Authorized by Law

In accordance with 10 CFR 50.12, the Commission may grant exemptions from the regulations in 10 CFR part 50 as the Commission determines are authorized by law. The NRC staff has determined that granting the licensee's proposed exemption will not result in a violation of the Atomic Energy Act of 1954, Section 170, as amended, other laws, or the Commission's regulations, which require licensees to maintain adequate financial protection. Therefore, the proposed exemption for SONGS from the onsite property damage insurance requirements of 10 CFR 50.54(w)(1) is authorized by law.

The Exemption Will Not Present an Undue Risk to Public Health and Safety

The onsite property damage insurance requirements of 10 CFR 50.54(w)(1) were established to provide financial assurance that following a significant nuclear incident,

onsite conditions could be stabilized and the site decontaminated. The requirements of 10 CFR 50.54(w)(1) and the existing level of onsite insurance coverage for SONGS are predicated on the assumption that the reactor is operating. However, SONGS is a permanently shutdown and defueled facility. The permanently defueled status of the facility has resulted in a significant reduction in the number and severity of potential accidents, and correspondingly, a significant reduction in the potential for and severity of onsite property damage. The proposed reduction in the amount of onsite insurance coverage does not impact the probability or consequences of potential accidents. The proposed level of insurance coverage is commensurate with the reduced risk and reduced cost consequences of potential nuclear accidents at SONGS. Therefore, the NRC staff concludes that granting the requested exemption will not present an undue risk to the health and safety of the public.

The Exemption is Consistent with the Common Defense and Security

The proposed exemption would not eliminate any requirements associated with physical protection of the site and would not adversely affect SCE's ability to physically secure the site or protect special nuclear material. Physical security measures at SONGS are not affected by the requested exemption. Therefore, the proposed exemption is consistent with the common defense and security.

Special Circumstances

Under 10 CFR 50.12(a)(2)(ii), special circumstances are present if the application of the regulation in the particular circumstances would not serve the underlying purpose of the rule or is not necessary to achieve the underlying purpose of the rule. The underlying purpose of 10 CFR 50.54(w)(1) is to provide reasonable assurance that adequate funds will be available to stabilize conditions and cover onsite cleanup costs

associated with site decontamination, following an accident that results in the release of a significant amount of radiological material. Because SONGS is permanently shut down and defueled, it is no longer possible for the radiological consequences of design-basis accidents or other credible events at SONGS to exceed the limits of the EPA PAGs at the exclusion area boundary. The licensee has performed site-specific analyses of highly unlikely, beyond-design-basis zirconium fire accidents involving the stored irradiated fuel in the SFPs. The analyses show that after October 12, 2014, the probabilities of such an accident are minimal. The NRC staff's evaluation of the licensee's analyses confirm this conclusion.

The NRC staff also finds that the licensee's proposed $50 million level of onsite insurance is consistent with the bounding cleanup and decontamination cost, as discussed in SECY-96-256, to account for hypothetical rupture of a large liquid radwaste tank at the SONGS site, should such an event occur. The staff notes that the SONGS technical specifications provide controls for unprotected outdoor liquid storage tanks to limit the quantity of radioactivity contained in these tanks, in the event of an uncontrolled release of the contents of these tanks. Therefore, the staff concludes that the application of the current requirements in 10 CFR 50.54(w)(1) to maintain $1.06 billion in onsite insurance coverage is not necessary to achieve the underlying purpose of the rule for the permanently shutdown and defueled SONGS reactors.

Under 10 CFR 50.12(a)(2)(iii), special circumstances are present whenever compliance would result in undue hardship or other costs that are significantly in excess of those contemplated when the regulation was adopted, or that are significantly in excess of those incurred by others similarly situated. The NRC staff concludes that if the licensee was required to continue to maintain an onsite insurance level of $1.06 billion, the associated insurance premiums would be in excess of those necessary and

commensurate with the radiological contamination risks posed by the SONGS site now that it has entered decommissioning. In addition, such insurance levels would be significantly in excess of other decommissioning reactor facilities that have been granted similar exemptions by the NRC.

The NRC staff finds that compliance with the existing rule would result in an undue hardship or other costs that are significantly in excess of those contemplated when the regulation was adopted and are significantly in excess of those incurred by others similarly situated. Therefore, the special circumstances required by 10 CFR 50.12(a)(2)(ii) and 10 CFR 50.12(a)(2)(iii) exist for the proposed exemption from the onsite property damage insurance requirements of 10 CFR 50.54(w)(1).

Environmental Considerations

The NRC approval of an exemption to insurance or indemnity requirements belongs to a category of actions that the Commission, by rule or regulation, has declared to be a categorical exclusion, after first finding that the category of actions does not individually or cumulatively have a significant effect on the human environment. Specifically, the exemption is categorically excluded from further analysis under 10 CFR 51.22(c)(25). Pursuant to 10 CFR 51.22(c)(25), the granting of an exemption from the requirements of any regulation in Chapter I of 10 CFR is a categorical exclusion provided that (i) there is no significant hazards consideration; (ii) there is no significant change in the types or significant increase in the amounts of any effluents that may be released offsite; (iii) there is no significant increase in individual or cumulative public or occupational radiation exposure; (iv) there is no significant construction impact; (v) there is no significant increase in the potential for or consequences from radiological

accidents; and (vi) the requirements from which an exemption is sought are among those identified in 10 CFR 51.22(c)(25)(vi).

The NRC staff has determined that approval of the exemption request involves no significant hazards consideration because reducing the licensee's onsite property damage insurance at the decommissioning San Onofre Nuclear Generating Station, Units 1, 2, and 3, does not (1) involve a significant increase in the probability or consequences of an accident previously evaluated; (2) create the possibility of a new or different kind of accident from any accident previously evaluated; or (3) involve a significant reduction in a margin of safety. The exempted financial protection regulation is unrelated to the operation of SONGS.

Accordingly, there is no significant change in the types or significant increase in the amounts of any effluents that may be released offsite, and no significant increase in individual or cumulative public or occupational radiation exposure. The exempted regulation is not associated with construction, so there is no significant construction impact. The exempted regulation does not concern the source term (i.e., potential amount of radiation involved an accident) or accident mitigation; therefore, there is no significant increase in the potential for, or consequences from, a radiological accident. In addition, there would be no significant impacts to biota, water resources, historic properties, cultural resources, or socioeconomic conditions in the region. The requirement for onsite property damage insurance may be viewed as involving surety, insurance, or indemnity matters in accordance with 10 CFR 51.22(c)(25)(vi).

Therefore, pursuant to 10 CFR 51.22(b) and 10 CFR 51.22(c)(25), no environmental impact statement or environmental assessment need be prepared in connection with the approval of this exemption request.

IV. Conclusions

Accordingly, the Commission has determined that, pursuant to 10 CFR 50.12(a), the exemption from 10 CFR 50.54(w)(1) is authorized by law, will not present an undue risk to the public health and safety, and is consistent with the common defense and security. In addition, special circumstances are present. Therefore, the Commission hereby grants SCE an exemption from the requirements of 10 CFR 50.54(w)(1), to permit the licensee to reduce its onsite property damage insurance to a level of $50 million.

This exemption is effective upon issuance.

Dated at Rockville, Maryland, this 5th day of January, 2018.

For the Nuclear Regulatory Commission.

NRC Webinar
San Onofre Nuclear Generating Station Final Enforcement Action and Follow-up Inspection Preliminary Results

March 25, 2019

NRC Region IV, Arlington, TX

NRC Region IV Presenters

- Linda Howell, Deputy Director
  Division of Nuclear Materials Safety

- Lee Brookhart, Senior Inspector, Team Leader
  Fuel Cycle and Decommissioning Branch
  Division of Nuclear Materials Safety

Agenda

Topic	Participants
Opening Remarks	Linda Howell
Final Enforcement Action	Linda Howell
NRC Follow up Inspection Activities	Lee Brookhart
Path Forward	Linda Howell
Questions and Answers/Discussion	All Webinar Participants Michael Bloodgood, Facilitator
Closing Remarks	Linda Howell

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

- Only in the event of technical difficulties with the webinar, a telephone bridge line will be used:
  - –Bridge Number: (800) 369-1771
  - –Passcode: 7382934
  - –Link to NRC Spotlight web page: https://www.nrc.gov/reactors/operating/ops-experience/songs-spec-insp-activities-cask-loading-misalignment.html

Predecisional Enforcement Conference

- Held on January 24, 2019
- Discussed two apparent violations, safety significance, root causes, and corrective actions

SIGNIFICANCE = "Severity Level"

SEVERITY LEVEL – I
(most significant regulatory concern)

SEVERITY LEVEL – II
(very significant regulatory concern)

SEVERITY LEVEL – III
(significant regulatory concern)

(Escalated Enforcement)

(Non-Escalated Enforcement)

SEVERITY LEVEL – IV
(less significant concern, but more than minor)

Civil Penalty Assessment

- NRC Enforcement Policy Considers:
  - –Enforcement history
  - –Whether the licensee identified the issue
  - –Adequacy of corrective actions

Violation No. 1
Loss of Redundant Drop Protection Features

10 CFR 72.212(b)(3) requires, in part, that each cask used by the general licensee conforms to the terms, conditions, and specifications of a Certificate of Compliance. The spent fuel storage system's Certificate of Compliance requires that the canister be lifted and carried with redundant drop protection features to prevent uncontrolled lowering of the load.

Violation No. 1
Loss of Redundant Drop Protection Features

- S v r t / L v I Vi t
- $116,0 vi Pe y

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Violation No. 2
Failure to Make Required Notification to NRC

10 CFR 72.75(d)(1) requires, in part, that each licensee notify the NRC within 24 hours after the discovery of events involving spent fuel in which important to safety equipment is disabled or fails to function as designed when required to mitigate the consequences of an accident and redundant safety equipment is not available.

Violation No. 2
Failure to Make Required Notification to NRC

- Severity Level III Violation
- No Civil Penalty

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Licensee Response to NRC's Enforcement Action

Southern California Edison has three options:

- Accept the violations and pay civil penalty
- Deny the violation(s) or severity levels
- Protest civil penalty in whole or in part

NRC Follow-up Inspection Activities

- To Determine If:
  - –Root and contributing causes were understood
  - –Extent of condition and extent of cause were identified
  - –Corrective actions taken to preclude reoccurrence were effective

Licensee Causal Evaluations

Four causal evaluations performed by Licensee:

- Root Cause for Downloading Incident
- Apparent Cause to Assess Licensee's Oversight
- Common Cause Evaluation
- Root Cause for Reportability

NRC determined that the evaluations were of adequate depth and breadth; however, two weaknesses were identified.

Causal Evaluations Weaknesses

- Inadequate changes to Executive Oversight Board process
- Issues with Radiation Protection were not formally addressed in causal evaluations

Corrective Actions

- **From the Four Cause Evaluations:**
  - Total of 71 Corrective Actions
  - Total of 9 Corrective Actions to Preclude Repetition
  - Total of 8 Effectiveness Reviews

- **NRC Assessment:**

The corrective actions were comprehensive to address and prevent reoccurrence; however, six corrective action weakness were identified.

Corrective Actions

Subject Areas

- Procedures Changes
- Personnel Enhancements
- Equipment
- Training
- Corrective Action Program
- Demonstrations
- Reportability
- Special Inspection Follow-up Items

Procedures

- **Licensee made changes to spent fuel handling procedures**
  - Critical steps with specific criteria
  - Clearly defined personnel roles, responsibilities, and qualifications
  - Load monitoring equipment enhancements
  - Additional required personnel during downloading

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Corrective Action Weaknesses

- Downloading Procedure
  - –Lacked contingency steps for equipment failures
  - –Incomplete criteria for suspending downloading operations
  - –Incomplete steps to maintain seismic qualifications during cask transport from fuel building to the storage pad

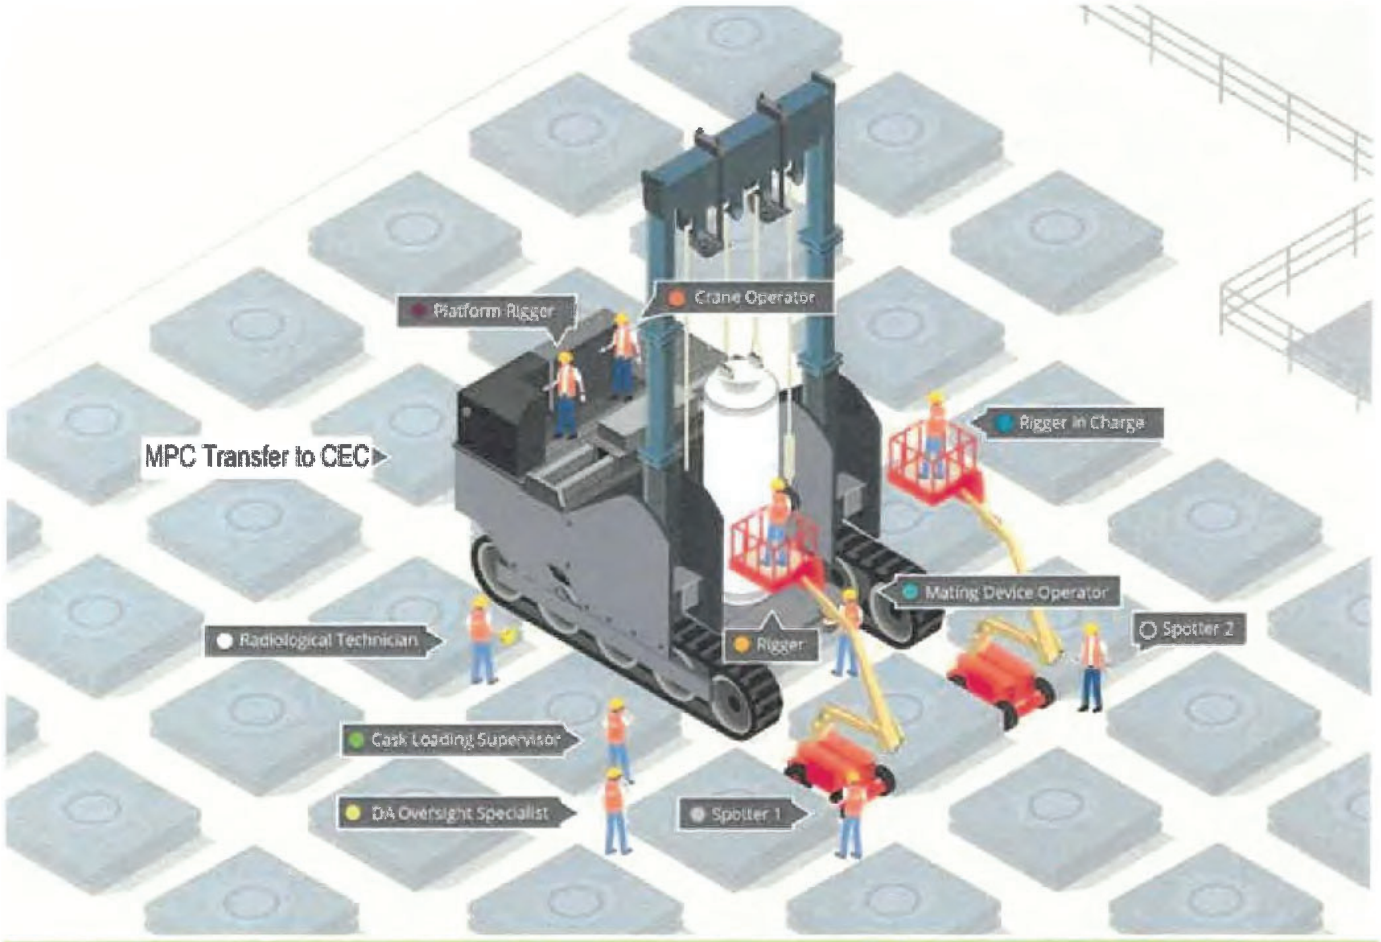
Personnel Enhancements

Previous Personnel on the Storage Pad

- Vertical Cask Transporter Operator
- Spotter in lift basket

Revised Personnel on the Storage Pad

- Vertical Cask Transporter Operator
- Vertical Cask Transporter Platform Rigger
- Rigger-in-Charge in lift basket
- 2nd Rigger in 2nd lift basket
- Cask Loading Supervisor
- Licensee Oversight Specialist
- Radiation Protection personnel
- Two Vertical Cask Transporter spotters
- Mating Device Operator



Revised Downloading Personnel 21

Camera above Transfer Cask

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Corrective Action Weakness

- Improper classification of new equipment
  - Intermediate slings and devices
- Inadequate procurement of Important to Safety equipment
  - Load cell devices

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Training

- Developed SONGS specific spent fuel training programs and training procedures
- Revised training program for SONGS Oversight Specialists
- Revised Corrective Action Program training
- Developed event notification training

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Oversight

- Revised contractor oversight procedures
- Dedicated additional SONGS oversight personnel for contractors

NRC identified a weakness regarding maintenance procedure review

Corrective Action Program

- Holtec project personnel work directly under SONGS Corrective Action Program
- Established a full-time Quality Assurance Manager Position
- Training conducted to emphasize use of a low-threshold for initiating corrective action process

Demonstrations Observed by NRC

- Demonstrated moving transfer cask from fuel building to storage pad
  - HI-PORT operations
  - Vertical cask transporter operations
- Demonstrated simulator canister downloading
- Demonstrated simulator canister uploading
- Demonstrated revised fuel building lifting operations

Transfer Cask on HI-PORT to Storage Pad

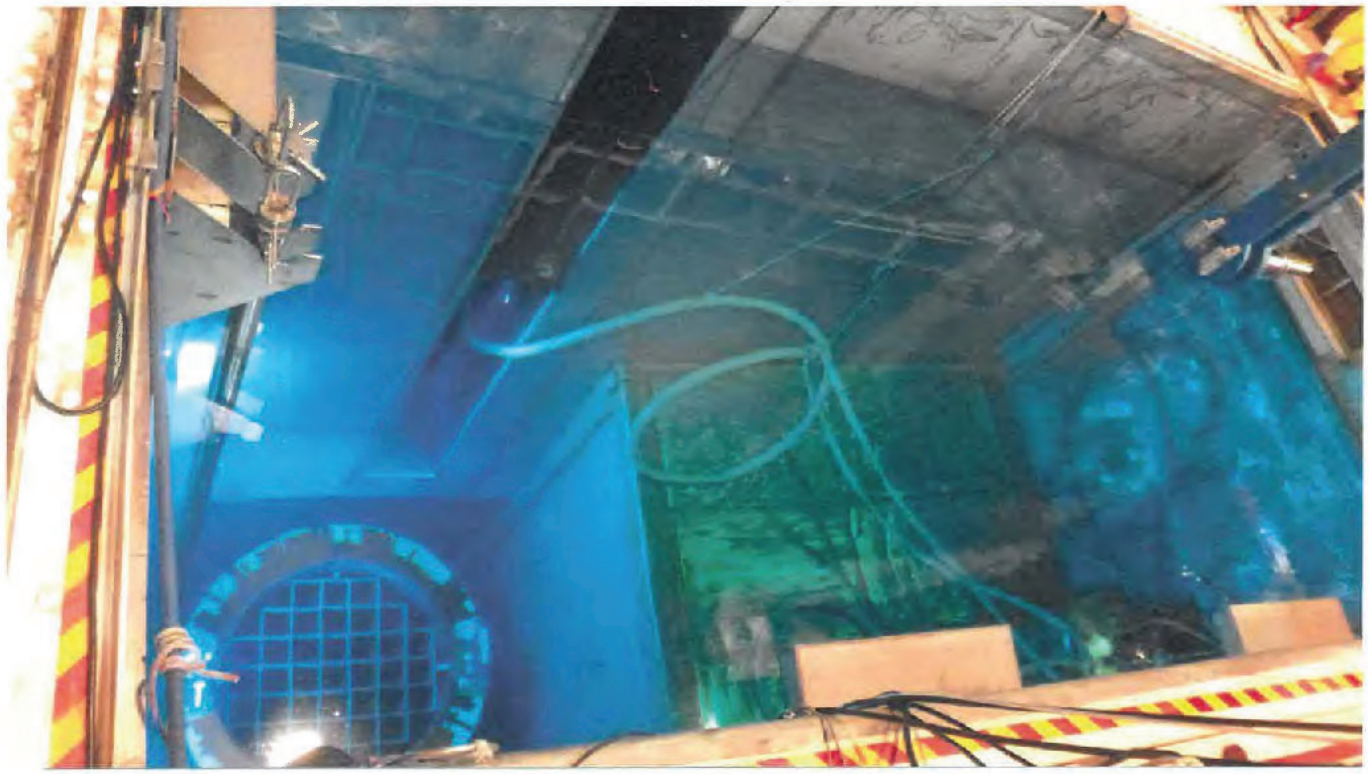
Fuel Building Operations



U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Corrective Actions Weakness

- Removal of restraint band from HI-TRAC invalidated seismic analysis

U.S.NRC
United States Nuclear Regulatory Commission
Protecting People and the Environment

Reportability

- Revised Notification Procedure to have a conservative bias
- Developed Reportability Training for Managers and Regulatory Affairs personnel
  - Identify reportable events
  - Identify Important to Safety components
  - Identify potential failures or deviations that require NRC notification
- Biennial Refresher Training

Special Inspection Follow-up Items

- Drop Evaluation
  - Canister integrity maintained
  - Fuel damage would likely occur
- Scratch Evaluation
  - Inadequate to support change to Final Safety Analysis Report
  - Several calculation errors

Path Forward

- Corrective actions implemented for causal factors and issues identified during Special Inspection
- Outstanding issue is the assessment of ongoing licensee analyses and process used to change the Final Safety Analysis Report (FSAR)
- Enhanced inspection oversight continues
- Licensee continues to suspend fuel loading operations until analysis is complete and NRC has reviewed the results

CONCLUSION OF WEBINAR

EXHIBIT 13

WEBINAR TRANSCRIPT

This document provides the transcript from a public meeting (webinar) that was held on November 8, 2018, to discuss preliminary observations of an NRC special inspection that was conducted at San Onofre Nuclear Generating Station in September 2018. The inspection was conducted in response to a situation that resulted in the misalignment of a multi-purpose canister loaded with spent fuel at the San Onofre Nuclear Generating Station.

Hosts of Webinar:

Troy Pruett, Director
Division of Nuclear Materials Safety
Region IV

Patricia Silva, Chief
Inspection and Operations Branch
Division of Spent Fuel Management
Office of Nuclear Material Safety and Safeguards

Eric Simpson, Health Physicist
Fuel Cycle and Decommissioning Branch
Division of Nuclear Materials Safety
Region IV

- This is Troy Pruett, with the NRC
in Region IV, and we're going to commence today's webinar
on the results of the San Onofre special inspection.
Thank you for joining the webinar.
NRC speakers will present information related
to the August 3rd, 2018 misalignment
of a multi-purpose canister loaded with spent fuel
at the San Onofre Nuclear Generating Station.
This is the NRC Region IV's first use
of the webinar format to provide information
to the public on a special inspection.
There's are pros and cons
for conducting a webinar public meeting
in place of a face to face meeting.
Ultimately, we decided that the large number
of people from across the United States
that were interested in learning more
about this event made the webinar the best option.
During the webinar, we will present information
explaining photographs and bullets shown on the slides.
The photos we are referencing today are
from downloading operations that occurred prior
to the August 3rd event.
The slides are also available from the webinar handout tab,
as well as the NRC Spotlight Section
on the NRC public webpage at www
.NRC.gov.
From the Spotlight Section, click
on SONGS Cask Loading Issue, and from there,
you'll see a variety of documents available for your review,
today's slides being one of the options.
During the presentation, you may submit written comments

and questions via the webinar chatroom feature.
NRC staff will collect items, and refer them
to today's panel, the NRC panel will answer questions
and respond to comments as time allows.
The webinar is scheduled to end at 5:00 p.m. Central Time,
or 3:00 p.m., Pacific.
If, for some reason, the NRC loses internet connectivity,
we will dial into a telephone bridge line,
and continue the presentation.
The backup bridge line may be reached
by dialing 888-
469-
1677,
and the passcode is 247-
1451.
And again, we will only use this bridge line
if the internet connection
for the NRC fails during the webinar.
We are recording the session today,
and plan to make the video publicly available.
Today's NRC panel has three members,
myself, Troy Pruett, and I'm the Director
of Nuclear Materials Safety in Region IV.
The Region IV office is located in Arlington, Texas,
and my division oversees the inspection activities
at San Onofre.
Also on the panel is Eric Simpson.
Eric is the Special Inspection Team Leader
for the event we are presenting today.
Eric is also an inspector in NRC Region IV.
We also have Patty Silva, Patty is a Branch Chief

from the Division of Spent Fuel Management,
in our headquarters office in Rockville, Maryland.
Patty was also a member of the Special Inspection Team.
Patty joined the panel to provide responses
to some of the questions or comments you might have
that are beyond the scope of Eric's special inspection.
Supporting our presentation,
we have technical staff monitoring the chatroom
for questions and comments,
and communications staff monitoring
and adjusting the audio and video.
Via, our webinar capability will only host up
to 500 participants,
and my staff has communicated
to me that we have hit the 500 registered limit,
and so, just as a reminder, if you encounter somebody
that's not able to log in to the webinar today,
remind them that the presentation will be publicly available
after the meeting, once we get the recording transcribed,
and posted to the public webpage.
So Eric will provide most of the information
regarding the misalignment event at San Onofre.
Eric will begin with background information
on the independent spent fuel storage installation
at San Onofre, he will then provide an overview
of a typical downloading operation.
By downloading, I mean the operation
that lowers the multipurpose canister into the storage vault
at the independent spent fuel storage installation.
Eric will then cover what happened on August 3rd, 2018,
during the downloading operation.
After he explains the event,

Eric will outline the NRC's regulatory concerns,
and our next steps.
While the misalignment event at San Onofre is serious,
at no time was there an actual load drop,
and at no time was there a release
of radioactive material from the multipurpose canister.
Once Eric has completed his presentation,
the NRC panel will begin responding
to questions and comments, when multiple questions
and comments on a similar topic are received,
the NRC staff monitoring the chatroom will provide
the panel a representative question or comment.
I'll now turn the presentation over to Eric.
- Good afternoon, I am Eric Simpson,
a Dry Fuel Storage Inspector of the NRC Region IV office,
here in Arlington, Texas.
Before we discuss the August 3rd event at San Onofre,
I would like to acknowledge the other members
of the NRC Special Inspection Team
that are not sitting on the panel with us today,
those members being Marlon Davis, NRC Headquarters Inspector
for the Division of Spent Fuel Management,
Chris Smith, a Region IV Engineering Inspector,
my Branch Chief, Dr. Janine Katanic, and Mr. Lee Brookhart,
our Senior Dry Fuel Storage Inspector, who has been working
behind the scenes throughout our efforts.
Let's start with an overview of the
San Onofre Independent Spent Fuel Storage Installation.
You will hear me refer
to Independent Spent Fuel Storage Installations as ISFSIs
for short throughout this webinar.

What you see is an overhead schematic
of the San Onofre ISFSI, north is to the left,
which places the Transnuclear horizontal ISFSI
on the eastern side, and the Holtec UMAX ISFSI
on the west, or bottom of the map.
The design is a horizontal storage module.
San Onofre has 63 horizontal storage modules
on this eastern ISFSI pad, 51 of which are loaded
with spent fuel in Unit One reactor waste,
the other three are empty, to the west
of the horizontal ISFSI is the Holtec UMAX ISFSI,
spent fuel is stored in stainless steel canisters
called multipurpose canisters, or MPCs.
Today we will refer to the MPCs simply as a canister.
The canisters are stored vertically
in the UMAX ISFSI vault.
San Onofre has room for 75 canisters in its UMAX ISFSI.
San Onofre had about 2,668 spent fuel assemblies stored
in its unit two and three spent fuel pools.
Currently, about 40% of the spent fuel has been transferred
to the UMAX ISFSI.
This photo shows what it's like looking down
into a UMAX storage vault, what you see are the features
of the divider shell,
we will discuss this in more detail later,
but for now, make a note of the shield ring.
During the August 3rd event, a portion
of the canister was resting on the shield ring.
San Onofre personnel and Holtec contractors failed
to note the misalignment, and that the weight
of the canister was no longer being supported
by the important-to-safety lifting equipment.

This photo shows a Holtec canister.
Spent fuel is placed into a canister
while it is inside the transfer cask.
The transfer cask is then placed
to reduce radiation exposures to workers,
and it is also used to help move the loaded canister out
onto the ISFSI pad.
This photo shows a shield cone.
After loading, the canister of spent fuel contents are dried
and welded shut, the shield cone is installed
on the canister as an additional help
to reduce radiation dose to cask storage workers.
The green slings are for retrieval
of the shield cone after the canister has been lowered
into the storage vault.
The yellow slings are important-to-safety, and are intended
to hold the canister weight during downloading operations.
This photo shows the flat bed transporter
with a transfer cask meeting up
with the vertical cask transporter.
The transfer cask, with the canister inside,
is moved from the fuel building
to the ISFSI pad used in a flatbed transporter.
A vertical cask transporter is used
to move the transfer cask into position
on the ISFSI pad, the vertical cask transporter is also used
to align the transfer cask and the canister
for downloading operations.
This photo shows the mating device used
to connect the transfer cask to the ISFSI vault.
The mating device has a hydraulic door

to allow access from the transfer cask into the ISFSI vault.
As you can see, the mating device is open in this photo.
This photo shows the vertical cask transporter being aligned
to the mating device,
the vertical cask transporter is positioned
over the mating device, properly aligned,
and then they're bolted together.
The mating device door is closed during this process.
This picture shows the spotters,
those are the people in the lift baskets,
pulling the slings through the sheaths
on the vertical cask transporter crossbeam.
The important-to-safety yellow slings are connected
to the canister through lift cleats in the shield cone,
and anchored to the vertical cask transporter.
This photo shows the canister ready for downloading,
the vertical cask transporter lift beam has been raised,
and the full load
of the spent fuel canister is being suspended.
The mating device door is open,
allowing the canister to be downloaded into the ISFSI vault.
So, what exactly happened on August 3rd?
This slide shows a schematic of the ISFSI pad,
and the location of the low dose waiting area.
The slide also shows a photo of the view from that location,
as you can see from the photo to the right,
the low dose waiting area has an obstructed view
of what is happening out on the pad.
Before downloading, all oversight staff,
other than the spotter
and the vertical cask transporter operator, are moved
to the low dose area.

From this position, none of the management
or supervisory oversight staff from San Onofre
or Holtec could observe the downloading of the canister.
San Onofre oversight staff did not have radio headsets,
and did not monitor communications
between the cask loading supervisor, spotter,
and vertical cask transporter operator.
This slide shows photos of the vertical cask transporter,
and the control panel.
The vertical cask transporter operator attempted
to lower the canister into the vault
by lowering the vertical cask transporter lift beam.
The NRC identified numerous deficiencies involving
the operation of the vertical cask transporter.
First, the training program did not ensure
the vertical cask transporter operator was capable
of performing the canister download.
Second, the vertical cask transporter operator is seated
behind shielding, and cannot see the canister being lowered
into the vault, third, cameras are not used
to aid the vertical cask transporter operator,
or oversight staff during downloading operations.
Fourth, the vertical cask transporter operator
did not monitor data available
on the vertical cask transporter control panel
during the download.
As a result, the vertical cask transporter operator
did not identify a decrease in hydraulic pressure,
which in and of itself is an indication
of a loss of mode condition.
Fifth, procedures did not provide adequate instructions

for the monitoring
of critical parameters during the download.
Lastly, the August 3rd event was the first time
for the vertical cask transporter operator
to download a spent fuel canister into the vault,
and no supervisory oversight was available
on the vertical cask transporter.
This slide shows a spotter in position
to observe the download,
the spotter was the only person capable of observing
the canister being downloaded during this event.
NRC identified numerous deficiencies involving
the spotter positioning, first,
the training program did not ensure the spotter was capable
of performing a canister download.
Second, procedures did not provide adequate instruction
for monitoring of critical parameters
during download processes.
Third, the August 3rd event was the first time
for the spotter to download a spent fuel canister
into the ISFSI vault, and no supervisory oversight
was available in the lift basket.
Fourth, no cameras were provided for management
and supervisory oversight to observe the download.
Fifth, once the downloading was in progress,
the spotter moved the lift to the side,
where he could no longer directly observe
the canister's progress into the ISFSI vault, and lastly,
the spotter did not know how
to determine the important-to-safety slings for slack.
Communications during the download were informal,
and failed to relay critical information,

for example, during the download, the spotter communicated
that the canister was four feet down.
Management and supervisor incorrectly believed
this meant four feet below the mating device, it did not.
The VCT operator fully lowered
the vertical cask transporter crossbeam, and communicated
that the canister was fully loaded, lowered into the vault.
A radiation protection technician noticed
the dose rates were significantly higher than expected,
and alerted the cask loading supervisor.
Station personnel observed that the slings were slack,
and that the canister was not downloaded.
At the direction of the rigger in charge,
at the direction of the rigger in charge,
the vertical cask transporter operator raised the lift beam
to regain load of the canister.
The canister was properly aligned,
and then lowered into the ISFSI vault.
The canister load was unsupported by lifting equipment
for approximately 53 minutes.
This slide shows a photo of the installed canister
in the ISFSI vault.
Before starting downloads of lowered canisters,
San Onofre trains staff using test equipment.
The training canister was smaller
than the actual canisters used at San Onofre.
The training canister provided about three quarter
of an inch more clearance, this made the lining
and lowering the training canister much easier
than would be experienced
during actual downloading operations.

Staff conducting downloading operations were not trained
on the differences,
when training does not match the actual conditions,
we refer to this as negative training.
During downloading operations,
San Onofre frequently experienced the bottoms
of canisters getting caught on the shield ring.
San Onofre never identified the misalignments
as conditions adverse to quality, consequently,
San Onofre never implemented actions
that would have prevented the August 3rd event.
On August 3rd, the canister made contact,
and rested on the shield ring, if you look closely
at the picture, you can see contact surface wear,
paint scrape, but no deformation of the shield ring.
San Onofre has not inspected the bottom of the canister,
their preliminary analysis indicates negligible wear
on the canister.
The NRC will evaluate San Onofre's analyses,
and San Onofre's plan to monitor the canisters,
as part of their Aging Management Program, when completed.
The NRC does not believe there is
an immediate canister integrity concern, so,
what's been done since August 3rd?
We'll look at San Onofre's activities since August 3rd,
then we'll look at NRC's actions.
We will discuss San Onofre's notification
to the NRC Operation Center, we'll briefly touch
on San Onofre's causal evaluations, and lastly,
we'll touch on San Onofre's proposed corrective actions.
The canister involved
in the August 3rd event was successfully lowered

into the UMAX ISFSI vault, we call this canister MPC 29
because it was the 29th canister loaded at San Onofre.
After MPC 29 was lowered into the ISFSI vault,
San Onofre immediately put a halt
to all spent fuel activities on site.
There was a spent fuel canister
that was being processed in a Unit Two Fuel Building,
that canister was fully processed, meaning it was dried,
helium back-fill operations were completed,
final welding of the closure rings were performed,
and it is currently in the Unit Three Fuel Building.
It is seismically restrained, it is placed
in a transfer cask, and this is a condition
that is acceptable for the canister,
and its spent fuel contents.
NRC's involvement, we were notified of the August 3rd event
on the afternoon of August 6th.
We then initiated daily oversight communications
between San Onofre, NRC headquarters,
and ourselves in the regional office.
On August 7th, San Onofre committed to an NRC review,
before resuming dry cask loading operations.
On August 17th, we decided to conduct a special inspection.
If you go to the Spotlight Section of the NRC website,
our charter is available for review there.
We arrived at San Onofre to initiate our special inspection
on September 10th, we were onsite the entire week,
reviewing procedures, records,
and talking with former and current employees.
The inspection continued offsite until we formally exited
with San Onofre on this past Thursday, November 1st,

which brings us to our findings.
We have two preliminary violations
that are being considered for escalated enforcement,
those being a preliminary violation
for the event itself, San Onofre's license requires
that during downloading operations, the canister, MPC,
be handled with redundant drop protection features
to prevent uncontrolled lowering of the load.
Contrary to the requirement, during MPC transfer,
when loaded with spent fuel, the licensee failed to ensure
the lifting equipment had redundant drop protection features
to prevent uncontrolled lowering.
Specifically, San Onofre inadvertently disabled
the important-to-safety downloaded slings,
when personnel lowered
the vertical cask transporter crossbeam
to the fully seated position, while the MPC was suspended
by the shield ring, approximately 18 feet
above the fully seated position in the vault.
The second preliminary violation being considered
for escalated enforcement is the notification requirement.
10CFR
72.75(d)(1)
requires
that a licensee notify the NRC
within 24 hours when important-to-safety equipment
is disabled, or fails to function as designed.
Contrary to the requirement, San Onofre failed
to make proper NRC notification
of the August 3rd event to the NRC Operation Center,
until September 14th, they were prompted by us
to make the required notification during our inspection.

We are also considering three preliminary violations
of lesser severity level to San Onofre,
a violation for inadequate procedures, a violation
for failing to acknowledge conditions adverse to quality
for entry into the site's corrective action program,
and a violation for inadequate training
of personnel operating important-to-safety equipment.
It is important to note
that management oversight weaknesses contributed to each
of the preliminary violations being considered by NRC.
Southern California Edison
and Holtec have both performed causal evaluations related
to the August 3rd event.
Preliminary root and apparent causes are lack
of adequate procedures, lack of adequate training
to support the procedures, lack
of adequate licensee oversight of contractor activities.
Some of the preliminary corrective actions
at San Onofre revolve around enhancing
the training requirements, procedure enhancements,
and equipment enhancements to give more positive indication
of a loss of load condition.
San Onofre is also looking at improving its performance
in the oversight role.
NRC will perform an inspection at San Onofre
to fully assess its corrective actions,
prior to them resuming fuel handling operations.
A word or two about the event, and its significance.
San Onofre was not required to have a drop analysis
for this type of event because the license required
redundant drop protection features at all times.

That's why this misalignment event is so very significant.
San Onofre provided preliminary analysis
of a canister drop from 19 feet into the vault,
that analysis is still under review by NRC experts.
The San Onofre analysis document
that the canister must still maintain confinement,
and that no breach would occur, however,
the analysis does describe that some fuel assemblies
would likely fail, due to the drop.
However, the San Onofre preliminary analysis describes
that the canister would still be able to perform safely,
it would still meet all thermal, pressure,
criticality, and confinement criteria.
This part of the analysis is still under review.
NRC plans to issue its special inspection report
before the Thanksgiving holiday.
Next steps involve dispositioning
the escalated enforcement findings,
which means moving through the NRC enforcement process,
along with San Onofre,
to disposition with preliminary violations
and severity levels to be assigned.
The timing of that process begins
once we issue the inspection report.
Having moved through the events of August 3rd,
and having discussed NRC and San Onofre's next steps,
I'll hand the presentation back over to Mr. Troy Pruett.
- Thank you, Eric, I'm going to,
I'm going to pause for just a second, and,
and ask a couple of questions to you.
- Okay.
- That, that we've been receiving through the chatroom.

- All right.
- One of the questions involves redundant drop protection,
and so what was the redundant drop protection?
- Okay, as I mentioned earlier in the presentation,
I pointed out two yellow slings,
each of those slings can fully support the weight
of a loaded canister, that is to say,
the weight of a loaded MPC, and since there are two slings,
that counts as redundant drop protection.
Again, they can both completely support the weight
of the loaded MPC, if one fails,
the other one is there to provide that redundant protection.
- Right, so Rachel, could you pull up slide 10?
- There we are.
- Right, so slide 10 is the picture
of the shield cone, and as Eric mentioned earlier,
there's a photo there showing the two yellow slings,
that is the redundant drop protection, so.
- Yes, and the event revolves
around inadvertently disabling both of those slings
by having the crossbeam in the fully lowered position,
while those slings were completely slack.
If there had been, in the event of a drop,
those slings would have been rendered completely incapable
of stopping that drop.
- And then there were another set of questions, was,
just, just how much does one of these canisters weigh?
- Well, they're analyzed to weigh up to 113,000 pounds,
but I think the MPC in question was roughly
around 100,000 pounds, so 50 tons.
- Okay, and then, and then

about how many fuel assemblies does the canister hold?

- Each fuel, each MPC 37, as named,

will hold 37 spent fuel assemblies.

- Okay, thank you, so I'm going to,

I'm going to conclude the, our meeting presentation,

and then we still have some more questions that my staff

that's monitoring the chatroom is sending me,

and we'll jump into the questions in just a minute, so.

So I bet the take aways are,

this event could have been prevented

with effective management and supervisory oversight

of important-to-safety operations performed at San Onofre.

Management oversight weaknesses led

to inadequate training of the staff,

the failure to provide appropriate procedures,

not identifying and correcting conditions adverse

to quality, and not providing appropriate supervision

at job sites, these deficiencies converged

on August the 3rd, resulting in a failure

to provide redundant load drop protection,

during the downloading of a spent fuel canister.

As a result, the NRC has increased the regulatory oversight

at the facility to ensure that the root

and contributing causes are understood,

and that the corrective actions will prevent another loss

of load event, so with that,

that's going to wrap up our formal part of the presentation,

and we're going to transition into responding

to the questions and the comments

that we're receiving in the chatroom.

So one of the,

or many of the questions

and comments involve the retrievability of a canister.
And I know, Patty, this was something we talked
about yesterday, would you like to touch on what the,
is a licensee required to be able to retrieve a canister,
and maybe Eric, you can jump in if you,
if you hear something that needs to be said.
- Well, if you like, I can start off
on this, and-- - Okay, all right.
Fair enough. - Well, 10CFR72
.122(l)
requires that storage systems must be designed
to allow ready retrieval of spent fuel,
high level waste, and reactor related grade
and class C waste for further processing of disposal,
and each licensee must demonstrate the ability
to retrieve a canister, for taking back
into the spent fuel pool, if it's available.
And licensees are also required to demonstrate the ability
to cut open a canister to allow them access
to the spent fuel contents inside.
Now, saying this, I will tell you all that each licensee,
generally, does not have to display the ability
to cut open a canister, we allow for the vendor
to demonstrate the ability to cut
that canister open at their facility, the belief being
that if the licensee ends up in the position
where they have to retrieve a canister,
and take it back into their spent fuel pool,
the vendor can provide them
with the equipment to cut that canister open.
And Holtec has demonstrated

that they can cut open an MPC 37, or an MPC 89 canister,
which are other types of canisters
that are licensed for storage in the UMAX vault.
- And then, and then, Eric, I'm going to send this question
to you, as well. - Okay.
- Was there actual damage to the canister in question?
- We don't believe there was damage
to the canister in question, or at least not to the extent
that its safety features are being disabled, however,
we think that the Aging Management process will be able
to go in and inspect these canisters
because San Onofre is part of the Aging Management,
we will be inspecting the canisters for degradation,
beginning within five years.
- And what, if this canister really dropped,
as a result of this misalignment event,
what do you perceive the consequences would have been?
- Well, as it stands now,
we do not believe the canister would have been breached.
It would have ended up being a question of the contents.
If the contents were designated as undamaged fuel,
certainly everybody who's been looking
at these drop analyses pretty much concedes
that the fuel inside the canister will no longer meet
the criteria of undamaged fuel.
It would end up being a question as to whether we,
they want a license amendment to allow them
to remain in the stored position,
and damaged fuel, or whether or not we would be asking them
to retrieve the canister to remove the spent fuel contents,
to repackaging in a damaged fuel canister.
- Okay.

And isn't, isn't the August 3rd event exactly
the same as the event that happened in July?
- It is not, the event that happened in July,
one of the reasons I think that it did not make its way
into the corrective action program is
because I think that they believed
that during that entire extended time it took them
to download the MPC into the UMAX vault,
for the record, there was an event on July 22nd, where
San Onofre experienced an abnormal delay
in downloading operations, what should have
taken 15 minutes ended up taking an hour and a half
because they failed to get the MPC properly aligned
for downloading for over an hour and a half.
Again, this should have taken place
in 15 minutes or less, during that time,
never was the MPC, or the canister,
not suspended by the slings, every time they attempted
to download, they caught the loss of load condition.
The VCT operator actually caught the loss
of load condition using his monitoring devices
on the vertical cask transporter screen, something
that did not happen on August 3rd, where the VCT operator
was not monitoring these proper parameters
on his vertical cask transporter screen.
So they were always within procedure during this event.
We feel, however, that the event being captured
in what was known as a production traveler,
it should have also been recorded,
and it's part of their corrective action program.
So at no point were the redundant safety features

completely disabled for the July 22nd event,
and they were always in procedure during that event.
- So perhaps you can clarify what we mean by disabled.
So the slings, I mean, the slings were always okay.
- The slings were always okay.
- So what do you mean by a disabled sling?
- What I mean by disabled sling, well,
I wish I had a picture, that you guys could look at it.
Well, if you refer to the picture
that's being displayed on the webinar right now,
you see the MPC is being suspended
by two yellow slings, now,
when those slings are no longer supporting the load,
it's called a slack condition, to use the parlance
of the Holtec procedures.
During the downloading event of July 22nd,
they never completely lost the load from the slings.
- Just a second, Rachel, let's try slide 16.
- Yeah, there we go, so the slings were always supported
in the load for July 22nd event.
Contrasting that event, we don't actually have a picture
of what happened on August 3rd,
but if you can visualize with me,
on August 3rd, the crossbeam that you see
in that picture there was all the way down
in the completely lowered position,
and the slings on either side of that high track canister,
they were completely bunched up on the ground,
supporting no load whatsoever.
And at that time, that MPC was resting
on the shield ring on top of the divider shell inside
of the ISFSI vault.

If that MPC had slipped, or the canister had slipped somehow
because of vibration, or some other mechanism during
that time, those slings, in the completely slack
and bunched up position, were in no condition
to capture and arrest that drop.
That MPC would have dropped to the bottom
of that canister with no slings being enabled
to suspend the load.
That's really what I mean by the July 22nd event.
On the July 22nd event,
the slings were never rendered completely disabled.
- Okay, thank you for that clarification.
And then, earlier you had talked
about a Aging Management, the Aging Management Program.
Patty, is that something you want to talk to?
- Sure. - Okay.
- So Aging Management Program is required upon 20 years,
upon the 20 year license renewal of the storage system.
The licensee's Aging Management Program requires
it will inspect during the, requirements will be inspected
during NRC's routine inspections.
Some licensees have performed in-service inspections
of their canisters as part
of the license renewal applications,
also the Electric Power Research Institute studies
on methods for inspecting,
and through implementing Aging Management Programs.
No breaches of canisters have been identified,
no chlorine induced stress corrosion cracking
has been identified.
So that's the Aging Management Program.

- For, oh, when you, might have, no indications
of cracking have been identified,
that's during the non-destructive exams at other facilities?
- Correct, that's, they usually use
what they call a crawler with a camera, usually,
or other NDE, non-destructive evaluation equipment.
- Okay, thank you for that,
and I think you heard Eric mention earlier that San Onofre
is a little bit different than the rest of the industry.
So other utilities have
to initiate an Aging Management Plan, as part
of license renewal for the ISFSI, which occurs at year 20.
San Onofre actually has an agreement
with the California Coastal Commission,
and they're actually required
to submit their Aging Management Plan for review
by the state, I think it's by 20--
- November, 2020. - November of 2020.
So that's an important distinction at San Onofre.
And then, just to clarify, for the August 3rd event,
there was no damage to any of the fuel assemblies
and the canister,
and there was no damage to the canister itself.
And then we, and we have also had several questions
regarding the drop analysis, and so,
just to clarify one more time what Eric said,
San Onofre was not required by their license
to have a drop analysis
for this condition
that existed on August 3rd, so they're not required
to analyze for 18 foot drop of a canister.
And the reason for that is, is that their license requires

that they provide redundant drop protection
throughout the movement of a canister.
And that's what makes this event so serious, is that,
is that not only did they lose one method
of drop protection, they lost all methods
of drop protection,
so that's what makes this event so serious.
The corrective actions coming out of this will be to,
to beef up the controls at the site to ensure
that they don't lose redundant drop protection
in the future,
and Eric touched on a few of those earlier,
but there are many procedural enhancements
that are taking place, there's additional training,
the workforce that's taking place,
the standards for job site presence by supervisors
and managers and quality assurance are all being revised,
and then there's actually some engineering changes.
- Yep. - That are being considered.
I think there's a possible addition
of a load cell indicator. - Correct.
- And I think there's a couple of more.
- Oh, yeah, they're talking about having alarms
in place when a certain loss of load condition is met,
an unambiguous alarm that will let everyone know
that you need to come back up on the beam
to regain load, they also have cameras
that they're investigating using to assist in the process.
And there's some even somewhat lower tech methods
they're using to make sure, but they are putting
in place procedure enhancements and equipment enhancements

to sort of ensure that they never end up
in this situation again.
- All right, and still more clarifications
on the drop analysis, so when we said,
I think you said, clearly the fuel inside the canister
would no longer meet the undamaged criteria,
but, so, so we're going to have damaged fuel.
What do you mean when you say damaged fuel?
- Well, what I mean, technically damaged fuel is fuel
that, it cannot be moved by normal means.
You can't grapple it with a regular spent fuel
tool, and move it about,
is essentially what it means, I mean--
- I don't think-- - That's about all I--
- I don't think we believe there would be
a complete disintegration of the fuel assemblies,
there would be some rupture of the cladding,
there could be some pellets that are released
in the lower portions of the fuel assembly,
but not a complete destruction
of the fuel assemblies within--
- No, no, not at all.
- And we don't believe there was damage
to the fuel assemblies
because the canister was slowly lowered when it made contact
with the shield ring, and was resting on the shield ring.
So there wasn't a drop of the canister,
such that it made an impact that would have caused damage
to the canister, or the fuel ...
- No, no, not in this unit.
- So Eric, I keep calling on you, but.
- That's fine.

- But how about a little more specificity on the,
when we issued the report, what kind
of timeline are we on for, between today
and let's say the final enforcement action
that might be taken?
- Oh, my goodness, I don't have any sense of that at all.
We enter into the enforcement process,
I think the first bar that needs to be crossed is, I think
San Onofre has to answer as to what route they want
to take with this enforcement action within 30 days--
- All right, I'll help you out,
you want me to help you out with it?
- Yes, please.
- I'll help you out a little bit.
Okay, so, so we have to, we had an exit meeting on?
- November 1st.
- November 1st, and so by our own procedures,
where we have to issue the inspection report
within 45 days. - That's right.
- So that would put us out the mid-December, worst case,
we're targeting some time before the Thanksgiving holidays,
we will issue the report with something,
something we call a choice letter,
and essentially they're going to have a choice of,
of coming in for an enforcement conference,
or for a negotiation
through the alternate dispute resolution process.
They'll have roughly 10 days to make that decision
on what they want to do at that point,
and then we will schedule whichever path
San Onofre wanted to take, the enforcement conference,

or ADR, from the time they make that decision
to the time we actually have that conference,
it's about another 30 days to get to that point.
And then it takes the NRC roughly two to four weeks
to issue a final action, following the conference.
And because we are considering escalated enforcement
for two of the preliminary violations,
that does mean that there is a possibility
of a civil penalty, but that's, that's two
or three or more months down the road,
before we're in a position to make
that final determination ...
Did I miss anything?
- Thank you. - All right.
So Eric, any thoughts on whether
or not this is a generic industry issue?
- Well, this issue, it would only have applicability
at one other site in the United States,
and that's the Callaway Nuclear Station out there
in Missouri because there are only
two Holtec UMAX ISFSIs currently licensed.
So, and I think we were out
at Callaway after this event happened,
and they were already putting corrective actions in place.
There was lots of supervisory oversight,
lots of licensee oversight at
Callaway because everyone was very much aware
of what was going on out at SONGS, so.
The existing body of affected users knows very well
what's going on, and they are very aware of
what they need to do to prevent it
from happening at their site.

- And, and
why was the NRC not notified,
following the event?
- Well, that's a very good question.
I believe that it came down to an interpretation,
and San Onofre simply didn't interpret the event the way
that we did because it took for us to prompt them
before they made the proper NRC notification.
And several times in conference calls
and other venues, we asked them, you know,
why aren't you making a notification?
And it took that prompting to have them to do it.
So I think it boils down to interpretation.
- And then we're, so there's a few more questions
on inspection of the canister itself.
Currently San Onofre is evaluating,
through engineering analysis, the, the,
what needs to be done, in terms of inspecting the canister,
or can they, or immediately, or can they do it as part
of the Aging Management Program.
And we're, we don't believe there's an immediate concern
with the canister, so there's time to allow San Onofre
to do the appropriate engineering review work here,
and then they will turn that, they'll submit
that back to the NRC, and we'll take a look at it,
to see if we agree, or if we think something else needs
to be done, in terms of inspection of that canister.
That's an item that's on our plate
for our future inspection, I think,
so in the future, we're thinking in December timeframe,
before fuel handling is resumed,

the NRC will send a team out, the focus
of that team will be to review the adequacy
of the root and causal evaluations
that have been completed by the licensee
to ensure that the corrective actions have been implemented,
and then to complete our review of the analysis
to support this canister in particular,
the inspection of this canister.
And I don't think, and so,
so fuel loading campaigns won't restart
until we've completed our inspection,
and that inspection won't occur until early December,
at the earliest.
Then there's several questions, Eric, on what,
what are the specific regulatory requirements?
So, like, for the, I don't know if we brought
that with us, so the--
- Regulatory requirements-- - 10CFR.
- Well, all the regulatory requirements exist
in 10CFR part 72, but in particular, what is--
- I think that's what they're looking for,
is the citation, so the failure,
the failure to report-- - Oh, that's,
failure to report is 10CFR, part 72
.75(d)(1), is the particular one we're,
we're considering escalated enforcement on.
- Okay, and the failure
to provide redundant drop protection?
- Well, that goes back to their original licensing.
They are a general licensee,
so that would have been part of the 10CFR 72
212-- - Body of--

- Regulations, I think 212(b)(3) is the one.
- Okay, but they actually had the,
what's referred to as a Certificate of Compliance.
- That's right.
- Which required them to implement provisions
under technical specifications.
- Exactly right.
- And the technical specifications themselves,
I believe that was,
it's Tech Spec 5-- - 5.2. whatever, yeah.
- In section 5.2 of the tech specs,
requires that they maintain redundant load drop protection
during movement of a canister,
that's the specific citations for the redundant load.
And then the procedures, corrective actions
and training program requirements all reside
in 10CFR part 72, there's a specific sub-paragraph
for each and every one of those.
- Yeah, and I can tell you those, that would be 72.150,
72 for the, for the procedure parameter,
72.190, the training requirements,
and 72.172 for the corrective action portion
of their violation.
- And there are some questions
regarding asking clarification
on how was the canister misaligned?
- Well,
and Rachel, if you could go back to the,
the slide that has the picture of the, looking down
into the ISFSI vault, I'd really appreciate it.
- You want this one, or you want--

- No, it's-- - This one?

- There we go. - Slide 8, Rachel.

- Slide 8.

All right, if you look down, at the picture we're looking at now, that's looking down into the UMAX ISFSI vault.

What you see there is a divider shell.

Now, when the MPC, or the canister is moving down into the divider shell, ultimately to rest at the bottom of that cavity,

there's very little clearance, there's about a quarter of an inch clearance on either side of the canister,

so thinking about it, you're putting a round peg in a round hole, but that hole is very close in diameter, the hole is very close in diameter to the round peg, so as you can imagine,

you have to have that round peg lined up pretty good to drop it right into that hole.

Now, luckily you have redundant drop protection that allows you to sort of manipulate things until you get things just right.

This violation revolves around inattentiveness.

They weren't paying attention to what they were doing,

so instead of paying attention, and getting that round peg lined up just so, and down into the hole,

they fell asleep at the switch,

and that round peg ended up resting on that divider shell.

- Figuratively. - Figuratively speaking.

- Right, and so,

and so how do they make the alignment adjustment pad, to get it perfectly centered?

- You know, the VCT operator is key to this

because once you get initial alignment,
there's still some manipulations you typically have to do
because the ISFSI pad isn't completely level.
There's a little bit of a grading of the ISFSI pad,
it's leaning a little bit in each direction
because you want rainwater to run off of it.
So the VCT operator oftentimes has
to position the VCT a little bit to the north,
or a little bit to the south, position a little bit
to the east, or a little bit to the west
to get it perfectly lined up, and in this case,
they thought things were proceeding smoothly,
and you need vigilance, you need the rigger,
or the spotter to be paying attention
to the MPC going down, and you also need the VCT operator
to be vigilant in looking at his indications
because he would notice a loss of load.
You've got two people there, and both
of them failed open in this case.
- So I think there might, Rachel,
there might be a better picture
that shows that alignment, I'm looking real quick.
Maybe slide,
let's try slide 16.
Right, and that kind of shows the stack up
of how, how, in the, the VCT rig,
and how the operator has to position
that entire rig. - That's right.
- To get it perfectly aligned--
- And also, this VCT, the operator,
he can make very fine adjustments

with the vertical cask transporter,
he can bump this thing a half inch,
an inch in one direction, a half inch,
an inch in another direction, you know,
he has a lot of degrees of mobility there,
where they can get these things aligned.
So if you have a good VCT operator,
and someone who's aware of what's going on,
you really shouldn't have a problem downloading these MPCs
into the ISFSI vault.
- Thanks for that, and Patty, are you able
to address chloride stress cracking corrosion, NRC?
If not, we can take it, or I'm trying
to give you a chance here. (overlapping)
All right, so the agency has evaluated the likelihood
of chloride induced stress cracking corrosion.
This is a longterm aging phenomena,
we do not believe it would occur within the first 30 years
of the life of the canister,
that's why we've imposed regulations
to require an Aging Management Inspection Program
to start at year 20.
And one of the specific concerns there is inspections,
non-destructive examination type inspections
that look for chloride stress cracking corrosion sides.
And to date, based on the inspections
that have been done in the industry, we have not encountered
any chloride stress cracking corrosion of a canister,
is that right, Patty? - That's correct.
- Eric, talk more about this canister number 30
that's stored in the Unit Three Fuel Building,
is that allowed? - Yes, it is allowed.

It is an analyzed condition, as they say,
and they can store it indefinitely
in the transfer cask because it's cooled, it is able
to maintain its thermal stability in
that configuration, and it's fine.
- And this actually, this question came
in both during today's webinar, but it was also submitted
through a participant, ahead of the webinar,
and one of the technical staff did some more research on it.
It's actually,
the canister, in a transfer cask, seismically restrained
to the fuel building wall,
is an acceptable condition at San Onofre.
They, the bounding temperature profiles were used
to determine the impacts on the canister,
and the results of that evaluation are all published
in a publicly available section of the FSAR for,
or the Final Safety Analysis Report for San Onofre.
And the numerical results for thermal analyses,
and peak clad temperature, and pressures are all described
in the data tables that go with it.
So this is an acceptable condition for San Onofre.
Do you want to talk about radiation surveys?
- You want me to? - Yeah.
Rachel, can you pull up the slide
on the radiation surveys?
(background noise drowns out speaker)
- There is a schematic of a UMAX lid there.
- Right, so prior, prior to the webinar,
we also received a number of questions regarding
the radiation levels at the San Onofre ISFSI.

This is something, the licensee would periodically do their
own surveys of the ISFSI pad, and the individual vaults,
to make sure radiation levels are consistent
with technical specifications.
What this slide shows is the top of a,
of a UMAX vault, that's the closure lid.
We recently, I think it was two weeks ago,
we had some inspectors out doing
decommissioning inspection activity at San Onofre,
and we decided to perform independent surveys
of each and every ISFSI vault at San Onofre,
the surrounding fence, the beach area,
for those that live out there, the bluff above the ISFSI,
and the parking lot that's also up above the ISFSI.
Every, every reading we took on each and every vault was,
was at least an order of magnitude, if not more,
below the technical specification limit
for radiation levels in the ISFSI area,
and adjacent to the ISFSI, in addition,
San Onofre's required to submit an annual report,
radiological effluents report,
I'm getting a nod of agreement.
And, and they have reported
less than one millirem total exposure to the public,
that's the lowest value you can report in that document.
So again, it's,
the radiological issue of the ISFSI location
at San Onofre is not a significant concern.
- No.
- Not from the actual dose rates
that are present at the, at the site.
And then there's a lot of questions about,

well, what could happen to a canister,
would it be a significant radiological event?
And for an ISFSI, the radiological release concern,
it's a function of the likelihood of a zirconium fire,
and the likelihood of a zirconium induced fire
in a canister goes down, the longer the fuel decays,
the less of a chance there is of a zirconium fire.
These canisters were all helium inerted, so there's,
there's insufficient oxygen to sustain a fire.
And then the zirconium itself is in the wrong form
to support a fire, you really want, to have a fire,
you would want it to be in the powder type form,
and that's not what exists inside the fuel canister.
So again, in order to get that big release
that a lot of people are concerned about,
you really need to get that zirconium fire,
and that's just not a plausible event.
- Yeah, and all this fuel has been cooled
for at least five years in the spent fuel pools.
So you're well outside of the risk range
for a zirc fire event.
- And then I think it's,
and so there's a question on why doesn't
the NRC require realtime radiation monitoring, and,
and that's, so the NRC does require radiation monitoring.
- Right. - It takes place in the form
of exposure monitoring devices--
- TLDs. - TLDs that are,
that are connected to the fence surrounding the ISFSI pad.
So there is realtime radiation monitoring,
but there's not, the NRC doesn't require a,

a digitized type radiation monitoring system,
to where there's the detector,
that then converts that signal,
and then it goes up to a, to a wifi signal
to feed a webpage, or something like that.
The NRC does not require that for ISFSIs,
and I don't know why we don't, I speculate it's
because of a very low radiological hazard presented
by an ISFSI location in the first place.
- Yeah, and don't forget, also, Troy,
ISFSIs are passive mechanisms, they have passive cooling
of a spent fuel, the fuel is getting cooler
and less radioactive over time,
and there's an active surveillance requirement,
where you have to look at each
and every ISFSI vault every day to make sure
that the, the intake screens are clear,
and the outtake screens are clear.
So there's an eye on the ISFSI at all times,
every day, to make sure everything is still in place.
And the radiation monitoring is just added assurance.
- Okay, I'm going to, I'm going to take you back
to canister number 30 again, how is it cooled?
- Natural convection.
You know, all of the fuel in a spent,
in an independent spent fuel storage installation
is cooled naturally, by natural convection currents.
The helium transfers the heat to the MPC shell,
which is then, which is then taken
by the environmental air out into the atmosphere,
it's really simple.
- How does that work if it's in a transfer cask, though?

- The same mechanisms are in place.
- Okay. - In a transfer cask.
It is, you know, there's an annulus that allows heat
to go up, outside of the transfer cask.
- Just scrolling down now, one second.
So there's a question on, Patty, maybe I'll talk,
I'll give you a shot at this.
Can chloride stress cracking corrosion breach a canister
in less time than
the Aging Management Program would detect it?
- No, we don't believe it could.
Stress corrosion cracking takes awhile
to get to a canister, and
we don't think that would, it would.
- Yeah, so what Patty's saying is that the,
in short, the answer is no, it's a,
chloride stress cracking corrosion is a,
takes a long time to occur,
our studies suggest it would take more than 30 years.
Aging Management Programs start at year 20, and,
and that program requires
that the licensee determine the most susceptible containers
for the inspection.
And so we don't believe there would be cracking due
to stress, chloride stress cracking corrosion,
before we detected it was occurring.
(background noise)
I'm scrolling through the questions
that are being sent out to me.
Canister 30.
We do have questions on keeping spent fuel

at San Onofre, and the transfer of fuel
to a permanent nationwide waste storage facility.
- Yeah. - Permanent?
- Yeah.
- Or an interim consolidated--
- Either, something that moves it away from San Onofre,
is that something you can talk to?
- Well, we do have two,
two license applications in
For consolidated interim storage facilities,
one in New Mexico, and one in Texas,
they're actually right across the border from each other.
So we have to review those, those licensing applications.
So there is a possibility for movement there,
if that's what the licensee intends to do,
to move it off of the site.
- And I believe it would, we're still waiting
on some type of Congressional level action
to take place for a permanent repository
for high level waste. - Correct.
We do not have a permanent repository for disposal.
- I'm not sure, I don't think I have
the right people here today to talk about the--
- whistleblower protection?
- Yeah, do you?
I don't think we've inspected that,
you haven't, Eric, have you? - No.
- Yeah, so there's some questions
involving whistleblower protection,
and safety conscious work environment.
So the regulations still apply
and are in effect at San Onofre for,

for employee protection rights,
that would include whistleblower protection rights,
employees, and we do go out,
I don't have the right inspectors up here today
to talk about our last inspection
of the safety conscious work environment program
at San Onofre, but employees do have the right
to bring forward safety concerns, and not be retaliated.
And if they, if they feel that the licensee
has been unresponsive to their concerns,
or they think they've been retaliated in some manner
for raising a concern, they can always reach out to the NRC,
they can call our Headquarters Operations Officer,
they can call anyone in the regional office.
We'll capture that concern, we'll enter it into our process.
So that's always an option for them, that you
could even call our Office of Investigations directly,
if that's what they wanted to do,
if they didn't want to talk to an NRC inspector.
So there's a number, number of pathways, we take those
in the mail, telephone, email, anonymous,
a person's name attached to it,
any form, we'll take that, then we'll,
we'll either inspect it or investigate it as is appropriate.
Okay.
Right, now I'm scrolling through the questions
that are coming in.
- Did I see one about a criticality analysis or--
- That is there, what's the chance of a criticality of?
- Well, the licensee actually provides information
about a criticality event, and in the absence

of water in the cask, and along with the,
with the boron impregnated lattice structure
in the canister, criticality is, cannot happen
in a dry cask, in a dry fuel storage canister.
It is just, you can't get there.
k-effective is so low,
you can't get the multiplication of neutrons,
without water, and with the boron, again,
and the lattice structure of the canister, it's impossible.
- Okay, and there are some followup questions regarding the,
it's with the opening of a canister, once it's been,
once it's been put in a vault,
and then taking it back out and whatnot, that's something,
if a canister had to be opened, or repackaged,
that's not something that's going to take place very quickly.
The first step would be for the licensee
to establish a safe environment
to transfer that canister to, it could be,
most likely it would be a hot cell of some sort,
so if you're at a fully decommissioned facility
where there's no structures left,
like San Onofre will be in the future,
they would likely have to, to either, one,
they would have to figure this out,
and get NRC approval, but they would, one,
have to either build a hot cell,
or a radiological confinement purposes.
It might be something where they could
have a vendor, or somebody construct a new shipping package,
and then just repackage it into a different type of device
for shipment somewhere else.
They, it might be something where you could put it back

into a spent fuel pool, but that would have
to be closely evaluated before something like that's done
because the, the fuel is hot, the canister is, you know,
there is, it is at an elevated temperature.
So you'd want to make sure that you'd carefully analyzed
and studied the impact of a, of a water shock
on the canister before you put it in a water environment.
- And, and to add to that, Troy,
remember, when it comes to radioactive decay,
time is on your side, the longer you wait,
the safer it's going to be. - That's right.
And there's a question, well, if the canister is dropped,
how are you going to get it back out?
And, and again, the licensee isn't required
to analyze for a load drop event,
that's why we put in the license,
the requirement for redundant drop protection at all times.
And again, that's what made the August 3rd event
so significant, was,
was the loss of redundant load drop equipment.
So they don't have to analyze for a load drop,
I don't think anybody's really, and maybe,
Eric, you can correct me-- - I want to say
that San Onofre has demonstrated the ability,
during their dry run operations,
to retrieve a canister. - An undamaged canister.
- An undamaged canister, right.
- Right, and so the question is,
if you dropped it that 18 feet,
and you somehow deformed the canister, which we don't,
right now, our evaluations aren't showing

that there would be a canister deformation
from an 18 foot drop, but hypothetically,
I don't think anybody's analyzed trying
to pull a stuck canister
from a drop out of the bottom of the vault.
I just, I don't think it's been done, and again, it's not,
the NRC doesn't require that type of analysis.
What we do require is redundant load drop protection
features so that you cannot drop the canister.
And again, we don't, just to go back to the consequences
of the August 3rd event, that this canister was,
was lowered in a slow and controlled manner.
It made contact with the shield ring,
and then rested on it, and then the slings were disabled
because they went completely slack,
and therefore, we don't believe there's any damage
to the canister, or to the fuel assemblies inside.
So this would be no different
than if they successfully lowered the canister all the way
to the bottom of the vault, when it finally made contact
with the surface, it would have been an easy,
slow mating of the surface.
So there's, we don't believe there's any fuel damage
whatsoever to the affected canister.
(inaudible)
- You want to talk about that at all?
- Yeah, you can.
- Well, there's a question here about criticality,
due to water entering through a crack.
If there was any evidence of a crack in a canister,
they would have to take immediate actions
to either re-containerize that canister,

or remove the spent fuel contents, or repair.
- And we actually think cracks, when we're talking
about cracks, we're talking about weld cracks,
and that would most likely occur
from a canister in storage, due to some type
of stress corrosion cracking, and again,
the Aging Management Program is set up such
that you detect the early signs of cracking,
and you have the option to, the ability to make repairs
before you would actually have a through wall crack
of the canister, and in San Onofre's case, again,
they're, they have an agreement with the state
of California to have that Aging Management Program
in place by year five, which is well,
well more conservative than what the NRC would require
for a similar equipment.
Now, one of the questions, I see some in here,
Eric, and I know I've asked you,
so they've been, San Onofre's been moving fuel out
to the pad for a long time.
Why isn't this something the NRC, all these weaknesses
with oversight, and procedures, and whatnot,
is this something that the NRC inspectors should have picked
up on from the very beginning?
- Well, you know, and I think me and Troy were talking
about this earlier today, you know,
NRC inspectors, we go out to these sites
where they have to demonstrate for us their ability
to safely load fuel, and while we're out onsite,
and when NRC's there, you're going to have lots
of management oversight out there, also,

you're going to have lots
of supervisory oversight during these activities
because everybody wants to get it right
for the NRC, you know?
I mean, we've talked about some aspects
to them having their A team out there
during these operations, and even for the first loading,
you know, they're going to have their best performers out there
because nobody wants to fail in front of the NRC.
I think what we saw out there at SONGS is,
with time, you have turnover of staff,
the A team leaves and moves on, and you know the amount
of people you have monitoring these operations,
it goes down, in a very real sense,
radiation protection programs don't want a lot
of people out there standing around, soaking up dose
because it's not good for their numbers, you know?
And so you end up having a situation,
what we had out there at SONGS,
you have fewer and fewer people out there,
actually observing the operations.
When we were out there observing dry runs, you had everybody
and their mother out there watching these operations,
but once we left, you know, they get into a little bit
of a battle rhythm, and they start fighting
with things like dose, and oversight falls off.
Instead of having two people up in the man basket
during downloading operations, now you have one.
Instead of having supervisors observing
every little thing you're doing
because NRC's looking over your shoulder,
you have, you know, you have people down

in the low dose waiting area,
just having a little bit of a chitchat, maybe.
And you end up in a situation where we ended up here
on August 3rd, it's unfortunate,
but, I mean, that's what sometimes happens, I believe.
- Yeah, so I think when we inspected during the,
during the dry runs in early,
during the initial loading campaigns, what we observed was,
well-qualified people involved in the evolutions,
and plenty of management oversight
and quality assurance oversight to observe and make sure
that everything was being done correctly.
And so when you have well-qualified people,
and a lot of oversight, you can get by
with procedures that don't prescribe each
and every little thing somebody has to do
because they're knowledgeable of the work
that has to be done.
And then, I think in San Onofre's case,
as they got past the first couple of loading campaigns,
and they started to experience turnover
of the riggers, and some of the contract force
that was available to them, they didn't maintain
that same level of rigor, and rigor and quality
in the training program.
And so now you had people being put out on a job site
that had less knowledge than what the original team had
when they first started.
And then, and so when, and that's okay,
to even do that, but you have to balance these three pieces.
(overlapping)

So if you have people come out, and you put 'em to work,
that have a little bit less knowledge, then,
then the procedures have to go up
to account for that, or you have
to apply even more management supervisory oversight
to monitor all the critical evolutions.
And in this case, what happened was, we ended up with people
that had less qualifications, or less knowledge,
and the oversight piece slowly backed off, and so,
and then the procedures were never updated
to reflect the gap left by a decrease in oversight,
and a decrease in knowledge.
And so, so that's not, for the,
I think for the, we expect the licensees to be able
to manage and balance those three pieces of the puzzle,
and the NRC can't be there every day to do that,
that's why we give these folks a license,
and that's why it's their responsibility
to stay on top of it.
We did not think there needs to be a design change
to the vault storage system at San Onofre,
it is possible that, with the right corrective actions,
and put into place, that provide the critical parameters
and measurements that need
to be made during the downloading evolution,
people with the right knowledge and skills,
and the right level of oversight, you can safely lower
that canister down into the vault
without making a design change to the, to the vault system.
- Right.
- And then, and then there's a question
about the notification, and--

- Do you want me to answer that one?
- And there is a difference between a courtesy call,
and a formal notification
to the Headquarters Operation Center.
That call to the Headquarters Operation Center
starts everything for the NRC,
and it also is a way for the public to get aware of events
that have occurred at a licensee's facility.
But when that call is made to the Headquarters Ops Center,
they're, our operations officer immediately calls
the regional duty officer that's on call,
and that initiates the NRC's response actions.
And so it is significantly different
to have an immediate report to the ops center,
than trying to catch somebody in the regional office,
to let them know that something's going on with the site.
And how about you take external events?
Seismic, do you have that one?
- Sure.
- We have a slide for that, too.
- Yeah, the, the problem I have
with this one is just, it's, well.
- I can take it.
- Okay, you go ahead and take it.
(background noise)
- So, Rachel, can you pull up 39, slide 39?
Seismic and flooding, so there's some questions
on seismic and flooding, I'm going to refer
to that as tsunami, so the ISFSI systems
at San Onofre are evaluated for earthquake,
they are evaluated for a maximum flood height,

and flood velocity, at San Onofre, the,
I'm going to refer to the UMAX system,
but the TN system's a little bit different,
but it's not as,
I don't,
the UMAX has a,
it's designed to withstand ground motions of 2.1 Gs
in the horizontal, and one G in the vertical direction.
The San Onofre design basis earthquake is 0.67 G,
so it's, there's plenty of design margin
for earthquakes at San Onofre,
and then, with respect to flooding,
the UMAX system
is designed to withstand flood levels up to 125 feet,
that's 125 feet, fully submerged.
The Transnuclear system, it's 50 feet, fully submerged.
For those that are out on the West Coast, and have been
by the site, you've been down around the beach,
you've seen the seawall, atop of the seawall,
just as a reference point, is 28 feet.
And the maximum design tsunami wave height
is roughly 27 feet, so there's plenty of design margin
at San Onofre for both flooding, and for seismicity.
And then we're back to the unpacking, so,
of a canister, if required, so that,
San Onofre, nor any other site,
is required to maintain a spent fuel pool,
solely for the purpose of repacking,
or opening a canister, there are other safe ways
to do that, if required, or needed by a facility,
they would have to determine the safe radiological facility
to do that evolution in.

Most likely, it would be, involve some type
of construction of a hot cell to do the work.
But there are other options, again, that would be
on the licensee to figure out the safest option that works
for their facility, and then the NRC would approve that.
But they are not required
to have a fuel pool to do the work.
And then there's a question about evidence,
with respect to damage to the canister,
or other canisters in question,
during the downloading evolution.
That's still something, San Onofre is still analyzing
that question, we've put that to them.
We think there's probably been some metal to metal contact
during downloading at more
than just this canister in question,
but if you go back to the photo,
Rachel, maybe you can remember it, the.
Look, the one with, that says, "Look close."
That one, thank you, Rachel, so if you look,
if you look close at that photo,
you can tell there was contact between the canister
and the shield ring, but,
there, and I think, and we've examined this photo,
and in detail, it,
essentially it's just paint scrape-age off the,
off of the shield ring, off the divider shell.
So we don't think there, if there was some wear marks,
they're not significant wear marks on the canister,
and I believe the acceptance criteria
for wear indication on a new canister is gouges up

to a quarter inch depth, and we certainly don't believe,
at this time, that there would have been gouges
that even come close to a quarter inch depth,
due to a downloading operation.
Therefore, we don't think there's an immediate concern
with the canister, but that said,
we're waiting on San Onofre to complete their analysis
for not only wear marks on the canister in question,
but the other canisters, and what type of impact will
that have on their longterm Aging Management Program.
The other piece with that is,
is these are stainless steel canisters, and even
if you did have scrape-age on the canister's surface,
it's likely you would re-oxidize the stainless steel layer
that was scraped, prior to the onset of some type
of chloride pitting, or stress cracking, so.
But we're still going to wait for the analysis,
and do our full review.
So there's a question on the hot cell, again.
So canisters don't have fast breaking emergencies,
and so, so what would likely happen--
(inaudible)
What would likely happen is, is the,
through the Aging Management Program,
you would identify an indication, or early signs
of cracking of a weld, and you would have the time,
because chloride stress cracking corrosion
is a longterm phenomena, you would have the time
to construct the hot cell, or repackage the canister
for shipment elsewhere, if need be, and do the repair work.
We don't see this as something
where you have an indication one day,

and you must make repairs that afternoon,
that's not the type of scenario we're talking about.
These are long range, lots of time available types
of repairs, okay, we have some questions on shims,
do you want to take shims?
- Rachel, you want to go to 34?
Oops, 34, is that it?
Do you have the shims? - Let's try slide 34.
- Oh, oh. - Or--
- They changed the slides, okay.
- No, there you go.
- That's, that's the one I'm thinking, so in this picture,
it shows the bottom of the shims, so the original design
was called the monolithic shim standoff,
and that's why see on the left hand picture.
And Holtec changed their design
to the shim standoff pins, which are shown
on the right hand of the, the right picture.
The pin design has a possibility
of failing during fabrication process,
and during transportation of the canister,
and since this issue had been identified,
Holtec has ceased application of the pin,
of the pin design, and replaced existing and new canisters
with the original monolithic standoff design.
This change to the shims was the subject
of an NRC inspection done by headquarters,
by my team, out at the Holtec Camden, New Jersey facility.
Results of the inspection are still pending,
we reviewed the thermal analysis
that had been provided by Holtec,

and the agency does not believe there's
an immediate safety issue with any of the four canisters
that were loaded with the shim pins at San Onofre.
So additional information will be available,
once we issue the inspection report,
which we hope will be sometime soon, in the next few weeks.
- If you see something.
- This may be for you to answer...
- Yeah, so I'll, so there was,
there's a question that came in on,
on the NRC doing unannounced inspections.
That's, that is a part of our tool bag,
we do use that, but it's mostly,
mostly at our other materials licensees,
hospitals, radiographers, those types of facilities,
most of those are unannounced.
Of course, our resident inspectors
that are at the operating sites,
most of the work they do is unannounced inspection activity.
We do have that option, and maybe that's something we think
about with our inspection program, is do we announce all
of our fuel loading campaign inspections,
like with our current practice?
Or do we just go out, unannounced?
Part of the problem, at San Onofre,
it'd be a little bit easier because they,
theirs is a longterm fuel loading campaign.
When Fort Calhoun starts next year,
it'll be a many month window, and so we could do that.
But most of the time,
these are short duration type campaigns,
and so we have to coordinate with the licensee

to understand the schedule for, for a fuel loading campaign.
And so it's not that we can't do unannounced,
but it is a closely coordinated activity,
the schedules are, but that's something we can talk
about later. - Okay.
(inaudible)
(inaudible)
- A lot of these questions, people have the same questions.
- Yeah.
So the, the presentation slides are,
are already available on the webinar handout link,
they're available on the NRC Spotlight.
Any slides we use today to answer,
to help support some of the Q&As,
questions and answers, those will be attached
to the meeting summary that'll be published following,
within two weeks of, I think of today's discussion.
The session is being recorded, and we do plan
to upload that to the NRC website,
and the conversation that you hear will all be transcribed,
so you'll have a text version of today's presentation,
as well, for review.
So, and we have a question on,
how do we enforce the licensee's commitment to us,
to cease fuel handling activities.
So the licensee, when they called us on the sixth,
and then again on August the 7th,
verbally committed, that came from the site vice president,
verbally committed to cease all fuel handling activities
at San Onofre until the NRC came out and inspected,
and was satisfied with the corrective actions,

at which point, they would, once we,
once the NRC was satisfied,
they would resume fuel handling activities.
And so for now, we're taking the licensee for their word,
that they're not going to refuel, and to date,
they have not done fuel handling activities
since August the 7th.
If, for some reason, the licensee decided they weren't
going to wait for the NRC, and start moving fuel this week,
once we became aware of that, of course,
we would talk about it internally.
We have the option to impose a confirmatory order,
ceasing fuel handling activities at San Onofre,
if we chose to do that, but for now,
we don't believe the licensee is going to make any attempt
at fuel handling activities, and so we're comfortable
with where we are, and not, and the licensee is comfortable
with waiting on us to do our inspection activity.
In addition, we have at least a,
a weekly phone call with the licensee team,
to talk about their progress with the causal evaluations,
engineering evaluations, implementation
of corrective actions, retraining and qualification
of the staff, so that takes place once a week, so,
so I think we have a pretty good handle
on what they've done, and where they're heading,
and the timeline they're on to be able
to resume fuel handling activities.
And I'll, I don't,
I'm going to have to, I don't know the answer
to this question, maybe one of you guys can send me a note,
but it's, will all questions be made publicly available,

and I don't,
and I'm getting indications from my IT staff
that the chatroom, are we going to make the,
we can make the chatroom publicly available?
Yes. (laughs)
They didn't want to, they didn't want to be heard,
though I got a thumbs up, yes. (laughs)
And again, the NRC doesn't require drop testing
because the load drop event's not supposed to happen.
We require redundant load drop protection,
we require that, the load drop protection to be tested,
so those slings have to be tested,
they have to meet industry codes,
lifting equipment has to meet industry codes,
and if you implement that program, as we required it,
you would not have the drop event, so.
Therefore we don't require drop testing.
There are, there is some drop analysis that is done
because you do have to lift the canister a certain height
in order to move it from one location to the other.
Those heights are small, they're on the order
of one to two feet, and licensees do have
to do drop analyses for those distances,
or heights, if you will.
So this, so there's a question,
would this event be possible with a standard,
above ground ISFSI, so there are some sites
where, where they do some of the cask,
the transfer cask loading in a pit that does require a lift,
not to the same height as the UMAX storage vault,
where you have that 18 foot vulnerability,

but there are some where it's more than,
more than a one or two foot lift to, of a canister.
So, and those sites, well, at all the sites,
they're required to have the same, they're required to meet
the redundant drop protection we require at all sites.
- Right.
- So it's not, it is directly applicable
to the UMAX design, but there are some sites,
because of the configuration of their fuel building,
where they have to make a similar type of lift,
and they're required to have the redundant drop protection.
I think we've addressed all, did you,
I haven't seen, I think we addressed--
- No. - All right.
(inaudible)
Hmm?
And, and we've asked ourselves that same question, do we,
should we make licensees have a drop analysis
in their final safety analysis report,
given this event, and we've talked about that,
and the answer is no, we need to make sure licensees comply
with the redundant drop protection feature.
Had San Onofre complied
with the redundant drop protection features,
there would have never been a near-miss event.
- Hmm, that's an interesting question.
- And so the other one is, did we,
should we require Holtec, or San Onofre,
or other licensees to use, on this,
we're going to talk specifically about San Onofre.
So should San Onofre's training canister be full size?
So you heard Eric talk earlier

about there being an additional three quarter
of an inch clearance, it's okay for the actual,
for the equipment used in training
to be different than what's actually in the field,
but the training program has to teach the workers
what those differences are, and how
to compensate for that difference in the field,
during actual conditions, so we don't have plans
to require a full size canister be used during dry runs
at San Onofre, but we do expect the training program to--
- Acknowledge the differences.
- Acknowledge, and train on the differences.
- Exactly.
- And I think, and we'll re-answer this question.
So San Onofre, the question involves
removing a canister from the vault,
and San Onofre has the capability
to remove a canister from a storage vault.
Just, the canister in question did not drop,
so we don't think, so, so there's no damage
to that canister, no damage to the fuel.
Had it dropped,
the early analysis suggests
that there would not have been a sufficient deformation
to the canister, such that we would not have been able
to remove it, but in any event,
it didn't drop, so that's, that's
not something we have to consider today.
"Why are two slings on the same device redundant?"
- Well, you want me to answer that one?
- You can, you can say it out loud.

- Okay, why are two slings
on the same device considered redundant?
Because two slings on the same device are redundant.
If one of the slings would have failed,
the other sling would be there to carry the full weight
of the canister with a lot of margin,
with some margin included.
Unfortunately, as I've stated earlier,
this is sort of an extraordinary event,
where the vigilance of two individuals both failed
open at the same time,
and that's a very unfortunate situation,
it is really, in essence, why we're here right now today,
discussing the event, and why San Onofre is put
in the position to ensure that this,
an event like this can never happen again.
- The slings are attached to different points, as well.
- Oh, yeah, yeah. - Yeah.
- Each sling is attached to a different point at a canister.
So any given sling could fail,
and the other sling would be able to support the load.
- And I don't, maybe you know this one, too,
any, the differences between Callaway's system, and,
and San Onofre's, the vault?
- There are subtle differences between the two systems,
but for all intents and purposes, they are the same.
You know, San Onofre has a somewhat longer fuel
than Callaway, Callaway has a shorter canister,
SONGS has a longer canister.
So there are those differences,
Callaway's MPC is slightly more narrow
than the MPC being used out at SONGS,

but those differences are as far as it goes.
It's still the same stack up configuration,
it's still the same downloading operation at both locations.
It's just that, I think the real difference is
that San Onofre, it was in the production mode
of loading numerous canisters,
and Callaway has only been involved
in six, in 12 cask campaigns so far.
Far less than were loaded out at SONGS,
and so SONGS had a much more of a opportunity
to have an event like this happen, so.
Yeah, and the shield ring, it can,
at Callaway, is actually further down into the ISFSI vault,
further down on the divider shell than it is at SONGS.
So by the time you make it that low
in the Callaway divider shell,
you're probably fairly well aligned,
whereas when you're up that high,
when you encounter the shield ring at SONGS,
you're probably, and the evidence bears it out,
you aren't very aligned at all.
It's more of a, more of a nuanced approach they have
to do out there when they're downloading than at Callaway.
- Rachel, can you pull up slide 35, please?
There's a question specifically regarding canister 29,
radiation levels, and if you look in the bottom right corner
of this slide, we actually have the gamma radiation levels
from canister 29 on the slide,
the lid was .015 millirem per hour,
and the outlet vent was 0.12 millirem per hour.
It just, it just happened that canister 29 was the,

had the lowest radiation level readings
of all the storage vault, UMAX storage vaults at San Onofre,
and it was the canister involved in the event,
which gives us a,
kind of reconfirms that we don't believe there was damage
to any of the fuel assemblies,
or any damage of significance to the canister, as well.
And then, is it, is a horizontal vault more safer
than a vertical vault, or vice versa, and I think
we believe they're equally acceptable, equally safe.
And then
the VCT operators, were they,
were they around during the July event,
or were they new since the July event?
Do you have a perspective?
- This particular VCT operator involved,
in the August 3rd event,
was present onsite during the July 22nd event,
however, there was no communication or no,
no operational experience passed on
from that VCT operator to this one.
It is actually one of our biggest concerns
at the San Onofre site, is that,
depending upon who you spoke to,
there was a vastly different amount of experience
and amount of knowledge, given one person versus another,
in our interviewing of people out at SONGS.
And that was one of our findings, was that a lot
of this operational experience wasn't being fed forward
to other cast members, it wasn't being shared freely
among all of the workers onsite,
and it really should not be that way.

Everyone should have the benefit
of all of the experience that's going on on a site,
but out at San Onofre, this was not taking place.
- And Patty, I had a couple of questions coming in
that I think are going to be your territory, right?
So the, for the proposed interim storage facilities,
do you know, are they being proposed as vertical,
or horizontal, or is it too early to know?
- So one of the, one of the license applications
is actually UMAX, the Holtec one that's in New Mexico.
And then the other one is,
is
multiple, I mean, it can be the horizontal,
I believe they can, they're also proposing
that they can handle other ones, like the HISTORM
that's just up on the pad, vertical.
- Vertical or horizontal?
- Vertical or horizontal, but not,
I don't think they're proposing, you know, beneath grade.
- And then the, and then just a canister
life,
right, from, so I know we initially licensed for 20 years,
but can you get a perspective on the beyond 20?
- I can actually give a little bit of perspective on that,
because canisters, at least the Holtec UMAX components,
they have a license life of 20 years.
And they have a design life of 60 years,
and they have actually a service life of 100 or more years,
with proper maintenance and surveillance activities.
So that goes into the designing
of the dry cask storage systems.

- Okay, and then they, they're,
they have to come in for license renewal,
prior to year 20?
- Right, they have to come in for license renewal,
prior to year 20, and then they,
their renewal can be up to 40 years.
- Okay.
And then
there's a question on the radiation reports
and measurements that we took,
and it's my plan to have the staff document, in the next,
well, they're writing, in that decommissioning
and inspection report now, as we speak,
and we plan to attach all our surveyed measurements
and data tables to support the work of my two inspectors
that were out at the site, so that will be included
in an inspection report.
And, and so there's a question on
when the canister was aligned with its weight shifted,
doesn't this warrant the canister being opened
to inspect the fuel, and so I'm going to go back
to the picture that shows the transfer cask
on the vault door.
And I wish I had a dimensional slide,
I know Eric's pulling it up, which one?
- It's this one.
- I think the one, that one right there, that top one, no.
- This one? - What is that?
- 11. - 11, slide 11, Rachel.
So the canister's inside the transfer cask.
What you see here is the transfer cask,
and if we could look down on top,

and see a cutaway, it's a pretty,
the tolerances are pretty small,
between the canister and transfer cask.
And so what we believe happened is,
when the canister was lowered and it made contact
with the, with the shield ring, it most likely tilted,
but it wouldn't have tilted very much at all.
And maybe you have a perspective on that,
I know I don't have a real perspective.
- Well, it'll tilt probably at the order
of maybe one to two inches, but that's all.
And when it tilts like that, it is completely suspended.
- Right.
- Unless something happens to jostle it.
(overlapping)
- Well, it wasn't suspended, it was resting
on the shield ring, but it wouldn't have been a,
a sudden, it hit the shield ring, and then slammed over
into the transfer cask, that wouldn't have happened.
It would have rested, it would have rested gently
on the shield ring, and then gently made contact
with the transfer cask. - Side of the transfer cask.
- So the inside of the transfer cask,
and so there's not enough force
or stress being placed on the canister at that time
to give us concern about the integrity of the contents.
- Right, the downloading process is a very gradual process.
They come down with the lift beams
on the vertical cask transporter
in a very slow and methodical fashion.
- And, and Patty, I don't know the answer to this.

It involves warranties of the UMAX system,
versus the warranty of a canister, I don't--
- I'm not sure what they mean by warranty.
- Okay, I don't, Eric, do you have any idea?
- I don't know. - All right.
So we're going to, that's one that we'll take away,
and maybe Lee, in the back, you can make note
of that one, and then we'll do some research on that.
We have, on the NRC Spotlight page,
we have posted some FAQs on that page,
and we'll take a look at this,
and depending on what kind of answer we get,
we'll put that back on our FAQ, on the NRC Spotlight.
And what's the structural rating of the shield ring?
That's something that,
that, as I mentioned before, the licensee's evaluating the,
the drop analysis of the, what would it,
what would have happened, had there been an actual drop?
And I think that's something the,
the capability of the shield ring to support the weight, and
that's something that we still
have asked some questions about.
- That's right, according to Holtec,
the shield ring can support the full load
of a dry cask storage canister, however,
that's not what it's designed for, so, I mean.
In that regard, if we understand that's not
what it was designed for, and so they get no credit
for having the analysis showing it would support the MPC,
because that's not what it was designed for.
- And,
and we asked this question earlier today,

or yesterday, we were talking about it.
So, if at the end of the first,
the initial 20 years, the licensee says,
we're done, we're not going to renew.
- Yeah, okay, so if they say they're done,
and not going to renew, so it depends on who's saying that.
So you've got the certificate holder,
with all their general licensees,
who are using their systems, and if they decide
that they, they aren't going to renew the certificate,
the licensee can actually renew the certificate,
if they choose to, so that they can remain,
continue to, to have their spent fuel
in that, their, that cask system.
If it's a specific licensee, they would have to have a plan
on how they were going to exit out of that, so.
That's the answer, they, I mean.
- And the, and I would think that the NRC can always impose,
through orders of requirements
that would replicate a renewal period.
- Right. - It's, right.
To ensure that there was longterm safe storage,
so the, the licensee, ultimately,
is still responsible for the safe storage of that.
The NRC has legal options we could pursue
to make sure that takes place.
Eric, what's the shield ring actually designed for?
- You know, there are a lot of good aspects
to a lot of these dry cask storage designs.
For instance, the shield ring, in and of itself,
helps to reduce radiation dose out there

on the ISFSI pad, so it's saving dose for workers,
sort of at the expense of downloading your MPCs.
The same way the cone that we showed you on top
of the MPC, that's also designed
to help reduce, I mean, reduce radiation dose
to the workers, so it's a good idea.
- And then there's a question along structural integrity,
regarding the MPC 37 canister, just in general.
And these are robust canisters, they're,
I think the bottom surface is almost three inches thick.
- Yeah, it's three inches thick,
the top lid is nine inches thick,
and the shell itself is five eights of an inch.
- Five eights, so well, so over a half inch thick,
and this is all high grade stainless steel,
so we do not have issues or concerns with,
with the structural integrity
of the multipurpose canister 37 design, very robust,
highly capable of maintaining the integrity
and the confinement barrier.
And the shield-- (overlapping)
Rachel, can you go back to the shield cone picture?
- Yeah, you see the green slings?
You probably missed it in my initial discussion,
but those green slings are there
for retrieval of the shield cone because it,
it's going to be used again with the next MPC
that is downloaded, so the shield cone comes out,
along with the yellow slings, and the MPC lift cleats,
something we hadn't discussed too much,
all come out after the canister has been installed
in the ISFSI vault, that way they can be used again

on the next canister.
- And then they put another, another lid on top
of all that, to seal it up, the vault up.
- That's right. - Right.
- That's right.
"...MPC Guide. - With the sole purpose
of helping to guide the canister into the hole. It's not a shield ring."
- Well, honestly--
- Let's read the question out loud.
- Oh, I'm sorry, you read the questions for me, and I'll.
- Okay, so there's a question regarding the, the
guide ring
versus a shield ring,
so is it, is it really something
that helps guide the canister,
or is it providing shielding, or is it a little bit of both?
- Rachel, if you could go back
to picture, slide number eight?
So,
those guides that you discussed in your question,
they're actually the gussets that are on top
of the shield ring, and they are there
to help guide the MPC into the storage vault.
But the shield ring, in and of itself,
as I mentioned earlier, is there
to provide radiation shielding
for the MPC while it's in storage,
and should reduce radiation dose to workers,
and out on the cask.
So we're sort of talking about the same thing,
and they are part of one another,

but the shield ring and the guides are connected,
but separate, so. - Okay.
And then, and then the cables, the slings,
and the yellow ones, is there,
is there a required inspection program for those,
and what does that involve?
- Yeah, the slings are actually, they're,
the guidance that you follow when,
when designing and making slings is ASME,
that's the American Society of Mechanical Engineers,
30.9, and it spells out all the requirements for slings, in,
in the design.
- Do they have to be load tested?
- Yeah, load tested requirements,
how much of a dynamic load you're going to impose,
in addition to the load rating,
and all the slings out at SONGS,
they're actually load tested to twice their rated capacity.
- And the yellow covers on the slings,
are those removed for inspection, or how does that work?
- Well, actually, they're actually areas
on the slings where you inspect them.
Now, we don't have a picture of this,
but if you look at a sling up close,
they'll have a little bitty tell-tale on it.
And any time that tell-tale begins to move inside
of the sling, it's an indication
that the slings are wearing.
And so if that tell-tale disappears, it's time for you
to get rid of the sling, and purchase a new one.
- And is that something they would inspect
before each lift, or-- - Absolutely.

Yes, the slings are inspected before each lift,
when they're being installed on the MPC.
- Rachel, can I get you to go back to
that other slide on the vault?
That one, so, so earlier, we talked about the,
the spotter said, said it was four feet down.
- Right. - Right?
And we said, and how there was some confusion about,
was that four feet below the shield ring, or whatnot,
about how far down is the shield ring from the, from the--
- The top? - From the top?
- About four feet. - About four feet?
- Yep. - Okay.
So that would be somebody standing on top,
with a camera, could easily take that,
zoom in on it, it wouldn't be an issue for,
for that, right? - No, no.
- And that's an empty vault there?
- That's right, that's right, and I took that picture.
- And Eric says he actually took that picture, so.
- I took them all.
- So there's a question that says, if they have gussets,
are there to guide the canister into the storage vault.
Why is the fact that they actually fail
to do what they are designed to do not being addressed
by the inspection report? - You know,
that is something that we are addressing,
as part of our special inspection.
And it's, it's the,
there's an important nuance here.
When you guys look at the shield ring,

and you look at the gussets that are there
to guide the MPC into the canister,
there is a little bit of an offset
in a lot of these shield rings and gussets,
where the gusset does not go flush
with the interior surface of the shield ring.
And that's actually a,
an engineering enhancement that they actively made out
at the Callaway site, to address those gussets
in the fabrication of their divider shells.
We had questions during our inspection,
why weren't any of these enhancements fed forward,
out to the divider shells used at SONGS?
And the fact of the matter is simply
that the divider shells at SONGS were all manufactured long
before Callaway got out to perform their,
their vendor inspections out at Holtec,
and had those enhancements put in place.
So there is, those gussets aren't perfect,
is what I'm saying, there's still a little bit
of a lip inside of that gusset,
about a quarter of an inch, on a lot of these shield rings,
and that's unfortunate.
- Yeah, the key factor here is
to make sure you have the correct alignment
from the beginning, before the canister gets
to that part of the shield ring,
before it starts to approach the shield ring,
so that you don't have the challenge
of the canister making contact
with the shield ring in the first place.
- Right.

- And, and we don't believe there's any plans to,
to enhance the gussets used at San Onofre.
So there's a question about the radiation levels
during loading, and being concerned
about the amount of radiation during loading,
if you have to have folks go to a low radiation area.
So just as a good ALARA,
as low as reasonably achievable practice,
you want, you want the staff involved, and working
in radiological areas to minimize their exposure.
One way to do that is to take advantage
of the distance from the source of the radiation,
and so many licensees will adopt a low dose waiting area,
or low dose area during any job site type of evolution,
and so it, it was appropriate for San Onofre
to designate a low dose waiting area, but you have
to balance that with maintaining the right level
of oversight at the job site
to ensure quality standards are maintained, and so.
And I think the, during the downloading, there's,
there is one part of the downloading
where there is a radiation streaming effect
from the canister. - There is.
- And those levels are about--
- Well, at San Onofre, those levels can go as high as
three and a half R per hour, and actually,
what ends up happening during downloading operations, most
people will post the area immediately around the VCT,
during downloading, as a locked, high radiation area,
which requires special dispensation
to be able to enter into that area,

and so they restrict a lot of people.
Everyone but who is absolutely necessary
will not be in that high, locked high radiation area.
But in this case, I think they could have found
a better area to have staged themselves,
where they could still observe downloading operations,
and not have an obstructed view,
as they did in their low dose waiting area.
There are other areas on top of the ISFSI pad,
for instance, where they could have gone,
and not been in a locked, high radiation area.
- Yeah, and just to put it in perspective,
a locked high radiation areas are greater
than 1,000 millirem per hour.
- That's right, one R per hour.
- And so it's acceptable to work
in the locked high radiation area.
You do want to provide
the appropriate rad engineering controls for workers
that are in, that work in those kind of spaces, and
I do think, and that's why there's shielding provided
for the VCT operator, so that they're not exposed.
The spotter is up in a man lift,
so they're above that high, high radiation area,
so they're, and then the issue here was,
everybody else was moved to that low dose area.
As Eric mentioned, there were probably other places
on the pad that provided an unobstructed view
of the operation, and you could definitely leverage cameras,
video capability, to assist
in the oversight monitoring role.
- Absolutely.

- And I'm not sure, so going back to that,
Rachel, can you go back to the shield ring picture again?
And the question is, it looks like there's a gap
between the shield and the canister wall.
- Well, actually,
there has to be a gap between the shield ring
and the canister because you want the hot air,
that's being heated by the MPC, to be able to rise
to an exit through the top of the UMAX vault.
If you go to the lid picture, Rachel, if you don't mind.
You see the lid there, you have inlet vents
on the outer periphery of the lid
on all the low corners, those are inlet vents,
and they feed air to the outside of the divider ring,
that's cool air coming in.
That cool air travels down, it enters
into the MPC cavity, underneath the shield ring.
That air is heated by the MPC,
and it exits up, out through the top vent there,
and that's essentially the cooling
for the spent fuel in the storage canister,
while it's in the UMAX ISFSI vault.
So a gap is an integral part of that design.
- And, I don't, so the question, is turnover related
to radiation exposure at the site?
And I don't believe that's the case.
- I don't believe that to be the case, either.
Most of these, most of these people want to work,
and they mostly enjoy going to work.
So I don't think radiation's an issue out at,
for workers out at San Onofre,

I don't think that's a disincentive to, no.

- And it's said, there's a comment
about inspectors avoiding radiation
of downloading the canister into the vault,
and that was a consideration at San Onofre,
was the, was moving people to a low dose area.
I'm going to think inspectors here--

- Oversight.

- This actually refers to San Onofre,
or Holtec oversight staff.
And again, they want to minimize exposure, but you need
to minimize exposure while maintaining the correct level
of job oversight, so there's a balance between the two.
My inspectors, when they go out and watch these,
they're asked to go to the low dose waiting area,
but they go over there with the VCT operator,
and observe the downloading evolution up close
and personal, that's what they do, so,
to get a good understanding of what's going on,
and talk to people while they're doing the task.
And then we're back to the, hey, Rachel,
can you go back to the vault photo again?
So there's another comment about the quarter inch there,
where the gusset is. - I saw that.

- Yeah, so that is, that's just a fact of life
for San Onofre, there is a quarter inch,
about a quarter inch space there at the end of the gusset.
They need to account for that, train the staff,
and make sure that they're knowledgeable of it,
and do a better job aligning the canister,
before they do the download, and I think,
and at Callaway, they actually brought that gusset out

to the edge, so that, so that you didn't have
that same vulnerability, both designs are acceptable.
At Callaway, I think there's more forgiveness
to the, to the operators, at San Onofre,
you have to be more vigilant,
to make sure you get the initial alignment
of the canister correct, and that is definitely something
that's achievable and doable.
So there's a question about, is there any type
of quantifiable requirement by NRC
for qualifications of workers
and supervisors performing the work, so, in 10CFR72,
point, the qualification requirement, which is, what is it?
(overlapping)
Yeah, one of these, which one--
- It's 190. - 190.
So 10CFR72.190 requires a qualification program
for all individuals involved with important-to-safety tasks,
so these frontline workers here, that would involve the--
- VCT operator. - Okay.
- The guy responsible
for making sure the MPC is being downloaded properly.
- The spotter?
- The spotter into the vault, and it actually goes
onto other operations during fuel processing
inside of the fuel building.
So it's not just activities out on the ISFSI pad,
it's all of the quality related activities,
which includes things like welding,
on the placement of the fuel assemblies into the MPC,
into the lattice basket inside of the MPC.

All of these jobs are quality related, in dry fuel storage.

- Okay, and then if it's okay to use workers
that haven't completed the qualification process,
but they have to be directly accompanied by an individual
that has completed the qualification process.

- Correct.

- So, and that's why we, one of the reasons why we chose
to go with the qualifications violation,
was because you have people doing a task for the first time,
where the training program didn't get them
where they needed to be, and there wasn't a
supervisor, or somebody with the appropriate quals
right there with them during the job.
So Eric, I think one last time,
we'll talk about metal to metal contact,
and what our thoughts are on the significance
of that on a canister.

- Well, metal to metal contact isn't the best thing
to happen to a canister, however,
realize that in the case of MPC contact
with the divider shell ring, there is paint there,
that's designed to take these kind of scuffs,
and absorb some of that impact.
And Holtec is going to provide us with an analysis,
to give us the bounding conditions,
as far as scrapes and scratches that they think this
MPC number 29, installed in their ISFSI, experienced.
And I think that could be considered
to be a bounding analysis for all the other canisters,
because all the other canisters,
while they experienced a little bit of scuffing,
and a little bit of contact going into the ISFSI pad,

none of them actually hung up as MPC 29 did.
So, and then moving forward, we'll see how
that informs San Onofre's Aging Management Program,
how far they intend to go, as far as evaluating all
of their canisters for future degradation,
because, again, a scratch today isn't that big of a deal,
however, as time goes on, that could be a point
where stress corrosion cracking could initiate,
but again, those are all longterm concerns
on these canisters.
There are absolutely no immediate concerns regarding the
condition of the MPCs, and their ability
to perform their confinement function.
- And there's a question regarding radiation being an issue
to the folks that live within 50 miles of San Onofre,
and again, we'll just, one last time, the,
we don't think there's a radiological concern
with the ISFSI being located at San Onofre,
and as the fuel inside the canisters continues
to decay, there's less and less risk
of a zirconium fire, that's the principal driver to
what would be a radiological release,
and we don't think the conditions exist within a canister
to have a zirconium fire, because of the lack
of oxygen, and the wrong form of zirconium,
to propagate a fire, so we don't--
- And-- - Yeah?
- There's also another requirement
that San Onofre has to abide by,
and they've been abiding by this requirement for years.
It's the publishing

of a radiological environmental monitoring program report,
each and every year,
where they have TLD monitoring stations,
effluent monitoring stations,
monitoring stations onsite, as well as offsite.
And they're actively measuring the radiation impacts
of their facility on the surrounding environment,
and those reports are available in ADAMS,
they're publicly available in ADAMS,
and anyone in the Southern California area,
or anyone in the United States can go
to our agency-wide document system, and find these reports,
they are there, it's a requirement.
- And so there's a question about are, if,
whether or not San Onofre is going to use cameras
in the future to see into the vault during the downloading?
- All indications right now are yes,
but we'll see, when we perform our next inspection,
and see how they're engineering enhancements
and procedure enhancements are truly being borne out.
But all indications now are yes, they will be using cameras.
- And there's a question on, back on,
Rachel, slide 21, just so I have it for reference.
And there's a question about, what's actually paint?
Are the canisters painted?
- The canisters are not painted, however,
the divider shell that you're looking at in the webinar,
that is a painted surface, and if you look closely,
you can see, the paint has been scuffed off
by the contact this divider shell made with the canister.
- Yeah, so the canisters are stainless steel,
and then the divider plate is?

- Coated carbon steel.
- Coated carbon steel, okay. - I believe.
- All right. (inaudible)
Okay.
And there's a question about, why not have two spotters?
- That's a very good question, I think,
probably, moving forward, you're going to find certainly more
than one spotter, or more than one person
who has a vantage point out on the ISFSI pad,
during future downloading operations at San Onofre.
- All right, and if they, if they leverage cameras,
then you would be able
to have multiple people spotting the downloading evolution,
depending on the number and placement of the cameras.
So that, so there's a question
on the transfer cask cooling system,
so there's not a cooling system,
if you will, for the transfer cask.
This is for, so the fuel is maintained cool--
(overlapping)
We're talking about MPC 30 now, the one in the field,
though, so heat goes from the fuel assembly
to the helium gas to the canister wall--
- It's radiated out to the--
- It's radiated out to the transfer cask inner wall.
- And then to the environment.
- And then that's transferred through
the transfer cask shell, and then just the normal air
surrounding the transfer cask shell is
what dissipates that to the environment.
- Yes. - Okay.

And there's a question on the bottom of the canister,
and whether or not the weight of the canister,
sitting on that half inch gusset did more than scrape it,
it seems like there'd be a deformation at the bottom
of the canister, and that's one
of the key engineering evaluations we're waiting
to be provided with from San Onofre.
So we haven't, we haven't ruled out deformation,
but we're waiting to see the engineering analysis.
Our own experts think, if there was deformation,
it would be very minimal,
this is a three inch thick bottom lid,
and it would be minor deformation at most,
which would not have an impact on the canister integrity.
- So where do we find monitoring reports,
can you direct them to ADAMS, or?
- Yeah, so the licensee does the annual filing of the--
- Regional environmental--
- Of the environmental reports,
those should be available in a search of our,
of our public library, ADAMS, and you should be able
to pull that up, and in the prior years.
Is there an outside agency that monitors radiation levels,
or is only, or is it only left to Edison
to measure and report levels to the public?
- Well, there's one agency
that monitors radiation levels, it's the EPA,
they have their Environmental Radiation Monitoring Program,
however, the EPA program is sort of a voluntary program,
where they partner with universities,
and local interest groups, and they'll provide you
with a realtime radiation monitoring system.

Again, talk to your, whatever EPA region you're in,
and you can find out from them
where their closest monitoring station is.
It's actually called the ERAM system,
so maybe if you search on the EPA website for ERAMS,
you can find it, and it's a realtime monitoring system.
- And then, and then, just to make sure that,
that San Onofre is doing the right radiological surveys,
and monitoring, we have inspectors that go out,
and that's one of the things they look at each year,
they check those, the reports, the accuracy
of the reports, and they actually go out
with the technicians at the station,
and make sure they're actually taking the right measurements
from the right locations.
So that is, that process is validated and verified
by the NRC through direct inspection each year.
And then,
so the question is, the divider plate,
we keep talking about the vault picture, that's for
which location? - What do you mean?
- Which vault was that, vault number, do you remember?
- Oh, that was a picture I took during the dry runs out
at SONGS, September, 2017, just,
it's whatever vault they were downloading
into during the dry run when we were there.
- Okay, and the one with the paint scrape-age on it?
- That is the actually vault number 22.
- And that was for canister 29.
- For canister number 29.
- And if the canister was in there,

then how were we able to take a picture of that?

- That picture was taken by staff out at San Onofre.

- Okay.

- And they would have been able to take it

from the surface of the ISFSI?

- Yeah, and they can, they can take,

they can get a boom, and put a selfie stick or something--

- And zoom in on it. - Oh, yeah.

- Yeah. - Yeah.

- Okay.

- Or they could just have someone stand there.

- And so there's a question about cracking,

and cracking would allow oxygen to enter the canister,

again, we would expect the Aging Management Program

to detect, early detection of signs of cracking,

and then the cracks would be mitigated.

So we don't believe, and then, if it was a crack,

we're talking a very, very small opening.

If it did exist, it'd be small quantities of oxygen,

and you still don't have the right form of zirconium

to cause that spontaneous combustion, and have a,

to have that type of fire.

And there's a question about the,

when the canister was leaning onto the side

of the transfer cask, it's not three inches thick there,

it's something less. - Well, if.

Go ahead.

If you think about it, when the canister is leaning,

it is leaning, the very top edge

of the canister is going to be in contact

with the wall of the transfer cask.

And at that location, there's several layers of weld,

and actually, a nine inch thick shield plug,
which is the MPC lid, resting there.
So they're really, we really don't have
that many concerns about the confinement at that location.
- Yeah, where, it would have been leaning against the side
of the transfer cask, it's actually thicker than where it is
on the bottom of the MPC? - Yes.
(overlapping)
- And so there's a question, back on slide 21,
it seems to be our favorite slide today.
- Oh, okay.
- If, where's the canister, in relation
to where that picture was taken?
- Isn't that picture--
- You know, if you back up, that's right,
if you back up the slide, thank you, Patty,
if you back up to slide number 20, there's the canister.
- There's the canister, so you can see,
that is canister number-- - 29.
- 29, loaded,
and that's the gusset in question,
is directly above it, and that's about,
what is that, how many feet is that,
from the canister to the gusset?
- I couldn't tell you, but it looks like,
probably about a foot and a half.
- Okay. - Maybe.
- And then you could take that--
(overlapping)
- It's probably six to eight inches.
- All right, and you could take a picture of that,

either standing from the side, or from up above.

- You absolutely can because,

we're there when they're welding,

this lid that you're looking at right now, we're there

when they're welding that in, and we stand directly over it

to observe the welding operations,

and the NDE, when they install that.

Now, radiation levels can be very high there,

but you can go in and take a picture fairly quickly,

you don't have to linger around for too long.

And, again, that is absolutely the thickest portion

of this canister, it's nine inches thick,

just to provide shielding for those operations of welding.

- And then if, again, if there were early signs

of crack propagation, or crack indications,

we think the licensee would have time

to develop a repair strategy, and if it required removal

of the canister, it would be able to do that,

they'd have plenty of time to do that

before there was a significant impact on the canister.

- That's about right.

It's probably closer than that.

Go ahead (inaudible). - Yeah, and,

and I don't think today's panel is in a position to,

I wish we could give you an exact value

on the distance from top of the,

of the--

- MPC canister, to the top of the--

- To the lid, I just don't, yeah, we just don't have that.

This is one, I'm going to have Lee, who's one of my inspectors,

I'm going to have him flag that comment,

about how, you know, the shield ring to the top,

and the shield ring to the top of the canister,
and we'll see if we can't put something
in one of the FAQs about, that provides dimensions
of the storage vault.
There's a question on high burn up fuel, and how long it has
to stay in the pool before you can move it out, and I think.
- Those, those lengths of time have been changing,
it's new studies, I don't have that information.
- So will we get back to them for that one, too?
- No, I think there's, I'm not sure
what we prescribed, I think that the reference here is,
high burn up fuel require longer cooling time
than five years, before putting in the dry storage, and,
and I think five years is sufficient time
for decay purposes, prior to loading the, an MPC.
So I think that's okay, and in San Onofre's case,
they ceased operations (overlapping)
more than five years, it's been more than five years
since they've ceased operations, so they're okay
to move high burn up fuel into an MPC.
"If Slide 21 is of the
actual problem vault, why don't we see the canister,"
but we showed the canister.
- Yeah, and so, there, we received a lot
of questions throughout the course of the presentation,
on how long does it, how much time do you need
to build a hot cell, I don't have an answer for you.
That's something the licensee would have to do,
but there are, there are different ways
to do it, it could be brick and mortar,
it could be, you could move it into a,

a building, and then compensate with lead shielding,
and that would take less time,
so there's different alternatives out there,
so I don't, I can't give you a direct answer
on how long it takes to build a hot cell,
so it's very case dependent.
And any idea on the skin temperature
of a canister, loaded canister?
- We've seen it get close to 300 degrees,
a loaded canister, but that's, albeit,
after welding activities have taken place.
I think the hottest canister I've seen
on surface, maintaining the temperature,
is probably at 200, 235, 240 degrees, and--
- But what would be the hottest point of the canister,
would it be radially, or would it be top,
bottom, do you have a?
- Well, when I'm on top of the can,
it's usually at the welding point.
- Right.
- That's really hot, so I really couldn't tell you.
- Okay.
- And I haven't seen
fuel loaded at the top end of what's allowed, either.
- Right. - So.
- But normally, you'd see something in the 250
to 300 degree range? - Oh, yeah, yeah.
- And Patty, we have a question,
you talked about the shims before, right,
and so San Onofre does have four, I think it's four--
- It's four canisters--
- Canisters with the shim pins?

- Correct.
- So there's a question about those,
the canisters with the defective stand off shim pins.
Will they, will they withstand the weight
of a fully loaded can?
- Not really holding weight.
So the shim pins are on the shims, which are the,
they're along the,
okay, so the basket has a lot of square pieces in it,
and then there's, the canister is round,
so in those areas. (overlapping)
Oh, there we go. - Oh, there we go.
(overlapping)
- Basket in there, tight, so then we move around,
the shims, the
stand off pins are at the bottom of that,
to hold it off the bottom of the canister,
to leave some air space for the circulation
of the helium through the whole basket system.
- And, just to confirm, we were talking
in degrees Fahrenheit, not the.
- Not Celsius.
- Not Celsius, degrees Fahrenheit.
So,
are those scratches on the CEC,
with canister 29, and what's the whitish looking material?
- That's actually not the CEC, and,
it gets a little confusing when we begin
to talk about all these different terms,
and dry cask storage, especially with the UMAX ISFSI
because a storage vault actually consists of,

you mentioned the CEC, the cavity enclosure container.
That is the
stainless steel hole
that's in the concrete pad, inside of that hole,
they insert a divider shell, which provides the conditions
for continual cooling of the MPC.
So the divider shell is what we were looking at,
when we're looking at the scrapes and scratches.
The CEC is actually the outer wall, outside,
on the outside of that inner divider shell there.
- That white powdery material right there, what's--
- Oh, that's just--
- That's what we're talking about.
- Oh, that's just, that's residual cleaning fluid,
left over from the developer.
That white stuff you see on top of the MPC there,
that's probably left over developer
that wasn't properly cleaned completely off
of the welding when they performed the,
the NDE testing, if you look around the inside
of the ring there, there's an outer ring,
I can't explain this well for you
because I don't have a pointer.
But that is probably just cleaning
that was done incompletely, that's right, that's right.
That's what that white stuff, that's what it looks like
to me, but I wouldn't be concerned about that at all.
- That's something that they would eventually clean off,
before they put the closure lid on?
- I don't think so, in this case, no.
- All right, okay.
While we're waiting for more questions

from my staff back there, for those
that are still, still with us on the webinar, if you,
that have hung in for I guess almost two and a half
or so hours now, if you have comments regarding
the webinar itself, and did it help you be a,
participate in learning more about this event,
and the NRC activities, if you want to provide feedback
on that, that'd be great, if you could just add them
to the, to the chatroom,
and then we'll take that feedback, and
see if we can't make the next one better.
So there's a question about, about the NRC allowing
promises, I'm not going to, or commitments, I'll say,
from a licensee, to figure out how to inspect,
repair, retrieve fuel, and inspect fuel,
to be a strong regulatory framework.
And so we've established a regulatory framework
that we think, that we believe provides
for the safe storage of spent fuel at San Onofre,
and we think the requirement,
to have the Aging Management Program,
goes a long way, in the early detection of,
of deficiencies that allows sufficient time
to complete the repair, and so we think
that provides an appropriate regulatory framework
for the licensee.
And so I have, I have,
there's a question regarding comparing procedures
at San Onofre with that of other licensees,
or training programs, and
I have two inspectors in Region IV, Eric and Lee,

and that's one of the things that they do,
when they go from site to site,
is they're able to compare and contrast the adequacy
of different programs, from one licensee to another.
- And I can tell you that the real difference is not
in the quality of the procedures from site to site,
the true difference in a dry cask storage program is
how the licensee, that is the utility,
how engaged they are in dry cask loading operations,
how engaged they are,
are they out performing deck plate oversight,
or are they sitting back in an office someplace, you know?
That's the real difference in dry cask loading operations,
is just how involved the licensee is going to be,
how intrusive they're going to be.
NRC is only going to be there for one can
of a loading campaign. They are there
for all the cans, and they need
to be out there providing deck plate oversight,
looking over the welders' shoulders
when they're doing welding, they need
to be out there watching dry cask storage operations out
on the pad, or when they're downloading into a HISTORM,
or any other type of overpack, that is the difference.
That is the difference between a good program
and a program that doesn't perform so well,
that is the difference, in a nutshell, and that is
what we see when we're out inspecting these licensees.
- And there's a question on, again, on
requiring licensees to do drop analysis,
and,
and how the public can intervene

to require that a licensee does some type of drop analysis,
and so, so as of now, the NRC believes
that the drop analysis is not required,
not for this type of event, that exists at San Onofre,
because the ultimate requirement is
to maintain the redundant load drop protection.
And so we don't plan to require a change
to the final safety analysis report
to include the, a load drop event.
That said, that the public always has the right
to petition the NRC, through the petitioning process, to
impose additional requirements on licensees.
And if you choose to do that, you can,
you can follow the NRC's program for that,
and ask the NRC to reconsider their decision
on when a drop analysis is required.
And then the question on how can the licensee inspect,
or monitor canisters?
- Oh, (inaudible) inspect or monitor the canisters?
So I had mentioned,
I don't know, it's,
EPRI, the Electric Power Research Institute,
did some studies to kind of help industry figure out methods
of doing their Aging Management inspections,
and they put, what I mentioned before,
these crawlers that you see they have,
either keep, you know, (inaudible) for a camera,
or other non-restrictive
examination equipment to go,
depending on what kind of system it is,
you know, the cases around the canister,

to be able to go through close to, like,
the annulus to go through and see,
or there's other probes, not maybe crawlers all the time,
and they were testing these, they did a few tests
that the NRC sent, we sent one inspector,
and one technical reviewer to,
to watch their testing, and they did.
We've also gone out to a number of facilities
that were preparing for their renewals,
and they did, they brought out whatever pieces
of equipment that they were going, that they were planning
on using in their Aging Management Program,
just to test those out, to see if those were going to be useful
when they actually had
to do their Aging Management inspections.
So usually, it has to do with some sort of probe,
or crawler that goes along the annulus,
and looks at sides of the canister.
- And this, and the use of robotic technology
to do non-destructive examinations
at nuclear power plants, and else,
and other industries, that's, that's not new technology,
that's been around for awhile,
and so we're just taking advantage of the technology
that already exists in the US,
and applying it to multipurpose canisters.
There is no requirement to do an inspection
on the inside of the multipurpose canister,
these are all inspections that are done external
to the surface of the canister.
And I know we're getting a lot of comments
about hot cell construction,

and the NRC does not require licensees to maintain a pool,
or to maintain a hot cell structure for,
for retrieving fuel from a multipurpose canister,
or some other canister, should the need arise.
They do have to have the ability to,
to perform that, and we don't think that it's a,
an immediate or rapid type of inspection to meet.
So you would have early detection,
you have the ability to construct the facility you need,
and there'd be ample opportunity to,
to make those repairs, and at this time,
we don't have any requirements imposed
on licensees to maintain either type of facility,
pool or hot cell, again,
I understand that there are probably a wide assortment
of views on whether that should be imposed
on licensees, and that, and if you feel strongly about that,
this is where'd you want to avail yourself
of the NRC's petition process, and,
and send it to the NRC for consideration.
So there's a question that says,
given that Edison created this fuel under the impression
that there would be a national repository,
would you consider it fair for Edison
and other companies to be getting national assistance
for help for maintaining safe procedures
and monitoring systems for this fuel?
And.
- So that,
so those that were required to,
the acceptance of, for the disposal of the fuel was,

was Department of Energy's task,
and yes, they do not currently have a repository
for disposal, I believe there are some facilities
that are tapping DOE for some funding,
for some of the operations that they're doing,
with their spent fuel, I'm not certain, as I'm not,
I don't look at that directly,
but I'm not certain what they've been approved
to get funding for, but it's up to the Department of Energy,
and whatever their responsibilities were,
and what the licensee is doing,
whether those items could be reimbursed or not.
- Right, right-- - So there is a small part,
that they are getting reimbursed--
- Okay, and of course, with the appropriate legislation,
Congress could dictate that that happen, as well.
- Correct, yeah.
- And says, how much longer will loading take at San Onofre?
- Probably another year, once they start,
a year or less, is my best guess.
- And then there's a comment that says,
in the case of San Onofre, there's no room
for cameras, or other actual ability to do any other checks,
after loading into the vault?
And so, and so I think actually San Onofre is looking
into that, and there is, my understanding is,
the robotic technology is such that you can get a crawler
into the storage vault, and do the inspections at,
of a canister at San Onofre.
And it's also my understanding
that the robotic technology being deployed today
is using the, an eddy current testing methodology,

and that that's, that has,
that's proving to be sufficient at checking
for crack initiation,
and that's why we,
the testing has been going on with EPRI at some
of the sites, to fine tune and work out a solution
for everybody to follow.
And then there's a question
about how involved has Edison been
in the oversight of moving waste.
- Well, one of their corrective actions is,
they're going to be much more involved than they were,
prior to this event, that's for sure.
- That, one of our concerns that we've communicated,
and it's been identified in the root causal evaluations
by San Onofre, is they weren't as involved
in the contractor oversight at the facility
as they should have been, they recognized that,
and many of their corrective actions that they're,
that they're developing now involve
building up that contractor oversight.
So it's important to us that they get it right
for Holtec during the, when they resume fuel handling,
and it's important that they get it right
for their decommissioning contractor, before they
start significant decommissioning work at the site.
- That's a good question.
- And so I'm going to skip down the, Patty,
if the shim pins all break, in the affected canister,
would there still be adequate cooling of the canister,
if the shim pins were all snapped off?

- I don't know if we have an analysis of that.
- A final analysis?
- Yeah, a final analysis.
- Yeah, I think the early analysis said
that there was adequate cooling of the canister,
even with broken shim pins-- - Right.
- For the fuel that's currently loaded,
affected-- - For the fuel
in the affected canisters. - That's right.
- That we believe that there's still adequate cooling
of the canister,
so, but I also recognize
that there's more engineering evaluation continuing
on that question, but we didn't believe
that there was an issue, based on our own evaluations.
And so there's a question, I guess, I don't know.
(inaudible)
And so there's a question on, if the canister dropped,
and the containment boundary breached,
what's the worst case, and again,
for the scenario at San Onofre,
if this canister had dropped the distance of 18 feet,
into the storage vault,
we don't believe there would have been a major loss
of the containment boundary.
So there wouldn't have been
a significant radiological impact from a canister drop.
So the worst case scenario
would be some cracking
of the weld of,
of the MPC,
and the release,

via cracking of a weld of an MPC, if,
would be marginal, it would be very small.
So I don't think there would be
a significant radiological hazard, that,
that keep, with that said, that is one of those evaluations
that we are waiting for, giving the licensee the opportunity
to complete that, and then,
and then we're going to take a look at that,
do our own independent engineering look at
that evaluation, and reach our own assessment
of what the consequences could have been.
I think we're in the five minute range,
left on the webinar, is that about right,
in the back of the room, okay.
So why is the mesa not being discussed for safer storage?
- You mean the big bluff overlooking the ISFSI--
- No, mesa, on the other side of the freeway, where the,
where the training building, there were some warehousing,
over on the other side of the freeway,
why isn't that being considered,
why wasn't that considered for the ISFSI pad location?
- Well, actually, the NRC doesn't decide
where it's going to be, it's the licensee who decides.
They propose, they give us all of their analysis,
and we review that, so it's based on what,
where they were identifying it would go.
- Okay, and so, and then our role is to,
when presented with the location that they wanted,
is it a safe location, we determined
that met our requirements for, for placement
of an ISFSI pad, so.

So there's a question about,
what are the internal mechanisms in the NRC
to identify opportunities for improvement
from this and other situations,
where licensee has multiple violations?
Who's in charge of thinking about those questions,
and how do corrective action programs occur
within the NRC itself?
So the,
in the San Onofre case,
what we've done is, we've taken the learning
from our inspection activities at San Onofre,
and what actually happened,
and we've been providing operating experience
and knowledge management,
knowledge transfer briefings throughout the NRC.
And one of the next steps we have to do is
to take the presentation we've provided today,
and offer it up to the other regional offices
and program offices at headquarters,
and brief them on the event, our learnings,
and where we think there might be areas
to improve within the inspection program.
So that's done, at least within my division,
that's done as a matter of routine.
If we go out and find significant issues
with the licensee, we come back,
we talk about it with the whole division,
and if we think those learnings are generically applicable
to the inspection program, we seek inspection program change
to get it right.
Is what, is the ISFSI site for indefinite use?

I think Eric, talk--
- It's safe for indefinite use.
- I think Eric talked about this before,
so it's initially licensed for 20, and--
- Can be re-licensed for 20 or 40 years.
- 20 or 40, we think it's good to go
for up to 100 years-- - The canister.
- The canister. - The canister.
- Yeah. - Yeah, for 100 years.
And, and the NRC believes that,
that there'll be a, within the next 100 years,
there'll be a solution for longterm waste disposal
of high level waste.
And I think we're down to a couple of minutes,
I do want to thank those that have hung on this long
to participate, I really appreciate the use
of the chatroom features, and all the dialogue
and questions that came into the chatroom for the,
for the panel to respond to.
We do plan to go back through the chatroom comments
and questions, and scrub them some more,
and where we find things that we didn't address today,
or we don't think we did a good enough job addressing,
then we'll collect those, we'll likely add those
to our frequently asked questions document
on the NRC Spotlight, underneath the San Onofre tab.
So the dialogue is, I view this as,
the dialogue has just begun,
this is not a one and done opportunity.
If you think this forum was useful,
we'd like to do it again, we have another inspection activity

and corrective actions coming up
in early mid-December timeframe,
I think, you know, this is-- - If all goes to schedule.
- You know, if desired, this,
that might be a good opportunity to,
to use this forum again, to brief out to the public
on what we found, and why, you know, if we make a decision
to resume fuel loading, that we can communicate
that with you, what the basis of our decision is.
- That's the last question.
Is it over?
- Okay, so I think we're going to,
to wrap up the webinar, again, thanks to everybody
that joined and participated, have a good evening.
- Thank you.

EXHIBIT 14

Dr. Kris Singh

CEO Holtec International

Event: Southern California Edison's Community Engagement Panel (CEP)

Location: San Juan Capistrano, CA

Date: 2014-10-14

31:04 to 34:30

Panel Member Gene Stone: Yes, so, another question I had was, on your map you showed that you had your products being used in several different countries. Do any of the European countries, or Asian countries, you know, are they using a, are your materials that are underground, are they covered by a building as well, to protect from external weather conditions?

Dr. Singh: Yeah, in Europe there's a misconception. Europeans put their casks inside buildings. The reason they so that, it's been a historical practice, because, they don't have, you know, huge land mass sites. Here you go to a nuclear plant it's bigger than Luxembourg, some sites. You know . . .

Chairman David Victor: Not to disparage Luxembourg.

Dr. Singh: You go to Europe and you see people living in apartments, you know, right outside the fence. So they, to deal with people, people's sensibilities, they put a structure around it. Most of these structures are not seismically qualified to Californian earthquakes. There are cranes that they use are not single failure proof cranes. They basically, it's more of an optical protection than it's a safety protection. And that's the practice that's been in Europe forever. It's not a, this is not something that we need to be copying here. You don't really gain anything. Yeah, of course we should not go inside the canister. You don't breach the confinement integrity to be monitoring for breach of confinement and integrity. But there is, there is a, a direct way, at least in our canister, to see if you if you are getting any, getting any breach of the wall. The canister, and you saw, in the slide, the helium circulates, and it makes the lid hot. This lid on our canister is quite hot. We imbed a thermocouple, in the lid, and you can see the temperature fluctuation. If you had loss of helium, that temperature will drop. So…

Chairman David Victor: I bet you learn a lot from the temperature.

Dr. Singh: You learn just by metal temperature, not by air temperature. Metal temperature is very sensitive. And in our thermally circulating, helium circulating canister there's a direct way to measure what's going on, on the inside, without breaching the wall.

Well, in, in my personal belief, it's not practical to repair a canister, if it were damaged. If it had a through-wall damage, first you prevent it, but, in the most unlikely circumstance, if that canister were to develop a leak, let's be realistic, you have to have find it, that crack, where it might be, and then find the means to repair it. You will have, in the face of millions of curies of radioactivity, that is coming out of the canister, we think it's not [unintelligible]. However, let, let me, uh, you can easily, easily isolate the canister in a cask that keeps it cool and basically you've provided a next confinement boundary, and you're not relying on the canister. So, that it a practical way to deal with it, and that's the way we advocate for our clients.

(202) 225-3906

Congress of the United States

House of Representatives

Washington, DC 20515–0549

June 11, 2019

The Honorable Kristine Svinicki
Chairwoman
U.S. Nuclear Regulatory Commission
Washington, DC 20555-0001

Dear Chairman Svinicki,

I write to follow up on my letter to you dated April 15, 2019, calling for a full-time inspector to be assigned to the San Onofre Nuclear Generating Station (SONGS). The letter, sent nearly two months ago, was signed by both of California's Senators and five Members of Congress whose constituents are directly impacted by your oversight responsibilities at SONGS. We have yet to receive a written response from you or any other Nuclear Regulatory Commission (NRC) official. This lack of response is particularly concerning in light of the Commission's May 21, 2019, determination allowing Southern California Edison and Holtec International to resume spent fuel loading.

On June 7, 2019, the House Oversight Committee held a hearing that I participated in examining federal spent nuclear fuel policies and safety at SONGS. NRC Region IV Administrator Scott Morris testified on behalf of the Commission. During the hearing, Administrator Morris confirmed that the following facts about occurrences at SONGS over the last year:

- The August 2018 "near-miss" incident at SONGS was caused by deficiencies in Southern California Edison's training, equipment, procedures, and oversight.
- Southern California Edison's staff at SONGS were not properly trained, certified, and supervised.
- Southern California Edison failed to formally report the August 2018 "near-miss" incident within the timeframe required by the NRC.
- A similar event had previously taken place at SONGS, but Southern California Edison did not take corrective action to ensure such an event would not happen again.
- The August 2018 "near-miss" and reporting deficiencies led to the NRC assessing Southern California Edison with a Level II violation.
- It is not common for NRC licensees to receive Level II violations.
- Southern California Edison inspected only eight of the 29 canisters that have been downloaded into the independent spent fuel storage installation (ISFSI) at SONGS.

Administrator Morris's testimony further illustrated the extraordinary record of non-compliance at SONGS. Southern California Edison's violation stemming from its failure to report the August 2019 "near-miss" in a timely manner demonstrates that the Commission cannot rely on its licensee to self-report. As such, periodic inspections are inadequate to provide local communities the level of safety and transparency that they deserve. With this in mind, I reiterate my call for a

full-time inspector to verify that all spent fuel loading activities at SONGS comply with NRC safety requirements.

Additionally, I was disappointed to learn that Southern California Edison and the NRC visually assessed only eight of the 29 loaded canisters at SONGS. The facility's location presents unique environmental threats and elevated hazard to canister integrity, including seismic activity and corrosive ocean air. Southern California Edison has informed me that it costed approximately $400,000 in total for the eight visual inspections. The cost of additional inspections is a small price to pay for greater certainty about canister conditions, especially given the $4.7 billion price tag for the decommissioning of SONGS.[1] I urge you to immediately require the visual inspection of the remaining 21 canisters.

Please provide a response to this letter no later than June 24, 2019. Thank you.

Sincerely,

Mike Levin

MIKE LEVIN
Member of Congress

WASHINGTON, DC 20515
(202) 225-3906

Congress of the United States
House of Representatives
Washington, DC 20515–0549

June 21, 2019

The Honorable Kristine Svinicki
Chairwoman
U.S. Nuclear Regulatory Commission
Washington, DC 20555-0001

Dear Chairman Svinicki,

Thank you for agreeing to meet with me in the coming weeks regarding the San Onofre Nuclear Generating Station (SONGS), located in my Congressional district. I look forward to a thorough discussion of the Nuclear Regulatory Commission's (NRC) decisions regarding safety at SONGS. While I am sure that our conversation will be valuable, it is my understanding that Southern California Edison (SCE) may plan to resume the loading of spent fuel canisters prior to our meeting. With this in mind, I feel it is important that I voice my concern with the NRC's repeated decisions that fail to maximize safety and transparency at SONGS.

The NRC's mission statement clearly affirms that the Commission has a responsibility to provide "adequate protection of public health and safety."[1] As I look back at recent incidents at SONGS, I see a record that demands greater NRC intervention. That record includes the following:

- Falsified fire safety recordkeeping.[2]
- Failed backup power systems.[3]
- Backlash against employees who reported poor safety practices.[4]
- An NRC review that found SCE's corrective actions had "not resulted in sustained and measurable improvement" of human performance onsite.[5]
- Unexpected degradation of new steam generators, an incident that was incorrectly dismissed as minor.[6]
- A radioactive leak that resulted in the shutdown of a reactor.[7]
- The discovery of loose bolts in spent fuel canisters.[8]

[8] Sforza, Terry. 29 Mar. 2018. "Here's how the bolt on the container of nuclear waste at San Onofre may have been shaken loose. *Orange County Register.*

- A "near-miss" incident that could have resulted in the 18-foot drop of a spent fuel canister.[9]

These incidents still loom large in the consciousness of my constituents who live near SONGS. They hear about how the most recent "near-miss" was caused by deficiencies in SCE's training, equipment, procedures, and oversight, and they see how the incident fits into a larger pattern of behavior.

I would like to be able to tell my constituents that they should be comforted to know that the NRC is genuinely committed to protecting their safety. However, a review of your recent record fails to provide that comfort. After you found SCE had committed a Level II violation, a violation level that NRC Region IV Administrator Scott Morris called "uncommon," you only assessed a $116,000 civil penalty on a company with assets totaling more than $56 billion.[10] In response to unplanned scratching on the surface of the spent fuel canisters at SONGS, you required SCE to visually inspect only eight of the 29 loaded canisters onsite, despite the minimal incremental cost of additional inspections.[11] Finally, you have decided it is unnecessary to assign a full-time inspector to SONGS while being aware of the dubious record at the site and knowing how such an action would help to rebuild the public trust.

Further, your justification for refusing to assign a full-time inspector to SONGS does not seem to account for the unique loading campaign that SCE intends to conduct. In your June 17, 2019, letter to me, you state that canister loading activities "are usually limited in duration." However, NRC Region IV staff has confirmed that SCE will be carrying out an ongoing, accelerated decommissioning that is significantly different than the process by which most utilities transfer spent fuel. NRC Region IV staff has acknowledged that the accelerated decommissioning presents unique challenges and can be more difficult than a standard decommissioning.[12]

Given the noteworthy nature of the spent fuel transfer campaign at SONGS, I urge you to assign an inspector to SONGS at all times that fuel transfer activities are taking place. Please respond to the following questions related this proposed inspection regime:

- Do you have the statutory authority to assign an inspector to SONGS at all times that fuel transfer activities are taking place? If you do not, please describe the authorities you would need in order to do so.
- Do you have funding available to assign an inspector to SONGS at all times that that fuel transfer activities are taking place? If you do not, please provide the estimated cost of this inspection regime.

---

[12] Ibid.

Each incident at SONGS listed in this letter was thought to be the last after they became public. You have a responsibility to take every action available to minimize the chance of future incidents. I would be incredibly disappointed if history repeats itself.

I look forward to further discussion at our meeting.

Sincerely,

Mike Levin

MIKE LEVIN
Member of Congress

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D.C. 20555-0001

CHAIRMAN

July 16, 2019

The Honorable Mike Levin
United States House of Representatives
Washington, DC 20515

Dear Congressman Levin:

On behalf of the U.S. Nuclear Regulatory Commission (NRC), I am responding to your letters of June 11 and June 21, 2019, expressing concerns related to the San Onofre Nuclear Generating Station (SONGS).

I very much appreciated the opportunity to meet with you on July 11th to discuss in greater detail your concerns. I agree with you on the importance of accountability to ensure the safety of the people in the communities surrounding SONGS, and am committed to continued communications with you on this issue.

As I mentioned during our conversation, I am confident that the NRC's inspection plan for the SONGS decommissioning process is the most effective approach to ensure the safe decommissioning of the site. We have extensive experience and a proven record with performing inspections at decommissioning sites, and the NRC's inspectors who perform this function are experts with extensive experience in this area. In addition, I want to assure you that we will not hesitate to devote the inspection resources necessary to ensure the safe decommissioning of SONGS.

Thank you again for your time and the opportunity to discuss the NRC's inspection and oversight of these activities. Please feel free to contact me or have your staff contact Eugene Dacus, Director of the Office of Congressional Affairs, at 301-415-1776 if you have additional questions or need more information.

Sincerely,

Kristine L. Svinicki

SUBJECT: INSPECTION CHARTER TO EVALUATE THE NEAR-MISS LOAD DROP EVENT AT SAN ONOFRE NUCLEAR GENERATING STATION

A special inspection has been chartered to review the licensee's follow-up investigation, causal evaluation, and planned corrective actions regarding the near-miss drop event involving a loaded spent fuel storage canister at the San Onofre Nuclear Generating Station (SONGS) Independent Spent Fuel Storage Installation (ISFSI) on Friday, August 3, 2018. (License Nos. NPF-10 and NPF-15, Docket Nos. 50-361, 50-362 and 72-41).

CONTACT: Janine F. Katanic, PhD, CHP, FCDB/DNMS
(817) 200-1151

BACKGROUND AND BASIS

On Friday, August 3, 2018, at approximately 1:30 pm (PST), SONGS was engaged in operations involving movement of a loaded spent fuel storage canister into its underground ISFSI storage vault (HI-STORM UMAX storage system). As the loaded spent fuel canister was being lowered into the storage vault using lifting and rigging equipment, the licensee's personnel failed to notice that the canister was misaligned and was not being properly lowered. The licensee continued to lower the rigging and lifting equipment until it believed that the canister had been fully lowered to the bottom of the storage vault. However, a radiation protection technician identified elevated radiation readings that were not consistent with a fully lowered canister. The licensee then identified that the loaded spent fuel canister was hung up on a metal flange near the top of the storage vault, preventing it from being lowered, and that the rigging and lifting equipment was slack and no longer bearing the load of the canister.

In this circumstance, with the important to safety (ITS) rigging and lifting equipment completely down in the lowest position, the ITS equipment was disabled from performing its designed safety function of holding and controlling the loaded canister from a potential canister drop condition. The licensee reported that the canister was resting on a metal flange within the storage vault. It was estimated that the canister could have experienced an approximately 17-18 foot drop into the storage vault if the canister had slipped off the metal flange or if the metal flange failed. This load drop accident is not a condition analyzed in the dry fuel storage system's Final Safety Analysis Report (FSAR).

In response to the discovery that the canister was not fully lowered, the licensee took immediate actions to restore control of the load to the rigging and lifting devices. The estimated time the canister was in an unanalyzed credible drop condition was approximately 45 minutes to 1 hour in duration. The licensee regained control of the load, repositioned the canister, and lowered the canister into the storage vault. The licensee halted all dry fuel storage movement operations in order to fully investigate the incident and develop corrective actions to prevent a recurrence. In addition, the licensee has shared the operational experience with another site with a similar dry fuel storage system.

Region IV became aware of the SONGS "near-miss" incident on Monday, August 6, 2018, when the licensee provided a courtesy notification and described it as a "near-miss" or "near-hit" event. The reporting requirements of the incident are still being evaluated by the Region and discussed with the licensee.

On August 7 and 16, 2018, Region IV and NMSS representatives participated in conference calls with licensee representatives in order to gather additional facts regarding the circumstances of the incident and the licensee's investigation. Region IV is evaluating the information provided by the licensee and is coordinating with the Division of Spent Fuel Management, NMSS.

The NRC is chartering this special inspection pursuant to Management Directive 8.3, "NRC Incident Investigation Program," and NRC Inspection Manual Chapter 0309, "Reactive Inspection Decision Basis for Reactors."

The purpose of the inspection is to investigate the occurrence; interview personnel; observe equipment; and review relevant documentation, including the results of the licensee's investigation and causal analysis, and development and implementation of actions to prevent

recurrence. The licensee has committed to not resume fuel loading operations until after this special inspection and associated reviews are complete. Once the licensee has confirmed its plans to resume fuel loading operations, inspectors will also observe the loading operations to ensure that the corrective actions are adequate. These observations may be conducted as part of this special inspection or as an independent inspection activity, as directed by regional management.

SCOPE

The inspection should seek to address the following items at a minimum:

1. Identify and review all pertinent records, documents, and procedures related to the licensee's downloading operations at the ISFSI pad including but not limited to: worker training and qualifications; rigging equipment qualification, testing, and preventative maintenance; and lifting equipment qualification, testing, and preventative maintenance. Evaluate the adequacy of the above noted procedures, worker training and equipment testing and preparation.

2. Evaluate the adequacy of the loading procedure(s) with respect to verification of MPC movement, centering the MPC over the ISFSI vault, lowering the MPC, and positioning the MPC within the ISFSI vault. Interviews with personnel involved in the ISFSI loading operations should be conducted to evaluate licensee and contractor communications between crane/VCT operators, rigging and spotting staff, cask loading supervisors, radiation protection staff, and licensee oversight personnel. Evaluate the adequacy of pre-job briefings that may have taken place prior to fuel loading operations.

3. Review and evaluate the licensee's immediate corrective actions taken after the event for adequacy of notifications to the licensee and safety assessments performed immediately following the event. Review the licensee's inspection documentation and/or analysis to determine whether the vault's divider shell experienced any damage that would inhibit the component from performing its designed safety function.

4. Based on the review of procedures and interviews of personnel involved with loading operations, evaluate the adequacy of procedure adherence.

5. Interview personnel associated with the event to develop a timeline to ensure the licensee's investigation contained all necessary information to identify all contributing factors and develop adequate corrective actions.

6. Review the licensee's root cause investigation results, to determine whether the review thoroughly identified all contributing factors and that final corrective actions will be adequate to prevent reoccurrence. Evaluate whether prior operational experience relating to complications or issues associated with canister downloading operations was identified and considered as part of the licensee's root cause investigation and corrective action development.

7. Review the licensee's planned actions that will address the point loading condition that was experienced by the affected canister. If applicable, review the licensee's analysis that demonstrated the canister will continue to perform as designed for continued storage OR review licensee's inspection plan to safely remove or lift the canister from the vault to support inspection of the bottom of the canister to demonstrate the canister did not

receive any damage that would inhibit the component from continuing to perform as designed.

8. Investigate the licensee's procedures for reportability to the NRC and determine if the licensee made the correct decision regarding notifications made to the NRC for this event.

9. As directed by regional management, observe resumption of fuel loading operations to verify that corrective actions were effective in addressing deficiencies that contributed to the event. This should include evaluation of procedure and/or equipment enhancements; review or observation of training and briefings provided to riggers, crane operators, spotters and observers, supervisors and other personnel involved in fuel loading operations.

10. Determine if the inspection should be elevated to an AIT and promptly notify regional management of any recommendation to escalate the special inspection to an AIT.

GUIDANCE

The NRC is chartering this special inspection pursuant to Management Directive 8.3, "NRC Incident Investigation Program," and NRC Manual Chapter 0309, "Reactive Inspection Decision Basis for Reactors." The Manual Chapter and Management Directive identify Inspection Procedure 93812, "Special Inspection," for specific use in reviewing events. Planned Dates of Inspection are September 10-14, 2018.

This inspection should emphasize fact-finding in its review of the circumstances surrounding the near-miss canister drop event. Safety concerns identified that are not directly related to near-miss drop event should be reported to NRC management for appropriate action.

Daily briefings with NRC management should occur to discuss the team's progress and preliminary observations.

In accordance with Manual Chapter 0610, a report documenting the results of the inspection should be issued within 30-45 days of the completion of the inspection.

This Charter may be modified should NRC inspectors find significant new information that warrants review. Should you have any questions concerning this charter, please contact Janine F. Katanic at 817-200-1151.

UNITED STATES
NUCLEAR REGULATORY COMMISSION
REGION IV
1600 EAST LAMAR BOULEVARD
ARLINGTON, TEXAS 76011-4511

March 25, 2019

EA-18-155

Mr. Doug Bauder, Vice President
and Chief Nuclear Officer
Southern California Edison Company
San Onofre Nuclear Generating Station
P.O. Box 128
San Clemente, CA 92674-0128

SUBJECT: NOTICE OF VIOLATION AND PROPOSED IMPOSITION OF CIVIL PENALTY - $116,000 AND NRC SPECIAL INSPECTION REPORT 050-00206/2018-005, 050-00361/2018-005, 050-00362/2018-005, 072-00041/2018-001

Mr. Bauder:

This letter refers to the special inspection conducted on September 10-14, 2018, at your facility in San Clemente, California. The inspection was conducted in response to the misalignment of a loaded spent fuel storage canister as it was being downloaded into the storage vault at the San Onofre Nuclear Generating Station (SONGS) on August 3, 2018. A final exit briefing was conducted telephonically with Mr. Thomas Palmisano and members of your staff on November 1, 2018, and the details regarding two apparent violations were provided in the subject inspection report dated November 28, 2018, NRC's Agencywide Documents Access and Management System (ADAMS) Accession ML18332A357. An errata to this inspection report was issued on December 19, 2018, ADAMS Accession ML18341A172.

In the letter transmitting the inspection report, we provided you with the opportunity to address the apparent violations identified in the report by either attending a predecisional enforcement conference (PEC) or requesting alternative dispute resolution (ADR). On December 10, 2018, SONGS staff informed the NRC that they requested a PEC. On January 24, 2019, a public PEC was conducted in the Region IV office with you and members of your staff to discuss the apparent violations, their significance, their root causes, and your corrective actions.

Based on the information developed during the inspection and the information that you provided during the PEC, the NRC has determined that two violations of NRC requirements occurred. The violations are cited in Enclosure 1, Notice of Violation and Proposed Imposition of Civil Penalty (Notice), and the circumstances surrounding them are described in the subject inspection report. Violation A involved the failure to ensure that important-to-safety equipment was available to provide redundant drop protection features for a loaded spent fuel canister during downloading operations. Violation B involved the failure to make a timely notification to the NRC Headquarters Operations Center for the August 3, 2018, disabling of important-to-safety equipment.

The NRC considers that Violation A could have resulted in a significant safety consequence because an important-to-safety feature was disabled during a spent fuel canister downloading operation. Therefore, this violation has been categorized in accordance with the NRC Enforcement Policy at Severity Level II. The NRC considers that Violation B impacted the NRC's ability to perform its regulatory oversight function. Therefore, this violation has been categorized in accordance with the NRC Enforcement Policy at Severity Level III.

Because Violation A was associated with a Severity Level II violation, the NRC considered whether credit was warranted for *Identification* and *Corrective Action* in accordance with the civil penalty assessment process in Section 2.3.4 of the NRC Enforcement Policy. The NRC determined that *Identification* credit was not warranted because Violation A was identified through a self-revealing event.

Your corrective actions included: (1) a revised corrective action program that encompasses all dry cask storage operations at SONGS with a defined threshold for problem identification and entry; (2) additional staff training and resources to implement Southern California Edison Company's (SCE's) revised and more intrusive contractor oversight of dry cask storage operations; (3) additional equipment to provide load indications and visual indications for defense-in-depth to prevent a future disabling of important-to-safety downloader slings during spent fuel canister downloading operations; (4) a revised SONGS-specific training program for all dry cask storage workers to ensure that workers understand and know how to perform their assigned roles and responsibilities; (5) revised procedures that provide qualitative and quantitative means to ensure that important steps for dry cask storage operations have been accomplished; and (6) a commitment to enhance future management and executive management oversight through the above programs, policies, and procedures.

During the NRC's follow-up inspections, several weaknesses were identified by the inspection team related to the above-noted corrective actions. The three most significant weaknesses included failures to: (1) establish measures to ensure appropriate quality standards were specified in design documents for the new load monitoring equipment used in the downloading process; (2) ensure that newly-installed load monitoring equipment conformed to the procurement documents; and (3) conduct spent fuel handling operations within established design basis seismic criteria when moving loaded transfer casks from the site's spent fuel buildings to the independent spent fuel storage installation.

In addition, SCE's corrective actions did not adequately address a change to the design and performance requirements for certain structures, systems, and components described in the Holtec UMAX Final Safety Analysis Report (FSAR). At the time of the August 3, 2018, incident, the version of the Holtec UMAX FSAR in effect (i.e., Revision 4) stated that "there is no risk of scratching or gouging" on a canister during downloading operations into the UMAX vault. Following the special inspection, the FSAR was revised to allow scratches on the canisters during downloading operations. Southern California Edison Company used the Title 10 of the *Code of Federal Regulations* (10 CFR) 72.48 process to implement the FSAR change. The NRC determined that SCE's calculations and evaluation did not contain an adequate basis to support the change to the FSAR. As a result, SCE initiated corrective actions to reperform the 10 CFR 72.48 evaluation. The NRC will review SCE's subsequent evaluation to determine if the FSAR design change to allow scratches is acceptable.

Based on the overall assessment of SCE's corrective actions, the NRC has concluded that *Corrective Action* credit is not warranted for Violation A.

Since neither *Identification* credit nor *Corrective Action* credit are warranted for Violation A, the NRC Enforcement Policy provides for a civil penalty that is twice the base civil penalty amount of $58,000 for a total of $116,000.

Because Violation B was associated with a Severity Level III violation and your facility has not been the subject of an escalated enforcement action within the last 2 years, the NRC considered whether credit was warranted for *Corrective Action* in accordance with the civil penalty assessment process in Section 2.3.4 of the NRC Enforcement Policy. Your corrective actions included: (1) making the required notification to the NRC; (2) providing training to shift managers on the NRC reporting requirements; (3) revising your reporting procedures; and (4) establishing biennial refresher training on reportability. We have determined that these actions are sufficiently comprehensive and appropriate. Therefore, the NRC determined that *Corrective Action* credit was warranted, which would not result in a civil penalty for this Severity Level III violation.

Given the above, to emphasize the importance of identification and comprehensive correction of violations, I have been authorized, after consultation with the Director, Office of Enforcement, to issue the enclosed Notice of Violation and Proposed Imposition of Civil Penalty (Notice) in the amount of $116,000 for the Severity Level II violation (Violation A). In addition, issuance of this Notice constitutes escalated enforcement action that may subject you to increased inspection effort.

If you disagree with this enforcement sanction, you may deny the violation, as described in the Notice, or you may request ADR with the NRC in an attempt to resolve this issue. Alternative dispute resolution is a general term encompassing various techniques for resolving conflicts using a neutral third party. The technique that the NRC employs is mediation. Mediation is a voluntary informal process in which a trained neutral mediator works with parties to help them reach resolution. If the parties agree to use ADR, they select a mutually agreeable neutral mediator who has no stake in the outcome and no power to make decisions. Mediation gives parties an opportunity to discuss issues, clear up misunderstandings, be creative, find areas of agreement, and reach a final resolution of the issues. Additional information concerning the NRC's ADR program can be found in Enclosure 3 and at http://www.nrc.gov/about-nrc/regulatory/enforcement/adr.html.

The Institute on Conflict Resolution at Cornell University facilitates the NRC's program as a neutral third party. If you are interested in pursuing this issue through the ADR program, please contact: (1) the Institute on Conflict Resolution at 877-733-9415, and (2) Dr. Janine F. Katanic at 817-200-1151 within 10 days of the date of this letter. You may also contact the Institute on Conflict Resolution for additional information about ADR. Your submitted signed agreement to mediate using the NRC's ADR program will stay the 30-day time period for payment of the civil penalties and the required written response, as identified in the enclosed Notice, until the ADR process is completed.

You are required to respond to this letter and should follow the instructions specified in the enclosed Notice when preparing your response. In particular, you should address actions you have taken or plan to take to improve your corrective actions. If you have additional information that you believe the NRC should consider, you may provide it in your response to the Notice. The NRC will use your response, in part, to determine whether further enforcement action is necessary to ensure compliance with regulatory requirements.

In accordance with 10 CFR 2.390 of the NRC's "Rules of Practice and Procedure," a copy of this letter, its enclosures, and your response will be made available electronically for public inspection in the NRC Public Document Room and from the NRC's ADAMS, accessible from the NRC Web site at http://www.nrc.gov/reading-rm/adams.html. To the extent possible, your response should not include any personal privacy or proprietary information so that it can be made available to the public without redaction. The NRC also includes significant enforcement actions on its Web site at http://www.nrc.gov/reading-rm/doc-collections/enforcement/actions.

If you have any questions concerning this matter, please contact Dr. Janine F. Katanic of my staff at 817-200-1151.

Sincerely,

Scott A. Morris
Regional Administrator

NOTICE OF VIOLATION
AND
PROPOSED IMPOSITION OF CIVIL PENALTY

Southern California Edison Company
San Clemente, California

Docket Nos. 050-00206, 050-00361, 050-00362, 072-00041
License Nos. DPR-13; NPF-10; NPF-15
EA-18-155

During an NRC inspection conducted September 10-14, 2018, two violations of NRC requirements were identified that were considered for escalated enforcement. (Note: three other Severity Level IV violations were identified and documented in the NRC special inspection report.) In accordance with the NRC Enforcement Policy, the NRC proposes to impose a civil penalty pursuant to Section 234 of the Atomic Energy Act of 1954, as amended (Act), 42 U.S.C. 2282, and 10 CFR 2.205. The particular violations and associated civil penalty are set forth below:

I. Violation Assessed a Civil Penalty

A. 10 CFR 72.212(b)(3) requires, in part, that each cask used by the general licensee conforms to the terms, conditions, and specifications of a Certificate of Compliance listed in 10 CFR 72.214. 10 CFR 72.214 includes a list of all the approved spent fuel storage casks that can be utilized under the conditions specified in a specific Certificate of Compliance, including Amendment 2 of Certificate of Compliance 072-01040. Certificate of Compliance 072-01040, Amendment 2, Condition 4, "HEAVY LOADS REQUIREMENTS," requires, in part, that lifting operations outside of structures governed by 10 CFR Part 50 must be in accordance with Technical Specifications, Appendix A, Section 5.2.

Technical Specifications, Appendix A, Section 5.2.c.3 requires, in part, that the transfer cask, when loaded with spent fuel, may be lifted and carried at any height during multi-purpose canister transfer operations provided the lifting equipment is designed with redundant drop protection features which prevent uncontrolled lowering of the load.

Contrary to the above, on August 3, 2018, the licensee failed to ensure that the redundant drop protection features were available to prevent uncontrolled lowering of the load during multi-purpose canister transfer operations. Specifically, the licensee inadvertently disabled the redundant important-to-safety downloading slings while lowering canister 29 into the storage vault. During the approximately 45-minute time-frame, the canister rested on a shield ring unsupported by the redundant downloading slings at approximately 18 feet above the fully seated position. This failure to maintain redundant drop protection placed canister 29 in an unanalyzed condition because the postulated drop of a loaded spent fuel canister is not analyzed in the final safety analysis report.

This is a Severity Level II violation (NRC Enforcement Policy Section 6.3.b.2).
Civil Penalty - $116,000 (EA-18-155)

II. Violation Not Assessed a Civil Penalty

B. 10 CFR 72.75(d)(1) requires, in part, that each licensee shall notify the NRC within 24 hours after the discovery of an event involving spent fuel in which important-to-safety equipment is disabled or fails to function as designed when: (i) the equipment is required by Certificate of Compliance to be available and operable to mitigate the consequences of an accident; and (ii) no redundant equipment was available and operable to perform the required safety function.

Contrary to the above, from August 6 to September 14, 2018, the licensee failed to notify the NRC within the required time period after the discovery of an event involving spent fuel in which important-to-safety equipment was disabled or failed to function as designed when: (i) the equipment was required by Certificate of Compliance to be available and operable to mitigate the consequences of an accident; and (ii) no redundant equipment was available and operable to perform the required safety function.

Specifically, the licensee failed to notify the NRC within the required time period after an event that occurred on August 3, 2018, in which the licensee inadvertently disabled the redundant important-to-safety downloading slings while lowering spent fuel canister 29 into the storage vault, which resulted in the canister resting on a shield ring unsupported by the redundant downloading slings at approximately 18 feet above the fully seated position for approximately 45 minutes. These slings are required by Certificate of Compliance 072-01040, Amendment 2, Condition 4, and Technical Specification 5.2.c.3 to be available and operable during canister transfer operations, and no redundant equipment was available and operable to perform the required safety function.

This is a Severity Level III violation (NRC Enforcement Policy Section 6.9.c.2).

Pursuant to the provisions of 10 CFR 2.201, Southern California Edison Company (SCE) is hereby required to submit a written statement or explanation to the Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, with a copy to the Document Control Desk, Washington, DC 20555-0001, and the Regional Administrator, U.S. Nuclear Regulatory Commission, Region IV within 30 days of the date of this Notice of Violation and Proposed Imposition of Civil Penalty (Notice). This reply should be clearly marked as a "Reply to a Notice of Violation; EA-18-155" and should include for each violation: (1) the reason for the violation, or, if contested, the basis for disputing the violation or severity level; (2) the corrective steps that have been taken and the results achieved; (3) the corrective steps that will be taken; and (4) the date when full compliance will be achieved.

Your response may reference or include previous docketed correspondence, if the correspondence adequately addresses the required response. If an adequate reply is not received within the time specified in this Notice, the NRC may issue an order or a Demand for Information requiring you to explain why your license should not be modified, suspended, or revoked or why the NRC should not take other action as may be proper. Consideration may be given to extending the response time for good cause shown. Under the authority of Section 182 of the Act, 42 U.S.C. 2232, this response shall be submitted under oath or affirmation.

You may pay the civil penalty proposed above, in accordance with NUREG/BR-0254 (Enclosure 2) and by submitting to the Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, a statement indicating when and by what method payment was made, or may

protest imposition of the civil penalty in whole or in part, by a written answer addressed to the Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, within 30 days of the date of this Notice.

Should SCE fail to answer within 30 days of the date of this Notice, the NRC will issue an order imposing the civil penalty. Should SCE elect to file an answer in accordance with 10 CFR 2.205 protesting the civil penalty, in whole or in part, such answer should be clearly marked as an "Answer to a Notice of Violation; EA-18-155" and may: (1) deny the violations listed in this Notice, in whole or in part; (2) demonstrate extenuating circumstances; (3) show error in this Notice; or (4) show other reasons why the penalty should not be imposed. In addition to protesting the civil penalty in whole or in part, such answer may request remission or mitigation of the penalty.

In requesting mitigation of the proposed penalty, the response should address the factors in Section 2.3.4 of the Enforcement Policy. Any written answer addressing these factors pursuant to 10 CFR 2.205, should be set forth separately from the statement or explanation provided pursuant to 10 CFR 2.201, but may incorporate parts of the 10 CFR 2.201 reply by specific reference (e.g., citing page and paragraph numbers) to avoid repetition. Your attention is directed to the other provisions of 10 CFR 2.205, regarding the procedure for imposing a civil penalty.

Upon failure to pay any civil penalty which subsequently has been determined in accordance with the applicable provisions of 10 CFR 2.205 to be due, this matter may be referred to the Attorney General, and the penalty, unless compromised, remitted, or mitigated, may be collected by civil action pursuant to Section 234c of the Act, 42 U.S.C. 2282c.

The responses noted above, i.e., Reply to Notice of Violation, Statement as to payment of civil penalty, and Answer to a Notice of Violation, should be addressed to: Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, with a copy to the Document Control Desk, U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001 and the Regional Administrator, U.S. Nuclear Regulatory Commission, Region IV, 1600 E. Lamar Blvd., Arlington, TX 76011-4511. Your response will be made available electronically for public inspection in the NRC Public Document Room or in the NRC's Agencywide Documents Access and Management System (ADAMS), accessible from the NRC Web site at http://www.nrc.gov/reading-rm/adams.html. To the extent possible, it should not include any personal privacy or proprietary information so that it can be made available to the public without redaction.

If personal privacy or proprietary information is necessary to provide an acceptable response, then please provide a bracketed copy of your response that identifies the information that should be protected and a redacted copy of your response that deletes such information. If you request that such material is withheld from public disclosure, you must specifically identify the portions of your response that you seek to have withheld and provide in detail the bases for your claim (e.g., explain why the disclosure of information will create an unwarranted invasion of personal privacy or provide the information required by 10 CFR 2.390(b) to support a request for withholding confidential commercial or financial information).

In accordance with 10 CFR 19.11, you may be required to post this Notice within two working days of receipt.

Dated this 25th day of March 2019.

Payment Methods

ENCLOSURE 2

APPROVED BY OMB: NO. 3150–0190

Estimated burden per response to comply with this voluntary collection request: 10 minutes. This brochure provides information about available payment methods. Forward comments about to burden estimate to the Records Management Branch (T6-F33), U.S. Nuclear Regulatory Commission, Washington, DC 20555-0001, and to the Paperwork Reduction Project (3150-0190), Office of Management and Budget, Washington, DC 20503. If a means used to impose an information collection does not display a currently valid OMB control number, the NRC may not conduct or sponsor, and a person is not required to respond to, the information collection.

NRC accepts the methods described below.

PAYMENT BY AUTOMATED CLEARINGHOUSE

To pay by Automated Clearinghouse / Electronic Data Interchange (ACH/EDI), provide a copy of NRC Form 628 to your financial institution. You may obtain a copy of NRC Form 628 by calling the NRC Accounts Receivable Help Desk at (301) 415-7554.

PAYMENT BY CREDIT CARD

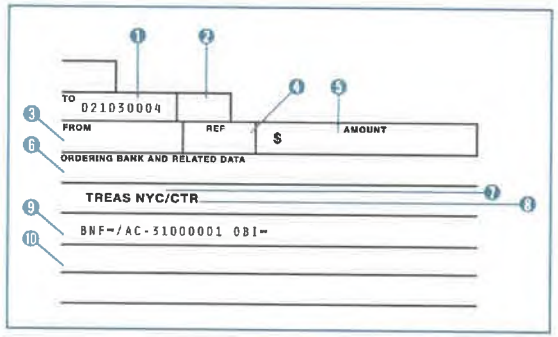
The NRC is currently accepts credit card payments of up to $24,999.99. For payment by credit card, go to Pay.gov, search for "U.S. Nuclear Regulatory Commission Fees" and enter the required information.

You may also mail or fax NRC Form 629 following the directions on the form. To obtain a copy of NRC Form 629 go to http://www.nrc.gov and search for "NRC Form 629" or call the NRC Accounts Receivable Help Desk at (301) 415-7554.

PAYMENT BY FEDWIRE DEPOSIT SYSTEM

The NRC can receive funds through the U.S. Department of the Treasury (Treasury) Fedwire Deposit System. The basic wire message format below complies with the Federal Reserve Board's standard structured third-party format for all electronic funds transfer (EFT) messages.

See the sample EFT message to Treasury below. Each numbered field is described below.



❶ **RECEIVER-DFI#** – Treasury's routing number for deposit messages is 021030004.

❷ **TYPE-SUBTYPE-CD** – The sending bank will provide the type and subtype code.

❸ **SENDER-DFI#** – The sending bank will provide this number.

❹ **SENDER-REF#** – The sending bank will insert this 16-character reference number at its discretion.

❺ **AMOUNT** – The transfer amount must be punctuated with commas and decimal point; use of the "$" is optional. The depositor will provide this item.

❻ **SENDER-DFI-NAME** – The Federal Reserve Bank will automatically insert this information.

❼ **RECEIVER-DFI-NAME** – Treasury's name for deposit messages is "TREAS NYC". The sending bank will enter this name.

❽ **PRODUCT CODE** – A product code of "CTR" for customer transfer should be the first item in the reciever text field. Other values may be entered, if appropriate, using the American Bankers Association's options. A slash must be entered after the product code.

❾ **AGENCY LOCATION CODE (ALC)** – THIS ITEM IS OF CRITICAL IMPORTANCE. IT MUST APPEAR ON THE FUNDS TRANSFER DEPOSIT MESSAGE IN THE PRECISE MANNER AS STATED TO ALLOW FOR THE AUTOMATED PROCESSING AND CLASSIFICATION OF THE FUNDS TRANSFER MESSAGE TO THE AGENCY LOCATION CODE OF THE APPROPRIATE AGENCY. The ALC identification sequence can, if necessary, begin on one line and end on the next line; however, the field tag "BNF=" must be on one line and cannot contain any spaces. The NRC's 8-digit ALC is: BNF=/AC-31000001

❿ **THIRD-PARTY INFORMATION** – The Originator to Beneficiary Information (OBI) field tag "OBI=" signifies the beginning of the free-form third-party text. All other identifying information intended to enable the NRC to identify the deposit—for example, NRC annual fee invoice number, description of fee, 10 CFR 171 annual fee, and licensee name—should be placed in this field.

The optimum format for fields 7, 8, 9, and 10 using an 8-digit ALC is as follows:

TREAS NYC/CTR/BNF=/AC-31000001 OBI=

The optimum format, shown above, will allow 219 character positions of information following the "OBI=" indicator.

If the licensee's bank is not a member of the Federal Reserve System, the nonmember bank must transfer the necessary information and funds to a member bank, which then must transfer the information and funds to the local Federal Reserve Bank.

For a transfer of funds from local Federal Reserve Banks to be recorded on the same day, the transfer must be received at the New York Federal Reserve Bank by 4 p.m., EST. Otherwise, the deposit will be recorded on the next workday.

PAYMENT BY CHECK

Checks should be made payable to the U.S. Nuclear Regulatory Commission with the invoice number, Enforcement Action number, or other information that identifies the payment, written on the check. Mail the check to the following address:

U.S. Nuclear Regulatory Commission
U.S. Bank
P.O. Box 979051
St. Louis, MO 63197-9000

FedEx or overnight mailings must be delivered to the following address:

U.S. Nuclear Regulatory Commission
U.S. Bank Government Lockbox
SL-MO-C2GL
1005 Convention Plaza
St. Louis, MO 63101

TAXPAYER IDENTIFICATION NUMBER

You must file your Taxpayer Identification Number (TIN) with the NRC. Use NRC Form 531 to provide your TIN. You may obtain NRC Form 531 from the NRC Web site at http://www.nrc.gov by searching for "NRC Form 531" or by calling the NRC Accounts Receivable Help Desk at (301) 415-7554.

Mediation Location and Duration

The parties usually hold the mediation at or near one of the NRC's offices. However, the parties may agree on any alternate location. Mediation sessions are usually no longer than 1 day. In some cases, the mediation may take longer with the mutual consent of the parties.

The NRC Mediation Team

The responsible NRC senior manager (i.e., Office Director, Regional Administrator, or his or her designee) will serve as the principal negotiator for the NRC in cases that involve wrongdoing and technical issues. When a case involves discrimination, the Director of the Office of Enforcement will serve as the principal negotiator. The other members of the NRC mediation team typically include an enforcement specialist, an attorney, and a staff representative who is familiar with any technical issues under discussion.

The Confirmatory Order

A CO is a legally binding document that includes the terms of the AIP. The NRC will issue a CO only with the prior written consent of the other party and with a waiver of the right to a hearing. After the entity or the individual has completed the terms of the CO, the NRC will verify that the terms of the CO have been satisfied in a timely manner. Because the CO is legally binding, failing to comply with its terms exposes the entity or individual to additional enforcement action.

Although the substance of the mediation session remains confidential, the details of the settlement will normally be made public via a press release and the publication of the CO in the *Federal Register*.

Timeliness Goals

The timely resolution of issues is one of the goals of the enforcement ADR program. Accordingly, the NRC expects timely progress of a case at each stage of the mediation process. In cases where the parties achieve settlement, the NRC expects to issue a CO within 90 calendar days of the date of the agency's letter offering the ADR option to the other party.

Additional Sources of Information

More information about the NRC's ADR program is available from the following:

- Cornell University's Scheinman Institute on Conflict Resolution
  Toll-Free Number: (877) 733-9415

- The NRC's ADR Program Manager in the Office of Enforcement
  Toll-Free Number: (800) 368-5642 or (301) 287-9527

- The NRC enforcement ADR program on the agency's Web site at www.nrc.gov/about-nrc/regulatory/enforcement/adr.html

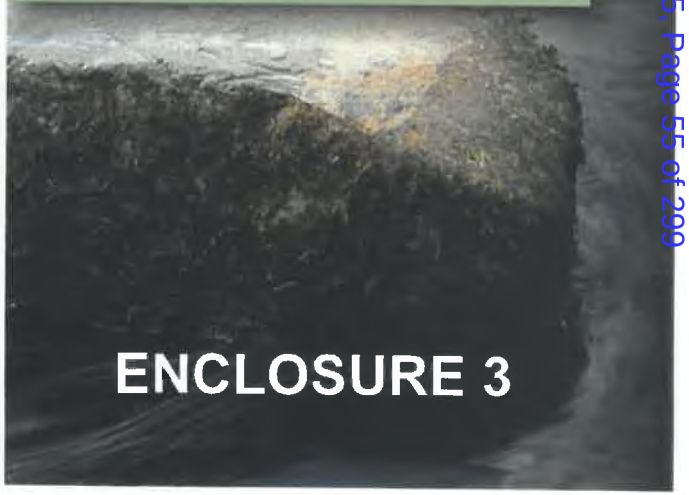
Enforcement Alternative Dispute Resolution Program



ENCLOSURE 3

The Program

The U.S. Nuclear Regulatory Commission's (NRC's) enforcement alternative dispute resolution (ADR) program, formerly referred to as "post-investigation ADR," provides an amicable process for resolving enforcement matters. It is intended to produce more timely and effective outcomes for the NRC and an entity (e.g., an NRC licensee, certificate holder, or contractor of an NRC licensee or certificate holder) or an individual who is subject to an enforcement action, through mediation.

The NRC established the post-investigation ADR program in 2004. In 2015, the NRC expanded its scope to include certain types of enforcement cases that do not involve an investigation. Accordingly, the name of this program was changed from "post-investigation ADR" to "enforcement ADR."

Enforcement ADR includes two distinct case types: (1) discrimination cases or other wrongdoing and, (2) nonwillful (traditional) enforcement cases with the potential for civil penalties (not including violations associated with findings assessed through the Reactor Oversight Process). For discrimination cases or other wrongdoing, mediation is used after the completion of an investigation by the NRC Office of Investigations.

As long as the enforcement matter is within the scope of the program, the NRC normally offers enforcement ADR at each of the following stages of the enforcement process: (1) before an initial enforcement action, (2) after the initial enforcement action is taken, typically upon issuance of a notice of violation, and (3) when a civil penalty is imposed but before a hearing request.

Mediation is an informal process in which a trained and experienced mediator works with the parties to help them reach a resolution. The parties are the NRC and the entity or individual in the mediation. The mediator focuses the attention of the parties on their needs and interests rather than on their stated positions. Mediation gives the parties an opportunity to discuss issues, clear up misunderstandings, identify creative ways to address issues, find areas of agreement, and resolve their dispute.

Participation in the program is entirely voluntary. The NRC and the entity or the individual may withdraw from the mediation process at any time.

The Program Administrator

The NRC has a contract with the Cornell University Scheinman Institute on Conflict Resolution (Cornell) to serve as the program administrator for the enforcement ADR program. Cornell manages the logistics associated with enforcement ADR, including working with the parties to select a mediator from Cornell's roster of mediators. Cornell uses a network of independent and experienced mediators who help the parties find areas of agreement and settle their dispute.

The Mediator

The mediator is an experienced neutral individual who is mutually selected by the parties. He or she has no stake in the outcome of the mediation or any power to make decisions that may bind either party. The role of the mediator is to facilitate communication between the parties and to provide an environment where the parties can address their differences. The mediator uses consensus-building skills and knowledge of negotiation to help the parties find ways to overcome any misunderstandings and find areas of agreement. The mediator does not act as legal counsel or provide legal advice. Each party should consult an attorney for legal advice as appropriate.

The Mediation Process

Historically, most enforcement ADR mediations have occurred at the first stage of the enforcement process (i.e., before an initial enforcement action). In those cases, the NRC presents the entity or the individual with the opportunity to engage in mediation with the agency before it makes an enforcement decision. If the entity or the individual elects ADR, Cornell will help the NRC and the entity or the individual, jointly select a mediator. After selecting a mediator, the parties, in coordination with the mediator, set a date and place for the mediation. Typically, the mediator holds a premediation teleconference with the parties to discuss logistics or any special needs.

During the mediation, the mediator will give the parties an opportunity to discuss their views on the issue. Often, the mediator will meet privately with each party to develop a clear understanding of the party's perspective and explore and assess options. Although the mediator does not have any power to make decisions that may bind either party, he or she may ask questions intended to help the parties assess the merits of their positions, help them converse in a respectful atmosphere, and identify potential settlement options.

If the parties reach a settlement agreement during the mediation session, they will typically document the terms of their agreement in writing by developing an agreement in principle (AIP) document. The AIP is not enforceable by either party against the other, but it is the basis on which the NRC drafts a confirmatory order (CO). The CO is a legally binding document used to confirm the commitments made in the AIP. However, if the parties do not reach a settlement agreement, the traditional enforcement process resumes—that is, the enforcement process continues as it would have if the parties had not engaged in ADR.

Confidentiality

Although the terms of an ADR settlement become publicly available through the issuance of the CO, with certain exceptions, the substance of the discussions during the mediation session is confidential. The mediator is prohibited from discussing the mediation proceedings, testifying on anyone's behalf concerning the mediation, or submitting a report on the substance of the discussions.

Cost

The NRC and the entity or individual, equally share the fees and travel expenses of the mediator and any meeting room fees. However, each party is responsible for its own expenses, such as travel, lodging, and legal representation.

them you need to tell me how you're going to remediate this, and they came back and said we want to go back to the older design.

CHAIRMAN DR. VICTOR: People are going to want to know about these four canisters. Why not take eight or ten days and move them back into the pool, and unload them and reload them? Help us understand. I know, it's early days. 19:05:32

MR. PALMISANO: Sure.

CHAIRMAN DR. VICTOR: Help us understand what the logic process is going to be there. 19:05:45

MR. PALMISANO: Yeah. And let me just -- because I faced this issue back in the mid '90s at the Palisades Nuclear Plant with a loaded canister that had a potential weld defect and got into this very discussion. 19:05:58

So nobody has unloaded a commercial canister, either a bolted cask or a welded cask or canister. Okay. It is possible. What you would do is basically have a mechanism, either to do it in a fuel pool or do it in a dry transfer facility. It's possible either way. 19:06:15

You would take the canister back in. And the first thing you would do is reconnect the valves and find a way to purge the helium and refill its hole with water. Okay.

The biggest technical issue that we've looked at 19:06:29

in the industry over the many years -- not just related to SONGS -- is the thermal transient to actually reintroduce water into a -- let's say a canister with hot fuel, 200-300 degrees C. And the thermal transient that you put the fuel through. Okay. 19:06:44

So once you get it reflooded, cooled down, you would then put that similar machine on, grind out the weld, take the lid off. That's just the mechanics. That's certainly doable.

The real challenge as we would understand it today, and nobody has had to do it yet, is the reflood. Certainly, technically possible. What I would tell you is just I was back in Washington with the NRC last week, if you were just to brainstorm, this would probably be a two- to three-year project to develop the techniques, pile up the techniques. The NRC would want to have explicit approval on this because of the radiological hazards. 19:06:54 19:07:09

CHAIRMAN DR. VICTOR: To the workers?

MR. PALMISANO: Well, to the workers, yeah. 19:07:20

So when you think about this, you have a canister that has intact fuel rods inside of a sealed canister. This pin problem doesn't affect the canister itself. Okay. So you've got that condition.

You've got to weigh that condition -- if this 19:07:34

SCE-03: Testimony On The 2017 Decommissioning Cost Estimate for SONGS 2&3

List Of Tables

I.

INTRODUCTION

The purpose of this testimony is to demonstrate the reasonableness of the 2017 Decommissioning Cost Estimate for San Onofre Nuclear Generating Station Unit Nos. 2&3 (2017 SONGS 2&3 DCE). The 2017 DCE estimates that the total cost to decommission SONGS 2&3 will be $4,479 million (100% share, 2014 $), an increase of approximately 1.5% over the 2014 SONGS 2&3 DCE. The Commission-approved 2014 DCE estimated that the total cost to decommission SONGS 2&3 would be $4,411 million (100% share, 2014 dollars).

Chapter II of this testimony provides a summary of the 2017 DCE. Chapter III provides testimony from ABZ Incorporated (ABZ), a third-party consultant who performed an independent review of the 2017 DCE. Chapter IV provides a detailed reconciliation of the 2017 DCE to the 2014 DCE. Chapter V concludes SCE's testimony.

II.

SUMMARY OF 2017 SONGS 2&3 DECOMMISSIONING COST ESTIMATE

A. Methodology and Description

SCE and the other SONGS participants[1] began accumulating funds for the eventual decommissioning of SONGS 2&3 early in the units' operating lives. Because the units were licensed to operate for several decades,[2] decommissioning fund accumulations were based on conceptual cost estimates.[3] These conceptual DCEs were developed by third-party vendors using proprietary estimating algorithms consistent with recognized industry guidelines such as AIF/NESP-036, "Guideline for Producing Commercial Nuclear Power Plant Decommissioning Cost Estimates" and the Department of Energy (DOE) Decommissioning Handbook.[4] These estimates were updated periodically to reflect changes in regulations, technology, and economics; additions and deletions to the nuclear facilities;

---

[1] San Diego Gas & Electric Company and the City of Riverside own 20% and 1.79% shares of SONGS 2&3, respectively. On December 29, 2006, SCE acquired the City of Anaheim's ownership share of SONGS 2&3. Under the Anaheim Settlement Agreement adopted by the Commission in D.06-11-025, however, the City of Anaheim retained a pro-rata share of the SONGS 2&3 decommissioning obligation as shown approximately in the table below:

Decommissioning Obligation		
	SONGS 2	SONGS 3
SCE	75.7363%	75.7475%
SDG&E	20.0000%	20.0000%
Anaheim	2.4737%	2.4625%
Riverside	1.7900%	1.7900%
	100.00%	100.00%

[2] On March 9, 2000, the U.S. Nuclear Regulatory Commission issued Amendment No. 166 to Facility Operating License No. NPF-10 and Amendment No. 157 to Facility Operating License No. NPF-15 for San Onofre Nuclear Generating Station (SONGS) Units 2 and 3, respectively. These amendments revised the expiration dates of the SONGS 2 and SONGS 3 operating licenses from October 18, 2013, to February 16, 2022 and November 15, 2022, respectively.

[3] In this context, "conceptual" means that the decommissioning cost estimates were developed based on Unit Cost Factors coupled with the Critical Path Method, using the best-available current information, for projects that were not expected to commence until several years or decades into the future. These "conceptual" cost estimates were not intended to be executable decommissioning project plans or schedules.

[4] *See* Decommissioning Cost Estimate for SONGS 2&3 Prepared for SCE by ABZ Incorporated, dated December 14, 2012, page 5. From 2001 to 2013, SCE utilized ABZ, Incorporated to develop the decommissioning cost estimates for SONGS 2&3. Prior to 2001, SCE utilized TLG Services, Incorporated to develop the decommissioning cost estimates for SONGS 1 and for SONGS 2&3.

updated site radiological assumptions; lessons-learned from other nuclear decommissioning projects; and other related information necessary to complete accurate cost estimates.

On July 22, 2013, after SCE announced its decision to permanently retire SONGS 2&3, SCE notified the Commission that it intended to prepare a new DCE for SONGS 2&3 after the development of a site-specific decommissioning plan.[5] SCE informed the Commission that this new estimate would be included in the Post Shutdown Decommissioning Activities Report (PSDAR) that SCE was required to submit to the NRC.[6]

SCE retained the consortium of Energy*Solutions* and Chicago Bridge & Iron Company (ES/CBI) to develop the 2014 SONGS 2&3 DCE, which included the total estimated cost for the decommissioning project. SCE and SDG&E submitted the 2014 DCE to the Commission in Application (A.) 14-12-007. The Commission adopted the 2014 SONGS 2&3 DCE in Decision (D.) 16-04-019.

As required by the California Nuclear Facilities Decommissioning Act of 1985[7] (Decommissioning Act), SCE is required to periodically update the SONGS 2&3 DCE. Therefore, in 2017, SCE engaged The Kenrich Group (Kenrich)[8] to prepare the 2017 SONGS 2&3 DCE. This DCE is consistent with the guidance provided in NRC Regulatory Guide 1.202, "Standard Format and content of Decommissioning Cost Estimates for Nuclear Power Reactors." The 2017 DCE presents the total estimated project cost, including recorded costs to date, to allow for comparisons to the 2014 DCE. That is, the 2017 DCE includes recorded costs from project inception through September 30, 2017, and estimated costs from October 1, 2017 through assumed project completion in 2051. The 2017 DCE estimates that the total cost to decommission SONGS 2&3 will be $4,479 million (100% share, 2014 $). The 2017 DCE uses the same Work Breakdown Structure (WBS) that was used in the 2014 DCE, and includes the following new and updated information:

- The pricing for the contract awarded to Holtec International, Inc., (Holtec) for the Independent Spent Fuel Storage Installation (ISFSI) expansion and the transfer of spent fuel from the SONGS 2&3 spent fuel pools to the ISFSI;

---

5 A.12-12-013, Exhibit SCE-06, page 1.

6 *Id*.

7 Pub. Utilities Code § 8321 et. seq.

8 *See* Exhibit SCE-01, pages 17-18.

- The pricing for the contract awarded to SONGS Decommissioning*Solutions* (SDS) for the decontamination and dismantlement (D&D) of SONGS 2&3, and the removal and disposal of radiological, hazardous, and non-hazardous waste;

- Recorded costs through September 30, 2017;

- Revised DOE spent fuel acceptance date to reflect DOE's continued failure to perform its contractual obligations to pick up fuel from commercial nuclear reactors during the four years since the 2014 DCE was completed;

- Revised environmental review costs and approval dates based on the current permitting strategy and the requirements of the California State Lands Commission (CSLC), the California Coastal Commission (CCC), and the U.S. Department of the Navy (Navy);

- Revised project execution strategy, including the deferral of the start of substructure removal until 2046;

- Updated undistributed cost projections based on historical recorded costs and revised projections;

- Updated ISFSI demolition costs to reflect the final design of the Holtec ISFSI; and

- Other project costs not previously identified.

Significant components of the 2017 DCE are now based on competitively bid contracts, as well as three additional years of experience managing a decommissioning plant and overseeing decommissioning personnel. Where new information was not available, Kenrich worked with third-party consultants and SCE personnel to validate and refine the cost and schedule assumptions for 2017 SONGS 2&3 DCE.

B. <u>2017 DCE Assumptions</u>

The 2017 DCE includes the following assumptions that have not changed from the 2014 SONGS 2&3 DCE:

- SONGS 2&3 will be decommissioned using the prompt DECON decommissioning methodology;

- All fuel assemblies will be transferred from the SONGS 2&3 spent fuel pools to the ISFSI by mid-2019;

- A dry transfer facility will not be necessary to transfer the spent fuel canisters to DOE transport canisters;

- Decommissioning will be performed by a decommissioning general contractor (DGC) with oversight by the SONGS Participants;

- SONGS 2&3 major D&D activities will be completed by the end of 2028;

- All onshore substructures and offshore conduits will be removed; and

- ISFSI decommissioning, NRC license termination, and site lease termination will be completed by the end of 2051.

In addition, the 2017 DCE is based on the following updated assumptions:

- SONGS 2&3 D&D will commence in January 2019 based on expected completion dates of environmental reviews and approvals; and

- The DOE will commence accepting spent fuel from U.S. commercial nuclear facilities in 2028, which results in the DOE removing the last spent fuel from the SONGS ISFSI in 2049.

C. Contingency

Contingency is applied to cost estimates to account for unknown or unplanned occurrences during the performance of a project. "Contingency" is defined in the American Association of Cost Engineers *Project and Cost Engineers' Handbook* as, "specific provision for unforeseeable elements of cost within the defined project scope; particularly important where previous experience relating to estimates and actual costs has shown that unforeseeable events which will increase costs are likely to occur." The consensus in the industry literature, including sources from the DOE[9] and the Association for the Advancement of Cost Engineering International,[10] is that a contingency factor for cost estimates in this stage of development should fall within a range of 15% to 30%.

In its decision for the 2005 Nuclear Decommissioning Cost Triennial Proceeding (NDCTP), the Commission ordered the Utilities (SCE, SDG&E, and PG&E) to serve testimony in the next NDCTP

[9] Chapter 11 of U.S. Department of Energy (DOE) Decommissioning Implementation Guide DOE, G 430.1-1, March 28, 1997.

[10] Association for the Advancement of Cost Engineering International, Recommended Practice No. 18R-97, at page 2 of 9.

that demonstrates they have made all reasonable efforts to conservatively establish an appropriate contingency factor for inclusion in the decommissioning revenue requirements.[11]

To comply with this Commission order, in the 2009 NDCTP,[12] which occurred at a time when the Utilities still believed that decommissioning would not begin until decades in the future, PG&E prepared a paper titled, *Technical Position Paper for Establishing an Appropriate Contingency Factor for Inclusion in the Decommissioning Revenue Requirements*. Based on industry and regulatory documents, the position paper concluded that it is appropriate to add a 25% contingency factor to estimated decommissioning costs because it provides reasonable assurance for unforeseen circumstances[13] that could increase decommissioning costs, and should not be reduced or eliminated simply because foreseeable costs are low. In that proceeding, SCE agreed based on its own independent research that the 25% contingency factor was conservative and appropriate.[14] Consistent with this assumption, each of the DCEs submitted by the Utilities in that proceeding contained a 25% contingency factor. The Commission found that each such DCE was reasonable.[15]

Later, an Independent Review Panel (Panel) examined the definition and role of contingency factors in DCEs.[16] The Panel identified that DCEs should consider four types of risk or uncertainty, including: (1) performance risk; (2) scope risk; (3) regulatory risk; and (4) financial risk.[17] The Panel found that the DCEs prepared by third-party vendors on behalf of the Utilities typically only addressed performance risks by including 17%-22% contingency, and that the Utilities' adjustments to target their DCEs' overall contingency to 25% was intended to capture all risks, and was consistent with the

---

[11] D.07-01-003, Ordering Paragraph 8.

[12] A.09-04-007 and A.09-04-009.

[13] For example, some activities in the remaining decommissioning work are less familiar activities in the industry. To terminate the easement with the Navy, SCE may be required to perform extensive site restoration work that is unique to the SONGS site.

[14] D.10-07-047, page 23.

[15] *Id*., Conclusions of Law 4, 5, 6, 7, 13, and 14. Also see D.11-07-003 at page 25.

[16] Report on Nuclear Decommissioning, February 28, 2011, For The California Public Utilities Commission, Prepared by Nicholas Capik, Geoffrey Griffiths, and Bruce Lacy, at pages 40-42.

[17] *Id*., at page 40. Financial risk is typically addressed through conservative assumptions for cost escalation and fund earnings rates.

contingency value normally used by the NRC.[18] The Commission also approved SCE's decommissioning cost estimates in the 2012 NDCTP and SCE's 2014 SONGS 2&3 DCE, each of which also included a 25% contingency factor.[19]

In the 2017 SONGS 2&3 DCE, SCE did not apply contingency to the $1,156 million (100% share, 2014 $) of SONGS 2&3 decommissioning costs that were recorded between June 2013 and September 2017. For work scopes that have been contracted or are well defined in the 2017 DCE, SCE applied lower contingency factors. Kenrich and knowledgeable SCE personnel reviewed each DCE line item, giving consideration to the technical complexity, contracting status, estimating approach, and timing of each work scope, and applied an appropriate contingency factor. For decommissioning activities in the 2017 DCE that will not be performed until decades in the future when their scopes become better defined, SCE applied a 25% contingency factor as approved by the Commission in the past several NDCTPs.

[18] *Id.*, see Footnote 37.

[19] See D.14-12-082 at page 38, Findings of Fact 13, and Conclusions of Law 17, 22, 23, and 24; and D.16-04-019 Conclusion of Law 1.

Table II-1 below identifies the range of contingency factors utilized for each 2017 DCE cost category:

Table II-1
Contingency Factors Applied in 2017 DCE

2017 DCE Category	Contingency Factor
Recorded Costs Through September 2017	0%
Service Level Agreements	10%
Undistributed Labor	10%
ISFSI & Fuel Transfer Operations	[redacted]
Undistributed Non-Labor	15%
[redacted]	[redacted]
ISFSI Aging Management	20%
Plant Easement/Lease Renewals	20%
Other Projects	15-20%
GTCC Waste Storage	25%
Offshore Conduit Removal	25%
Substructure Removal	25%
ISFSI Demolition	25%
Final Site Restoration	25%

The composite contingency factor included in the 2017 DCE is approximately [redacted] of the base costs.

III.

INDEPENDENT REVIEW OF 2017 SONGS 2&3 DCE

A. Introduction

This testimony describes ABZ, Incorporated's (ABZ) independent review of the 2017 San Onofre Nuclear Generating Station (SONGS) Units 2 and 3 Decommissioning Cost Estimate (DCE), and the conclusions reached by ABZ in that review.

Nick Capik was the project manager and principal author of the ABZ review of the 2017 SONGS 2&3 DCE. In this testimony, he describes the scope of ABZ's review and the conclusions reached during that review.

B. ABZ Background And Experience

ABZ was founded in 1986 to provide consulting and engineering services to the nuclear power industry. ABZ supports nuclear decommissioning projects in a number of ways including cost estimating, licensing, project management, due diligence, and litigation. ABZ has been engaged from conceptual design of decommissioning through implementation and site restoration.

ABZ has also prepared or reviewed 43 decommissioning cost estimates covering 63 nuclear plants. This includes preparing DCEs for SONGS 2 & 3 from 2001 through 2014. These SONGS cost estimates were accepted by the California Public Utilities Commission (CPUC) as reasonable and formed the basis for ratemaking for decommissioning collections. In addition, I participated as the ABZ representative in an Independent Review Panel established by the CPUC to examine decommissioning cost issues as part of Decision (D.) 10-07-047. As part of this work, ABZ evaluated the 2008 SONGS 2&3 DCE in comparison to Pacific Gas and Electric's Diablo Canyon estimate, the Palo Verde Nuclear Generating Station estimate, and the estimates for four other similar nuclear power plant sites. Significant areas of focus included cost and financial assumptions, waste management approaches, state requirements for site restoration, severance costs, and use of actual industry performance and cost data.

In addition to cost estimating, ABZ has performed direct oversight of decommissioning activities for several nuclear power plant decommissioning projects, including Zion, Trojan, and Shoreham. ABZ

staff has provided additional support for decommissioning at Connecticut Yankee, Maine Yankee, Yankee Rowe, Fort St. Vrain, Millstone, and others.

ABZ has participated in litigation associated with decommissioning in several venues, including the U.S. Court of Claims, U.S. Tax Court, and State proceedings. Finally, ABZ has performed due diligence reviews of decommissioning plans, efforts, and costs as part of two nuclear plant sales.

C. ABZ Independent Review

1. Scope

ABZ performed an independent review of the 2017 SONGS 2&3 DCE. This review was conducted in several phases as the DCE was being developed such that responses to ABZ comments and questions could be evaluated and incorporated into the final DCE. ABZ's review focused on key assumptions, scope and cost of decommissioning projects, project schedules, and undistributed costs, including staffing, and contingency.

2. Review Process

ABZ reviewed the draft DCE and supporting information over a seven-month period in 2017. ABZ performed distinct reviews at 60 percent complete, 90 percent complete, and just prior to issuance of the final DCE. ABZ's intent was to assess the reasonableness of the DCE assumptions, project scopes, costs, and schedule. ABZ provided comments addressing the scope of the estimate compared to previous SONGS estimates and industry experience, estimated costs, work completed to date, and assumptions used in preparing the estimate.

ABZ started by reviewing the key assumptions of the DCE for reasonableness. ABZ evaluated these assumptions in light of similar assumptions made at other decommissioning projects.

ABZ then evaluated the projects included in the DCE to ensure that the collective scope of activities was sufficient to terminate the NRC license and restore the SONGS site. ABZ evaluated the costs of these projects against previous estimates and with comparable industry costs. In parallel with its review of projects, ABZ evaluated the schedule for these projects to ensure that sufficient time was allocated for successful performance, and to evaluate the ability to adjust the planned schedule to accommodate potential delays.

Separate from its review of decommissioning projects, ABZ evaluated undistributed costs in the DCE, including both staff costs as well as non-staff costs to ensure that all such costs were included and that the estimated costs were reasonable.

Finally, ABZ reviewed the contingency included in the DCE and the basis used to allocate contingency. ABZ evaluated the change in contingency from previous DCEs as well as the basis for such changes.

D. ABZ Findings

1. Key Facts And Assumptions

The 2017 SONGS 2&3 DCE contains a number of key facts and assumptions. ABZ reviewed these key facts and assumptions and concluded that the facts represent known conditions and that the assumptions are reasonable.

2. Scope

The SONGS DCE includes two major fixed-price contracts that cover a large portion of the work to remediate radiological hazards and reduce the footprint of the NRC license to that required to store spent fuel, and to transfer spent fuel on-site to a dry storage facility. Beyond these two major contracts, the DCE includes continued management of spent fuel until accepted by DOE, demolition of uncontaminated structures, and restoration of the site. ABZ reviewed this scope of work against previous SONGS DCEs including the 2014 DCE performed by Energy*Solutions* as well as previous ABZ estimates.

ABZ verified that the 2017 DCE included all identified activities needed to terminate the NRC operating license and restore the site consistent with the end-state assumptions.

3. Schedule

ABZ reviewed the schedule for decommissioning activities, identified critical path activities, and ability to manage delays in performance of major activities. ABZ compared this schedule to previous SONGS schedules and evaluated the proposed activity lengths to relative to recent decommissioning projects. ABZ concluded that the schedule allowed adequate time to complete required activities.

4. Risk Mitigation

ABZ reviewed both the contingency included in the 2017 SONGS 2&3 DCE as well as the schedule to determine whether and how uncertainties could be accommodated without an increase in project cost or duration. ABZ concluded that the schedule provided sufficient flexibility to allow for a delay in completing critical path activities while still maintaining the overall project schedule and keeping costs within the estimate total. Further, ABZ evaluated the overall contingency compared to the current state of the SONGS decommissioning project and concludes that the contingency is reasonable for the current project state.

E. Conclusion

ABZ concludes that the scope of the 2017 SONGS DCE is sufficient to terminate the NRC license and restore the site; that the projected schedule allows sufficient time for completion of all required activities; that the cost is reasonable for performance of those activities; and that sufficient risk mitigation has been included.

IV.

RECONCILIATION OF THE 2017 DCE TO THE 2014 DCE

A. Overview

In D.16-04-019, the Commission found reasonable the 2014 SONGS 2&3 DCE of $4,411 million (100% level, 2014 $). The 2017 SONGS 2&3 DCE estimates the total cost to decommission SONGS 2&3 will be $4,479 million (100% share, 2014 $). There are several variances between the 2014 and 2017 DCEs that net to small 1.5% increase in the 2017 DCE, as shown in Table IV-2 below.[20] At a high level, the increase is due to new scope not included in the 2014 DCE including ISFSI Aging Management Project and GTCC waste storage; the remaining variances essentially net to a zero change.

[20] Appendix C provides a table which shows the differences between Table 2 of the 2017 SONGS 2&3 DCE and this Table IV-2. SCE made these changes to be able to provide better description of the activities and variances.

Table IV-2
Reconciliation of 2017 DCE to 2014 DCE
(100% Share, Millions of 2014 $)

	Description	2017 DCE Total (2014 $)	2014 DCE Total (2014 $)	Variance
1	**Distributed Projects**			
2	ISFSI & Fuel Transfer Operations	$ 270.2	$ 405.1	$ (134.9)
3	Final Site Restoration	6.9	57.4	(50.5)
4	ISFSI Aging Management	36.5	-	36.5
5	Decontamination, Demolition, and Disposal	[redacted]	1,208.2	[redacted]

B. Distributed Projects

1. ISFSI & Fuel Transfer Operations

SCE retained Holtec as the vendor to construct sufficient additional dry spent fuel storage capacity for the fuel currently stored in the SONGS 2&3 spent fuel pools, and to transfer the fuel to dry storage. Holtec's ISFSI & Fuel Transfer Operations work scope includes the following activities:

- Design and license a seismically designed dry storage system for the 2,668 fuel assemblies that remain in the SONGS 2&3 spent fuel pools
- Excavate and install the foundation base mat
- Fabricate, transport, and install the 75 vertical canister enclosure containers (CECs)

- Install a perimeter form surrounding the CECs and backfill with concrete
- Install a protected area security perimeter around the new ISFSI
- Fabricate and transport 75 multi-purpose canisters (MPCs) and seal lids, two shielded transfer casks, canister sealing equipment, and cask transfer equipment to the SONGS site
- Re-certify the spent fuel pool cranes to ensure safe lifting of the fully loaded MPCs and transfer casks
- Perform dry-run testing of fuel loading, canister sealing, and canister drying in the spent fuel pools
- Perform dry-run testing of fully loaded MPCs/transfer casks from the SONGS 2&3 spent fuel pools to the ISFSI
- Load each MPC with up to 37 spent fuel assemblies and install MPC lid and drain line
- Remove each fully loaded MPC/transfer cask from spent fuel pool, decontaminate, weld MPC lid and leak test, dehydrate MPC interior and fill with helium, weld vent and drain ports and closure ring
- Transfer each fully loaded MPC/transfer cask from the spent fuel pool to the ISFSI
- Lower each MPC from the transfer cask into its CEC
- Install the closure lid on each CEC
- Construct stand-alone ISFSI security building

Based on SCE's contract with Holtec,[21] the cost to complete the ISFSI and Fuel Transfer Operations project is estimated in the 2017 DCE to be $270.2 million[22] (100% share, 2014 $). In the 2014 DCE, SCE estimated that the cost to expand the SONGS ISFSI and transfer all remaining fuel from the SONGS 2&3 spent fuel pools to the ISFSI was $405.1 million (100% share, 2014 $). Thus, the 2017 DCE reflects a decrease of $134.9 million. This decrease is attributable to the lower cost of the

[21] SCE selected Holtec after a competitive procurement process.

[22] *See* 2017 DCE, Appendix C, Table 2, line 37.

competitively bid Holtec contract relative to the 2014 DCE. Because SCE negotiated a substantial reduction relative to the previously estimated ISFSI and Fuel Transfer Operations costs, the Commission should find that the estimated cost is reasonable.

2. Final Site Restoration

The 2017 DCE includes the following scope for Final Site Restoration: (1) remove railroad tracks, gunite slope protection, site access roads, and parking lots; (2) perform final site grading and re-vegetation; and (3) perform any other work required by the Navy real estate authorization, which is expected to include end state requirements for the SONGS site.

The estimated cost for Final Site Restoration work in the 2017 DCE is $6.9 million[23] (100% share, 2014 $). The estimated cost for Final Site Restoration in the 2014 DCE was $57.4 million (100% share, 2014 $). This resulted in a cost decrease of $50.5 million (100% share, 2014 $). This cost decrease occurred because SCE consolidated two previously planned dewatering campaigns that would have been separated by nearly two decades into a single campaign that will occur near the end of the decommissioning schedule after SCE will have secured the final real estate authorization from the Navy and will know the Navy's final site restoration requirements. Final site restoration is a necessary part of the decommissioning process, and therefore, the Commission should find that these estimated costs are reasonable.

3. ISFSI Aging Management

The ISFSI Aging Management Program (AMP) project was established to develop inspection and maintenance programs for both the Areva and Holtec spent fuel dry storage systems.[24] The project also includes the cost to renew the NRC Certificates of Compliance (CoCs) for the storage systems. Areva and Holtec currently hold 20-year CoCs for their spent fuel dry storage systems used at SONGS. The Areva and Holtec CoCs will expire in 2023 and 2035, respectively. Under 10 C.F.R. § 72.240, the CoC holder may apply for renewal of the CoC for a term not to exceed 40 years. The CoC renewal applications must include Safety Analysis Reports (SARs) that provide descriptions of the

---

[23] *See* 2017 DCE, Appendix C, Table 2, line 251.

[24] In September 2014, NEI 14-03 [Revision 0], *Guidance for Operations-Based Aging Management of Dry Cask Storage* was issued.

AMPs and time-limited aging analyses demonstrating that the structures, systems, and components important to safety will continue to perform their intended functions for the requested period of extended operation.

The estimated cost for the ISFSI Aging Management Program in the 2017 DCE is $36.5 million[25] (100% share, 2014 $). The 2014 DCE did not include a specific line item for the ISFSI Aging Management Program. This resulted in a cost increase of $36.5 million (100% share, 2014 $). As discussed above, these costs include initial cask testing, inspection equipment and licensing costs for dry cask CoC renewals and SAR updates for the Holtec and Areva AMPs.[26] These estimated costs are necessary to renew NRC required CoCs and therefore should be deemed reasonable by the Commission.

4. Decontamination, Demolition, and Disposal

The Decontamination, Demolition, and Disposal cost category includes many activities that will be performed by the DGC. As such, the pricing of these activities is primarily based on the executed SDS contract, which was achieved through a competitive procurement process that included multiple experienced contractors.[27] The work included in this category encompasses the removal and disposal of the necessary structures, systems, and components, as well as the removal of radiological and non-radiological contaminants necessary to meet the approved license termination plan. This category has been subdivided into the following major projects, consistent with the Milestone Framework:

- Initial D&D Activities – includes modifying the units' containment access to support future decommissioning activities; removing the missile shields and reactor heads; constructing an electrical ring bus for the site; and executing the necessary waste disposal contracts
- Reactor Vessel Internals (RVI) Segmentation and Disposal – includes designing and procuring the necessary RVI segmentation equipment; testing the specially

[25] *See* 2017 DCE, Appendix C, Table 2, line 163.

[26] SCE will also incur undistributed non-labor costs for the ISFSI Aging Management Program for periodic maintenance and inspections of the spent fuel dry storage systems. Those costs are discussed in Section IV.C.5 below.

[27] *See* Exhibit SCE-05 for additional information regarding the DGC selection process.

engineered equipment and installing the equipment within containment; performing RVI segmentation; packaging GTCC waste; and disposing non-GTCC waste

- Spent Fuel Systems and Equipment Removal and Disposal – includes removing the spent fuel pool racks; installing a water processing system; and draining the spent fuel pools
- Steam Generator Removal and Disposal – includes removing the steam generators (two per unit); and segmenting, packaging, and disposing of the steam generators
- Non-Essential Systems Removal and Disposal – includes removing systems in multiple maintenance buildings, administration buildings, and warehouse buildings; and removing injection systems, condenser tubes, and auxiliary transformers
- Large Components Removal and Disposal – includes removing and disposing of reactor vessel insulation; and segmenting, packaging, and disposing of the reactor vessels, pressurizers, and turbine gantry cranes
- Initial Plant Buildings Demolition and Disposal – includes procuring building demolition equipment; and then demolishing the auxiliary control/radwaste building, full flow condensate polishing demineralizer and turbine buildings, emergency diesel generator buildings; transformer pads, administration/warehouse/shop (AWS) building, and numerous other support structures
- Buildings Decontamination – includes removing the remaining radioactive materials embedded within the concrete and steel surfaces, walls, and floors of the buildings in the SONGS radiological control area; and performing decontamination verification surveys to validate the effectiveness of the decontamination work performed
- Final Plant Buildings Demolition and Disposal – includes demolishing the buildings in the central area of the plant, (i.e., the fuel handling and penetration buildings); and removing the protective area pavement

- Offshore Conduits Diffusers and Risers Removal – includes preparing hydro-geological analysis; and removing specified vertical diffusers and risers from the two offshore intake conduits and the two offshore discharge conduits
- Containment Buildings Demolition and Disposal – includes de-tensioning and removing the containment building post-tensioning cables; and demolishing the containment and safety equipment buildings
- Site Backfill, Compaction, etc. – following the demolition of structures, systems, and components, backfilling and compacting the site to a specified grade to meet the interim end-state
- Final Site Radiological Survey and NRC License Termination (for Partial Site Release of SONGS 2&3 Site) – includes performing the final radiological site status survey in accordance with NRC guidelines; and developing and supporting the License Termination Plan
- Waste Taxes (pass-through)[28] – per the DGC contract, the SONGS Participants are responsible to pay the DGC for the actual waste taxes and fees invoiced to SDS based on the actual waste disposed

The estimated costs for Decontamination, Demolition, and Disposal activities are shown in Table IV-3 below:

[28] These costs are not included in the SDS contract, but have been estimated in the 2017 DCE. In the 2014 DCE, applicable waste taxes were included with the estimated costs for each distributed project.

Table IV-3
2017 SONGS 2&3 DCE
Decontamination, Demolition, and Disposal Costs
(100% Share, Millions of 2014 $)

	Description	2017 DCE Total (2014 $)
1	**Decontamination, Demolition, and Disposal**	
2	Initial D&D Activities	$ [redacted]
3	Reactor Vessel Internals Segmentation and Disposal	[redacted]
4	Spent Fuel Systems/Equipment Removal and Disposal	[redacted]
5	Steam Generator Removal and Disposal	[redacted]
6	Non-Essential Systems Removal and Disposal	[redacted]
7	Large Components Removal and Disposal	[redacted]
8	Initial Plant Buildings Demolition and Disposal	[redacted]
9	Building Decontamination	[redacted]
10	Final Plant Buildings Demolition and Disposal	[redacted]
11	Offshore Conduit Diffusers/Risers Removal	[redacted]
12	Containment Buildings Demolition and Disposal	[redacted]
13	Site Backfill, Compaction, etc.	[redacted]
14	Final Site Radiological Survey and NRC License Termination	[redacted]
15	Waste Taxes (pass-through)	[redacted]
16	**Decontamination, Demolition, and Disposal Total**	**$** [redacted]

In the 2017 DCE, the estimated cost for Decontamination, Demolition, and Dismantling activities is $[redacted][29] (100% share, 2014 $). In the 2014 DCE, the estimated cost for these activities was $1,208.2 million (100% share, 2014 $), resulting in an increase of $[redacted].[30] The primary reason for the increased cost is the addition of activities expected to be performed that are currently outside the scope of the SDS contract. [redacted]

[29] *See* 2017 DCE, Appendix C, Table 2, lines 8 and 50, 57, 66, 70, 75, 86, 108, 121, 130, 132, 134, 144, 149, and 153.

[30] SCE is not providing a line-by-line comparison and variance analysis of DGC contract values to the 2014 DCE, because such an analysis would not provide meaningful information given how the DGC contract values were determined. The SDS contract reflects negotiated terms and conditions regarding the contract pricing and timing of payments agreed to between SCE and SDS. The SDS contract also assumes a grouping and sequencing of work different than assumed in the 2014 DCE. Although a line-by-line variance analysis is not possible given these issues, SCE is able to compare the total costs of the scope included in the SDS contract to the same scope of work included in the DCE.

[redacted]. However, this increase in distributed project costs is more than offset by a $[redacted] (100% share, 2014 $) decrease in undistributed DGC staffing costs.[32] The combined variance of these two cost categories resulted in a net cost savings of $[redacted] (100% share, 2014 $) achieved by SCE through the competitive bidding process for the DGC contract. All of these activities are required to decommission SONGS 2&3. The Commission, therefore, should find that these estimated costs are reasonable.

5. Substructure Removal

As briefly described above, the removal of remaining non-contaminated substructures, which is now estimated to occur during 2046-2049, will be a large-scale project that will require the expertise of a qualified third-party vendor. SCE estimates that the cost to perform this work scope, including the disposal of waste materials, will be lower than the cost assumed in the 2014 DCE.

The 2017 DCE assumed the cost would be $273.0 million[34] (100% share, 2014 $), whereas the 2014 DCE assumed the cost for the Substructure Removal project would be $303.8 million (100% share, 2014 $), a decrease of $30.8 million. The decrease is due to the identification of a closer waste disposal location.

6. Other Distributed Projects

The Other Distributed Projects cost category includes many distributed cost activities that either were not included in the 2014 DCE or for which the work scopes were determined to have changed substantially between the 2014 DCE and the 2017 DCE.

Examples of such activities include:

---

31 [redacted]

32 For further discussion of DGC Staffing and the variance against the 2014 DCE, see Section IV.C.3 below.

33 [redacted]

34 *See* 2017 DCE, Appendix C, Table 2, line 224.

- GTCC Disposal – Under the DOE Standard Contract, the DOE is obligated to accept and dispose of "spent nuclear fuel" and "high level waste." The courts have determined that GTCC is "high level waste," which DOE is obligated to accept and dispose of under the DOE Standard Contract, but have stated that that does not mean that the government will have to bear the cost of GTCC waste disposal alone. The courts have not provided a disposal cost.[35]
- Cyber Security Modifications – Under 10 C.F.R. § 73.54, SCE was required to develop a cyber security plan that addressed eight milestones to ensure certain digital assets, such as computer and communication systems and networks, are secure and protected.
- California Environmental Quality Act (CEQA) – Under CEQA, the CSLC, as lead agency, is required to evaluate the SONGS decommissioning project and prepare an Environmental Impact Report (EIR) in response to SCE's application to modify and extend the existing CSLC lease regarding the offshore conduits. The CEQA process began in 2015. The CSLC is expected to certify the EIR in late of 2018. The CCC is then expected to review an application for a CDP for SONGS decommissioning based on the EIR, as well as its own additional analysis. The CCC is expected to consider SCE's CDP application by the end of 2018. Following the receipt of the CDP, physical decommissioning of the plant can proceed.
- Mesa Site Turnover – SCE's Mesa lease from the Navy consists of five parcels.[36] Parcel 5 is on the west side of U.S. Interstate Highway 5 (I-5) and includes a security station to control access to Parcels 6 and 7. Parcels 6 and 7 are located on the east side of I-5 and along with Parcel 5 comprise the area known as the Mesa site. Parcels 8 and 9 include a parking lot and lay-down area on the west side of I-5 and abut the SONGS site. SCE currently estimates that Parcels 5, 6, and 7 will be returned to the

[35] *Yankee Atomic Electric Co. v. U.S.,* 536 F.3d 1268, 1278 (Fed. Cir. 2008).

[36] *See* Appendix E for map of the parcel locations.

Navy in 2021, and Parcels 8 & 9 will be retained until the end of decommissioning. As part of the process to return Parcels 5, 6, and 7 to the Navy, SCE must first assess the property and remediate SONGS-caused contamination to the extent necessary to obtain "No Further Action Letters" from the California Department of Toxic Substances Control (DTSC) indicating the property is available for unrestricted use.[37]

- Substructure Removal Contractor Procurement – In 2044, SCE will begin efforts to procure a contractor for the removal of SONGS substructures and placement of permanent backfill. Because the dewatering, shoring, excavation, removal, and backfilling of the substructures will be a very large and specialized work scope, SCE will incur the cost to undertake a competitive procurement process to identify and select a specialty vendor to perform this work.
- Coastal Development Permit Extensions – SCE holds a CDP for the storage of SONGS 2&3 spent fuel in the Areva ISFSI system until November 2022, and a separate CDP to store SONGS 2&3 spent fuel in the Holtec ISFSI system until 2035. Therefore, the 2017 DCE assumes SCE will need to obtain CDP extensions from the CCC for the Areva and Holtec ISFSI systems prior to the expiration of the permits in 2022 and 2035, respectively.
- ISFSI Coastal Development Permit (CDP) Settlement – In August 2017, SCE reached a settlement agreement with parties who challenged the CDP, wherein SCE agreed to incur up to $4.3 million (100% share, 2014 $) on commercially reasonable efforts to identify an offsite location for SONGS spent fuel storage.
- Future DCE Updates – Under the Decommissioning Act, SCE is required to periodically revise the DCEs to include descriptions of changes in regulation, technology, and economics affecting the estimate of costs; and of additions and

[37] On April 24, 2017, the DTSC issued a No Further Action Letter for Parcel 5. The efforts to assess and remediate contamination for Parcels 6 and 7 are ongoing. SCE continues to hold Parcel 5 because it provides access to Parcels 6 and 7.

deletions to nuclear facilities.[38] SCE submits such DCE updates to the Commission in NDCTP proceedings.

- North Industrial Area (NIA) Sump Modifications – The NIA sump (located on the site formerly occupied by SONGS 1) currently discharges to the SONGS 2&3 dilution water system. The SONGS 2&3 dilution water system will be retired by SDS, and therefore the discharge pathway for the NIA sump will need to be modified.

The estimated costs for the Other Distributed Projects category are shown in Table IV-4 below:

Table IV-4
Reconciliation of 2017 DCE to 2014 DCE
Other Distributed Projects
(100% Share, Millions of 2014 $)

	Description	2017 DCE Total (2014 $)	2014 DCE Total (2014 $)	Variance
1	**Other Projects**			
2	GTCC Disposal	$ 40.7	$ 50.6	$ (9.9)
3	Cyber Security Modifications	9.4	1.9	7.5
4	CEQA	7.9	2.7	5.2
5	Mesa Site Turnover	20.3	17.8	2.6
6	**Previously Included Project Subtotal**	**$ 78.3**	**$ 72.9**	**$ 5.4**
7				
8	Substructure Removal Contractor Procurement	$ 7.0	$ -	$ 7.0
9	Coastal Development Permit Extensions	5.2	-	5.2
10	ISFSI CDP Settlement	4.3	-	4.3
11	DCE Update	3.7	-	3.7
12	NIA Sump Modifications	1.1	-	1.1
13	**New Projects Subtotal**	**$ 21.3**	**$ -**	**$ 21.3**
14	**Other Projects Total**	**$ 99.6**	**$ 72.9**	**$ 26.7**

The total estimated cost for these Other Distributed Projects in the 2017 DCE is $99.6 million (100% share, 2014 $). The estimated cost for such Other Distributed Projects in the 2014 DCE was $72.9 million (100% share, 2014 $). Thus, the 2017 DCE includes a $26.7 million increase for the Other Distributed Projects category.

[38] Pub. Utilities Code § 8326.

After the development of the 2014 DCE, SCE determined that the cost to complete several of its Other Distributed Project work scopes would be different than estimated in 2014. For example, in the 2014 DCE SCE estimated that the disposal cost for GTCC waste would be $50.6 million (100% share, 2014 $) based on the highest published disposal rates for Class C low level radioactive waste (LLRW). In the 2017 DCE, however, SCE assumed that the disposal cost for a canister of GTCC waste would be comparable to the disposal cost for a canister of spent fuel. This resulted in an estimated GTCC disposal cost in the 2017 DCE of $40.7 million[39] (100% share, 2014 $), a decrease of $9.9 million.

With respect to Cyber Security-related work, the 2014 DCE included $1.9 million (100% share, 2014 $) and assumed the work would be completed in 2013. At that time, SCE believed that after SCE submitted the certifications of permanently ceased operations for SONGS 2&3, SCE would no longer be subject to the cyber security requirements of 10 C.F.R. § 73.54. However, SCE subsequently determined that the SONGS Cyber Security Plan was still required because it was described in the Physical Security Plan License Condition for SONGS 2&3. Other decommissioning plants had sought an exemption from the cyber security requirements, but the NRC had not yet approved those requests. It was prudent for SCE to wait for the NRC to review these requests and provide further guidance prior to SCE submitting an exemption request so as to avoid any protracted delays in the NRC's review process. In the meantime, SCE was obligated to comply with the requirements related to performing cyber security assessments, but not the more costly implementation aspects of the requirements. When the NRC indicated a willingness to grant such exemption requests, SCE submitted a License Amendment Request (LAR) to the NRC in June 2017, wherein SCE requested removal of the requirement to fully implement the SONGS Cyber Security Plan. At the end of 2017, the NRC granted approval for SONGS to remove the cyber security license condition, thus waiving the implementation requirements. Prior to the NRC's granting of the exemption, SCE had expended $9.4 million[40] (100%

[39] *See* 2017 DCE, Appendix C, Table 2, line 188.

[40] *See* 2017 DCE, Appendix C, Table 2, line 191.

share, 2014 $) to implement cyber security assessments. SCE included this recorded amount in the 2017 DCE, resulting in a $7.5 million increase over the amount estimated in the 2014 DCE.

With respect to the CEQA project, the 2017 DCE forecast $7.9 million[41] (100% share, 2014 $). The 2014 DCE forecasted this major project at $2.7 million (100% share, 2014 $), resulting in an increase of $5.2 million. The increase occurred because the time and effort required to complete this activity were greater than assumed during the development of the 2014 DCE. Specifically, SCE originally anticipated the CEQA review would be completed in approximately one year. Given the complexity of and varied interests (Navy, local communities, environmental advocates) that must be considered, SCE now anticipates that it will be nearly a four-year effort. SCE underestimated the level of effort necessary to complete the CEQA review, resulting in the variance. This activity is required in order to begin D&D.

With respect to Mesa Site Turnover project, the 2017 DCE forecast $20.3 million[42] (100% share, 2014 $). The 2014 DCE forecasted this major project at $17.8 million (100% share, 2014 $), resulting in an increase of $2.6 million. The increase occurred because the time and effort required to complete this activity were greater than assumed during the development of the 2014 DCE. Specifically, SCE originally expected to return the property to the Navy in 2017 with limited environmental characterization. Subsequently, the Navy imposed stringent remediation standards for the property requiring more extensive characterization and remediation, so turnover is now expected to occur in 2021. SCE must comply with the Navy's requirements.

The remaining Other Distributed Projects were not included in the 2014 DCE because their scopes emerged after the 2014 DCE was developed. SCE estimated their costs as follows:

Substructure Removal Contractor Procurement – The 2017 DCE includes costs of $7.0 million[43] (100% share, 2014 $) for a competitive bidding process to select a substructure removal contractor, including the development of a Request for Proposal, proposal evaluation, and contract

41 *See* 2017 DCE, Appendix C, Table 2, line 184.
42 *See* 2017 DCE, Appendix C, Table 2, line 178.
43 *See* 2017 DCE, Appendix C, Table 2, line 190.

award. The estimate is approximately one-half the cost to procure a DGC for the major D&D work because the scope of this effort is nearly half the scope of the DGC D&D work.

Coastal Development Permit (CDP) Extensions – The 2017 DCE includes costs of $5.2 million[44] (100% share, 2014 $) for SCE to obtain extensions for the Areva and Holtec CDPs. SCE holds a CDP to construct and operate the Areva ISFSI to store SONGS 2&3 spent fuel until November 2022, and a separate CDP to construct and operate the Holtec ISFSI to store SONGS 2&3 spent fuel until 2035. The 2017 DCE assumes SCE will need to obtain CDP extensions from the CCC for the Areva and Holtec ISFSI systems prior to the expiration of the permits in 2022 and 2035, respectively. SCE considered the recorded costs from past CDP applications and the complexities of the anticipated issues that will require evaluation in these two CDP extensions to estimate the cost to obtain these two CDP extensions.

ISFSI CDP Settlement – As part of the ISFSI CDP Settlement, SCE agreed to incur up to $4.0 million (100% share, nominal $) on commercially reasonable efforts to identify an offsite location for SONGS spent fuel storage. SCE also included $0.3 million (100% share, nominal $) for SCE outside counsel legal costs to reach the settlement.[45] SCE also included $0.8 million (100% share, nominal $) for attorney's fees to plaintiff's counsel, as agreed to in the settlement.[46] This $5.1 million (100% share, nominal $) increase was unforeseeable at the time the 2014 DCE was developed. This cost category was shared between SONGS 1 and SONGS 2&3. The amount allocated to SONGS 2&3 is $4.3 million (100% share, 2014 $). The settlement allowed SCE to proceed with transferring fuel to the ISFSI. It is also reasonable for SCE to explore offsite locations for the storage of spent fuel.

Future DCE Updates – SCE assumes a cost of $3.7 million[47] (100% share, 2014 $) to develop future DCE Updates because SCE now assumes that it will use a third-party vendor to develop

---

[44] *See* 2017 DCE, Appendix C, Table 2, line 167.

[45] Given the ongoing analyses and the current uncertainty regarding the potential location and requirements for an acceptable alternative spent fuel storage site, the estimated cost to re-locate the SONGS 2&3 spent fuel to an alternative site are speculative and have not been included in the 2017 DCE.

[46] Under the California Civil Procedure Code, a prevailing plaintiff in a mandamus proceeding is entitled to seek recovery of attorney's fees. *See* Cal. Civ. Proc. Code § 1021.5.

[47] *See* 2017 DCE, Appendix C, Table 2, line 182.

the DCE Updates instead of preparing them in-house at an average cost of approximately $0.3 million (100% share, 2014 $) per update. Under the Decommissioning Act, SCE is required to periodically revise the DCEs and submit them to the Commission.

NIA Sump Modifications – The North Industrial Area (NIA) sump currently discharges to the SONGS 2&3 dilution water system. Because SDS will remove the dilution water system, the discharge path for the NIA sump must be modified. SCE provided an estimated cost of $1.1 million[48] (100% share, 2014 $) for this work scope.

Relative to the 2014 DCE, the cost increases for Other Distributed Projects described above are partially offset by the lower estimated cost to dispose of GTCC waste, and result in a net increase of $26.7 million (100% share, 2014 $). The Commission should find the increased estimated costs for the Other Distributed Projects reasonable because each of these projects is required to fulfill an unavoidable regulatory requirement or a contractual obligation.

7. Greater Than Class C (GTCC) Waste Storage

In the 2017 DCE, SCE assumes that it will be required to license and purchase ten new canisters for storing and disposing of GTCC waste from SONGS 2&3 D&D activities and will use two existing Areva canisters for storing GTCC waste from the spent fuel pools. In contrast, SCE assumed in the 2014 DCE that it would use the ten Areva canisters that were originally fabricated for storing and disposing spent fuel from SONGS 2&3. SCE made this change because, although the ten Areva canisters are licensed for storing and transporting spent fuel, they are not licensed for transporting GTCC waste.[49] Although the radiological and physical characteristics of spent fuel would seem to bound those of GTCC waste, SCE determined that the canisters may only be used for their intended (and licensed) purpose, and that they would need to be re-licensed before they could be used to store and transport GTCC waste. Because most of the GTCC waste generated at SONGS 2&3 will come from the reactor vessel internals segmentation project, which is scheduled near the beginning of D&D activities, and the time required to re-license the Areva canisters is uncertain, SCE determined that it would be

[48] *See* 2017 DCE, Appendix C, Table 2, line 192.

[49] The canisters can be used to store GTCC waste as long as the canister does not need to be modified. For these ten canisters, the canisters would need to be modified to store the GTCC from D&D activities.

imprudent to risk an unknown delay to the D&D schedule by allowing it to be constrained by an effort to re-license the Areva canisters. SCE determined that it would instead be more prudent to avoid such schedule uncertainties by obtaining ten new canisters that would already be licensed to store and transport GTCC waste.

The estimated cost for GTCC storage in the 2017 DCE is $26.6 million (100% share, 2014 $). The 2014 DCE did not include any costs for GTCC storage. This resulted in a cost increase of $26.6 million[50] (100% share, 2014 $). Nevertheless, the Commission should find this estimated cost increase reasonable because it will reduce the risk of substantially greater costs due to potential project delays resulting from a delay to re-license the Areva canisters for GTCC waste storage and disposal.

8. Plant Easement/Lease Renewals

SCE uses the land upon which the SONGS site is located pursuant to a grant of easement executed with the Navy in 1964. This easement expires in 2024. The Navy has informed SCE that the existing easement will not be renewed because the terms are outdated; therefore, a new real estate authorization will be negotiated. SCE anticipates that the new real estate authorization will: (1) modify land boundaries to exclude roads used by the public, exclude lands within the current easements that SCE does not use, include Parcels 8 and 9, and include lands that SCE occupies that are not within the current easements; and (2) include pricing that is consistent with the current fair market rental value of the property. The Navy will be required to perform a limited-scope NEPA review to issue this new real estate authorization. The public interest in the Navy's decision, mostly due to on-site spent fuel storage, may impact the extent of the Navy's NEPA review effort.

Due to the uncertainty of how long the spent nuclear fuel would be on-site and the potential for relocation of the ISFSI in 2035, the 2017 DCE conservatively assumes that SCE will have to negotiate real estate authorizations with the Navy two additional times. Therefore, the next real estate authorization will expire in 2035, requiring SCE to seek a renewal. It is assumed the terms and site use will remain the same, and that the term will also be 10 years. Thus, the cost for this effort is estimated to be less than for the previous negotiation. This effort will also require a limited-scope NEPA review.

---

[50] *See* 2017 DCE, Appendix C, Table 2, line 169.

When the real estate authorization needs to be renewed again in 2045, SCE will request the Navy to specify the final site restoration and substructure removal requirements. SCE currently plans to commence this effort in 2040, such that the real estate authorization renewal and final site restoration and substructure removal requirements would be in place by 2045. This would facilitate performing the Substructure Removal civil works project during 2046-2049; and ISFSI decommissioning, NRC license termination, and final site restoration during 2050-2051. Because this real estate authorization renewal will identify the conditions under which the land will be returned to the Navy, the Navy will be required to perform a more robust NEPA review.

In the 2017 DCE, the estimated cost for Plant Easement/Lease Renewals is $27.1 million[51] (100% share, 2014 $). In the 2014 DCE, the estimated cost was $1.4 million (100% share, 2014 $). This results in an increase of $25.7 million. The 2017 DCE includes costs for SCE labor, contract support, Navy costs (such as consultations/review hours), surveys and mapping for three distinct real estate authorizations and three corresponding NEPA reviews. At the time the 2014 DCE was developed, discussions between SCE and the Navy had not yet progressed to that point that the need for three such updates to the Navy real estate authorization and three NEPA reviews was identified.

Because each of these updates to the Navy real estate authorization and any corresponding NEPA reviews will be required: (1) for SCE to fulfill the Navy's requirements for ongoing use of the SONGS site until SCE is ready to relinquish the land; (2) for the Navy to appropriately analyze and identify the final site restoration requirements; and (3) for SCE to implement the site restoration requirements to the satisfaction of the Navy, these Plant Easement/Lease Renewal costs are necessary decommissioning costs. SCE based the estimate on its recent history negotiating real estate matters with the Navy, as well as the costs incurred to date for SONGS real estate authorizations. Recent history with the Navy regarding the Mesa lease and the switchyard indicates that SCE's negotiations with the Navy will involve a lengthy and more complex undertaking than assumed in the 2014 DCE. The Commission, therefore, should find that these estimated costs are reasonable.

[51] *See* 2017 DCE, Appendix C, Table 2, lines 185-187.

9. Offshore Conduits Removal

The 2017 DCE includes an estimated cost to perform the full removal of the SONGS 2&3 offshore conduits as estimated in the 2014 DCE.

The 2017 DCE includes $91.6 million[52] (100% share, 2014 $) to fully remove the SONGS 2&3 offshore conduits. In the 2014 DCE, the estimated cost was $96.0 million (100% share, 2014 $). This results in a decrease of $4.4 million. This decrease occurred because the estimated value in the 2014 DCE includes a 5% adder for A&G, whereas the A&G adder is excluded from the 2017 DCE estimated value.

10. ISFSI Demolition

Following the removal of all spent fuel and GTCC waste by the DOE, SCE will demolish and remove the ISFSI and perform activities necessary for the final restoration of the SONGS site.

The 2017 DCE includes $19.2 million[53] (100% share, 2014 $) for ISFSI decommissioning costs. In the 2014 DCE, the estimated cost was $21.1 million (100% share, 2014 $). This results in a decrease of $1.9 million. At the time the 2014 DCE was prepared, the specific plans to expand the ISFSI had not been defined. Later in 2014, SCE entered into a contract with Holtec to expand the ISFSI. The ISFSI demolition cost in the 2017 DCE is based on a new estimate completed by High Bridge Associates and reflects both the Areva and Holtec ISFSIs.

11. Completed Projects

During the period between the permanent retirement of SONGS 2&3 on June 7, 2013, and December 31, 2017, SCE completed several Distributed Projects. The following completed projects are some of those already submitted to the Commission for reasonableness review:

- Included in 2014 reasonableness testimony: (1) Development of the Certified Fuel Handler Program; (2) Post-Fukushima Modifications; (3) Independent Spent Fuel Storage Installation (ISFSI) Pad Study; and (4) Spent Fuel Pool Analyses.[54]

---

[52] *See* 2017 DCE, Appendix C, Table 2, line 229.

[53] *See* 2017 DCE, Appendix C, Table 2, line 241.

[54] The SONGS 2&3 Distributed Projects completed during 2014 are explained in greater detail in A.16-03-004, Exhibit SCE-09 at pages 18-21.

- Included in 2015 reasonableness testimony: (1) Nuclear Fuel Contracts Cancellations; (2) Legacy Radwaste Disposal; (3) Security Programs – Security Shutdown Strategy; (4) Regulatory Submittals; (5) Historical Site Assessment/Site Characterization; and (6) Transition Project Modifications – Special Purpose Vehicle (SPV) Feasibility Study.[55]

The following completed projects are being submitted for reasonableness review in this proceeding:

- Major Projects completed during 2016-2017: (1) the Spent Fuel Islanding project; (2) Selection of Decommissioning General Contractor; and (3) Transition Project Modifications, including the Large Organism Exclusion Device Modification, Special Purpose Vehicle - Implementation, Records Retention Project, and the Simplification and Streamlining Project.[56]

The following completed activity will be submitted for reasonableness review in the 2021 NDCTP:

- Defueled Safety Analysis Report (DSAR): Updates the current licensing basis for the decommissioning configuration state of SONGS 2&3 and is a reference available for reviewing decommissioning actions and plans affecting the SONGS 2&3 site.

The estimated costs for the Completed Projects are shown in Table IV-5 below:

[55] The SONGS 2&3 Distributed Projects completed during 2015 are explained in greater detail in A.16-03-004, Exhibit SCE-08 at pages 26-39, and in Exhibits SCE-10 and SCE-10C.

[56] The SONGS 2&3 Distributed Projects completed during 2016-2017 are explained in greater detail in A.18-03-XXX, Exhibit SCE-05.

Table IV-5
Reconciliation of 2017 DCE to 2014 DCE
Completed Projects
(100% Share, Millions of 2014 $)

	Description	2017 DCE Total (2014 $)	2014 DCE Total (2014 $)	Variance
1	2014 Reasonableness Review	$ 0.6	$ 0.6	$ (0.0)
2	2015 Reasonableness Review	93.5	76.8	16.7
3	2018 Reasonableness Review	27.2	19.2	8.0
4	Future Reasonableness Reviews	2.0	1.5	0.5
5	**Completed Projects Total**	**$ 123.3**	**$ 98.1**	**$ 25.2**

The total estimated cost for these Distributed Projects, as reflected in the 2017 DCE, was $123.3 million[57] (100% share, 2014 $). In the 2014 DCE, the total estimated cost for the SONGS 2&3 decommissioning-related Completed Distributed Projects completed during 2013-2017 was $98.1 million (100% share, 2014 $), resulting in a variance of $25.2 million more than estimated. The explanations for the variances associated with each of these Distributed Projects are provided in the testimony SCE provided to the Commission in its reasonableness review submittals for each of these completed projects. The 2014 and 2015 completed projects are not being reviewed in this proceeding.

C. Undistributed Activities

1. Contracted Services

Contracted Services are shorter-term supplemental resources, specialty contractors and consultants, third-party services, materials, and supplies that are provided on an as-needed basis to support SONGS. SCE must meet several NRC regulatory requirements,[58] and maintain and operate SONGS to support spent nuclear fuel in the spent fuel pools and ISFSI. SCE also must meet contractual obligations and provide support services (such as engineering, regulatory, financial, and custodial services) for the plant and the general facility,[59] as well as provide basic office services, to complete

[57] *See* 2017 DCE, Appendix C, Table 2, lines 1, 12, 15, 18, and 24.

[58] *See* Exhibit SCE-01, Section 1.F.2.a, Nuclear Regulatory Commission Requirements.

[59] The general facility includes SONGS office buildings, roads, parking lots, fencing, lighting, and all the services necessary to maintain the site in a condition suitable for all the activities that are needed to decommissioning the plant.

decommissioning planning and implement decommissioning. SCE utilizes Contracted Services for these purposes.

Contracted Services in the 2017 DCE consists of two distinct types of costs, recorded and estimated:

- June 2013-2017 recorded costs of $83.7 million (100% share, 2014 $) equaling an approximate annual average of $18.6 million (100% share, 2014 $);[60] and
- 2018-2051 estimated costs of $141.5 million (100% share, 2014 $) reflecting an approximate annual average of $4.2 million (100% share, 2014 $).

The estimated cost for Contracted Services for 2018-2051 includes support activities for the organizations shown in Table IV-6 below.

Table IV-6
Contracted Services
(100% Share, Millions of 2014 $)

	Description	2017 DCE 2018-2051 Total (2014 $)	Annual Average Over 2018-2051 (2014 $)
1	**Contracted Services (2018-2051)**		
2	Decommissioning Oversight	$ 50.9	$ 1.5
3	Maintenance and Work Control	31.3	0.9
4	Nuclear Regulatory Affairs and Nuclear Oversight	22.7	0.7
5	Site Engineering	13.8	0.4
6	Site Management & Administration	10.7	0.3
7	Emergency Preparedness	6.3	0.2
8	Decommissioning Finance	4.8	0.2
9	Operations	1.0	0.0
10	**Contracted Services (2018-2051) Total**	**$ 141.5**	**$ 4.2**

SCE discusses each of these below:[61]

[60] Recorded costs during 2014-2015 were reviewed for reasonableness in the 2015 NDCTP, A.16-03-004. Recorded costs during 2016-2017 have been submitted for reasonableness review in this proceeding. *See* Exhibit SCE-05.

[61] Each of these organizations also incurs common costs for items such as employment related training, office supplies, custodial support, and employment related travel expenses.

- Decommissioning Oversight – Contracted services include EPRI support, document governance, engineering consulting services, estimating services for supply chain, and radiation protection and environmental contract support.
- Maintenance/Work Control – Service vendor support to perform preventive and corrective maintenance on all electrical systems; mechanical systems; instrumentation and controls systems; other plant systems still in operation; and the seawall.
- Nuclear Oversight/Nuclear Regulatory Affairs – Consultants to support Nuclear Regulatory Affairs' (NRA) interface with the NRC regarding SONGS' compliance with regulatory requirements, and to support Nuclear Oversight's execution of SONGS' decommissioning quality assurance program (DQAP).
- Site Engineering – Software licenses, security computer maintenance, and consultants as required to resolve specific issues being faced.
- Site Management and Administration – Staffing consultant to determine appropriate SONGS staffing levels.
- Emergency Preparedness – Contractor support for planning functions that continue to be required by federal regulations as long as nuclear fuel is stored on-site, including periodic drills to verify the effectiveness of the SONGS emergency preparedness program.

The total estimated cost for Contracted Services in the 2017 DCE is $225.2 million[62] (100% share, 2014 $). In the 2014 DCE, the total estimated cost for Contracted Services was $34.6 million (100% share, 2014 $). This resulted in an increase of $190.6 million. The 2014 DCE assumed Contracted Services would involve only office supplies, computers, and related equipment for utility staff use, based upon an assumed cost of $10,500 per year per employee. SCE utilized this category more broadly for the services and activities discussed above. Therefore, there is a variance

[62] *See* 2017 DCE, Appendix C, Table 2, line 287.

between the DCEs because the 2014 DCE did not include forecasts for this broader group of services and activities.

SCE developed the estimated Contracted Services costs in the 2017 DCE by analyzing the costs incurred for these functions in 2013-2016, and then built them up throughout the remaining decommissioning schedule (2018-2051) based on the anticipated future contracted services requirements for the SONGS decommissioning organization. SCE only included the costs necessary to meet its regulatory requirements related to the safe storage of spent fuel on-site; and to provide services required to maintain the plant and general facility. As noted above, the annual requirements going forward are substantially lower than those recorded during the initial decommissioning period and reflect the changed conditions, including SCE's transition of certain work activities to the DGC. The Commission should find that they are reasonable.

2. Service Level Agreements/A&G

Beginning in 2016, SONGS implemented annual intra-company Service Level Agreements (SLAs) with SCE corporate service providers (e.g., HR, IT, Real Estate, Supply Management, Treasurer's, Environmental, and Controller's). Each SLA describes the specific administrative and general (A&G) functions and services SCE provides to SONGS that support and sustain the D&D activities. The SLAs meet the terms and conditions included in the Decommissioning Agreement between SCE and the Participants.[63]

The 2014 DCE included an A&G adder (5.0%) that was applied to the costs of each DCE line item to cover the costs of SCE corporate departments supporting SONGS decommissioning. To maintain the integrity of the values referenced from the 2014 DCE in the variance explanations provided elsewhere in this testimony (i.e., all other cost categories), SCE kept the 5% A&G adder with each DCE line item in Table IV-2 above. This results in the value for the SLA/A&G in line 17 of Table IV-2 being shown as zero dollars in the 2014 DCE column. Rather than comparing the SLA/A&G amount included in the 2017 DCE to zero, it is more appropriate to compare it to the

[63] Section 8.1.7.2 of the SONGS Decommissioning Agreement, dated April 23, 2015.

corresponding 5% A&G adder from the 2014 DCE. The number SCE calculated for the corresponding 5% A&G adder from the 2014 DCE for the period 2016-2051 is $160.8 million (100% share, 2014 $).

The 2017 DCE incorporated the SLA costs to replace the A&G adders during the 2016-2028 period. Beginning in 2029, the 2017 DCE resumes applying the 5% A&G adder to all remaining decommissioning costs until project completion in 2051. Under this approach, the 2017 DCE estimates the cost of these SCE corporate functions at $168.2 million[64] (100% share, 2014 $), an increase of $7.4 million, in comparison to the corresponding 5% adder noted above. Using the combination of SLAs and A&G adder provides greater transparency and certainty of costs for the benefit of Participant oversight and project cost control. The Commission should find the estimated costs for the SLAs/A&G adder reasonable because they more accurately reflect the anticipated costs for these corporate support functions.

3. DGC Staffing

DGC staff consists of SDS personnel who provide the project management of the D&D work being performed by SDS, and manage/perform the programs and functions transferred from SCE to SDS. Their project management function involves the continued planning, scheduling, and monitoring of the D&D work as timely as possible while maintaining a safe work environment. It also includes contracting with third party specialty vendors to complete specific tasks (e.g. RVI segmentation), and administering those contracts. SCE provides oversight of SDS's project management. This division of labor allows SDS and SCE to utilize their core competencies to complete the work in an efficient manner – SDS's expertise in deconstructing facilities and SCE's oversight role. This cost category also includes staffing for a DGC that will be required during substructure removal and ISFSI D&D/final site restoration to be performed during 2046-2051.

In the 2017 DCE, the estimated cost for DGC Staffing is $[redacted][65] (100% share, 2014 $). In the 2014 DCE, the estimated cost for DGC Staffing was $423.6 million (100% share, 2014

[64] *See* 2017 DCE, Appendix C, Table 2, line 381.

[65] *See* 2017 DCE, Appendix C, Table 2, lines 155 and 386.

$). This resulted in a decrease of $[redacted] million. This primarily reflects the result of the competitive procurement process that resulted in the selection of SDS.

4. Labor-Staffing

SCE records costs for the SONGS utility staff and security force as undistributed labor. The SONGS utility staff performs various decommissioning activities relating to state and federal regulatory requirements, external communications with stakeholders, and strategic planning and analysis. The utility staff's activities include complying with existing technical specifications; ensuring the health and safety of the workers and the public; planning and preparing the facility for decommissioning; retiring plant systems to minimize or eliminate costs; and keeping the public and stakeholders informed on decommissioning progress. The security force protects SONGS in accordance with NRC regulations 10 C.F.R. § 73 and 10 C.F.R. § 50.54, and has been sized to meet the current design basis threat assessment, pursuant to 10 C.F.R. § 73.

In the 2017 DCE, SCE estimates that Labor-Staffing costs will be $986.2 million[66] (100% share, 2014 $). In the 2014 DCE, SCE estimated that Labor-Staffing costs would be $1,029.4 million (100% share, 2014 $). This resulted in a decrease of $43.2 million (100% share, 2014 $) relative to the 2014 DCE. Now that SCE has four plus years of experience with the planning of decommissioning, it is better able to identify the required staffing to safely carry out the decommissioning of SONGS 2&3 and oversight of its contractors. The estimated staffing levels in the 2017 DCE were developed through a collaborative process between SONGS executive managers and Kenrich. The staffing levels were subsequently vetted by ABZ. The Commission should find these costs reasonable as they reflect the additional experience SCE has gained, have been reviewed by an industry expert, and represent a well-supported estimate of the staffing levels required going forward.

5. All Other Non-Labor

Non-Labor costs include a wide range of decommissioning activities and obligations, including the following:

---

66 *See* 2017 DCE, Appendix C, Table 2, line 265.

- Site Lease and Easement Expenses – SCE will be required to make annual easement and lease payments to the Navy for the onshore plant site and SONGS Mesa facility and to the CSLC for the SONGS 2&3 offshore conduits until the easement and lease agreements are terminated.
- Severance – Under the Decommissioning Act, SCE is required to provide severance benefits to SCE employees at SONGS whose jobs are eliminated as a result of the permanent retirement of SONGS.
- Energy – SCE must purchase electrical energy at retail rates to power the SONGS site.
- Loading Spent Fuel & GTCC Waste to DOE – Under the DOE Standard Contract, SCE is responsible for the cost to transfer spent fuel canisters from the ISFSI and loading them into DOE shipping containers on-site, and then onto the DOE's transportation device.
- Information Technology – SCE will be required to incur software and network licenses, pay network service providers, and provide internal technical support to site personnel at levels commensurate with site staffing until decommissioning is completed.
- Third Party Legal – SCE retains outside counsel as necessary to handle legal matters that require specific expertise or additional resources.
- Emergency Preparedness Fees – SCE provides funding to local jurisdictional authorities for their radiological emergency preparedness, and will continue to do so until all spent fuel has been removed from SONGS, under a memorandum of understanding.
- NRC Fees – As holder of the NRC licenses for SONGS, SCE will be required to pay 10 C.F.R. Part 171 annual license fees and 10 C.F.R. Part 170 inspection fees until the NRC licenses are terminated.

- Utility Staff Health Physics Supplies – After SDS completes the major D&D work, SCE will re-assume responsibility for providing health physics supplies as required to support the ISFSI-only staff.
- Community Engagement Panel – SCE has chartered a panel consisting of a group of representatives from surrounding cities and counties to serve as a conduit of information to the public and other stakeholders regarding decommissioning that seeks to educate and explain SONGS decommissioning matters of interest to the local public. SCE incurs costs to conduct quarterly CEP meetings at venues in the vicinity of SONGS.
- Environmental Permits and Fees – SONGS must comply with a variety of environmental regulations and maintain several environmental permits that will require periodic payments of fees.
- ISFSI Aging Management –The facility maintenance and inspection activities for the ISFSI, in compliance with the Areva and Holtec SARs, as will be determined by the ISFSI Aging Management Program to be developed.
- Security Related Expenses – As long as spent fuel remains on-site, the SONGS security force will continue to require uniforms, weapons, ammunition, other supplies and equipment, as well as background investigations, training, and vendor support.
- DGC Executive Oversight Committee – a five person committee that provides oversight and resolves contractual issues regarding the SDS contract. SCE and SDS share the cost of three independent members on the committee.
- Insurance – NRC regulations require SCE to maintain minimum levels of nuclear liability and property insurance until the spent fuel is removed from the SONGS site. SCE also maintains general liability insurance and excess workers' compensation insurance.

- Association Fees and Expenses – NEI membership fees, and costs related to an external Nuclear Oversight Board (NOB) and an outside advisor to SCE's Internal Nuclear Management Group (INMG).
- Water – SCE is required to purchase potable and service water for the SONGS Site.
- Office Space – During major D&D activities, SDS will demolish all existing office space on the SONGS site and provide temporary office space as necessary. After Major D&D is completed, SCE will need to provide office space for the remaining employees.
- Decommissioning Advisor – One or more outside consultants who provide subject matter expertise regarding decommissioning regulatory issues, spent fuel storage, and project management.
- Ground Water Monitoring – SCE will be required to periodically sample, analyze, and monitor the ground water beneath the SONGS site.

The estimated costs for Non-Labor are shown in Table IV-7 below:

Table IV-7
Reconciliation of 2017 DCE to 2014 DCE
All Other Non-Labor
(100% Share, Millions of 2014 $)

	Description	2017 DCE Total (2014 $)	2014 DCE Total (2014 $)	Variance
1	**Non-Labor**			
2	Site Lease and Easement Expenses	$ 97.5	$ 19.5	$ 78.0
3	Severance	121.0	170.8	(49.8)
4	Energy	84.7	50.2	34.5
5	Loading Spent Fuel & GTCC Waste To DOE	30.6	-	30.6
6	Information Technology	31.9	6.6	25.3
7	Third Party Legal	23.8	-	23.8
8	Emergency Preparedness Fees	48.3	25.8	22.5
9	NRC Fees	31.2	53.6	(22.4)
10	Utility Staff Health Physics Supplies	3.7	25.8	(22.1)
11	Community Engagement Panel	12.5	34.0	(21.5)
12	Environmental Permits and Fees	6.7	27.1	(20.4)
13	ISFSI Aging Management	15.3	-	15.3
14	Security Related Expenses	11.8	18.8	(7.0)
15	DGC Executive Oversight Committee	3.7	-	3.7
16	Insurance	63.7	67.3	(3.6)
17	Association Fees and Expenses	8.6	11.0	(2.4)
18	Water	16.5	14.5	2.0
19	Office Space	1.7	-	1.7
20	Decommissioning Advisor	9.9	11.4	(1.5)
21	Ground Water Monitoring	0.5	-	0.5
22	Property Tax	-	74.7	(74.7)
23	DGC Non-Labor	-	35.9	(35.9)
24	Spent Fuel Maintenance	-	7.4	(7.4)
25	DAW Disposal	-	3.9	(3.9)
26	Tools and Equipment	-	1.3	(1.3)
27	**Non-Labor Total**	**$ 623.6**	**$ 659.6**	**$ (36.0)**

In the 2017 DCE, Other Non-Labor costs are estimated at $623.6 million[67] (100% share, 2014 $). In the 2014 DCE, Other Non-Labor costs were estimated at $659.6 million (100% share,

[67] *See* 2017 DCE, Appendix C, Table 2, line 375 (minus line 287 Contracted Services costs, which are discussed separately in Section IV.C.1).

2014 $). This resulted in a decrease of $36.0 million. This net decrease reflects numerous offsetting increases and decreases as explained below:[68]

- Site Lease and Easement Expenses – In the 2017 DCE, SCE estimates $97.5 million[69] (100% share, 2014 $) for site lease and easement expenses, compared with $19.5 million (100% share, 2014 $) in the 2014 DCE. This resulted in an increase of $78.0 million. SCE expects payments to the Navy to increase after the easement is renegotiated and the Navy resets the fees based on the current fair market rental value of the property.
- Severance – In the 2017 DCE, SCE estimates $121.0 million[70] (100% share, 2014 $) for employee severance costs, compared with $170.8 million (100% share, 2014 $) in the 2014 DCE. This resulted in a decrease of $49.8 million. SCE expects decreased severance costs because it has incurred lower than anticipated payouts to previously terminated SONGS employees. In addition, because many employees were reassigned to other positions within the company, they are no longer eligible for SONGS severance benefits.
- Energy – In the 2017 DCE, SCE estimates $84.7 million[71] (100% share, 2014 $) for energy costs compared with $50.2 million (100% share, 2014 $) in the 2014 DCE, resulting in an increase of $34.5 million. This variance reflects an updated forecast of energy usage levels (at retail energy rates) during 2019-2028 based upon how SDS plans to perform D&D.
- Loading Spent Fuel & GTCC Waste to DOE – In the 2017 DCE, SCE estimates that the cost to transfer spent fuel canisters from the ISFSI into DOE shipping containers

---

68 SCE is not providing variance analyses for variances ≤ $7.0 million or when the 2017 DCE did not include costs for items included in the 2014 DCE.

69 *See* 2017 DCE, Appendix C, Table 2, line 358.

70 *See* 2017 DCE, Appendix C, Table 2, line 353.

71 *See* 2017 DCE, Appendix C, Table 2, line 308.

on-site, and then onto the DOE's transportation device, will be $30.6 million[72] (100% share, 2014 $). The 2014 DCE did not include a line item for this cost.

- Information Technology – In the 2017 DCE, SCE estimates $31.9 million[73] (100% share, 2014 $) for IT costs, compared with $6.6 million (100% share, 2014 $) in the 2014 DCE. This resulted in an increase of $25.3 million. The increased cost is due in part to some one-time payments to network service providers in 2018. After payment of these costs, SCE expects that ongoing support costs will be reduced after 2019.
- Third Party Legal – In the 2017 DCE, SCE estimates $23.8 million[74] (100% share, 2014 $) for third party legal expenses. This variance occurred because the 2014 DCE did not forecast these services as direct costs, but instead assumed that the costs were a part of overheads.[75] The services provided by outside legal counsel are required to perform normal business functions as well as tasks required by the NRC, and state and local agencies.
- Emergency Preparedness Fees – In the 2017 DCE, SCE estimates $48.3 million[76] (100% share, 2014 $) for emergency preparedness fees, compared with $25.8million (100% share, 2014 $) in the 2014 DCE. This resulted in an increase of $22.5 million. In the 2017 DCE, SCE anticipates that it will continue to incur emergency preparedness fees pursuant to a Memorandum of Understanding with local jurisdictional authorities until all spent fuel is removed from the SONGS site versus the assumption in the 2014 DCE that such payments would terminate when the spent fuel was removed from the pools.

---

72 *See* 2017 DCE, Appendix C, Table 2, line 361.

73 *See* 2017 DCE, Appendix C, Table 2, line 325.

74 *See* 2017 DCE, Appendix C, Table 2, line 336.

75 Corporate support is provided by SCE from organizations other than SONGS (e.g., legal, treasurer's, finance, IT, supply chain).

76 *See* 2017 DCE, Appendix C, Table 2, line 303.

- Utility Staff Health Physics Supplies – In the 2017 DCE, SCE estimates $3.7 million[77] (100% share, 2014 $) for utility staff health physics supplies, compared with $25.8 million (100% share, 2014 $) in the 2014 DCE. This resulted in a decrease of $22.1 million. The decreased cost occurred because SDS will be performing the health physics functions for the major D&D work, and incurring the cost of its health physics supplies. SCE will re-assume responsibility for providing health physics supplies after the major D&D work is completed, as required to support the ISFSI-only staff.
- Community Engagement Panel (CEP) – In the 2017 DCE, SCE estimates $12.5 million[78] (100% share, 2014 $) for Community Engagement Panel expenses, compared with $34.0 million (100% share, 2014 $) in the 2014 DCE. This resulted in a decrease of $21.5 million. The decreased cost occurred because SCE has incurred lower CEP costs than estimated in the 2014 DCE and expects similar CEP expenditures in the future.
- NRC Fees – In the 2017 DCE, SCE estimates $31.2 million[79] (100% share, 2014 $) for NRC fees, compared with $53.6 million (100% share, 2014 $) in the 2014 DCE. This resulted in a decrease of $22.4 million. The decreased estimated cost occurred because the NRC reduced its 10 C.F.R. Part 171 annual license fees, and SCE expects to incur lower NRC inspection costs under 10 C.F.R. Part 170 than previously estimated.
- Environmental Permits and Fees – In the 2017 DCE, SCE estimates $6.7 million[80] (100% share, 2014 $) for environmental permits and fees, compared with $27.1 million (100% share, 2014 $) in the 2014 DCE. This resulted in a decrease of $20.4 million. The decreased estimated cost occurred primarily due to a reduction to

77 *See* 2017 DCE, Appendix C, Table 2, line 373.
78 *See* 2017 DCE, Appendix C, Table 2, line 280.
79 *See* 2017 DCE, Appendix C, Table 2, line 340.
80 *See* 2017 DCE, Appendix C, Table 2, line 313.

the annual NPDES Permit fees. Due to a reduction in the quantity of discharges from the plant associated with the permanent shutdown, SCE was able to negotiate with the SWRCB a reduction to the annual NPDES permit fees from $1.1 million per year to $0.2 million per year. In addition to the reduced NPDES fees, the other environmental fees (e.g., hazardous waste, pollution fees) were less than estimated in the 2014 DCE. The 2014 DCE was prepared before the impact of decommissioning on the fees assessed by various local and state agencies was determined.

- ISFSI Aging Management – In the 2017 DCE, SCE estimates $15.3 million[81] (100% share, 2014 $) for undistributed ISFSI Aging Management expenses. The 2014 DCE did not include a line item for this cost.

The total net variance for Other Non-Labor costs is a decrease of $36.0 million (100% share, 2014 $). Because these estimated costs are necessary to complete decommissioning and reflect SCE's experiences throughout four plus years of decommissioning and incurring these types of costs, the Commission should find these estimated costs reasonable.

[81] *See* 2017 DCE, Appendix C, Table 2, line 270.

V.

CONCLUSION

The 2017 DCE estimates that the total cost to decommission SONGS 2&3 will be $4,479 million (100% share, 2014 $), an increase of approximately 1.5% over the 2014 DCE that the Commission found reasonable in D.16-04-019.

In Chapter II of this testimony, SCE presented a detailed discussion of the methodology by which the 2017 DCE was developed and the bases for its underlying assumptions. SCE also explained that due to the existence of contract pricing for much of the decommissioning work, SCE was able to reduce the overall contingency factor of the 2017 DCE from 25% to 17%. In Chapter III, SCE presented the testimony of Mr. Nicholas Capik, the Managing Director of ABZ Incorporated, a major provider of decommissioning cost estimates for U.S. nuclear facilities. Mr. Capik described the independent review that he performed regarding the completeness and accuracy of the 2017 DCE. In Chapter IV, SCE provided a detailed reconciliation of the 2017 DCE to the 2014 DCE, including detailed discussions of significant cost changes between the two estimates.

Given SCE's thorough and detailed explanation of the 2017 DCE, SCE has met its burden to demonstrate that the 2017 DCE is a reasonable estimate of SONGS 2&3 decommissioning costs, and provides an appropriate basis for the Commission to evaluate the reasonableness of the decommissioning costs. The Commission, therefore, should find the 2017 SONGS 2&3 DCE to be reasonable.

Appendix A

Witness Qualifications

SOUTHERN CALIFORNIA EDISON COMPANY

QUALIFICATIONS AND PREPARED TESTIMONY

OF JOSE LUIS PEREZ

Q. Please state your name and business address for the record.

A. My name is Jose Luis Perez, and my business address is 2244 Walnut Grove Ave, Rosemead, CA 91770.

Q. Briefly describe your present responsibilities at the Southern California Edison Company.

A. I am a Principal Manager, Nuclear CPUC Regulatory Affairs and Compliance, in the Regulatory Affairs Organization responsible for CPUC regulatory activities and financial planning & analysis for SONGS issues.

Q. Briefly describe your educational and professional background.

A. I earned an MBA from the University of California, Irvine in 1997. I earned a Bachelor of Science Degree in Civil Engineering from California State University, Long Beach in 1977. I am a Registered Professional Engineer in the State of California. Since joining Edison in 1982, I have held various management positions in nuclear generation business, finance, regulatory affairs, planning & strategy, and project controls organizations. In addition, I have managed various projects, including SONGS 1 decommissioning shortly after permanent shutdown and industry restructuring financial analysis. Prior to joining Edison, my professional background included various home office and jobsite positions in the civil engineering, nuclear power plant start-up, and project controls organizations of Bechtel Power Corporation and the collection and analysis of construction cost data for publication in cost estimating manuals for Marshall and Swift Publications.

Q. What is the purpose of your testimony in this proceeding?

A. The purpose of my testimony in this proceeding is to sponsor Exhibit SCE-03: *Testimony On The 2017 Decommissioning Cost Estimate for SONGS 2&3,* as identified in the Table of Contents thereto.

Q. Was this material prepared by you or under your supervision?

A. Yes, it was.

Q. Insofar as this material is factual in nature, do you believe it to be correct?

A. Yes, I do.

Q. Insofar as this material is in the nature of opinion or judgment, does it represent your best judgment?

A. Yes, it does.

Q. Does this conclude your qualifications and prepared testimony?

A. Yes, it does.

ABZ, INCORPORATED

QUALIFICATIONS AND PREPARED TESTIMONY

OF NICHOLAS J. CAPIK

Q. Please state your name and business address for the record.

A. My name is Nicholas Joseph Capik, and my business address is 4451 Brookfield Corporate Drive, Suite 107, Chantilly, VA 20151.

Q. Who is your current employer?

A. ABZ, Incorporated.

Q. Briefly describe your present responsibilities at ABZ.

A. I am a Managing Director of ABZ. In that role, I am responsible for the management and execution of numerous ABZ projects performed for the nuclear industry.

Q. Briefly describe your educational and professional background.

A. I earned an BS in Mathematics from the Pennsylvania State University in 1983. I completed the Navy Nuclear Training Program in 1985. I served in the U.S. Navy from 1983 through 1991. Since 1991, I have been employed at ABZ. At ABZ, I have performed cost estimates for over 40 clients related to due diligence, decommissioning, accident cleanup, and site restoration. In this role, I was responsible for the development of assumptions, the selection of scenarios, the preparation of studies, and the presentation of results. I have supported litigation related to spent fuel storage, and tax issues related to decommissioning. I have had oversight and involvement of decommissioning activities at several nuclear facilities.

Q. What is the purpose of your testimony in this proceeding?

A. The purpose of my testimony in this proceeding is to sponsor portions of Exhibit SCE-03: *Testimony On The 2017 Decommissioning Cost Estimate for SONGS 2&3,* as identified in the Table of Contents thereto.

Q. Was this material prepared by you?

A. Yes, it was.

Q. Insofar as this material is factual in nature, do you believe it to be correct?

A. Yes, I do.

Decommissioning Cost Estimate - Confidential

San Onofre Nuclear Generating Station Units 2 & 3
2017 Decommissioning Cost Estimate

Prepared For:
Southern California Edison
2244 Walnut Grove Avenue
Rosemead, CA 91770

Prepared By:
The Kenrich Group LLC
1919 M Street, NW
Suite 620
Washington, DC 20036

January 26, 2018

Revised March 8, 2018

Christopher F. Tierney
Vice President & Chief Financial Officer

San Onofre Nuclear Generating Station Units 2&3
2017 Decommissioning Cost Estimate

DESCRIPTION OF MINOR REVISION

Revision Number: 1

Effective Date: March 8, 2018

The revisions made to the 2017 SONGS 2&3 Decommissioning Cost Estimate are minor in nature and do not revise or otherwise impact the content or results of the cost estimate.

Item 1 – The Spent Fuel Shipping Schedule in Appendix A has been revised to correct the number of Units 2 & 3 canisters transferred to the ISFSI.

Item 2 – Revised an activity description in Appendix B, "Detailed Project Schedule."

Item 3 – Within Appendix C, "Detailed Cost Tables," the notes to Appendix C have been attached.

Item 4 – The line numbers in Table 10, "Utility & Security Force Average Staffing By Period," have been corrected.

I. Executive Summary

The 2017 San Onofre Nuclear Generating Station Units 2&3 (SONGS 2&3) Decommissioning Cost Estimate (2017 DCE) has been prepared by the Kenrich Group LLC[1] (Kenrich) for Southern California Edison Company (SCE).[2] ABZ, Inc. (ABZ) also performed an independent review of the 2017 DCE.

The 2017 DCE utilizes the same Work Breakdown Structure (WBS) and selected distributed cost estimates included in the 2014 SONGS 2&3 DCE (2014 DCE) prepared by Energy*Solutions*, and essentially is an update to that DCE. The 2017 DCE will be submitted for review by the California Public Utilities Commission (CPUC) in the 2018 Nuclear Decommissioning Cost Triennial Proceeding (NDCTP). SCE will also submit certain information contained in the 2017 DCE to the U.S. Nuclear Regulatory Commission (NRC) for its review.[3]

The 2017 DCE incorporates pricing from two significant contracts SCE has entered into for SONGS 2&3 decommissioning. In December 2014, SCE awarded a contract to Holtec International, Inc. (Holtec) to expand the SONGS Independent Spent Fuel Storage Installation (ISFSI) and transfer fuel from the SONGS 2&3 spent fuel pools to the ISFSI (ISFSI Expansion and Fuel Transfer Operations contract). In December 2016, SCE entered into a contract with the companies that have formed a joint venture called SONGS Decommissioning*Solutions* (SDS)[4], who will serve as the Decommissioning General Contractor (DGC) for major decontamination and dismantlement (D&D) activities. The ISFSI expansion project is in process, with transfer of spent fuel from the SONGS 2&3 spent fuel pools to the ISFSI planned to commence in 2018. SDS initially mobilized in January 2017, and is continuing to develop decommissioning plans and schedule. The DGC is currently expected to begin physical work in January 2019, following the approval of a Coastal Development Permit (CDP) by the California Coastal Commission (CCC). The 2017 DCE incorporates the pricing from both of these contracts.

In addition, the 2017 DCE incorporates and reflects recorded costs, new information, and experience gained from decommissioning activities SCE has completed since June 2013. Since announcing its decision in June 2013 to permanently retire SONGS 2&3, SCE has commenced preliminary decommissioning planning and performed other significant preparatory activities for

[1] Kenrich is a national management consulting firm with significant experience in power plant construction and decommissioning and in the energy industry more broadly in the United States and internationally.

[2] Per the SONGS Decommissioning Agreement dated April 23, 2015, Southern California Edison is currently the Decommissioning Agent acting on behalf of itself and the three other SONGS 2&3 Participants, including San Diego Electric & Gas Company, the City of Riverside, and the City of Anaheim.

[3] In accordance with 10 C.F.R. § 50.82(a)(8)(v), the licensee must annually submit to the NRC by March 31 a financial assurance status report.

[4] The contract is between Southern California Edison Company and Energy*Solutions* Services, Inc. and AECOM Energy & Construction, Inc., together the "contractor," and referred to herein as "SDS."

SONGS 2&3 decommissioning. The 2017 DCE incorporates recorded costs through September 2017 associated with these efforts.

The 2017 DCE for SONGS 2&3 is $4.702 billion in Nominal/2017 dollars. The 2014 DCE was $4.411 billion in 2014 dollars. For purposes of comparison to the 2014 DCE, the 2017 DCE expressed in 2014 dollars is $4.479 billion, which results in an approximate $68 million variance (less than 2%) between the two DCEs.

II. Introduction

A. Purpose And Scope Of 2017 DCE

In accordance with the California Nuclear Facilities Decommissioning Act of 1985 (Act), SCE is required by the CPUC to update the SONGS 2&3 DCE every three years in connection with the NDCTP. The DCE is reviewed by the CPUC to determine the sufficiency of SCE's and San Diego Gas & Electric Company's (SDG&E) nuclear decommissioning trust funds, and the amount of customer contributions to those trust funds, if any are required. The DCE is also used in subsequent CPUC reasonableness reviews of actual decommissioning costs.

On June 7, 2013, SCE announced its decision to cease power generation operations and permanently retire SONGS 2&3.[5] In 2014, SCE engaged Energy*Solutions* to "evaluate decommissioning alternatives and assist in the development of a detailed project schedule and DCE to support the preparation and submittal of a Post Shutdown Decommissioning Activities Report (PSDAR) in accordance with 10 C.F.R. § 50.82(a)(4)(i), which requires that a PSDAR be submitted [to the NRC] within two years following the permanent cessation of operations."[6] SCE submitted the PSDAR and 2014 DCE to the NRC on September 23, 2014 and to the CPUC on December 10, 2014.[7] The CPUC approved the 2014 DCE as reasonable in Decision (D.) 16-04-019 issued on April 21, 2016.

In 2017, SCE engaged Kenrich to prepare the 2017 DCE to reflect the actual costs and updated information and experience gained from SCE's decommissioning activities completed since June 2013. The 2017 DCE will be reviewed by the CPUC for the purposes identified above. New and updated information incorporated into the 2017 DCE includes: [8]

[5] SONGS 1 has largely been decommissioned and the site it occupied is now referred to as the North Industrial Area, which includes the SONGS ISFSI.

[6] Energy*Solutions*, "2014 Decommissioning Cost Analysis of the San Onofre Nuclear Generating Station Units 2&3," September 5, 2014.

[7] The NRC accepted the SONGS 2&3 PSDAR and found the 2014 Units 2&3 DCE estimate of $4.411 billion to be reasonable on August 20, 2015.

[8] Information in this DCE is intended to be current as of approximately September 30, 2017.

- The contract pricing for the contract awarded to Holtec International, Inc. (Holtec) for the ISFSI expansion and the transfer of spent fuel from the SONGS 2&3 spent fuel pools to the ISFSI;
- Contract value for the DGC contract awarded to SONGS Decommissioning*Solutions* (SDS) for the decontamination and dismantlement of SONGS 2&3, and the removal and disposal of hazardous and non-hazardous waste off the site;[9]
- Recorded costs for decommissioning activities through September 30, 2017;
- Revised U.S. Department of Energy (DOE) spent fuel acceptance date to reflect the DOE's continued failure to perform its contractual obligation to remove spent fuel from commercial nuclear reactors in the past four years;
- Revised environmental permitting approval dates based on the current permitting status and the requirements of the California Environmental Quality Act (CEQA) and the CCC's CDP processes;
- Revised project execution strategy to delay substructure removal until 2046;
- Updated undistributed cost projections based on historical recorded costs and revised projections;
- Updated ISFSI demolition costs to reflect the Holtec ISFSI pad; and
- Additional costs not included in the 2014 DCE.

In sum, significant components of the 2017 DCE are now based on competitively bid contracts, as well as three additional years of experience managing a decommissioning plant and overseeing decommissioning personnel. Where new information was not available, Kenrich worked with SCE personnel and third-party consultants to validate and refine the 2014 DCE cost and schedule assumptions. Table 1 and Figure 1 below provide a summary of the 2017 DCE in nominal/2017 dollars[10] and in 2014 dollars.

[9] See Appendix B for the schedule and activities for decontamination, and dismantlement.

[10] The 2017 DCE presents recorded costs in nominal dollars and estimated (i.e., October 2017-2051) costs in 2017 dollars.

TABLE 1 – 2017 DCE BY UPDATE CATEGORY [11, 12]
($ IN THOUSANDS)

	Description	2017 DCE (Nominal/ 2017$)	2017 DCE (2014$)

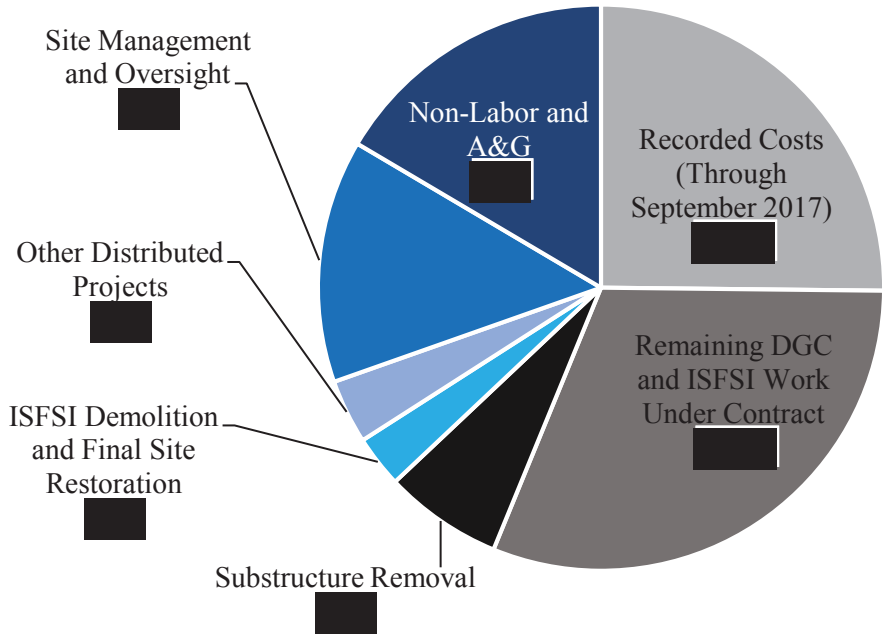
FIGURE 1 – 2017 DCE BY UPDATE CATEGORY
($ IN MILLIONS OF 2017 DOLLARS)



[11] Totals in tables throughout this report may not tie due to rounding.

[12] Of the $1,183,601 (nominal dollars) in recorded costs included in the 2017 DCE, $964,996 was recorded between June 2013 and December 2016, and $218,605 was recorded between January and September 2017 ($964,996 + $218,605 = $1,183,601).

B. Regulatory Framework

SONGS 2&3 decommissioning is governed by the following NRC regulations:

1. 10 C.F.R. Part 50 License – SCE holds a 10 C.F.R. Part 50 license for SONGS 2&3. SCE, as the license holder, must comply with all the requirements and standards of the Part 50 license. The Part 50 license authorizes SCE to store spent fuel on-site in wet storage (i.e., the spent fuel pool).

2. 10 C.F.R. Part 72 License – SCE is required to hold a 10 C.F.R. Part 72 license in order to store fuel on-site in dry storage at the ISFSI. The current ISFSI Part 72 license is a general license set forth in 10 C.F.R. § 72.210 and requires the possession of a Part 50 license.

3. 10 C.F.R. § 50.75(c) specifies the reporting and recordkeeping requirements for decommissioning planning and requires that the licensee provide adequate funding for termination of the Part 50 license.

4. 10 C.F.R. § 72.30 specifies the financial assurances and recordkeeping for decommissioning and requires that the licensee provide adequate funding for termination of the Part 72 license.

5. 10 C.F.R. § 50.54(bb) requires the licensee to submit written notification to the NRC within two years following permanent cessation of operation of the reactor or five years before expiration of the operating license(s), whichever occurs first, for review and preliminary approval of the program by which the licensee intends to manage and provide funding "for the management of all irradiated fuel at the reactor upon expiration of the reactor operating license until title to the irradiated fuel and possession of the fuel is transferred to the Secretary of Energy for its ultimate disposal in a repository." The 2014 DCE was submitted pursuant to this requirement.

C. SONGS Decommissioning Background

SONGS is located in southern California on the shore of the Pacific Ocean, approximately 62 miles southeast of Los Angeles and 51 miles northwest of San Diego. The plant is located entirely within Marine Corps Base Camp Pendleton on land owned by the U.S. Department of the Navy (Navy), except for the offshore intake and outfall conduits. SONGS 2&3 occupy approximately 53 acres of the 84-acre SONGS site. Approximately 16 acres are occupied by the North Industrial Area (NIA), formerly the SONGS 1 site, which is where the ISFSI is located. Additional SONGS support activities occurred on Navy property across Interstate 5 from the SONGS site, referred to as the Mesa site.

SONGS 2&3 was a 2,250-megawatt nuclear generation facility consisting of two pressurized water reactors, which commenced operation in 1983 and 1984, respectively. On June 7, 2013, SCE announced plans to permanently retire SONGS 2&3. On June 12, 2013, SCE

submitted a Certification of Permanent Cessation of Power Operations to the NRC, certifying that SCE had permanently ceased power operations of SONGS 2&3, and surrendering SCE's authority to operate the units. SCE submitted to the NRC a Certification of Permanent Removal of Fuel for Unit 3 on June 28, 2013, and for Unit 2 on July 22, 2013. As a result of these submittals, SCE now holds an NRC license that does not permit power operations, but authorizes the possession of the SONGS facilities and licensed nuclear material.

As noted above, SCE has completed preliminary planning and performed other significant preparatory activities associated with SONGS 2&3 decommissioning. These activities include: (1) expanding the on-site spent fuel dry storage facility (also referred to as the ISFSI) and beginning preparations to transfer fuel from the spent fuel pools to the ISFSI; (2) planning the major decontamination, dismantlement, demolition and disposal efforts; (3) selecting a DGC to complete major portions of the decommissioning project, including the decontamination and dismantlement of SONGS 2&3, and removal and disposal of hazardous and non-hazardous waste from the site; (4) obtaining necessary approvals of various NRC license amendments now that SONGS 2&3 is permanently retired and being decommissioned; and (5) implementing various site projects to comply with regulatory requirements and other obligations, and prepare the site for major decommissioning activities.

Along with these efforts, SCE's legal and environmental teams have been working to complete the CEQA process and obtain a CDP so that major decontamination and dismantlement work by SDS can begin.

The current Grant of Easement for SONGS from the Navy is scheduled to expire May 11, 2024. Efforts to obtain a new real estate authorization from the Navy for the plant site are ongoing, and approval for the issuance of a new real estate authorization is expected by 2024.

D. The Kenrich Group

Kenrich is a national management consulting firm with substantial experience in the public utility industry, nuclear power plant construction and decommissioning, and other commercial and public construction projects. Kenrich professionals have prepared and sponsored expert testimony with respect to cost and schedule analyses, project management, and economic damages before state and federal courts, domestic and international arbitration tribunals, and state utility commissions.

Kenrich personnel have consulted with utilities for more than 30 years on a wide range of matters, including strategic planning and financial analyses to support management decision-making, reviews and investigations by state and federal regulatory commissions, and economic damages analyses in the context of business disputes. Kenrich's consultants include accountants, financial analysts, and engineers, and the firm typically focuses on complex and detailed accounting and financial issues, as well as cost and schedule performance on major projects, including nuclear power plant construction and decommissioning.

III. Summary of the 2017 DCE

A. General Approach

This 2017 DCE builds on the 2014 DCE, incorporating recorded costs through September 30, 2017; contract pricing for the ISFSI expansion contract awarded to Holtec in December 2014 and the DGC contract awarded to SDS in December 2016; site restoration costs estimated by third-party engineering firms; and revised SCE estimates for ongoing plant security and maintenance, and project oversight. Kenrich worked closely with SCE management and project oversight to develop the 2017 DCE. This DCE is generally consistent with the guidance provided in NRC Regulatory Guide 1.202, "Standard Format and Content of Decommissioning Cost Estimates for Nuclear Power Reactors."

SCE retained ABZ, Incorporated (ABZ) to perform an independent review of the 2017 DCE. ABZ is a management consulting and engineering firm specializing in providing services related to decommissioning costs, scheduling, and spent fuel storage. ABZ has prepared decommissioning cost estimates for numerous nuclear plant owners, including an estimate of SONGS 2&3 decommissioning costs for SCE in 2013, shortly following the announcement of the permanent retirement of SONGS 2&3.

B. Energy*Solutions* 2014 DCE

In January 2014, SCE retained Energy*Solutions* to evaluate decommissioning alternatives and assist in the development of a detailed project schedule and DCE to support the preparation and submittal of a PSDAR in accordance with 10 C.F.R. § 50.82(a)(4)(i), which requires that a PSDAR be submitted to the NRC within two years following the permanent cessation of facility operations.

The 2014 DCE included the following three cost categories:

- **License Termination** -- Decommissioning SONGS 2&3 to the extent required to terminate the plant's operating license pursuant to 10 C.F.R. § 50.75(c);
- **Spent Fuel Management** -- Post-shutdown management of spent fuel until acceptance by the DOE pursuant to 10 C.F.R. § 50.54(bb) and ISFSI decommissioning pursuant to 10 C.F.R. § 72.30; and
- **Site Restoration** -- Demolition of uncontaminated structures and restoration of the site in accordance with the Navy Grant of Easement and the California State Lands Commission (CSLC) requirements.

The 2014 DCE was prepared using a WBS to differentiate between these three major cost categories. The 2014 DCE included SCE's actual costs incurred from June 7, 2013 through December 31, 2013 and estimated costs thereafter.

The 2014 DCE was based on the following technical approach to decommissioning:

- Prompt DECON decommissioning methodology;[13]
- Decommissioning would be performed by a DGC with oversight by the SONGS participants;
- Spent fuel would be transferred from the spent fuel pools and stored in Multi-Purpose Canisters at an on-site ISFSI; and[14]
- The DOE would begin accepting spent fuel from the nuclear industry in 2024 and complete the removal and acceptance of all spent fuel stored at SONGS by 2049. A dry transfer facility would not be necessary to transfer the spent nuclear fuel canisters to DOE transport canisters.

The 2014 DCE followed the approach originally presented in the Atomic Industrial Forum/National Environmental Studies Project Report AIF/NESP-036, "Guidelines for Producing Commercial Nuclear Power Plant Decommissioning Cost Estimates." The report was prepared in accordance with NRC Regulatory Guide 1.202, "Standard Format and Content of Decommissioning Cost Estimates for Nuclear Power Reactors." The estimate was based on compliance with current regulatory requirements and proven decommissioning technologies.

On December 10, 2014, SCE filed Application (A.)14-12-007 and submitted the 2014 SONGS DCE to the CPUC. On April 21, 2016, the CPUC issued D.16-04-019, determining that the 2014 SONGS DCE was reasonable. On August 20, 2015, the NRC accepted the PSDAR, and found the DCE to be reasonable, stating:

> The NRC staff reviewed the cost estimates against the guidance in RG 1.185, Section C.3 and finds that SCE's site-specific DCE and the costs of long-term storage of spent fuel for SONGS, Units 2 and 3, are considered reasonable, are described consistent with the guidance in RG 1.185, provide sufficient details

[13] DECON is one of three basic methods for decommissioning defined by the NRC. Under the DECON method, the equipment, structures, and portions of the facility and site that contain radioactive contaminants are promptly removed or decontaminated to a level that permits termination of the Part 50 license after cessation of operations.

[14] The three options for long-term post-shutdown spent fuel management currently available to power plant operators are as follows: (1) wet storage consisting of continued maintenance and operation of the spent fuel pools; (2) dry storage consisting of transfer of spent fuel from the fuel pool to on-site dry storage modules after a cooling period; or (3) a combination of the two as is the present case at SONGS. Maintaining the spent fuel pool for an extended duration following cessation of operations would prevent the reduction of the Part 50 license and result in higher annual maintenance and operating costs than the dry storage alternative. Transfer of spent fuel to an ISFSI requires additional expenditures for purchase and construction of the ISFSI and dismantlement and disposal of the ISFSI following the completion of spent fuel transfer to the DOE.

associated with the funding mechanisms, and meet the requirements of 10 CFR 50.82(a)(4)(i).[15]

C. 2017 DCE Structure

The 2017 DCE utilizes the WBS that was established in the 2014 DCE, [16] and is estimated in 2017 dollars. Certain comparisons of the 2014 and 2017 DCEs are provided in 2014 dollars for ease of comparison. Costs were de-escalated from 2017 dollars to 2014 dollars using escalation factors provided by SCE.

Consistent with the 2014 DCE, the 2017 DCE provides the total costs to decommission SONGS 2&3. The liability for the total decommissioning costs is shared between the SONGS participants.[17]

As noted above, the 2014 DCE summarized the decommissioning costs by the License Termination, Spent Fuel Management, and Site Restoration cost categories (as generally defined by the NRC). The costs were further summarized into sequential periods within each cost category. For the 2017 DCE, Kenrich revised the periods from the 2014 DCE and established common periods that include all cost categories to better align the estimated costs with SCE's current project schedule and to simplify cost and schedule reporting.[18]

The 2017 DCE periods were designed to reflect the timing and completion of certain decommissioning milestones, including the completion of: (1) ISFSI fuel transfer operations; (2) mobilization and transition of various program activities (e.g. radiation protection program, maintenance, etc.) to SDS; and (3) major D&D phases of work defined in the DGC contract.[19] The completion of these milestones are expected to trigger certain reductions in staffing and undistributed costs. Figure 2 illustrates how the 2017 DCE periods align to the DGC contract and the completion of fuel transfer operations.

---

[15] August 20, 2015 letter from NRC to SCE Vice President and Chief Nuclear Officer, Mr. Thomas J. Palmisano (ADAM Accession No.: ML15204A383)

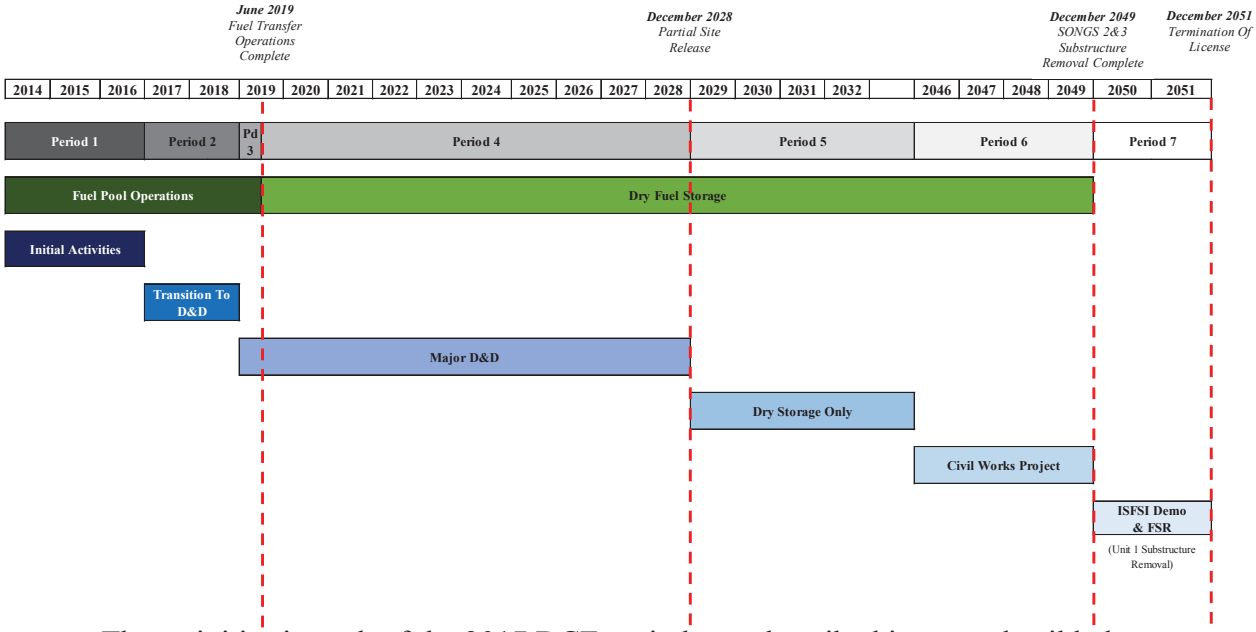
[16] The DCE line numbers in Appendix C of this report align to the line numbers in Appendix D of the 2014 DCE. The DCE line numbers in Appendix C of this report indicate the corresponding 2014 DCE: (1) NRC cost category, (2) 2014 DCE period, (3) cost type (i.e., distributed or undistributed), and (4) line number. For example, "LT-2-D-2.17" in Appendix C of this DCE corresponds to License Termination Period 2, distributed cost line number 2.17 in Appendix D of the 2014 DCE.

[17] The share of the liability for each of the SONGS Participants is provided in Appendix E.

[18] While new periods are used to summarize the costs in this DCE, the underlying cost structure remains the same as the 2014 DCE and will facilitate cost reconciliations between the two estimates.

[19] The phases of work in the DGC contract are described in more detail in Section V.D.3 below.

FIGURE 2 ALIGNMENT OF 2017 DCE PERIODS TO DECOMMISSIONING MILESTONES



The activities in each of the 2017 DCE periods are described in more detail below.

Period 1 – Initial Activities (June 2013 – December 2016)

Period 1 began on June 7, 2013 immediately following SCE's decision to permanently retire SONGS 2&3. As the decision was made approximately nine years before the units' Part 50 operating licenses would have expired, SONGS's premature retirement was unexpected. SCE spent the following six months reducing its workforce and beginning to formulate plans for decommissioning. This period includes preliminary decommissioning planning, obtaining necessary approvals of NRC license amendments, commencing the expansion of its on-site ISFSI facility, and procuring a DGC. The end of this period aligns with the selection and award of the DGC contract to SDS in December 2016.

Period 2 – Transition and Pool Storage (January 2017 – December 2018)

Period 2 began with the mobilization of SDS in January 2017 and extends through December 2018, during which time SCE will transition responsibility of D&D-related site management and support functions at SONGS to SDS. In addition, SCE will complete the CEQA process with CSLC and obtain a CDP from the CCC. The CEQA process and CDP are required for SDS to begin major decontamination and dismantlement work. Other activities during Period 2 include the ongoing expansion of the on-site ISFSI facilities, and various other smaller projects. In addition, SCE currently anticipates that Holtec will begin transferring spent fuel from the wet storage pools adjacent to the reactors into dry storage at the expanded on-site ISFSI in 2018. The fuel transfer operations will continue into Period 3.

Period 3 – D&D and Pool Storage (January 2019 – May 2019)

Period 3 begins with SDS's mobilization to commence the major physical work to decontaminate and dismantle SONGS 2&3. SDS's initial work during this period will primarily focus on the segmentation and packaging of reactor internals. The completion of the transfer of all fuel from the operating spent fuel pools into dry storage at the on-site ISFSI marks the end of Period 3. After the SONGS spent fuel pools are empty, related systems needed for the spent fuel pools will be retired, and otherwise applicable plant programs associated with spent fuel management will be modified, allowing SCE to further reduce SONGS staffing.

Period 4 – D&D and Dry Storage (June 2019 – December 2028)

Period 4 begins with the completion of fuel transfer operations and extends through the completion of the D&D work. Period 4 is expected to span approximately 9.6 years. This period includes the decontamination, dismantlement, demolition, removal, and waste disposal of the entire SONGS plant to approximately 3 feet below grade, with the exception of the on-site ISFSI and its associated security facilities, as well as the switchyard area. At the end of this period, SDS is expected to have completed all D&D work necessary to obtain NRC approval to reduce the Part 50 license site footprint to the ISFSI area only and to allow partial release of the SONGS site for unrestricted future use.

Period 5 – Dry Storage (January 2029 – December 2045)

During Period 5, the primary activity at SONGS will be the ongoing maintenance and security of the on-site ISFSI and the transfer of all SONGS spent fuel to the DOE. For purposes of the 2017 DCE, SCE has assumed that the DOE will begin performing its obligations nationally in 2028, which means that the DOE would begin removing the SONGS 2&3 spent nuclear fuel from the on-site ISFSI in 2034 under the pick-up rates published in the DOE's July 2004 "Acceptance Priority Ranking & Annual Capacity Report." In addition, Period 5 includes the Navy's National Environmental Policy Act (NEPA) environmental review process, associated with amending the SONGS real estate authorization to establish the site restoration or "end state" requirements for SONGS to return the property to the Navy. SCE will also initiate a Request For Proposal (RFP) process for substructure removal work.

Period 6 – Civil Works Project (January 2046 – December 2049)

Period 6 begins with a contractor mobilizing in order to perform the remaining work to restore the SONGS site for its return to the Navy. This work includes removing all onshore below-grade man-made structures, with the exception of the North Industrial Area where the on-site ISFSI is located. This work is currently expected to span approximately four years and is scheduled to be completed in December 2049. During Period 6, the DOE will continue to remove the remaining SONGS spent fuel from the ISFSI. SCE assumes all fuel is removed by the DOE by December 2049, marking the end of this period and the commencement of Period 7,

the demolition and removal of the ISFSI facilities and the final site restoration of the SONGS site.

Period 7 – ISFSI Demolition and Final Site Restoration (January 2050 – December 2051)

After all of the spent fuel is removed from SONGS, SCE can begin the final decommissioning and site restoration activities. These activities include dismantling and disposing of the ISFSI, completing the final site restoration work, obtaining NRC approval to terminate the remaining license covering the ISFSI, and returning the property to the Navy.[20] SCE projects that all decommissioning activities will be completed by 2051, approximately two years after the removal of the last spent fuel from the SONGS ISFSI.

In addition, for purposes of the 2017 DCE, SCE has assumed that the offshore intake and outfall conduits will be excavated and removed during this period.

At the end of decommissioning in 2051, all above and below ground man-made improvements, including the seawall and the offshore intake and outfall conduits, will be removed, and the site will be re-graded, re-vegetated, and returned to the Navy.

IV. Summary Of 2017 DCE Costs And Schedule

A. Summary Of 2017 DCE Recorded And Estimated Costs

SONGS has incurred $965.0 million (nominal dollars) through December 31, 2016 and estimates $3,737 million (2017 dollars) to complete decommissioning through 2051, for a total estimate of $4,702 million (Nominal/2017 dollars). The equivalent total in 2014 dollars is $4,479 million. Table 2 below summarizes the 2017 DCE by cost category.

[20] The Units 2&3 ISFSI Demolition and Final Site Restoration scope excludes the removal of the remaining Unit 1 foundations. The scope of the removal of the Unit 1 foundations is included in the Unit 1 DCE.

V. Bases Of Estimate And Key Assumptions

A. General Principles

Where available, Kenrich relied on executed contracts, actual cost data, and lessons learned from on-site performance to date. The cost estimate of decommissioning activities through the completion of the major decontamination, dismantlement, and waste disposal activities at SONGS in 2028 is based on competitively bid contracts and detailed project cost estimates prepared by SCE project managers. Kenrich worked with SCE personnel to ensure project cost estimates were reasonable and consistent with underlying key assumptions. Kenrich also worked with SCE to determine appropriate contingency factors to ensure that the total estimate remained reasonable and conservative. In addition, Kenrich incorporated project costs that were not included in the 2014 DCE, including those associated with the substantial environmental permitting efforts that are currently in process.

The majority of the cost estimates for activities after 2028, such as the substructures removal and the final site restoration are based on either the 2014 DCE values or updated estimates prepared by High Bridge Associates, experts in cost estimating.[23] Consistent with industry practice, the 2014 DCE used quantity take-offs from plant drawings and Unit Cost Factors.

Kenrich worked with knowledgeable SCE personnel to prepare cost estimates for the ongoing operations and maintenance of the SONGS facilities, as well as the oversight and support of the decommissioning project. Consistent with the 2014 DCE, these indirect project costs are referred to as undistributed costs in the 2017 DCE. Such undistributed costs include Utility Staffing, Contracted Services, Energy, Site Lease expenses, among other items. Kenrich worked closely with knowledgeable SCE personnel to develop detailed cost estimates that reflect the current known regulatory and project support requirements throughout the entire decommissioning project. Kenrich ensured these cost estimates were supported, reviewed by subject matter experts, and consistent with the project schedule and other key underlying assumptions.

B. Key Facts And Assumptions

Kenrich worked closely with SCE personnel to identify, define, and support the key assumptions underlying the 2017 DCE. As part of this process, subject matter experts were interviewed and meetings were held with cross-functional teams to review and refine the

[23] High Bridge Associates is a project management consulting and services company with experience supporting capital projects, decommissioning and closure projects, new build construction projects, and operating/maintenance programs in various markets. High Bridge has provided consulting and technical subject matter expert services to customers spanning Cost Estimating, Cost/Schedule Reviews, Risk Assessments, Due Diligence Evaluations, Feasibility Studies, Readiness Assessments, Contract Change Management/Claims, and Technical/Management Assessments.

assumptions. Additionally, relevant supporting documents were identified and reviewed to confirm accuracy and reasonableness.

The key assumptions and general bases of estimate for the 2017 DCE are summarized below. The detailed bases for the estimated costs for specific distributed and undistributed activities are described in subsequent sections of this report.

General

1. Costs are presented in the same WBS utilized in the 2014 DCE (see Appendix C). Distributed costs are summarized and discussed by major project, and undistributed costs are discussed by cost category.

2. Recorded costs for decommissioning activities through September 30, 2017 are included in this estimate.

3. Approximately $[redacted] billion of the SONGS decommissioning project are covered by two contracts (i.e., ISFSI expansion and fuel transfer operations with Holtec and the DGC contract with SDS). Those contract amounts are incorporated into this DCE.[24]

Decontamination, Dismantlement, Demolition, and Disposal to Achieve Partial Site Release

4. The DGC contract with SDS was executed in December 2016. SDS mobilized to the SONGS site and commenced Phase I work (transition and planning) on January 9, 2017.

5. The pricing of the SDS contract generally covers two phases of work: transition and planning (Phase I) and the decontamination, dismantlement, and removal of all man-made improvements to 3 feet below grade (and or deeper as required) to reduce the Part 50 license to the ISFSI area only (Phase II). In addition, SDS is expected to install backfill and perform other work as requested.

6. The CEQA review process completed by the CSLC will conclude with the issuance of an Environmental Impact Report that will be utilized by the CCC in connection with its issuance of a CDP in the last quarter of 2018. The CDP will allow physical decommissioning work to commence at SONGS. Accordingly, SDS is expected to begin Phase II work in January 2019.

7. SDS's Phase II work is estimated to be completed by December 2028, following the submission of Final Site Survey to the NRC and the approval of a partial site release, reducing the SONGS 2&3 NRC Part 50 license footprint to the ISFSI area only.[25]

[24] Contract milestone payments are aligned with SCE's current expected project schedule.

[25] SDS's Phase II work also covers non-radiological hazardous waste disposal, e.g., asbestos, chromates, lead paint, and polychlorinated biphenyls (PCBs).

8. Following the D&D work, the SONGS plant site will be backfilled to current grade levels. Clean material available on the SONGS plant site may be acceptable for purposes of backfill and additional required backfill material will be imported from offsite.[26]

9. The 2017 DCE includes costs to purchase and import backfill material from offsite.

Spent Nuclear Fuel and GTCC Waste

10. All spent fuel will be transferred from the SONGS 2&3 pools to the on-site ISFSI by June 1, 2019.

11. Greater Than Class C (GTCC) waste will be stored in twelve canisters (five for reactor internals and one for spent fuel pool hardware/contents at each unit). GTCC waste from the containment buildings (e.g., portions of the reactor vessel internals) and spent fuel pools will be loaded into canisters and the loaded canisters will be transferred to the ISFSI.

12. The DOE will remove all GTCC waste from SONGS by 2049.

13. The DOE will commence accepting spent fuel from the commercial nuclear industry in 2028. The DOE will accept the first SONGS 2&3 spent fuel in 2034. All SONGS spent fuel will be removed from the ISFSI by 2049.

14. SCE is responsible for the loading of spent fuel and GTCC waste canisters into DOE transportation containers. (No dry transfer facility is required.)

15. GTCC disposal costs are conservatively estimated to account for potential DOE charges for acceptance of GTCC waste (i.e., in addition to the one-mill fee charged per kilowatt of generation per the Standard Contract with the DOE).

Substructure Removal Below 3 Feet Below Grade (i.e., Below 27 Feet Elevation)

16. SCE anticipates submitting an application to the Navy to amend the then current real estate authorization to seek a Navy determination of the substructure removal requirements. The Navy is expected to establish those requirements after completing a NEPA process and to include the requirements within a new or amended real estate authorization. This will define the final site release criteria for turnover of the SONGS property back to the Navy. The

[26] Paragraph 12 of the Grant of Easement, U.S. Department of Navy to Southern California Edison Company and San Diego Gas & Electric Company, dated May 12, 1964 states, "That upon termination of the easement granted herein, the Grantees at their expense may remove, and if desired by the government, shall remove any and all improvements installed or constructed hereunder and shall restore the Premises to a condition satisfactory to the Director, Southwest Division, Bureau of Yards and Docks, except that the Grantees shall not be obligated to restore any natural material cut or filled in the necessary excavation and grading of the Premises and such surrounding area within the Reservation as may have been contaminated by the operation of the Nuclear Station." Thus, the contract states that the Navy will specify the final site restoration requirements. The Navy has not yet specified its decontamination, backfill, compaction, grading, or re-vegetation requirements. The Navy is expected to establish these requirements as a part of the NEPA process and specify them within a new real estate authorization.

application is currently expected to be filed in 2040, with a Navy decision by 2045. That timing may change depending upon the time frame for the DOE removal of the spent fuel.

17. The removal of substructures (i.e., man-made improvements remaining after the D&D work and reduction of the Part 50 license to the ISFSI area only) is expected to begin in 2046 and be completed by December 2049. The final site restoration criteria will not be known until the Navy amends the SONGS site real estate authorization to include such criteria. Therefore, for purposes of the 2017 DCE, it is assumed that all SONGS 2&3 substructures will be removed during 2046-2049 (Period 6) (excluding the ISFSI which will be removed in a subsequent period).[27]

18. The estimated costs for the substructure removal work scope included in the 2014 DCE were reviewed and updated by High Bridge Associates. High Bridge Associates validated the quantities contained in the 2014 DCE and reduced the costs for non-radioactive waste disposal (based on La Paz, Arizona disposal rates, as compared to Oregon state rates which were assumed for purposes of the 2014 DCE).[28]

19. All concrete and other demolition debris (including "clean;" i.e., non-radioactive, non-hazardous material) that is deemed by the Navy or SCE to be not suitable for purposes of backfill will be transported to and disposed at an out-of-state Class III landfill at La Paz, Arizona or other facilities as may be required.[29] Cost for transporting clean scrap metal to a recycler is included in the DCE. No credit is taken for any salvage value of the scrap metal.

Conduits, ISFSI Demolition, and Final Site Restoration

20. For purposes of the 2017 DCE, it is assumed the offshore intake and outfall conduit will be removed during Period 7, ISFSI Demolition and Final Site Restoration, and will be complete by 2050.

[27] Any determination in the 2017 DCE that accounts for only partial removal of substructures would be non-conservative, arbitrary and inconsistent with the U.S. Navy easement, and without basis. If the final site restoration requirements specified in the future by the Navy allow less than complete removal of non-contaminated structures below 3 feet below grade (i.e., 27 feet elevation), then that new assumption will be incorporated into the subsequent DCE update.

[29] This out-of-state disposal requirement is consistent with the Governor of the State of California Executive Order D-62-02.

21. Following the complete removal of SONGS spent fuel and GTCC waste in 2049, the ISFSI and related facilities, and all remaining man-made structures (e.g., gunite walls, roads and parking lots, rail facilities) will be demolished and removed.

22. The SONGS site will be re-established to meet Navy site restoration requirements, including grading and re-vegetated.

Other

23. SCE expects to return the Mesa site to the Navy by July 31, 2021. The April 2011 lease from the Navy is known as the "Mesa lease" and contains five parcels. Parcels 5, 6, and 7 are associated with the Mesa site and are being returned. Parcels 8 & 9 are adjacent to the SONGS site and will be retained and incorporated into a new site lease during the real estate authorization process.

C. Project Schedule

The 2017 DCE assumes the timing for completing major activities is generally the same as the 2014 DCE, with the exception of the timing for removing the substructures below 3 feet below grade, which moved from 2031 to 2049. The schedule assumed in the 2017 DCE is as follows:

- **June 1, 2019** – Fuel Transfer Operations Complete.
- **December 2028** – Completion of the D&D work and receipt of NRC approval of the amendment to achieve partial site release and reduce the Part 50 License to the ISFSI area only.
- **December 2049** – Completion of Substructures removal below 3 feet below grade (i.e., 27 feet elevation).
- **December 2049** – All spent fuel removed from the site.
- **December 2051** – Completion of ISFSI Demolition, Conduits Removal, Final Site Restoration, and Lease Termination.

D. Distributed Costs

1. Completed Projects

Following the transition to decommissioning in June 2013, SCE began efforts to prepare the site for decommissioning and obtain necessary approvals of NRC license amendments. During the period from June 7, 2013 to September 30, 2017, SCE began and completed projects

to implement "Cold & Dark,"[30] perform the initial site assessment, dispose of legacy radwaste, prepare and receive approval for regulatory submittals, and select a DGC.

During this period, SCE also implemented projects that were needed to comply with regulatory requirements and other obligations. SCE began and completed projects related to Security Shutdown Strategy, Large Organism Exclusion Device Modifications, Fuel Cancellation payments, and other efforts.

Kenrich incorporated the recorded costs for the completed projects into the 2017 DCE. SCE will support the reasonableness of costs incurred in separate filings in the 2015 and 2018 NDCTP.

2. ISFSI And Fuel Transfer Operations

Following a competitive bidding process, SCE awarded a contract to Holtec to license, design, and construct an expanded on-site ISFSI; and to supply, load, and transfer the multi-purpose canisters containing fuel assemblies, from the SONGS 2&3 spent fuel pools to the expanded ISFSI. Holtec's work scope generally includes:

- Perform engineering, procurement, and construction services for a new on-site ISFSI pad and supporting facilities (e.g., security building, haul path).
- Perform fuel inspections and spent fuel pool waste characterizations.
- Provide spent fuel canisters and vertical ventilated underground dry storage modules to store SONGS spent fuel assemblies.
- Load and transport the canisters to the ISFSI and place the canisters into the dry storage modules.
- Transport the loaded GTCC waste (reactor internals and certain other non-fuel waste material) canisters to the ISFSI.[31]
- Engineering analyses, documentation, licensing and permitting activities.

SCE also maintains an ISFSI oversight team to ensure safe and efficient execution of the work by Holtec. The estimate for ISFSI and Fuel Transfer Operations also includes these SCE project oversight costs.

---

[30] Includes plant modifications to systems that are not required to support spent fuel pool cooling or to meet other license conditions and places SONGS in a Cold and Dark condition in preparation of dismantlement and decontamination.

[31] The Holtec contract milestone payment for transferring the GTCC waste to the ISFSI, as well as costs associated with the procurement of GTCC canisters is included in a separate line item in the DCE for "GTCC Waste Storage" within "Other Projects."

TABLE 5 ISFSI & FUEL TRANSFER OPERATIONS ESTIMATE
($ IN THOUSANDS)

	Description	Recorded Through 2016 (Nominal $)	Estimate To Complete (2017$)	Total Estimate At Completion (Nominal /2017$)	Total Estimate At Completion (2014$)
1	**ISFSI & Fuel Transfer Operations**				
2	ISFSI Expansion	$ 60,485	$ 74,100	$ 134,585	$ 128,026
3	Canister Fabrication	79,562	27,705	107,266	104,026
4	Spent Fuel Loading & Transfer to ISFSI	-	40,580	40,580	38,159
5	**ISFSI & Fuel Transfer Operations Total**	**$ 140,047**	**$ 142,385**	**$ 282,432**	**$ 270,210**

3. Decontamination, Dismantlement, Demolition, And Disposal

In December 2016, following a competitive bidding process, SCE executed a contract with SDS to perform the major decontamination, dismantlement, demolition, and disposal work at SONGS. The SDS work will include removing all SONGS 2&3 structures, systems, and components to 3 feet below grade (i.e., to 27 feet elevation) to permit the release of the property for unrestricted future use.[32] The SDS work will include characterizing, packaging, transporting, and disposing of waste from the SONGS site to appropriately licensed or permitted facilities.[33] Additionally, SDS will support SCE to modify or amend its NRC Part 50 license for SONGS 2&3, as well as its existing agreements with the U.S. Navy and other permitting agencies as required for completion of this work scope.

The work is divided into two phases:

Phase I: Transition and mobilization

Phase II: Decontamination, dismantlement, demolition, and waste disposal activities necessary to achieve partial site release and reduce the SONGS Part 50 license footprint to the ISFSI area only.

SDS will provide project management and field oversight, as well as planning and execution of D&D-related site management and support functions during the decommissioning of SONGS. SCE will perform oversight of SDS's activities, as required by the applicable licenses and permits, and will retain responsibility for license-related operations and security (i.e., spent fuel pool, fuel transfer, and ISFSI operations).

[32] SDS's work scope excludes the ISFSI and switchyard facilities.

[33] GTCC waste and spent fuel will be stored on the ISFSI and are not expected to be transported to a disposal facility during SDS's performance of the work.

Phase II D&D activities will include:

- Segmenting the SONGS 2&3 reactor vessels and internals, and loading them into storage containers.
- Removing and disposing of large components including SONGS 2&3 reactor pressure vessels, steam generators, pressurizers, and turbine-generators.
- Decontaminating and removing all structures, systems, and components as necessary to achieve partial site release and reduce the Part 50 license to the ISFSI area only.
- Removing certain above-seabed components of the ocean conduits.
- Necessary backfill work to achieve level grade for the power block area at an elevation of +30.0 feet.[34]
- Development of the partial site release plan in accordance with 10 C.F.R. § 20.1402 site release criteria. SDS will perform necessary D&D work to meet a radiological release criteria that does not exceed 15 millirem per year.[35]

The work scope under DGC contract does not include removing the intake/discharge structure beneath the seawall; ocean conduits; seawall and pedestrian walkway; gunite slope protection; and certain railroad track and site access roads.

Support for SCE-Retained Responsibilities

SCE will remain the licensed operator for NRC licenses associated with SONGS and will retain responsibility for interfacing and corresponding with the regulatory agencies in the management of licenses.[36] SCE will also continue to be the primary interface with the Navy (property owner), and the regulatory agencies and other government authorities responsible for existing permits and the issuance of new permits necessary to perform decommissioning. SDS will support SCE interface with the regulatory agencies and the Navy.[37]

---

[34] Backfill material is excluded from the fixed price portion of SDS's contract scope.

[35] Per 10 C.F.R § 20.1402, the NRC site release criteria is 25 mrem per year calculated as the peak annual Total Effective Dose Equivalent ("TEDE") dose expected within the first 1,000 years after decommissioning. Release criteria is defined as residual radioactivity that is distinguishable from background radiation which results in a TEDE to an average member of the critical group, including that from groundwater sources of drinking water, and has been reduced to levels that are as low as reasonably achievable (ALARA).

[36] Nuclear operations are defined as operations and administration of installed, in-service structures, systems, and components within the Protected Area (PA).

[37] SCE will retain responsibility for personnel screening for access and badging to the SONGS protected areas (PAs) and vital areas (VAs) until all spent fuel is removed from the spent fuel pools and placed into storage on the ISFSI and the associated security plans are revised and approved. When the PAs/VAs are reduced to the ISFSI only, SCE will transition this responsibility to SDS for all areas except the ISFSI. SCE will retain responsibility for the

4. Substructure Removal

The substructure removal work will include the activities necessary to achieve the final "end state" requirements determined by the Navy (which are incremental to the NRC partial site release requirements that will be met during SDS's major D&D work). SCE currently plans to select a contractor to perform the substructure removal work in the mid-2040s.

For purposes of preparing the 2017 DCE, Kenrich retained High Bridge Associates to review and update the 2014 DCE estimate for the removal of substructures below 3 feet below grade.

More specifically, substructure removal activities will include the following:

- Removing substructure systems and components required to achieve "end state" requirements set forth in the applicable Navy real estate authorization for the SONGS Site. This work will include cleanup, remediation, and/or removal of structures, systems, and components, soils/debris, and/or contaminated groundwater, as required.[38]
- Backfilling excavations and voids with approved material and leveling the SONGS site, as required by regulatory and landowner closure requirements.
- Characterizing, packaging, transporting, processing, and disposing of SONGS waste as required to support the regulatory and landowner closure requirements.
- Removing the existing seawall and intake and outfall box culvert.

Excluded from the substructure removal work are the demolition and removal of the ISFSI after the spent nuclear fuel and GTCC waste is removed by the DOE. Also excluded is the other final site restoration work to meet requirements related to the final termination of the SONGS site easements (e.g., ocean conduits, gunite slopes, drainage requirements, access roads, etc.).

The estimated substructure removal costs are summarized in the table below.

industrial and commercial security requirements at SONGS until the security plans are revised and the NRC approves the reduction of the PA/VAs to the area associated with the on-site ISFSI. SDS will take over this responsibility following the transfer of all spent fuel and GTCC to the ISFSI and the implementation of the associated revised security plans.

[38] The activities may also include removal of certain above grade facilities remaining after the major D&D work performed by SDS, potentially including non-essential utilities, parking areas, roads, and other improvements.

TABLE 6 SUBSTRUCTURE REMOVAL ESTIMATE
($ IN THOUSANDS)

	Description	Recorded Through 2016 (Nominal $)	Estimate To Complete (2017$)	Total Estimate At Completion (Nominal /2017$)	Total Estimate At Completion (2014$)
1	**Substructure Removal**				
2	Excavation and Dewatering	$ -	$ 152,819	$ 152,819	$ 145,563
3	Demolition and Backfill	-	108,277	108,277	102,573
4	Other	-	8,833	8,833	8,386
5	Removal of Seawall and Box Culvert	-	17,410	17,410	16,520
6	**Substructure Removal**	**$ -**	**$ 287,340**	**$ 287,340**	**$ 273,042**

5. Offshore Conduit Removal

As was the case for the 2014 DCE, uncertainty remains regarding the requirements for removal of the offshore intake and outfall conduits located below the sea floor. For SONGS 1, the CSLC has allowed the SONGS 1 conduits to remain in place provided that the SONGS 1 Participants retain the liability to remove the SONGS 1 conduits should that be deemed by the CSLC to be necessary at a future date. For these reasons, the 2017 DCE continues to include an estimated cost to perform the full removal of the SONGS 2&3 offshore conduits as was estimated in the 2014 DCE. The 2017 DCE includes $96.0 million to fully remove the SONGS 2&3 offshore conduits.

6. ISFSI Demolition

Following the removal of all spent fuel and GTCC waste by the DOE, SCE will demolish and remove the ISFSI and perform activities necessary for the final restoration of the SONGS site. At the time the 2014 DCE was prepared, the specific plans to expand the ISFSI had not been defined. Later in 2014, SCE entered into a contract with Holtec to expand the ISFSI. Kenrich retained High Bridge Associates to update the ISFSI demolition estimate in the 2014 DCE to reflect the Holtec ISFSI pad. The updated estimate for ISFSI demolition is $20.2 million.

7. Final Site Restoration

The final restoration work includes the removal of the gunite slope protection; remaining railroad tracks, rails, and ballast; access roads and parking lots. In addition, this work includes any other work required by the Navy real estate authorization, which is expected to include the final grading and re-vegetation of the SONGS site. The total estimated final site restoration work in the 2017 DCE is $7.3 million. The 2014 DCE included, as part of final site restoration, the costs to remove the intake and outfall structure underneath the seawall, which required installing and removing dewatering equipment and a temporary seawall. The intake and outfall structure beneath the seawall, as well as the seawall itself, are now expected to be removed

during the civil works project (i.e., Period 6, 2046-2049). Therefore, the second dewatering process and temporary seawall are no longer necessary during final site restoration.

8. Other Distributed Projects

In addition to the major decommissioning projects discussed above, SCE must also perform other projects to comply with federal and state regulations and the terms of SCE's real estate authorizations with the Navy. These other projects and their associated estimated costs are shown in Table 7 and discussed in more detail below.

TABLE 7 OTHER DISTRIBUTED PROJECTS ESTIMATE
($ IN THOUSANDS)

	Description	Recorded Through 2016 (Nominal $)	Estimate To Complete (2017$)	Total Estimate At Completion (Nominal /2017$)	Total Estimate At Completion (2014$)
1	**Other Projects**				
2	ISFSI Aging Management	$ 385	$ 38,376	$ 38,761	$ 36,489
3	Coastal Development Permit Extensions	-	5,580	5,580	5,252
4	GTCC Waste Storage	-	28,270	28,270	26,632
5	Mesa Site Turnover	7,245	13,967	21,212	20,341
6	CEQA Permitting	3,169	5,162	8,331	7,914
7	Initial Real Estate Authorization Renewal And Plant Easements	646	14,658	15,305	14,427
8	Plant Lease Extension	-	4,118	4,118	3,878
9	Plant Lease Amendment For Final Site Restoration	-	9,290	9,290	8,745
10	Cyber Security Modifications	8,513	1,131	9,644	9,380
11	DCE Update	-	3,897	3,897	3,669
12	GTCC Disposal	-	43,200	43,200	40,662
13	ISFSI CDP Settlement	-	4,543	4,543	4,277
14	Substructure Removal Contractor Procurement	-	7,447	7,447	7,011
15	NIA Sump Modifications	-	1,150	1,150	1,081
16	**Other Projects Total**	**$ 19,959**	**$ 180,789**	**$ 200,748**	**$ 189,758**

a. ISFSI Aging Management

The "Aging Management" project was established to develop inspection and maintenance programs for the Areva and Holtec spent fuel dry storage systems. Also included are initial cask testing, inspection equipment and licensing costs for dry cask NRC Certificate of Compliance (CoC) renewals, and Safety Analysis Report (SAR) updates. Ongoing required annual maintenance and inspections of the spent fuel dry storage systems are included in the undistributed non-labor Aging Management category.

b. Coastal Development Permit Extensions

SCE holds a Coastal Development Permit for the storage of SONGS 2&3 spent fuel in the Areva ISFSI system until November 2022, and a separate CDP to store SONGS 2&3 spent fuel in the Holtec ISFSI system until 2035. Therefore, SCE will need to obtain CDP extensions

from the CCC for the Areva and Holtec ISFSI systems prior to the expiration of the permits in 2022 and 2035, respectively.

c. GTCC Waste Storage

As part of the DGC contract, SDS is responsible for preparing, characterizing, and packaging the GTCC waste into canisters, with the exception of the relatively small amount of GTCC waste which currently resides in the spent fuel pools and will be loaded by Holtec. Holtec will supply the GTCC canisters and is also responsible for transferring the loaded GTCC waste canisters to the ISFSI pad. The estimated costs cover the purchase and licensing of GTCC canisters, as well as their transfer from the containment buildings to the ISFSI pad.

d. Mesa Site Turnover

SCE's Mesa site consists of five parcels leased from the Navy. Parcel 5 is on the west side of U.S. Interstate Highway 5 (I-5) and includes a security station to control access to Parcels 6 and 7. Parcels 6 and 7 are located on the east side of I-5 and comprise the largest portion of the Mesa site. Parcels 8 and 9 include a parking lot and lay-down area on the west side of I-5.

SCE currently estimates that Parcels 5, 6, and 7 will be returned to the Navy in 2021, and Parcels 8 & 9 will be retained until the end of decommissioning. As part of the process to return the parcels to the Navy, SCE must first remediate any contamination and obtain "No Further Action Letters" from the California Department of Toxic Substances Control (DTSC) indicating the property is available for unrestricted use.[39] The estimated cost associated with the project is based on currently anticipated remediation requirements.

e. CEQA Permitting (California State Lands Commission)

Under CEQA, the CSLC, as lead agency, is required to evaluate the SONGS decommissioning project and prepare an Environmental Impact Report (EIR) in response to SCE's application to modify and extend the existing CSLC lease regarding the offshore conduits. The CEQA permitting process began in 2015. The CSLC is expected to issue a draft EIR in the second quarter of 2018 and issue its Final EIR in the third quarter of 2018. The California Coastal Commission is then expected to review an application for a CDP based on the EIR, as well as its own additional analysis. The CCC is expected to approve the CDP in the fourth quarter of 2018. Following the receipt of the CDP, the physical decommissioning of the plant can proceed.

[39] On April 24, 2017, the DTSC issued a No Further Action Letter for Parcel 5. The efforts to assess and remediate contamination for Parcels 6 and 7 are ongoing. SCE continues to hold Parcel 5 as it provides access to Parcels 6 and 7.

f. Real Estate Authorization Renewals and Plant Lease Amendments

The current SONGS Plant Easement with the Navy expires in 2024. SCE will therefore seek an extension (new real estate authorization) covering the time to complete major decommissioning activities. As a federal agency, the Navy must undertake a NEPA environmental review prior to issuing a new real estate authorization. The initial NEPA process is expected to be completed in 2024 and will allow SCE to continue using the property until 2035.

In 2030, SCE will begin the process to further extend the lease from 2035 until such time the property is projected to be to be turned over to the Navy. In 2040, the Navy is expected to undertake another NEPA review to determine the final site restoration conditions, including the substructure removal requirements. These end-state requirements should be determined by 2045, prior to beginning the civil works project in 2046.

g. Cyber Security Modifications

NRC regulations require a Cyber Security Plan at SONGS to ensure certain digital assets, such as computer and communication systems and networks, are secure and protected. SCE has implemented 7 of 8 Cyber Security Plan milestones. At the end of 2017 the NRC granted approval for a license amendment to remove the cyber security license condition, thus waiving the requirement to implement Milestone 8.

h. DCE Update

As part of the NDCTP, SCE is required to submit an updated DCE for approval by the CPUC.

i. GTCC Disposal

Presently, a disposal facility licensed to accept GTCC waste does not exist in the United States. Courts have determined that the DOE is obligated to accept and dispose of GTCC waste; however, issues regarding costs remain unsettled. For purposes of the 2017 DCE, the cost of shipping and disposing of a GTCC canister was assumed to equal the cost associated with a canister of SONGS spent fuel. The one-mill fee per kilowatt-hour of generation under the Standard Contract was used to estimate this cost.

j. ISFSI CDP Settlement

In August 2017, SCE reached a settlement agreement with parties opposed to the storage of spent fuel at SONGS. As part of that settlement, SCE agreed to incur up to $4 million on commercially reasonable efforts to identify an alternative location for SONGS spent fuel storage.

SCE also incurred third-party legal costs to reach the settlement. Given the ongoing analysis and current uncertainty relating to the potential location and requirements of an acceptable alternative spent fuel storage site, the associated costs with moving to an alternative site have not been included in this DCE.

k. Substructure Removal Contractor Procurement

In 2044, SCE will begin efforts to procure a contractor for the removal of SONGS substructures and placement of permanent backfill. The 2017 DCE therefore includes costs to cover a competitive bidding process, including the development of a Request for Proposal, proposal evaluation, and contract award. For purposes of this DCE, the effort was assumed to be approximately one-half the expended cost to procure a DGC for the major D&D work.

l. NIA Sump Modifications

The NIA sump currently discharges to the SONGS 2&3 dilution water system. The dilution water system will be retired by SDS, and therefore the discharge pathway for the NIA sump will need to be modified. Kenrich utilized the current budget estimate provided by the cognizant SCE Project Manager.

E. Undistributed Costs

Undistributed costs represent activities or fees, necessary to oversee, manage and support the overall decommissioning project. Undistributed costs are sometimes referred to as collateral, indirect, or "level of effort" costs. By their nature, such costs are not assignable to specific activities representing the physical work performed to decommission a nuclear plant.

Undistributed activities and cost items are characterized by a uniform rate of activity over a specific period of time. Accordingly, undistributed costs were estimated for each decommissioning period. Within each period, the undistributed costs are incurred at a fixed rate and are thus largely time-dependent.

The table below summarizes the undistributed costs incurred through 2016 and future costs estimated for each decommissioning period. The costs are also segregated between labor and non-labor. The labor items include staff to provide oversight, management and other support. Non-labor items include costs associated with services performed by third-parties, as well as rents, fees, and other costs necessary to ensure compliance with regulatory and other requirements.

1. Decommissioning Staffing

Since January 2017, SCE and SDS have been working closely to manage and implement the transition of numerous management programs and functions from SCE to SDS. Following this transition, SCE will maintain an oversight role with respect to SDS's contract. SCE will continue to be responsible for the ISFSI project, for ongoing nuclear operations, security, and other distributed projects (e.g., ISFSI Aging Management, Mesa Turnover). Following the completion of the SDS D&D contract, SCE will take back over the performance of the on-site programs and functions that had been transitioned to SDS.

With contracts now in place for the majority of the SONGS decommissioning work, SCE was able to carefully evaluate its own staffing needs. As part of the process to develop the staffing projections, each SONGS division was grouped into the following categories.

Site Management & Administration – Responsible for oversight and strategic planning, ensuring compliance with regulatory and permitting requirements, safety, security, and overall project cost and schedule.

Plant Management – Responsible for the operations, maintenance, and security of the plant facilities. Staffing levels are expected to decrease significantly after the nuclear fuel is transferred from the spent fuel pool to the ISFSI pad.

Project Oversight – Responsible for oversight of the SDS D&D contract, management of the ISFSI, and other distributed projects. The oversight role ensures all work is completed safely and in compliance with the contract, government regulations, and permits. The staffing levels will vary over the duration of the project based on the amount of physical work being performed (e.g., the number of radiological oversight personnel will decrease after D&D is complete).

As part of the process to estimate staffing needs, senior management met with SONGS division managers to identify major activities during each phase of the decommissioning project. The estimated staffing for each period was based on a "bottom up" assessment of each needed discipline and position. Kenrich also worked with SCE management to vet the underlying assumptions and confirm the rationale underlying the projections. This effort involved numerous interviews of SONGS division managers, an analysis of the plan to transition management and supervision responsibilities from SCE to SDS, and a reconciliation to the staffing levels in the 2014 DCE.[40]

Staffing levels at other utilities having nuclear decommissioning experience were reviewed and considered, while also taking into account site-specific requirements and characteristics of SONGS. To further ensure the reasonableness of the SONGS staffing projections, SCE retained ABZ, an industry expert in decommissioning cost estimating. SCE specifically requested ABZ to provide input based on their experiences working with other nuclear utilities and to confirm that the SONGS projections were in line with industry norms.

The table below summarizes the staffing projection by period. The average staffing levels estimated for each period are intended to account for anticipated adjustments within each decommissioning period.

[40] The 2014 DCE did not assume the transition of programs to the DGC, therefore the headcount for certain divisions, such as maintenance and radiological control and chemistry, decreased in the 2017 DCE, but the decommissioning oversight positions increased in the 2017 DCE.

The costs associated with the projected staffing is based on average labor rates for each position. The staffing cost estimate includes labor burdens and short-term incentive compensation, and accounts for positions being filled by contractors.

The table below summarizes the labor-staffing costs by each project period.

[41] Excludes DGC staffing and third-party contractors at SONGS.

TABLE 11 UNDISTRIBUTED LABOR COST ESTIMATE (NOMINAL/2017$ IN THOUSANDS)

2. Undistributed Non-Labor Costs

In addition to staffing, SCE incurs non-labor costs to support the decommissioning efforts. As part of the process to identify and estimate future non-labor costs, historical recorded costs were reviewed in detail. Kenrich worked with knowledgeable SONGS personnel to develop and estimate future decommissioning costs which are summarized in Table 13 and broken down below.

TABLE 13 UNDISTRIBUTED NON-LABOR COST ESTIMATE ($ IN THOUSANDS)

	Description	Recorded Through 2016 (Nominal $)	Estimate To Complete (2017$)	Total Estimate At Completion (Nominal /2017$)	Total Estimate At Completion (2014$)

24	Loading Spent Fuel & GTCC Waste To DOE	-	32,568	32,568	30,626
25	**Non-Labor Total**	**$ 241,104**	**$ 639,572**	**$ 880,676**	**$ 848,786**

a. Aging Management

Aging Management programs cover both the Areva and Holtec dry storage systems. In addition to the scope covered by the distributed Aging Management project, the programs include annual facility maintenance and inspection as well as in-service canister inspections every five years, in compliance with the respective Areva and Holtec SARs.

The Areva Aging Management undistributed costs begin in 2022, after the NRC Certificate of Compliance is renewed. These costs continue until the DOE is assumed to accept the final Areva canister from SONGS in 2037. The Holtec Aging Management costs begin in 2019 after all of the fuel has been transferred from the SONGS 2&3 spent pools to the ISFSI, and then continue until the DOE is assumed to accept the final Holtec canister in 2049.

b. Association Fees and Other Expenses

Association Fees and Other Expenses include Nuclear Energy Institute (NEI) membership fees, costs related to an external Nuclear Oversight Board (NOB), and an outside

advisor to SCE's Internal Nuclear Management Group (INMG). SCE remains an NEI member to obtain access to industry policies, standards, and guidance regarding decommissioning. The NOB is composed of independent review specialists who provide independent review of decommissioning activities.

NEI Fees are estimated to be incurred through Period 7 (ISFSI Demolition & Final Site Restoration); NOB costs are expected through Period 4 (major D&D); and SCE anticipates retaining an outside advisor to the INMG until 2022.

c. Community Engagement Panel

The SONGS Community Engagement Panel (CEP) holds periodic meetings with the public to provide information on various issues, including decommissioning plans, spent fuel management, emergency planning, security, and the environmental review process. CEP costs are estimated to be incurred through the end of Period 7 (ISFSI Demolition & Final Site Restoration). The annual estimate is based on the 2018 budgeted amounts per CEP meeting, and is adjusted proportionately based on the number of meetings estimated each year. Six CEP meetings are assumed in 2018, four CEP meetings per year are estimated during major D&D, through 2028, and one meeting per year is assumed after major D&D is complete.

d. Contracted Services

Contracted Services generally consist of shorter-term supplemental resources, specialty contractors and consultants, third-party services, materials, equipment, and supplies. SONGS senior management, division managers, and Kenrich worked together to identify and estimate the projected costs. Contracted Services costs were estimated for each decommissioning period in each of the following divisions: (1) Decommissioning Projects / Decommissioning Oversight; (2) Engineering; (3) Emergency Preparedness; (4) Maintenance; (5) Nuclear Oversight, Safety, Regulatory Affairs; (6) Operations; (7) Decommissioning Finance; and (8) Site Management & Administration.

Similar to the undistributed staffing, the projected needs for Contracted Services are reduced after major decommissioning milestones are achieved. For example:

- **Transition of SONGS Programs to SDS –** SDS will assume responsibility for the management of numerous SONGS programs by the end of 2017. Accordingly, the estimated costs for contracted services in the Maintenance and Decommissioning Projects divisions are significantly lower in 2018.

- **Completion of Fuel Transfer Operations –** After all spent fuel has been transferred to the ISFSI, the Operations division and its associated contracted services will no longer be needed.

- **D&D Complete** – Many of the contracted services costs in the Decommissioning Oversight and Site Management & Administration divisions will not be needed after SDS completes its work and the SONGS programs are reduced.

e. Decommissioning Advisor

The Decommissioning Advisor provides subject matter expertise and assistance on various matters, including regulatory issues, spent fuel storage, and project management. Decommissioning Advisor costs are estimated through Period 4 (D&D).

f. DGC Executive Oversight Committee

The SDS D&D contract requires an Executive Oversight Committee composed of five individuals charged with resolving contractual issues. The committee includes one person each from SCE and SDS, and three independent third-party members. SCE and SDS share the costs of the third-party positions.

g. Emergency Preparedness Fees

SCE provides funding to local jurisdictions for the management of radiological emergency preparedness, including planning, response, and recovery activities. Currently, SCE pays fees in accordance with a December 2015 Memorandum of Understanding (MOU) covering a period through 2020. The Emergency Preparedness fees are assumed to be paid annually until all spent fuel has been removed from SONGS.

h. Energy

SCE must purchase energy from the grid to power the site, including loads required for decommissioning work. The energy costs are based on historical retail electricity rates and on projected usage. The projected usage was prepared by SCE Engineering and reflects the major activities in each decommissioning period.

i. Environmental Permits And Fees

SONGS must comply with a variety of environmental regulations and maintain numerous permits, which involve the payment of fees. These permits and associated fees include: (1) the State Water Resource Control Board National Pollutant Discharge Elimination System (NPDES) permit fees and Stormwater Pollution Prevention Plan (SWPPP) fees; (2) State of California Board of Equalization mixed waste fees; (3) fees for the California Department of Environmental Health Permit, which includes the permit for Underground Storage Tanks; (4) Air Pollution Control District Permit (APCD) fees; (5) Diesel Generator permit fees; (6) California Coastal

Commission fees; (7) Refrigerant Management Program; and (8) Kelp consortium costs for monitoring and surveying ocean kelp.

During the D&D period, SDS will be responsible for certain permits and fees, including the NPDES permit, mixed waste fee, SWPPP fee, and APCD permit. However, SCE will continue to maintain other permits and incur other fees (e.g. Department of Environmental Health fees, Diesel Generator air permits, CCC fees, and Refrigerant Management Program fees) through this period.

j. Ground Water Monitoring

SCE is required to monitor the ground water beneath the site for the presence of tritium. The costs include sampling, analysis, and monitoring performed by third-party contractors and will be required through the end of SONGS decommissioning. During the D&D period, SDS will assume responsibility for ground water monitoring.

k. Information Technology

Information Technology (IT) costs include SONGS software and network licenses, internal technical support, and payments to network service providers. IT costs are expected to decrease after 2018 after one-time IT projects are completed, and ongoing support costs will be reduced after 2019.[42]

l. Insurance

NRC regulations require that SCE maintains a minimum level of nuclear liability and property insurance, including Nuclear Property Insurance (provided by Nuclear Electric Insurance Limited) and Nuclear Liability Insurance (provided by American Nuclear Insurers).[43] SCE must maintain nuclear-related insurance coverage until the spent nuclear fuel is removed from the SONGS site.[44]

In addition, SCE also maintains General Liability Insurance and Excess Workers' Compensation Insurance, the cost of which is generally a function of SONGS headcount. Historical costs were used as the primary basis to estimate future insurance costs.

---

[42] Separately, SONGS also incurs costs associated with support provided by SCE corporate IT personnel and resources. The costs for such additional IT support are provided via a Service Level Agreement with SCE.

[43] Should the Participants choose to reduce current insurance coverage amounts, the future premiums would be reduced accordingly. In December 2017, the Participants received an exemption from the NRC allowing them to reduce insurance coverage.

[44] Insurance requirements per NRC regulations 10 C.F.R § 50.54(w) and 10 C.F.R § 140.11.

m. Third Party Legal

SCE retains outside counsel as necessary to handle legal matters that require specific expertise, or when legal matters require additional resources. For example, SCE engaged outside counsel to support decommissioning licensing proceedings before the NRC, and environmental/land use permitting proceedings before the CCC, CSLC, and other government agencies.

n. NRC Fees

The NRC charges two different types of fees to nuclear reactor licensees: (1) annual fees (Part 171 Fees), and (2) inspection fees (Part 170 Fees). The Part 171 Fees are fixed annual payments per licensee (i.e., an annual fee for each SONGS unit), including nuclear plants that have been permanently retired. The Part 171 fees are to cover generic (i.e., non-licensee specific) activities performed by the NRC. In contrast, the NRC charges licensees Part 170 Fees based on the time it spends on performance reviews, evaluations, incident investigations, and other activities that are specific to an individual licensee.

o. Office Space

Following the completion of major D&D, SCE will need to lease office space for the remaining employees as all the existing office space on the SONGS site will have been removed. The costs to install trailers and annual lease payments are included in the estimate. During major D&D, SDS is responsible for providing SCE's office space.

p. Security Related Expenses

Security Related Expenses include uniforms, weapons, ammunition, and other supplies and equipment to support the SONGS Security Force, as well as background investigations, training costs, and vendor support.

q. Severance

Under the California Nuclear Facilities Decommissioning Act of 1985,[45] SCE employees at SONGS who are severed as a result of the shutdown and permanent retirement of SONGS are eligible for severance benefits. These benefits include lump sum cash payments based on years of service, outplacement services, and reimbursement for educational expenses.

[45] California Public Utilities Code § 8322(g).

r. Site Lease And Easements

SCE makes annual lease and easement payments to the Navy for the SONGS plant site and Mesa, and to the CSLC for the SONGS offshore conduits. The current site lease with the Navy ends in 2024. As previously discussed, SCE expects to negotiate a new lease to cover the period after 2024 through the end of Period 7 (ISFSI Demolition and Final Site Restoration). The rate per acre in the new plant site lease agreement is expected to increase to account for the fair market value of the property.

The Mesa lease payments to the Navy are expected to remain consistent with the current agreement until Mesa Parcels 5, 6, and 7 are returned to the Navy in 2021. The conduits lease payments to the CSLC are expected to remain consistent with the current agreement, which includes periodic increases in lease payments, through the end of Period 7 (ISFSI Demolition and Final Site Restoration).

s. Water

Utilities includes expenses for water provided by the South Coast Water District (SCWD) Joint Regional Water Supply System (JRWSS). Costs were estimated based on historical recorded costs.

t. Utility Staff Health Physics Supplies

Health Physics (also referred to as HP or Radiation Protection) supplies, including personal radiological monitoring and protection equipment, are used by personnel performing work in radiological areas of the plant. Beginning in 2018, SDS will assume responsibility for the radiation protection program. SCE will resume responsibility after the D&D work is performed. Minimal Health Physics supplies will be needed to support the ISFSI only staff as virtually all contaminated materials will have been removed from the site.

u. Loading Spent Fuel And GTCC Waste To DOE

Under the Standard Contract with the DOE, SCE is responsible for transferring canisters from the ISFSI and loading them into DOE shipping containers on-site. The estimate assumes the DOE will accept the loaded canisters and that a "dry fuel transfer" facility is not necessary. The DOE will take title to the waste after it is loaded onto the DOE's transport device and the carrier signs for the shipment at the plant site. For purposes of the 2017 DCE, DOE loading costs are assumed to equal approximately 50% of the costs to load and transfer the spent fuel to the ISFSI. The timing of the DOE loading costs is based on the assumed Spent Fuel Shipping Schedule (Appendix A).

3. Service Level Agreements For Administrative & General Expenses

The 2014 DCE included 5% on all estimated costs to account for SCE's administrative and general (A&G) expenses supporting the SONGS decommissioning project. Beginning in 2016, SCE started to develop Service Level Agreements (SLAs) between the SONGS Participants and the SCE departments that support SONGS decommissioning. The SLAs are intended to provide additional transparency with respect to types of costs and level of support needed. There are separate SLAs for each SCE department supporting SONGS (e.g., Human Resources, IT, Legal, CPUC Regulatory Affairs). Beginning in 2029, after Period 4 is completed, corporate support functions are estimated in the A&G line item in lieu of separate SLAs, and is calculated as 5% of all other 2029-2051 estimated costs. The table below summarizes the SLAs and their associated estimated costs.

TABLE 14 SERVICE LEVEL AGREEMENT (A&G) COST ESTIMATE
($ IN THOUSANDS)

	Description	Recorded Through 2016 (Nominal $)	Estimate To Complete 2017 - 2028 (2017$)	Estimate To Complete 2029 - 2051 (2017$)	Total Estimate At Completion (Nominal /2017$)	Total Estimate At Completion (2014$)

4. DGC Staffing

[redacted]

[redacted]

F. 2017 DCE Costs By NRC Cost Category

SONGS distributed projects are classified into one of the following three NRC cost categories: (1) License Termination (LT); (2) Spent Fuel Management (SNF); and (3) Site Restoration (SR). License Termination activities are those required to decontaminate the site and reduce residual radioactivity in order to terminate the NRC licenses pursuant to 10 C.F.R § 50.75(c). License termination activities are expected to be completed in 2028, following the SDS D&D work, and NRC approval of the partial site release.

Spent Fuel Management activities are those required to operate and maintain the on-site spent fuel storage facilities until such time the spent fuel is removed by the DOE, in accordance with 10 C.F.R § 50.54(bb). The decommissioning of the ISFSI after the spent fuel is transferred offsite (10 C.F.R § 72.30) is also classified as a Spent Fuel Management activity.

The remaining distributed costs are classified as Site Restoration costs, which are primarily driven by the terms of the easement and lease agreements with the Navy and CSLC. Site Restoration distributed projects include non-radiological decommissioning activities, such as the removal of non-contaminated substructures below 3 feet below grade.

The classification of distributed projects in this DCE to NRC cost categories is generally consistent with how projects were classified in the 2014 DCE.

Undistributed costs are also assigned to NRC cost categories. Certain undistributed cost items are assignable to a single NRC cost category (e.g., 100% of the annual cost to load spent fuel to the DOE is classified as Spent Fuel Management). However, given their nature, there are many other undistributed cost items which support multiple decommissioning activities (e.g., energy costs). These undistributed costs are allocated to License Termination, Spent Fuel Management, and Site Restoration based on the distributed cost amounts in each NRC cost category.[46]

The table below summarizes the 2017 DCE costs by NRC cost category.

[46] The undistributed costs incurred to date were recorded to each NRC cost category based on the allocation percentages assumed in the 2014 DCE.

TABLE 15 2017 DCE BY NRC COST CATEGORY
($ IN THOUSANDS)

G. Contingency

Contingency is used in cost estimates to account for the costs of unplanned events and circumstances that often occur during the performance of a project. As defined in the American Association of Cost Engineers Project and Cost Engineers' Handbook, contingency is "an amount added to an estimate to allow for items, conditions, or events for which the state, occurrence, or effect is uncertain and that experience shows will likely result, in aggregate, in additional costs."

Examples of costs intended to be covered by contingency include planning and estimating errors and omissions, design development and changes within scope, minor price fluctuations, and variations in the market and environmental conditions. Contingency is not intended to cover all unknowns or unplanned occurrences. For example, contingency usually excludes major scope changes, extraordinary events such as strikes and natural disasters, specified "management reserves" for defined issues, and general price escalation or currency effects.

The consensus in industry literature is that a primary consideration in determining appropriate amounts for contingency on a particular project is the stage of development and level of confidence in the estimated known base project costs. The 2014 DCE used a 25%

contingency factor,[47] which was deemed reasonable by the CPUC in D.16-04-019 given the then-existing level of uncertainty in the then-current DCE.[48]

Given the current stage of decommissioning, a lower contingency factor is warranted in some areas. Kenrich and knowledgeable SCE personnel reviewed each major category of costs and determined an individual contingency factor for each group. In determining the contingency factors for each cost grouping, consideration was given to contracting status (e.g., ISFSI and D&D work are under contract), technical complexity, estimating approach, and other variables.

The remaining work associated with ISFSI is primarily the loading and transfer of spent fuel canisters to the ISFSI. The associated contingency factor reflects that this work is under contract and benefits from significant learning and industry experience over many decades. The D&D work is also under contract, following a rigorous competitive procurement process. However, the contingency factor for this work also accounts for the significant influence of site-specific factors on D&D work. For other distributed work, not currently under contract and planned to occur in the relative distant future, the same 25% contingency factor used in the 2014 DCE was used in this DCE. With regard to undistributed labor and non-labor costs, the associated contingency factors account for a significantly more rigorous process used to develop the estimates contained in this DCE. In contrast to the 2014 DCE, the estimated headcount and non-labor costs for each division were subject to more substantial and iterative internal review and updating processes.

The table below summarizes the contingency factor applied to the to-go costs for each estimate.

[47] Contingency of 25% was applied to all costs in the 2014 DCE with the following exceptions: 2013 and 2014 Actual Expenditures 0%; Department of Navy Easement Payments 15%; Hazardous and Asbestos Wastes 50%; Site Characterization Surveys 15%; Temporary Facilities 15%; Backfill and Compaction 15%.

[48] Specifically referring to SONGS in its 2012 NDCTP decision, the CPUC stated, "[t]he Commission finds the reasonableness of a contingency amount is significantly related to the stage of decommissioning and the activities projected, including particular site-specific challenges. Consequently, the reasonable contingency factor may vary between nuclear plants and at different stages of decommissioning." (D.14-12-082 at 38). Further, in its April 20, 2017 proposed decision pertaining to PG&E's updated cost estimates for the decommissioning of its two nuclear power plants, the CPUC specifically noted that PG&E use of a 25% contingency factor for Diablo Canyon raised questions in light of other information which had been supplied by PG&E's third-party decommissioning cost consultant, TLG Services, Incorporated (TLG). Specially, TLG estimated contingency on a line item basis and the resulting composite contingency factor was 17.4%.

TABLE 16 CONTINGENCY FACTORS APPLIED IN 2017 DCE

2017 DCE Category	Contingency Factor
Recorded Costs Through September 2017	0%
ISFSI & Fuel Transfer Operations	[redacted]
[redacted]	
Substructure Removal	25%
Other Projects	15-25%
Offshore Conduit Removal	25%
ISFSI Demolition	25%
Final Site Restoration	25%
Undistributed Labor	10%
Undistributed Non-Labor	15%
Service Level Agreements	10%

The composite contingency factor included in the 2017 DCE is approximately [redacted] percent of base estimated costs.

TABLE 17 CONTINGENCY INCLUDED IN THE SONGS 2&3 2017 DCE ($ IN THOUSANDS)

2	Estimated Contingency		
3	**Subtotal Estimated Costs**	**$ 3,518,663**	**$ 3,322,641**
4	Recorded Costs	1,183,601	1,155,925
5	**Total DCE Value**	**$ 4,702,264**	**$ 4,478,566**

VI. Additional Discussion Regarding The Project Schedule

The SONGS decommissioning project schedule defines the sequence and timing of activities, the completion dates for major project milestones, and the duration of each decommissioning period. The 2017 DCE is presented in 2017 dollars. These constant dollars are spread over the duration of the SONGS entire decommissioning project based on the 2017 DCE project schedule.[49]

In accordance with the contract, SDS has developed a baseline schedule for completing its major D&D and achieving partial site release. SCE incorporated SDS's Baseline Schedule

[49] To assess the adequacy of the amount of funds residing in the Nuclear Decommissioning Trust, the annual constant dollar cash flows are escalated and discounted to present value.

into the overall decommissioning project schedule on which the 2017 DCE is based. The completion dates were mapped to corresponding 2017 DCE milestones.

As described earlier, the decommissioning schedule is comprised of seven (7) periods. Each period is generally defined by the major focus of activity on-site, as well as the licensing status of the plant (i.e., from an NRC perspective). SONGS is currently planning and preparing for the physical decommissioning of the plant facilities (Periods 1 and 2). The major D&D work is expected to begin in 2019 and estimated to be completed by late 2028 (Periods 3 and 4). At the conclusion of the major D&D work, all structures, systems, and components on-site will have been removed to at least 3 feet below grade and the NRC Part 50 license will have been reduced to the ISFSI area only.

From 2029 until 2046, when the work to remove the below-grade structures begins, the only significant activity at the site will be the transfer of spent fuel canisters to the DOE (Period 5). During this period, SCE will become informed regarding the regulatory and landowner "end-state" requirements for the SONGS site. The demolition and removal of the ISFSI and remaining below-grade structures will be performed after 2046 (Periods 6 and 7). This timing of this work is determined in part by the anticipated date by which the DOE is expected to have removed all SONGS spent fuel. The DOE is currently assumed to begin removing SONGS 2&3 spent fuel in 2034 and complete the removal of all fuel by 2049. Final site restoration and license termination is projected to be completed by 2051.

Two critical milestones include the completion of spent fuel transfer operations (i.e., transfer of all spent fuel from the wet pools to the ISFSI) in mid-2019 and the completion of major D&D work in late 2028. After each of these milestones, SONGS's licensing status and regulatory requirements change such that the associated costs to manage and support (e.g., operations, maintenance, security, management, and contract oversight) the decommissioning of the site will be substantially reduced.

SCE currently anticipates commencing spent fuel transfer operations in 2018 and is targeting completion in early to mid-2019. Fuel transfer operations are relatively complex, subject to extensive regulatory oversight, and intended to be performed 24 hours per day, seven days per week. Accordingly, for purposes of this DCE, SCE included schedule margin in its determination of the June 1, 2019 milestone completion date.

The critical activities driving the overall duration of major D&D work are the removal of the nuclear steam supply system (NSSS) equipment (e.g., reactor vessels, steam generators, reactor coolant pumps) from inside the containment buildings, and then the decontamination, demolition, and removal of the containment buildings. The decontamination, demolition, and removal of other SONGS buildings and facilities will be performed concurrently.

SCE and SDS are continuing to plan and schedule major D&D work. Currently, SDS intends to complete the physical decommissioning work in 2025 and obtain final NRC approval of the final site survey and partial site release in 2026. SDS's schedule is currently based on performing the preparation and segmentation of the reactor vessel internals and NSSS large component removal at both Units 2 and 3 in parallel. These activities include relatively high-risk

cutting and material handling operations. As another example of uncertainty that is currently inherent in the major D&D schedule, SCE is currently planning for increased radiological decontamination efforts associated with the below-grade structures that will remain at SONGS after SDS completes its work. Accordingly, for purposes of this DCE, SCE has included schedule margin in its determination of the planned completion date of major D&D in late 2028.[50]

VII. Waste Disposal

The disposition of waste is a significant activity in the decommissioning of SONGS. A brief description of the waste to be generated from the SONGS decommissioning process is described below. In addition, the estimated quantity of each type of waste is summarized in Table 18 below.

Spent Nuclear Fuel – Under the Nuclear Waste Policy Act of 1982, the DOE is responsible for the removal and permanent disposal of all SONGS spent nuclear fuel. In the 2014 DCE, SCE assumed the DOE would begin accepting spent fuel from domestic commercial nuclear power plants in 2024 at the rate published in DOE's July 2004 Acceptance Priority Ranking & Annual Capacity Report. Due to DOE inactivity in the past four years, SCE revised its spent fuel shipping schedule for the 2017 DCE to assume that the DOE will begin accepting spent fuel from the nuclear industry in 2028.

GTCC Waste – GTCC waste will be generated when SDS segments the reactor vessel internals. Additional GTCC waste may reside in the spent fuel pools. GTCC waste cannot be disposed of in a federally licensed low-level radioactive waste (LLRW) disposal facility. As explained above, courts have held that the DOE must accept GTCC waste, but currently there is no disposal facility in the U.S. that is licensed to accept it. Therefore, GTCC waste will be packaged and stored in licensed canisters on the SONGS ISFSI until final disposal.

Low-Level Radioactive Waste (LLRW) – 10 C.F.R. § 61 outlines the requirements for LLRW and identifies the criteria for the classifications of waste materials that can be accepted at federally licensed LLRW disposal facilities. SDS will characterize, package, and transport offsite the Class A, Class B, and Class C waste.

Exempt Waste – It is assumed that some waste generated during the decommissioning of SONGS will receive NRC approval to be disposed of at a facility that accepts very low-level waste. According to the NRC, "10 CFR 20.2002 is available for use by licensees for wastes that typically are a small fraction of the Class A limits contained in Part 61, and for which the extensive controls in Part 61 are not needed to ensure protection of public health and safety and the environment. Thus, 10 CFR 20.2002 provides an alternative, safe, risk-informed disposal

[50] The 2028 date is generally consistent with the schedule that was assumed in the 2014 DCE.

method for these materials, which are frequently called 'very low-level waste' (VLLW), or 'low-activity waste' (LAW)."[51]

Non-Radiologically Contaminated Waste – Radiologically clean concrete or debris will be disposed of at an out of state Class III landfill. This material will be scanned for radiological contamination prior to leaving SONGS to meet all applicable regulatory requirements. Non-contaminated reinforcing and structural steel may be recycled.

Non-Radiologically Contaminated Hazardous and Industrial Waste Disposal – Lead shielding and other hazardous materials and chemicals will be removed and properly disposed of during decommissioning. Non-Radioactive contaminated surfaces coated with tightly adhering and undamaged lead-based paint will be removed as non-hazardous building demolition debris.

Table 18 summarizes the estimated waste disposal quantities by class for the remainder of SONGS decommissioning.

TABLE 18 REMAINING WASTE DISPOSAL QUANTITIES

* Excluding GTCC Waste
** Before 2038, SONGS 2 & 3 fuel assemblies shipped in Areva 24-PTH canisters Beginning in 2038, SONGS 2 & 3 fuel assemblies shipped in Holtec MPC canisters
*** Unit 1 fuel assemblies transferred to DOE from GE facility in Morris, Illinois in TADS (21 assemblies per TAD)

Appendix B

Detailed Project Schedule

San Onofre Nuclear Generating Station Units 2 and 3 Decommissioning Schedule (Period 2 – 4)

SOUTHERN CALIFORNIA EDISON
An EDISON INTERNATIONAL Company

Based on SONGS DS Schedule Submitted 09/14/2017

2019 | 2020 | 2021 | 2022 | 2023 | 2024 | 2025 | 2026 | 2027 | 2028

2014 DCE Containment NSSS Removal Duration

2017 Containment Nuclear Steam Supply Systems Removal

U2 and U3 Containment NSSS Baseline

Unit 2 Containment

U2 – Containment Prep (1/19 – 10/19) | U2 – RV Internals Segmentation (10/19 – 1/21) | U2 – RV Shell (10/20 – 4/22) | U2 – Large Component Removal (1/21 – 4/22)

Complex Cutting and Handling Operations
Performed in Parallel in lieu of Series as in 2014 DCE

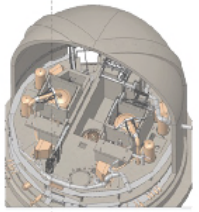
Unit 3 Containment

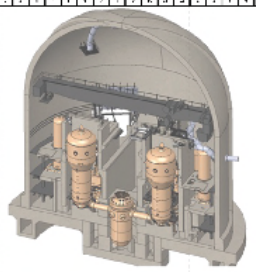
U3 – Containment Prep (1/19 – 10/19) | U3 – RV Internals Segmentation (10/19 – 1/20) | U3 – RV Shell (1/21 – 4/22) | U3 – Large Component Removal (1/21 – 5/22)

◇7/20 U1 Reactor Pressure Vessel

◇1/21 Final GTCC Offload

Additional Six Months to Manage Project Risk





2018 | 2019

2014 DCE Dry Storage Fuel Transfer Campaign

2017 Dry Storage Fuel Transfer Campaign

Spent Fuel Loading Services (1/18 – 12/18) | Closeout and Demobilization (1/19 – 12/19)

Additional Five Months Due to 24/7 Dual Plant Spent Fuel Offload

2014 DCE Containment Decontamination and Demolition

2017 Containment Decontamination and Demolition

U2 and U3 Containment Decontamination & Demolition Baseline

U2 Containment Decon (1/22 – 6/22) | U2 Interior Demo (6/22 – 9/23) | U2 Open Air Demo (7/25 – 8/25) | U2 Additional Decon (8/25 – 12/25)

U3 Containment Decon (6/23 – 12/23 3/24) | U3 Interior Demo (6/24 – 7/24) | Power Block Area Backfill (7/24 – 10/24) | U3 Open Air Demo (7/25 – 8/25) | U3 Additional Decon (7/25 – 9/25)

Additional Decontamination of Remaining Sub-Structure Surfaces to Leave as Clean as Practical for Subsequent Removal in 2046 – 2049

Risk Duration for Segregating, Handling and Packaging Concrete Rubble if not Considered for Backfill. Contract and Strategic Change Under Consideration.
Areas depicted: △ and △ or △

Auxiliary Radwaste Building

Auxiliary Control Building

Auxiliary Building Decontamination & Demolition

Aux Radwaste Planning & Characterization (10/19 – 4/20) | Aux Radwaste Systems Removal (4/20 – 4/22) | Aux Radwaste Decon (4/21 – 4/22)

Aux Radwaste Building Demo (11/22 – 6/23) | Aux Radwaste Additional Decon (7/23 – 7/25) | Remove Tents (6/23 – 7/23)

Install Tents (4/21 – 11/21)

Aux Control Planning & Characterization (6/21 – 11/21) | Aux Control Systems Removal (11/21 – 4/22) | Aux Control Decon (4/22 – 5/22) | Aux Control Building Demo (5/22 – 11/22) | Aux Control Additional Decon (7/23 – 9/23)

Unit 2 – Turbine Building

Unit 3 - Turbine Building

Turbine Building Decontamination & Demolition

U2 Planning & Characterization (1/20 – 10/20) | U2 Decon (10/20 – 12/20 1/21) | U2 Building Demo (1/21 – 2/22) | U2 Additional Decon (4/22 – 4/24)

U2 Systems Removal (6/20 – 8/20)

U3 Planning & Characterization (7/20 – 1/21) | U3 Systems Removal (1/21 – 6/21) | U3 Decon (6/21 – 7/21) | U3 Building Demo (8/21 – 6/23) | U3 Additional Decon (12/23 – 1/24)

Unit 2 – Safety Equipment Building

Unit 3 – Safety Equipment Building

Systems Removal & Decon

Planning & Characterization (4/20 – 7/20) | Systems Removal (7/20 – 1/21) | Decon (1/21 – 4/21) | Remove Safety Injections Systems (1/21 – 3/21)

Planning & Characterization (1/21 – 4/21) | Systems Removal (4/21 – 4/22) | Decon (4/22 – 5/22) | Remove Safety Injections Systems (3/21)

Interior – Open Air Demo

Interior Demo (7/24 – 5/24) | Open Air Demo (1/24 3/25) | Additional Decon (3/25 – 7/25)

Interior Demo (6/23 – 1/24) | Open Air Demo (12/24 1/25) | Additional Decon (3/25 – 7/25)

Unit 2 – Penetration Building

Unit 3 – Penetration Building

Systems Removal & Decon: Planning & Characterization (7/22 – 10/22) | Systems Removal (10/22 – 1/23) | Decon (1/23 – 4/23) | Interior Demo (4/23 – 6/23)

Interior – Open Air Demo: U2 FSS (CVS) Penetration (7/24) | Open Air Demo (1/24 12/24) | Additional Decon (2/25 – 4/25)

Systems Removal & Decon: Planning & Characterization (4/23 – 6/23) | Systems Removal (6/23 – 7/23) | Decon (7/23 – 8/23) | Interior Demo (8/23 11/23 01/24)

Interior – Open Air Demo: U3 FSS (CVS) Penetration (8/24) | Open Air Demo (11/24 12/24) | Additional Decon (2/25 – 4/25)

Unit 2 – Fuel Handling Building

Unit 3 – Fuel Handling Building

Systems Removal & Decon: Planning & Characterization (1/20 – 4/21) | Systems Removal (4/21 – 1/22) | Decon (1/21 – 4/22)

Systems Removal & Decon: Planning & Characterization (10/20 – 4/21) | Systems Removal (4/21 – 1/22) | Decon (1/22 – 5/22)

Interior – Open Air Demo: Interior Demo (1/23 – 6/24) | U2 FSS (CVS) Fuel Handling (7/24) | Open Air Demo (1/24 – 1/25) | Additional Decon (1/25 – 7/25)

Interior – Open Air Demo: Interior Demo (6/23 – 6/23) | U3 FSS (CVS) Fuel Handling (7/24) | Open Air Demo (10/24 12/24) | Additional Decon (1/25 – 7/25)

Additional Decon of These Ancillary Buildings May Change Means and Methods to Rip-and-Ship

Intake Area Backfill (12/22 – 3/23)

OCA Area Backfill (7/25 – 9/25)

P epare LTP (1/2/19 – 12/22)

◇7/20 Remove Unit 1 Reactor Vessel from Site (Unit 1 DCE)

◇4/21 Nuclear Security SAS Building

◇5/21 864/865 Buildings

◇5/21 862/863 Buildings

◇5/21 Maintenance Building

◇6/21 U2 Diesel Generator Building

◇6/21 Fire Protection Tanks

◇6/21 Outage Control Building

◇6/21 AWS Building

◇6/21 841 / 842 Modulars

◇10/21 U2 Main Transformer

◇11/21 K60 Warehouse

◇11/21 K70 South Security Building

◇12/21 K40 / K50 Office Building

◇1/22 K10 / K20 / K30 Buildings

◇2/22 U3 Diesel Generator Building

◇3/22 U3 Main Transformer

◇5/22 Intake Area / Structure

◇11/22 Full Flow Demineralizers

◇9/23 Removal of Off-Shore Components

◇12/22 Submit License Termination Plan to NRC

NRC Review of License Termination Plan (1/23 – 7/24)

LTP ASLB Hearing Support (6/23 – 1/25)

◇7/24 License Termination Plan NRC Approval

◇2/25 U3 Diesel Generator Tanks

◇3/25 U2 Diesel Generator Tanks

◇4/25 T10 / T20 Shop

FSS Preparation (8/25 – 1/26)

NRC FSS Approval Period (1/26 – 7/26)

◇5/26 Final Status Survey Approval and License Termination

◇6/26 Final Acceptance Certification

◇6/25 HazMat Building

◇6/25 Rems Staging Area

◇6/25 OCA Parking Yard Utilities

◇6/25 Multi-Purpose Building 60

◇6/25 Yard / Drains / Utilities

◇6/25 Security Building L50

◇7/25 Sewage Plant

Tertiary Major Finish Milestones

Project Closeout

- Final Status Surveys
- Contract Final Acceptance
- Administrative Closeout

Phase Legend:

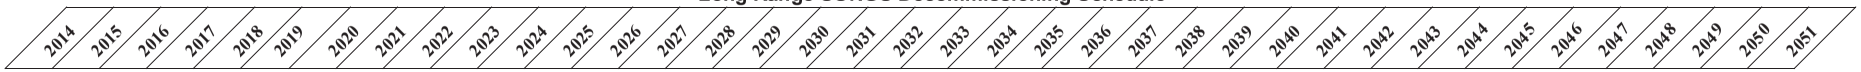
- 2017 Major Work Activity
- 2017 Period of Work Performed
- 2014 DCE Equivalent Period of Work Performed

Activity Legend:

Projected Baseline Plus 12 Months

- Summary
- Planning & Characterization
- Systems Removal
- Decon
- Support Activities
- Open Air Demo
- Combined Demo
- Interior Demo
- Backfill
- Additional Decon (Duration Undefined)

Long Range SONGS Decommissioning Schedule



Period 1 - Initial Activities
(June 2013 - Dec 2016)

- DGC Selection
- Fuel Cancellation
- Preps for Decommissioning

Period 2 - Transition and Pool Storage
(Jan 2017 - Dec 2018)

- Program Transition
- CEQA Permitting Approval
- ISFSI Pad / Security Building Completion
- Pool to Pad Campaign

Period 3 - D&D and Pool Storage
(Jan 2019 - May 2019)

- Pool to Pad Completion
- ISFSI Only Transition

Period 4 - D&D and Dry Storage
(June 2019 - Dec 2028)

- Nuclear Steam Supply System (NSSS)
- Large Component Removal (LCR)
- Building Decontamination
- Building Demolition
- Licensed Material Removal
- Part 50 License Partial Site Release
- Temporary Backfill

Period 5 - Dry Storage
(Jan 2029 - Dec 2045)

Dewatering

Period 6 - Civil Works Project
(Jan 2046 - Dec 2049)

- Civil Works Request for Proposal (RFP) (3)
- Oversight Team Mobilization (3)
- Seawall / Walkway Removal
- Civil Works Contractor Selection (3)
- Site Dewatering
- Substructure Removal
- Permanent Backfill

Period 7 - ISFSI Demolition & Final Site Restoration
(Jan 2050 - Dec 2051)

- ISFSI Demolition (AREVA and Holtec)
- Ocean Conduit Removal
- Site Vegetation
- Final License Termination

(1) All Unit 1 fuel at SONGS is expected to be removed from the site by the end of 2034
(2) Period 7 also includes the removal of Unit 1 substructures
(3) These activities occur prior to Period 6

Notes To Appendix C

Notes:

(1) The DCE line numbers align to the line numbers in Appendix D of the 2014 DCE. The DCE line numbers indicate the corresponding 2014 DCE (1) NRC cost account, (2) 2014 DCE period, (3) cost type (i.e., distributed or undistributed), and (4) line number. For example, "LT-2-D-2.17" in Appendix C of this DCE corresponds to License Termination Period 2 distributed cost line number 2.17 in Appendix D of the 2014 DCE.

(2) These line items were not included in the 2014 DCE, and therefore a new DCE No. has been created.

(3) The description for DCE line number SNF-1-D-7.02 in the 2014 DCE of "Design and Fabricate Spent Fuel Canisters" has been updated to "Holtec Long Lead Items and Areva Contract Closure" to better reflect the associated costs.

(4) The description for DCE line number SNF-2-D-8.08 in the 2014 DCE of "Design ISFSI Expansion" has been updated to "Design ISFSI Expansion, Fuel Inspection, and Oversight" to better reflect the associated costs.

(5) The description for DCE line numbers SNF-2-D-8.10 and SNF-2-D-8.11 in the 2014 DCE of "Purchase and Fabrication of Spent Fuel Canisters and AHSMs" for Units 2 & 3, respectively, have been updated to "Fabrication of Spent Fuel Canisters" to better reflect the associated costs.

(6) The description for DCE line numbers SNF-2-D-8.12 and SNF-2-D-8.13 in the 2014 DCE of "Deliver and Load Spent Fuel Canisters and Transfer to ISFSI" for Units 2 & 3, respectively, have been updated to "Load Fuel Canisters and Fuel Transfer Operations" to better reflect the associated costs.

(7) In Advice Letter 3589-E, Aging Management recorded costs were included in DCE No. SNF-2-D-AM. In the 2017 DCE, Areva and Holtec Aging Management costs are estimated separately, and therefore the Areva and Holtec recorded costs are also shown separately and are included in DCE Nos. SNF-2-D-AM Areva and SNF-2-D-AM Holtec 1.

(8) The description for DCE line number SR-1-D-14.01 in the 2014 DCE of "Mesa Site Phase I and II Site Assessment" has been updated to "Mesa Site Phase I and II Site Assessment and Lease Surrender" to better reflect the associated costs.

(9) The description for DCE line number SR-2-D-15.02 in the 2014 DCE of "Obtain Required Permits For Mesa, South Access and South Yard" has been updated to "Obtain Required Permits - Mesa" to better reflect the associated costs.

(10) The description for DCE line number SR-2-D-15.09 in the 2014 DCE of "Demolish Mesa Buildings" has been updated to "Mesa Buildings - Demo, Maintenance" to better reflect the associated costs.

(11) The description for DCE line number SR-3-D-16.05 in the 2014 DCE of "Obtain Required Permits and Approvals" has been updated to "Obtain CEQA Permit & Approvals" to better reflect the associated costs.

(12) The description for DCE line number SR-3-D-16.03 in the 2014 DCE of "Environmental Impacts Analyses for Lease Termination Activities" has been updated to "Initial Real Estate Authorization Renewal and Plant Easement" to better reflect the associated costs.

(13) The description for DCE line number SNF D&D-2-D-13.02 in the 2014 DCE of "Decon AHSMs" has been updated to "Decon Areva Modules" to better reflect the associated costs.

(14) The description for DCE line number SNF D&D-2-D-13.04 in the 2014 DCE of "Clean Demolition of ISFSI AHSMs and Pad" has been updated to "Clean Demo of Areva ISFSI Pad and Modules" to better reflect the associated costs.

(15) The description for DCE line number SNF D&D-2-D-13.05 in the 2014 DCE of "Clean Demolition of ISFSI Support Structures" has been updated to "Demolish ISFSI Security Building" to better reflect the associated costs.

(16) The description for DCE line numbers LT-U-1.08, SNF-U-2.11, and SR-U-3.06 in the 2014 DCE of "Materials and Services" has been updated to "Contracted Services" to better reflect the associated costs.

(17) The description for DCE line numbers LT-U-1.20, SNF-U-2.20, and SR-U-3.15 in the 2014 DCE of "Non-Process Computers" has been updated to "Information Technology" to better reflect the associated costs.

(18) All estimated (i.e., 2017-2051) undistributed Information Technology costs that are not covered by the IT Service Level Agreement are captured in DCE line items LT-U-1.20, SNF-U-2.20, and SR-U-3.15, "Information Technology," and therefore DCE line items LT-U-1.21, LT-U-1.22, and SNF-U-2.22 for Telecommunications and Personal Computers do not include any estimated costs.

(19) Estimated costs (i.e., 2017-2051) for workers compensation insurance are included in DCE line items LT-U-1.05, SNF-U-2.06, and SR-U-3.04, "Insurance."

(20) The description for DCE line numbers LT-U-1.18, SNF-U-2.18, and SR-U-3.13 in the 2014 DCE of "Utilities (Water, Gas, Phone)" has been updated to "Water" to better reflect the associated costs.

(21) The undistributed DGC staffing costs associated with the fixed price contract are included in the distributed project for Decontamination, Demolition, & Disposal.

Declaration of Todd R. Adler Regarding the Confidentiality of Certain Data

SCE's 2018 NUCLEAR DECOMMISSIONING COST TRIENNIAL PROCEEDING

DECLARATION OF TODD R. ADLER

REGARDING THE CONFIDENTIALITY OF CERTAIN DATA

I, Todd R. Adler, declare and state:

1. I am employed by Southern California Edison (SCE) as a Principal Manager for Nuclear Projects Management, San Onofre Nuclear Generating Station (SONGS). In my position as Principal Manager, I have responsibility regarding the Decommissioning General Contractor (DGC) Agreement between SCE, Energy*Solutions* Services, Inc. (Energy*Solutions*), and AECOM Energy & Construction, Inc. (AECOM), dated December 20, 2016 (DGC Agreement). EnergySolutions and AECOM formed a joint venture known as SONGS Decommissioning*Solutions* (SDS). I also am familiar with the Independent Spent Fuel Storage Installation (ISFSI) Agreement between SCE and Holtec International (ISFSI Agreement), dated December 5, 2015. I had responsibility for overseeing and reviewing Exhibits SCE-03 and SCE-05, which contain certain confidential information pertaining to the DGC Agreement and ISFSI Agreement. Thomas J. Palmisano, Vice President of SONGS Decommissioning and Chief Nuclear Officer, delegated authority to me to sign this declaration regarding the confidentiality of this information, as described below.

2. I am making this declaration in accordance with the instructions set forth in Decision 16-08-024 and Decision 17-09-023 of R. 14-11-001, which were issued August 25, 2016, and September 28, 2017, respectively, and govern the submission of confidential documents to the Commission.

3. I have personal knowledge of the facts and representations herein and, if called upon to testify, could and would do so, except for those facts expressly stated to be based upon information and belief, and as to those matters, I believe them to be true.

4. Listed below are the data for which SCE is seeking confidential protection and the basis for SCE's confidentiality request. Paragraphs 5-10 also provide additional reasons supporting SCE's confidentiality claim.

Location of Confidential Data	Pages (if available)	Description of Information that is Confidential	Basis for SCE's Confidentiality Claim
Exhibit SCE-03	8, 14, 20-21, 37-38 Appendix B, DCE, pp. B-9, 18-19, 21, 23, 34-35, 45-47, 49, 60-63, 65, 68-72, 74, 77. Appendix C, p. C-1.	1. DGC Agreement contract terms, including decommissioning plans and pricing terms contained therein. 2. Contingency and cost-estimating information pertaining to the DGC Agreement and ISFSI Agreement.	California Gov. Code § 6255 (the public interest served by not disclosing the information is clearly outweighed by the public interest served by disclosure of the record).
Exhibit SCE-05	34	1. DGC Agreement contract terms, including decommissioning plans and pricing terms contained therein.	California Gov. Code § 6255 (the public interest served by not disclosing the information is clearly outweighed by the public interest served by disclosure of the record).

5. Both the DGC Agreement and ISFSI Agreement require SCE to make reasonable efforts to protect the confidentiality of the terms and conditions in the agreements. The agreements require confidentiality because they contain commercially sensitive pricing terms and proprietary information, such as work sequencing and scope. If this information was publicly disclosed without protection, competitors, including potential vendors for decommissioning sub-contract work and other activities, could mis-use the information to the detriment of SCE's customers. For example, if a vendor seeking to bid on a subcontract or another activity knew the DGC Agreement or ISFSI Agreement pricing terms, the vendor would have an opportunity to adjust its bid prices (e.g., the vendor could bid higher than it otherwise may have bid).

6. Public release of this information could also hinder SCE's ability to obtain favorable contract terms for related decommissioning work not covered under the DGC Agreement and ISFSI Agreement. For example, if a vendor (who SCE has not yet contracted with for SONGS decommissioning) was aware of various terms in the DGC Agreement and ISFSI Agreement, the

vendor could mis-use this information during contract negotiations to extract terms favorable to the vendor that the vendor may not have otherwise sought.

7. Finally, it is also in the best interest of the long-term success of the SONGS decommissioning project that SDS and Holtec remain commercially competitive throughout the terms of the DGC Agreement and ISFSI Agreement, respectively. Both agreements are long-term agreements that will require SDS' and Holtec's continued performance for the next decade and beyond. If information regarding the agreements was disclosed without protection, their competitors could mis-use the information against them during the bidding process for other decommissioning projects across the world and potentially threaten the financial health of both companies. This in turn could threaten the companies' ability to complete contractually required services for SONGS in the future without interruption.

8. The other category of information that SCE seeks to maintain as confidential is contingency. SCE has applied various contingency amounts on the remaining decommissioning work identified in the 2017 SONGS 2&3 decommissioning cost estimate (DCE) submitted in this proceeding, including work to be completed under the DGC Agreement and ISFSI Agreement. The contingency reflects SCE's judgment of potential costs, based on the technical complexity, contracting status, estimating approach, and timing, of the remaining work scope. It is in SCE customers' interest for contingency included for the DGC Agreement and ISFSI Agreement to be protected as confidential, because the disclosure of the information without protection could allow vendors to mis-use the information to the detriment of SCE's customers. For example, if a vendor (including SDS, Holtec, or one of their competitors) knew the contingency SCE has applied in the 2017 DCE to work to be completed under the DGC Agreement and ISFSI Agreement, the vendor would have an opportunity to manipulate its negotiating strategy pertaining to new contracts and/or change orders regarding that work (e.g., the vendor could demand higher prices than it otherwise would have demanded).

9. The confidential information identified in Paragraph 4 cannot be provided in a form that can be further aggregated, redacted, summarized, masked, or otherwise protected in a manner that would allow partial disclosure of the data while protecting confidential information.

10. For the reasons described above, the confidential information should be protected from public disclosure. Information regarding the DGC Agreement and ISFSI Agreement, including the pricing terms of those agreements and contingency SCE applied in the 2017 DCE for work remaining under those agreements, is market sensitive information that should remain confidential under GO-66-C Section 2.2(b) ("unfair business advantage") and GO 66-C Section 2.8 ("Information obtained in confidence from other than a business regulated by this Commission where the disclosure would be against the public interest").

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed on March 13, 2018 at San Onofre Nuclear Generating Station, near San Clemente, California.

/s/ Todd R. Adler

Decommissioning Funding Status Report
San Onofre Nuclear Generating Station Units 1, 2, and 3
and Independent Spent Fuel Storage Installation

Dear Sir or Madam:

As required by 10 CFR 50.82(a)(8)(v), 10 CFR 50.82(a)(8)(vii), and 10 CFR 72.30(c), this letter provides the status of the decommissioning funding for San Onofre Nuclear Generating Station (San Onofre) Units 1, 2, and 3 and the San Onofre Independent Spent Fuel Storage Installation (ISFSI) as of December 31, 2017

Based on the requirements in 10 CFR 50.82(a)(8)(v) and 10 CFR 50.82(a)(8)(vii), this information is reported on an annual basis for SONGS Units 1, 2, and 3 because the units were permanently shut down and site-specific decommissioning cost estimates (DCEs) have been submitted for each of these units. In addition, based on the requirements in 10 CFR 72.30(c), information demonstrating the adequacy of funding for the San Onofre ISFSI is reported at intervals not to exceed three years, and is included. The required information for Southern California Edison, San Diego Gas & Electric, the City of Anaheim, and the City of Riverside is provided in the Enclosure.

There are no commitments contained in this letter or its enclosure.

If you have any questions regarding this matter, please contact me at (949) 368-6945.

Sincerely,

A001
NMSS01
NMSS26

Enclosure: San Onofre Nuclear Generating Station Units 1, 2, and 3 and ISFSI Decommissioning Funding Status Report for Calendar Year 2017

cc: K. Kennedy, Regional Administrator, NRC Region IV
M. G. Vaaler, NRC Project Manager, San Onofre Units 1, 2, and 3
W. C. Allen, NRC Project Manager, San Onofre ISFSI

Enclosure

San Onofre Nuclear Generating Station Units 1, 2, and 3 and Independent Spent Fuel Storage Installation (ISFSI) Decommissioning Funding Status Report for Calendar Year 2017

San Onofre Nuclear Generating Station Units 1, 2, and 3
and Independent Spent Fuel Storage Installation (ISFSI)
Decommissioning Funding Status Report
For Calendar Year 2017

San Onofre Unit 1 was a pressurized water reactor (PWR) rated at 1347 MWt. San Onofre Units 2 and 3 were pressurized water reactors (PWR) rated at 3438 MWt. Provided below is the information required by 10 CFR 50.82(a)(8)(v) and (vii) for San Onofre Units 1, 2, and 3; and the information required by 10 CFR 72.30(b) for the San Onofre ISFSI. This information is reported every year for San Onofre Units 1, 2, and 3 because site-specific decommissioning cost estimates (DCEs) have been submitted for them and they are currently being decommissioned.

The San Onofre ISFSI is located on the partially decommissioned site of San Onofre Unit 1, and is operated under a 10 CFR 72 General License issued to the holders of a 10 CFR 50 license.

The SONGS Unit 1 co-owners are reported as follows:

Southern California Edison (SCE)	80.00 %
San Diego Gas & Electric (SDG&E)	20.00 %
	100.00 %

The San Onofre Units 2 and 3 co-owners are reported as follows:

Southern California Edison (SCE)	78.21 %
San Diego Gas & Electric (SDG&E)	20.00 %
City of Anaheim (Anaheim)	0.00 %
City of Riverside (Riverside)	1.79 %

The decommissioning liability is shared between the current owners and former owner, Anaheim, as set forth below for each unit:

Owner	Unit 1 Decommissioning Liability	Unit 2 Decommissioning Liability	Unit 3 Decommissioning Liability
SCE	80.00%	75.7363%	75.7475%
SDG&E	20.00%	20.0000%	20.0000%
Anaheim	0.00%	2.4737%	2.4625%
Riverside	0.00%	1.7900%	1.7900%

All dollar amounts are in 100% share, 2017 dollars.

1) The estimated costs to decommission San Onofre Units 1, 2, and 3, and the San Onofre ISFSI, including all decommissioning and spent fuel storage costs estimated to be required pursuant to 10 CFR 50.75(b) and (c); 10 CFR 50.54(bb); and 10 CFR 72.30(b) are shown below:

The site-specific estimates for decommissioning include the following radiological decommissioning costs associated with terminating the site license pursuant to 10 CFR 50.75(b); non-radiological site restoration costs; spent fuel storage costs pursuant to 10 CFR 50.54(bb); and ISFSI decommissioning costs pursuant to 10 CFR 72.30(b):

	San Onofre Unit 1[1]
Estimate of License Termination Costs	$ 76.8 million
Less: Lic. Term. Costs during 2017	$ 1.3 million
"To Go" License Termination Costs	$ 75.5 million
Estimate of Site Restoration Costs	$ 92.6 million
Less: Site Restor. Costs during 2017	$ 0.3 million
"To Go" Site Restoration Costs	$ 92.3 million
Estimate of Fuel Storage Costs	$ 46.0 million
Less: Fuel Storage Costs during 2017	$ 0.4 million
"To Go" Fuel Storage Costs	$ 45.6 million
Estimate of ISFSI Decommissioning Costs	$ 5.3 million
Total Unit 1 "To Go" Costs as of 1/1/2018	$ 218.7 million

	San Onofre Unit 2[2]
Estimate of License Termination Costs	$1,017.0 million
Less: Lic. Term. Costs through 12/31/2017	$ 305.2 million
"To Go" License Termination Costs	$ 711.8 million
Estimate of Site Restoration Costs	$ 527.8 million
Less: Site Restor. Costs through 12/31/2017	$ 90.5 million
"To Go" Site Restoration Costs	$ 437.3 million
Estimate of Fuel Storage Costs	$ 687.0 million
Less: Fuel Storage Costs through 12/31/2017	$ 259.0 million
"To Go" Fuel Storage Costs	$ 428.0 million
Estimate of ISFSI Decommissioning Costs	$ 18.9 million
Total Unit 2 "To Go" Costs as of 1/1/2018	$1,596.0 million

	San Onofre Unit 3[2]
Estimate of License Termination Costs	$1,007.5 million
Less: Lic. Term. Costs through 12/31/2017	$ 302.5 million
"To Go" License Termination Costs	$ 705.0 million
Estimate of Site Restoration Costs	$ 746.6 million
Less: Site Restor. Costs through 12/31/2017	$ 102.2 million
"To Go" Site Restoration Costs	$ 644.4 million
Estimate of Fuel Storage Costs	$ 724.6 million
Less: Fuel Storage Costs through 12/31/2017	$ 254.7 million
"To Go" Fuel Storage Costs	$ 469.9 million
Estimate of ISFSI Decommissioning Costs	$ 18.9 million
Total Unit 3 "To Go" Costs as of 1/1/2018	$1,838.2 million

The site-specific decommissioning cost estimates for San Onofre Units 1, 2, and 3 and the San Onofre ISFSI include: (1) the cost to perform all decommissioning activities; (2) the cost of meeting the 10 CFR 20.1402 radiological criteria for unrestricted site use; and (3) adequate contingency factors for all costs.

2) Each San Onofre co-owner has established one or more external sinking trust fund accounts as provided in 10 CFR 50.75(e)(1)(ii) for their respective shares of the San Onofre Units 1, 2, and 3 decommissioning obligation, which also includes the San Onofre ISFSI. The Decommissioning Trust Fund amounts remaining at the end of calendar year 2017 (net of pending Trust Fund withdrawals and estimated capital gains taxes) are:[3][4][5]

Co-Owner	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
SCE	$ 303.5 million	$ 1,180.4 million	$ 1,370.9 million
SDG&E [5]	$ 150.5 million	$ 357.5 million	$ 412.5 million
Anaheim [5]	N/A	$ 52.2 million	$ 52.2 million
Riverside [5]	N/A	$ 27.9 million	$ 30.8 million
TOTAL	$ 454.0 million	$ 1,618.0 million	$ 1,866.4 million

3) Each San Onofre co-owner deposits its decommissioning fund contributions into their respective external sinking fund accounts as provided in 10 CFR 50.75(e)(1)(ii). The annual amounts projected to be collected in 2018 are:

Co-Owner	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
SCE	$ 0.0 million	$ 0.0 million	$ 0.0 million
SDG&E [5]	$ 0.0 million	$ 0.0 million	$ 0.0 million
Anaheim [5]	N/A	$ 0.0 million	$ 0.0 million
Riverside [5]	N/A	$ 0.0 million	$ 0.0 million
TOTAL	$ 0.0 million	$ 0.0 million	$ 0.0 million

4) The amounts spent on San Onofre Units 1, 2, and 3 decommissioning work performed during 2017 are summarized below:

Cost Category	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
License Term.	$ 1.5 million	$ 91.7 million	$ 88.9 million
Site Restoration	$ 0.9 million	$ 5.5 million	$ 11.3 million
Spent Fuel Storage	$ 0.6 million	$ 52.3 million	$ 53.3 million
ISFSI Decom.	$ 0.0 million	$ 0.0 million	$ 0.0 million
TOTAL	$ 3.0 million	$ 149.5 million	$ 153.5 million

5) The composite escalation rate and after tax investment rates of return for San Onofre Units 1, 2, and 3 Decommissioning are summarized below:

Composite Rate	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
Rate of Return	3.17%	3.32%	3.32%
Escalation	2.69%	2.91%	2.91%
Real Earnings Rate	0.48%	0.41%	0.41%

The composite investment rates of return less the composite escalation rates yield composite real earnings rates less than the 2% real rate of return allowed under 10 CFR 50.75(e)(1)(ii).

6) None of the co-owners of San Onofre Units 1, 2, and 3 or the San Onofre ISFSI is relying on any contracts for the purposes of providing decommissioning funding pursuant to 10 CFR 50.75(e)(1)(v). There have been no modifications to the method of providing financial assurance.

7) The amounts of decommissioning funds available as of December 31, 2017 for San Onofre Units 1, 2, and 3 License Termination, Site Restoration, Spent (Irradiated) Fuel Management, and ISFSI Decommissioning costs are shown in the tables below:[4]

San Onofre Unit 1	Estimated "To Go" Decommissioning Cost	Cost Ratios	12/31/2017 Net Trust Balance
License Termination Costs	$ 75.5 million	34.5%	$ 156.7 million
Site Restoration Costs	$ 92.3 million	42.2%	$ 191.7 million
Spent Fuel Management Costs	$ 45.6 million	20.8%	$ 94.6 million
ISFSI Decommissioning Costs	$ 5.3 million	2.4%	$ 11.0 million
TOTAL	$ 218.7 million	100.0%	$ 454.0 million

San Onofre Unit 2	Estimated "To Go" Decommissioning Cost	Cost Ratios	12/31/2017 Net Trust Balance
License Termination Costs	$ 711.8 million	44.6%	$ 721.6 million
Site Restoration Costs	$ 437.4 million	27.4%	$ 443.4 million
Spent Fuel Management Costs	$ 428.0 million	26.8%	$ 433.9 million
ISFSI Decommissioning Costs	$ 18.8 million	1.2%	$ 19.1 million
TOTAL	$ 1,596.0 million	100.0%	$ 1,618.0 million

San Onofre Unit 3	Estimated "To Go" Decommissioning Cost	Cost Ratios	12/31/2017 Net Trust Balance
License Termination Costs	$ 705.0 million	38.4%	$ 715.8 million
Site Restoration Costs	$ 644.4 million	35.0%	$ 654.2 million
Spent Fuel Management Costs	$ 469.9 million	25.6%	$ 477.2 million
ISFSI Decommissioning Costs	$ 18.9 million	1.0%	$ 19.2 million
TOTAL	$ 1,838.2 million	100.0%	$ 1,866.4 million

8) Key assumptions pertaining to spent fuel storage and ISFSI decommissioning:

San Onofre Unit 1:

- Permanently retired on November 30, 1992
- 395 fuel assemblies in 17 canisters are located in the SONGS ISFSI
- 1 canister of Greater Than Class C (GTCC) waste is located in the SONGS ISFSI
- The U.S. Department of Energy (DOE) will commence transporting spent fuel assemblies in 2028[6]
- DOE will remove last SONGS Unit 1 fuel from the ISFSI by 2034

San Onofre Unit 2:

- Permanently ceased operations on June 7, 2013
- 408 fuel assemblies in 17 canisters are currently located in the SONGS ISFSI
- Transfer of the remaining 1,318 fuel assemblies from the spent fuel pool to the SONGS ISFSI commenced in January 2018 and is scheduled to be completed by mid-2019
- Greater Than Class C (GTCC) waste will be placed in the SONGS ISFSI per schedule to be developed by Decommissioning General Contractor
- DOE will commence transporting spent fuel assemblies in 2028[6]
- DOE will remove last SONGS Units 2 & 3 fuel from the ISFSI by 2049

San Onofre Unit 3:

- Permanently ceased operations on June 7, 2013
- 384 fuel assemblies in 16 canisters are currently located in the SONGS ISFSI
- Transfer of the remaining 1,350 fuel assemblies from the spent fuel pool to the SONGS ISFSI commenced in January 2018 and is scheduled to be completed by mid-2019
- Greater Than Class C (GTCC) waste will be placed in the SONGS ISFSI per schedule to be developed by Decommissioning General Contractor
- DOE will commence transporting spent fuel assemblies in 2028[6]
- DOE will remove last SONGS Units 2 & 3 fuel from the ISFSI by 2049

San Onofre ISFSI:

- The San Onofre ISFSI will be decommissioned and the remaining plant and ISFSI site will be decontaminated to meet 10 CFR 20.1402 site release criteria for unrestricted use as required to terminate the Part 50 General License by 2051.

Notes:

(1) The new site-specific decommissioning cost estimate for San Onofre Unit 1 that was submitted to the California Public Utilities Commission (CPUC) on March 15, 2018, includes the radiological costs associated with terminating the site license, non-radiological costs, and fuel storage costs.

(2) The new site-specific decommissioning cost estimate for San Onofre Units 2 and 3 that was submitted to the CPUC on March 15, 2018 includes the radiological costs associated with terminating the site license, non-radiological costs, and fuel storage costs.

(3) During the period between June 7, 2013 and December 31, 2017, SCE incurred costs of $654.8 million for San Onofre Unit 2 and $659.4 million for San Onofre Unit 3 (100% share, 2017$). Some of the San Onofre decommissioning co-owners have not yet withdrawn funds for all or part of these costs from their Decommissioning Trusts. Therefore, the Net Balances are the differences between the December 31, 2017 Decommissioning Trust Balances and the 2013-2017 incurred or accrued costs.

(4) Pursuant to 10 CFR 72.30(e)(5), power reactor licensees are authorized to use the financial assurance methods provided for in 10 CFR 50.75(e). All four San Onofre co-owners recover the cost of decommissioning pursuant to cost-of-service rate regulation and, therefore, are eligible to provide assurance using the external sinking fund method provided for in 10 CFR 50.75(e)(1)(ii). To the extent the decommissioning costs are fully funded and annual deposits are no longer required, the Co-Participants provide assurance using the prepayment method provided for in 10 CFR 50.75(e)(1)(i).

SCE and SDG&E are also required to accumulate sufficient funds to decommission the SONGS facility under the California Nuclear Facilities Decommissioning Act, CA Public Utilities Code Section 8321, et seq. The CPUC has construed the SONGS decommissioning obligation to include: (1) radiological decommissioning as required to terminate the NRC licenses, (2) spent fuel storage (including ISFSI decommissioning), and (3) site restoration as required to terminate the SONGS site lease contracts granted by the U.S. Department of the Navy and the California State Lands Commission.

Under CA Public Utilities Code Section 8326(a)(2), SCE and SDG&E are required to update their site-specific nuclear facility decommissioning cost estimates periodically to reflect changes in decommissioning regulation, technology, and economics, for the purpose of adjusting contribution levels to their decommissioning trust.

Under CA Public Utilities Code Sections 8326(b), 8327, 8328, and 8329, the CPUC periodically reviews SCE and SDG&E's site-specific decommissioning cost estimates for the purpose of considering changes in electrical rates to ensure that sufficient funds will be available for payment of all decommissioning costs. The Cities of Anaheim and Riverside are not under the jurisdiction of the CPUC.

(5) SCE is submitting information with respect to the San Onofre co-owners, SDG&E, Anaheim, and Riverside, on their behalf, and they are responsible for the completeness and accuracy of their respective information.

(6) The current site-specific decommissioning cost estimates for San Onofre Unit 1 and for San Onofre Units 2 and 3 assume that the DOE will commence transporting spent fuel assemblies in 2028. This assumption may be updated periodically due to the ongoing uncertainties regarding the availability of a permanent repository for spent fuel.

Decommissioning Funding Status Report 2018
San Onofre Nuclear Generating Station Units 1, 2, and 3
and Independent Spent Fuel Storage Installation

Dear Sir or Madam:

As required by 10 CFR 50.82(a)(8)(v), 10 CFR 50.82(a)(8)(vii), and 10 CFR 72.30(c), this letter provides the status of the decommissioning funding for San Onofre Nuclear Generating Station (San Onofre) Units 1, 2, and 3 and the San Onofre Independent Spent Fuel Storage Installation (ISFSI) as of December 31, 2018.

Based on the requirements in 10 CFR 50.82(a)(8)(v) and 10 CFR 50.82(a)(8)(vii), this information is reported on an annual basis for SONGS Units 1, 2, and 3 because the units were permanently shut down and site-specific decommissioning cost estimates (DCEs) have been submitted for each of these units. In addition, based on the requirements in 10 CFR 72.30(c), information demonstrating the adequacy of funding for the San Onofre ISFSI is reported at intervals not to exceed three years, and is included. The required information for Southern California Edison, San Diego Gas & Electric, the City of Anaheim, and the City of Riverside is provided in the Enclosure.

There are no commitments contained in this letter or its enclosure.

Enclosure: San Onofre Nuclear Generating Station Units 1, 2, and 3 and ISFSI Decommissioning Funding Status Report for Calendar Year 2018

cc: S. Morris, Regional Administrator, NRC Region IV
M. G. Vaaler, NRC Project Manager, San Onofre Units 1, 2, and 3

Enclosure

San Onofre Nuclear Generating Station Units 1, 2, and 3 and Independent Spent Fuel Storage Installation (ISFSI) Decommissioning Funding Status Report for Calendar Year 2018

San Onofre Nuclear Generating Station Units 1, 2, and 3
and Independent Spent Fuel Storage Installation (ISFSI)
Decommissioning Funding Status Report
For Calendar Year 2018

San Onofre Unit 1 was a pressurized water reactor (PWR) rated at 1347 MWt. San Onofre Units 2 and 3 were pressurized water reactors (PWR) rated at 3438 MWt. Provided below is the information required by 10 CFR 50.82(a)(8)(v) and (vii) for San Onofre Units 1, 2, and 3; and the information required by 10 CFR 72.30(b) for the San Onofre ISFSI. This information is reported every year for San Onofre Units 1, 2, and 3 because they are permanently shut down and site-specific decommissioning cost estimates (DCEs) have been submitted for them.

The San Onofre ISFSI is located on the partially decommissioned site of San Onofre Unit 1, and is operated under a 10 CFR 72 General License issued to the holders of a 10 CFR 50 license.

The SONGS Unit 1 co-owners are reported as follows:

Southern California Edison (SCE)	80.00 %
San Diego Gas & Electric (SDG&E)	20.00 %
	100.00 %

The San Onofre Units 2 and 3 co-owners are reported as follows:

Southern California Edison (SCE)	78.21 %
San Diego Gas & Electric (SDG&E)	20.00 %
City of Anaheim (Anaheim)	0.00 %
City of Riverside (Riverside)	1.79 %

The decommissioning liability is shared between the current owners and former owner, Anaheim, as set forth below for each unit:

Owner	Unit 1 Decommissioning Liability	Unit 2 Decommissioning Liability	Unit 3 Decommissioning Liability
SCE	80.00%	75.7363%	75.7475%
SDG&E	20.00%	20.0000%	20.0000%
Anaheim	0.00%	2.4737%	2.4625%
Riverside	0.00%	1.7900%	1.7900%

All dollar amounts are in 100% share, 2018 dollars.

1) The estimated costs to decommission San Onofre Units 1, 2, and 3, and the San Onofre ISFSI, including all decommissioning and spent fuel storage costs estimated to be required pursuant to 10 CFR 50.75(b) and (c); 10 CFR 50.54(bb); and 10 CFR 72.30(b) are shown below:

The site-specific estimates for decommissioning include the following radiological decommissioning costs associated with terminating the site license pursuant to 10 CFR 50.75(b); non-radiological site restoration costs; spent fuel storage costs pursuant to 10 CFR 50.54(bb); and ISFSI decommissioning costs pursuant to 10 CFR 72.30(b):

	San Onofre Unit 1[1]
Estimate of License Termination Costs	$ 78.8 million
Less: Lic. Term. Costs during 2018	$ 1.5 million
"To Go" License Termination Costs	$ 77.3 million
Estimate of Fuel Storage Costs	$ 47.2 million
Less: Fuel Storage Costs during 2018	$ 2.3 million
"To Go" Fuel Storage Costs	$ 44.9 million
Estimate of ISFSI Decommissioning Costs	$ 5.4 million
Estimate of Site Restoration Costs	$ 94.7 million
Less: Site Restor. Costs during 2018	$ 0.4 million
"To Go" Site Restoration Costs	$ 94.3 million
Total Unit 1 "To Go" Costs as of 1/1/2019	$ 221.9 million

	San Onofre Unit 2[2]
Estimate of License Termination Costs	$1,045.0 million
Less: Lic. Term. Costs through 12/31/2018	$ 345.7 million
"To Go" License Termination Costs	$ 699.3 million
Estimate of Fuel Storage Costs	$ 705.7 million
Less: Fuel Storage Costs through 12/31/2018	$ 314.8 million
"To Go" Fuel Storage Costs	$ 390.9 million
Estimate of ISFSI Decommissioning Costs	$ 19.4 million
Estimate of Site Restoration Costs	$ 541.7 million
Less: Site Restor. Costs through 12/31/2018	$ 99.9 million
"To Go" Site Restoration Costs	$ 441.8 million
Total Unit 2 "To Go" Costs as of 1/1/2019	$1,551.4 million

	San Onofre Unit 3[2]
Estimate of License Termination Costs	$1,035.2 million
Less: Lic. Term. Costs through 12/31/2018	$ 346.4 million
"To Go" License Termination Costs	$ 688.8 million
Estimate of Fuel Storage Costs	$ 743.8 million
Less: Fuel Storage Costs through 12/31/2018	$ 312.0 million
"To Go" Fuel Storage Costs	$ 431.8 million
Estimate of ISFSI Decommissioning Costs	$ 19.4 million
Estimate of Site Restoration Costs	$ 765.7 million
Less: Site Restor. Costs through 12/31/2018	$ 114.7 million
"To Go" Site Restoration Costs	$ 651.0 million
Total Unit 3 "To Go" Costs as of 1/1/2019	$1,791.0 million

The site-specific decommissioning cost estimates for San Onofre Units 1, 2, and 3 and the San Onofre ISFSI include: (1) the cost to perform all decommissioning activities; (2) the cost of meeting the 10 CFR 20.1402 radiological criteria for unrestricted site use; and (3) adequate contingency factors for all costs.

2) Each San Onofre co-owner has established one or more external sinking trust fund accounts as provided in 10 CFR 50.75(e)(1)(ii) for their respective shares of the San Onofre Units 1, 2, and 3 decommissioning obligation, which also includes the San Onofre ISFSI. The Decommissioning Trust Fund amounts remaining at the end of calendar year 2018 (net of pending Trust Fund withdrawals and estimated capital gains taxes) are:[3][4][5]

Co-Owner	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
SCE	$ 289.4 million	$ 1,085.6 million	$ 1,267.5 million
SDG&E [5]	$ 149.3 million	$ 333.9 million	$ 387.5 million
Anaheim [5]	N/A	$ 51.4 million	$ 51.4 million
Riverside [5]	N/A	$ 26.9 million	$ 29.8 million
TOTAL	$ 438.7 million	$ 1,497.8 million	$ 1,736.2 million

3) Each San Onofre co-owner deposits its decommissioning fund contributions into their respective external sinking fund accounts as provided in 10 CFR 50.75(e)(1)(ii). The annual amounts projected to be collected in 2018 are:

Co-Owner	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
SCE	$ 0.0 million	$ 0.0 million	$ 0.0 million
SDG&E [5]	$ 0.0 million	$ 0.0 million	$ 0.0 million
Anaheim [5]	N/A	$ 0.0 million	$ 0.0 million
Riverside [5]	N/A	$ 0.0 million	$ 0.0 million
TOTAL	$ 0.0 million	$ 0.0 million	$ 0.0 million

4) The amounts spent on San Onofre Units 1, 2, and 3 decommissioning work performed during 2018 are summarized below:

Cost Category	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
License Term.	$ 0.1 million	$ 32.0 million	$ 35.4 million
Spent Fuel Storage	$ 1.8 million	$ 48.4 million	$ 50.2 million
ISFSI Decom.	$ 0.0 million	$ 0.0 million	$ 0.0 million
Site Restoration	$ 0.2 million	$ 6.7 million	$ 9.6 million
TOTAL	$ 2.1 million	$ 87.1 million	$ 95.2 million

5) The composite escalation rate and after tax investment rates of return for San Onofre Units 1, 2, and 3 Decommissioning are summarized below:

Composite Rate	San Onofre Unit 1	San Onofre Unit 2	San Onofre Unit 3
Rate of Return	2.95%	3.04%	3.04%
Escalation	2.69%	2.92%	2.92%
Real Earnings Rate	0.26%	0.12%	0.12%

The composite investment rates of return less the composite escalation rates yield composite real earnings rates less than the 2% real rate of return allowed under 10 CFR 50.75(e)(1)(ii).

6) None of the co-owners of San Onofre Units 1, 2, and 3 or the San Onofre ISFSI is relying on any contracts for the purposes of providing decommissioning funding pursuant to 10 CFR 50.75(e)(1)(v). There have been no modifications to the method of providing financial assurance.

7) The amounts of decommissioning funds available as of December 31, 2018 for San Onofre Units 1, 2, and 3 License Termination, Site Restoration, Spent Fuel Management, and ISFSI Decommissioning costs are shown in the tables below:[4]

San Onofre Unit 1	Estimated "To Go" Decommissioning Cost	Cost Ratios	12/31/2018 Net Trust Balance
License Termination Costs	$ 77.3 million	34.8%	$ 152.8 million
Spent Fuel Management Costs	$ 44.9 million	20.2%	$ 88.8 million
ISFSI Decommissioning Costs	$ 5.4 million	2.4%	$ 10.7 million
Site Restoration Costs	$ 94.3 million	42.5%	$ 186.4 million
TOTAL	$ 221.9 million	100.0%[7]	$ 438.7 million

San Onofre Unit 2	Estimated "To Go" Decommissioning Cost	Cost Ratios	12/31/2018 Net Trust Balance
License Termination Costs	$ 699.3 million	45.1%	$ 675.5 million
Spent Fuel Management Costs	$ 390.9 million	25.2%	$ 377.4 million
ISFSI Decommissioning Costs	$ 19.4 million	1.2%	$ 18.0 million
Site Restoration Costs	$ 441.8 million	28.5%	$ 426.9 million
TOTAL	$ 1,551.4 million	100.0%	$ 1,497.8 million

San Onofre Unit 3	Estimated "To Go" Decommissioning Cost	Cost Ratios	12/31/2018 Net Trust Balance
License Termination Costs	$ 688.8 million	38.5%	$ 668.4 million
Spent Fuel Management Costs	$ 431.8 million	24.1%	$ 418.4 million
ISFSI Decommissioning Costs	$ 19.4 million	1.1%	$ 19.1 million
Site Restoration Costs	$ 651.0 million	36.3%	$ 630.3 million
TOTAL	$ 1,791.0 million	100.0%	$ 1,736.2 million

8) Key assumptions pertaining to spent fuel storage and ISFSI decommissioning:

San Onofre Unit 1:

- Permanently retired on November 30, 1992
- 395 fuel assemblies in 17 canisters are located in the ISFSI
- 1 canister of Greater Than Class C (GTCC) waste is located in the ISFSI
- The U.S. Department of Energy (DOE) will commence transporting spent fuel assemblies in 2028[6]
- DOE will remove last SONGS Unit 1 fuel from the ISFSI by 2034

San Onofre Unit 2:

- Permanently ceased operations on June 7, 2013
- 1,000 fuel assemblies in 33 canisters are currently located in the ISFSI
- Transfer of the remaining 726 fuel assemblies from the spent fuel pool to the SONGS ISFSI is scheduled to be completed during 2019
- Greater Than Class C (GTCC) waste will be placed in the SONGS ISFSI per schedule to be developed by Decommissioning General Contractor
- DOE will commence transporting spent fuel assemblies in 2028[6]
- DOE will remove last SONGS Units 2 & 3 fuel from the ISFSI by 2049

San Onofre Unit 3:

- Permanently ceased operations on June 7, 2013
- 865 fuel assemblies in 29 canisters are currently located in the SONGS ISFSI
- Transfer of the remaining 869 fuel assemblies from the spent fuel pool to the SONGS ISFSI is scheduled to be completed during 2019
- Greater Than Class C (GTCC) waste will be placed in the SONGS ISFSI per schedule to be developed by Decommissioning General Contractor
- DOE will commence transporting spent fuel assemblies in 2028(6)
- DOE will remove last SONGS Units 2 & 3 fuel from the ISFSI by 2049

San Onofre ISFSI:

- The San Onofre ISFSI will be decommissioned and the remaining plant and ISFSI site will be decontaminated to meet 10 CFR 20.1402 site release criteria for unrestricted use as required to terminate the Part 50 General License by 2051.

Notes:

(1) The new site-specific decommissioning cost estimate for San Onofre Unit 1 that was submitted to the California Public Utilities Commission (CPUC) on March 15, 2018, includes the radiological costs associated with terminating the site license, site restoration costs, and fuel storage costs.

(2) The new site-specific decommissioning cost estimate for San Onofre Units 2 and 3 that was submitted to the CPUC on March 15, 2018 includes the radiological costs associated with terminating the site license, site restoration costs, and fuel storage costs.

(3) During the period between June 7, 2013 and December 31, 2018, SCE incurred costs of $760.4 million for San Onofre Unit 2 and $773.1 million for San Onofre Unit 3 (100% share, 2018$). In 2018, SDG&E and the City of Riverside did not withdraw funds for all or part of these costs from their Decommissioning Trusts. Therefore, their Net Balances are the differences between the December 31, 2018 Decommissioning Trust Balances and the 2013-2018 incurred or accrued costs.

(4) Pursuant to 10 CFR 72.30(e)(5), power reactor licensees are authorized to use the financial assurance methods provided for in 10 CFR 50.75(e). All four San Onofre co-owners recover the cost of decommissioning pursuant to cost-of-service rate regulation and, therefore, are eligible to provide assurance using the external sinking fund method provided for in 10 CFR 50.75(e)(1)(ii). To the extent the decommissioning costs are fully funded and annual deposits are no longer required, the Co-Participants provide assurance using the prepayment method provided for in 10 CFR 50.75(e)(1)(i).

SCE and SDG&E are also required to accumulate sufficient funds to decommission the SONGS facility under the California Nuclear Facilities Decommissioning Act, CA Public Utilities Code Section 8321, et seq. The CPUC has construed the SONGS decommissioning obligation to include: (1) radiological decommissioning as required to terminate the NRC licenses, (2) spent fuel storage (including ISFSI decommissioning), and (3) site restoration as required to terminate the SONGS site lease contracts granted by the U.S. Department of the Navy and the California State Lands Commission.

Under CA Public Utilities Code Section 8326(a)(2), SCE and SDG&E are required to update their site-specific nuclear facility decommissioning cost estimates periodically to reflect changes in decommissioning regulation, technology, and economics, for the purpose of adjusting contribution levels to their decommissioning trust.

Under CA Public Utilities Code Sections 8326(b), 8327, 8328, and 8329, the CPUC periodically reviews SCE and SDG&E's site-specific decommissioning cost estimates for the purpose of considering changes in electrical rates to ensure that sufficient funds will be available for payment of all decommissioning costs. The Cities of Anaheim and Riverside are not under the jurisdiction of the CPUC.

(5) SCE is submitting information with respect to the San Onofre co-owners, SDG&E, Anaheim, and Riverside, on their behalf, and they are responsible for the completeness and accuracy of their respective information.

(6) The current site-specific decommissioning cost estimates for San Onofre Unit 1 and for San Onofre Units 2 and 3 assume that the DOE will commence transporting spent fuel assemblies in 2028. This assumption may be updated periodically due to the ongoing uncertainties regarding the availability of a permanent repository for spent fuel.

(7) Some numbers may not add precisely due to rounding. Any such errors are immaterial to the substantive information presented in this report.

NRC Has Determined Fuel Loading Can Be Safely Resumed at San Onofre Nuclear Generating Station

The Nuclear Regulatory Commission has determined that fuel loading can be safely resumed at the San Onofre Nuclear Generating Station. The San Clemente, Calif., plant is owned by Southern California Edison and permanently shut down in 2013.

Fuel loading operations were suspended following an Aug. 3, 2018, incident involving a loaded spent fuel storage canister that was misaligned and became stuck on a flange while being lowered into a storage vault. Information about the incident and the NRC's response is available on the NRC website.

The NRC made its determination following extensive review of technical data submitted by Edison regarding the possible effects of scratching on spent fuel canisters during fuel loading operations.

The NRC will hold a virtual public meeting/webinar from 2-3 p.m. Central Time (12-1 p.m. Pacific Time) on June 3. Members of the public will have an opportunity to submit written comments and questions via the webinar user interface following a presentation by NRC officials. NRC staff will provide participation guidance during the webinar.

Interested members of the public should register for the webinar on the NRC website, at which time a confirmation e-mail will be sent with details for joining the webinar via computer or mobile device. There is an option to listen via a phone bridge; however participants must first register for the webinar to obtain the phone bridge number.

Re: ***Public Watchdogs v. Southern California Edison Co., et al.,***
Case No. 19CV1635-JLS (MSB) (S.D. Cal.)

Dear Counsel:

As outlined in Judge Sammartino's Order from today, you have until September 20, 2019, to brief the legal objections you raised to our Amended Motion for Preliminary Injunction and Temporary Restraining Order. But based upon your client's public statements, it appears that additional canisters will be interred between now and the time Judge Sammartino has an opportunity to adjudicate this dispute. Further complicating the matter is the fact that the technology does not presently exist to remove canisters that have already been buried.

Previously, your clients voluntarily agreed to suspend the removal, transport, and burial of spent nuclear fuel for almost a year. Given that you share our concern for the health and safety of the public and environment, we are asking your clients to again suspend that process for the very brief time it will take Judge Sammartino to resolve the pending Motion. If your legal arguments are correct, and our client cannot bring this case in federal district court at this time, the matter will be decided in your favor in short order. If, however, Judge Sammartino grants some or all of our requested relief—even temporarily—we will have been prejudiced by the current briefing schedule, and your clients will have the challenge of complying with a court order that requires them to undo something that can't be undone.

We recognize that this request is unusual. But we trust you appreciate the gravity of the situation, and the need to preserve Judge Sammartino's ability to adjudicate this dispute on the merits while the possibility of relief still exists. Please let us know by Monday, September 9, if you will agree to this modest proposal.

Very truly yours,

Eric J. Beste

Re: *Public Watchdogs v. Southern California Edison Company, et al.*
USDC Case No. 3:19-cv-01635-JM (MSB)

Dear Mr. Beste:

On behalf of Southern California Edison, San Diego Gas & Electric, and Sempra Energy (collectively the "SONGS Parties"), I am sending this letter to respond to your letter sent at 6 p.m. on Friday, September 6, 2019. In that letter you, as counsel for plaintiff Public Watchdogs ("Plaintiff"), requested that the SONGS Parties suspend the transfer of the spent nuclear fuel ("SNF") to the Independent Spent Fuel Storage Installation ("ISFSI") at the SONGS facility. However, Plaintiff's request is premised on a mischaracterization of key facts concerning the Nuclear Regulatory Commission's ("NRC") licensing process, and the SONGS Parties' spent fuel transfer and storage operations. The NRC completed a detailed review and analysis confirming the safety of the Holtec canister system and spent fuel transfer procedures, and has determined that the SONGS Parties may safely resume spent fuel transfer operations at SONGS.

Having received all necessary regulatory approvals from the NRC (the agency with exclusive jurisdiction over radiological matters) for the transfer of the SNF to Holtec canisters and storage of those canisters in the ISFSI, the SONGS Parties plan to safely continue the transfer operations so that they can timely move forward with decommissioning on behalf of their customers, and ultimately finding a permanent off-site location for SNF. Therefore, the SONGS Parties respectfully decline Plaintiff's request for a suspension of those operations. Further, having been provided with relevant information

in this letter, we expect that Plaintiff will satisfy its legal obligation to inform the District Court of these facts if it seeks to file any additional pleading with the Court prior to its reply brief on September 27, 2019.

Very truly yours,

Edward J. Casey

Office of the Inspector General
Report of Administrative Inquiry

March 23, 2010

William R. McCollum, Jr., LP 6A-C
Ralph E. Rodgers, WT 6A-K

(b) (7)(C)
(b) (7)(C)
HOLTEC INTERNATIONAL
555 LINCOLN DRIVE WEST
MARLTON, NEW JERSEY 08053
OIG FILE NO. 12E-102

This report was prepared at the request of Ralph E. Rodgers, Deputy General Counsel, Office of the General Counsel, Tennessee Valley Authority (TVA), to summarize investigative and audit efforts concerning the actions of (b) (7)(C). These efforts were initiated following the receipt of a complaint that (b) (7)(C) had engaged in funneling money to a TVA employee, John L. (Jack) Symonds, to secure TVA nuclear contracts for HI. This report provides information related to how those payments were made to the TVA employee, (b) (7)(C) involvement with those payments and the pattern of behavior exhibited by (b) (7)(C) when attempting to acquire nuclear contracts. The report also reflects audit findings of overbilling by HI for equipment costs and the rationale provided by HI and TVA for the price difference at two of TVA's nuclear plants. The findings in this report were based on the statements of (b)(7)(D), several witnesses, the statements of Mr. Symonds, former Brown Ferry Nuclear Plant (BFN) Technical Contract Manager, and documents included as attachments.

On August 3, 2007, Mr. Symonds pled guilty in U.S. federal court to making false financial statements to TVA by not disclosing receiving more than $54,000 from Krohn Enterprises LLC, a company he co-owned with his spouse. Mr. Symonds was paid by HI through another company called U. S. Tool & Die (UST&D). Mr. Symonds knew HI had contracted with TVA in November 2001 to design and construct a dry cask storage system for spent nuclear fuel rods at BFN, and had contracted with UST&D to fabricate some of the construction materials for the TVA BFN dry cask storage system. The money received by Mr. Symonds was used to pay personal expenses of Mr. Symonds and his spouse.

OVERVIEW

During June 2000, TVA needed above-ground storage containers to store spent nuclear fuel at Sequoyah Nuclear Plant (SQN). TVA entered into a contract with HI, for design and construction services, storage systems, and the necessary ancillary equipment for the storage containers. During November 2001, the contract was supplemented to authorize HI to perform the same services at BFN. TVA employee Mr. Symonds was involved in the negotiations for the BFN contract as the BFN Technical Contract Manager, while being courted by HI with promises of money and employment. Mr. Symonds was later paid over $50,000 for his assistance in obtaining the TVA contract for HI.

FINDINGS

While TVA was assessing re-racking spent nuclear fuel storage at BFN, the plant initiated a study to determine if BFN should convert to a dry cask storage system instead of re-racking its spent nuclear fuel. Mr. Symonds began advocating strongly for HI to perform the work at BFN that HI had performed at SQN. During this time, (b) (7)(C) agreed to pay Mr. Symonds $50,000. (b) (7)(C) suggested that Mr. Symonds create a company and took Mr. Symonds to HI's (b) (7)(C), who provided Mr. Symonds with a contact which would help Mr. Symonds establish an Limited Liability Company (LLC) in Delaware.

From July 29 to August 2, 2001, Mr. Symonds and his wife went to Philadelphia, Pennsylvania, on a birthday trip. The itinerary for the trip was arranged by HI and the round-trip airline reservation for Mr. Symonds and his wife was made and paid for by HI. From Philadelphia, Mr. Symonds and his wife traveled to Atlantic City, New Jersey, and stayed at the Taj Mahal, the Trump-owned hotel, paid for by HI. Mr. Symonds and his wife had dinner with (b) (7)(C) that night. On July 31, 2001, they returned to Philadelphia where HI had made reservations for the Symonds at the Rittenhouse Hotel. (b) (7)(C) arranged for a dinner party for the Symonds at a fine French restaurant, Le Bec-Fin, and HI paid $2,137.20 for the meal. Attending were Mr. Symonds and his wife, (b) (7)(C) and his wife, and three HI executives and their escorts. (b) (7)(C) placed Mr. Symonds at the head of the table.

Later in August, 2001, (b) (7)(C) and Mr. Symonds attended a meeting at Fitzpatrick Power Plant, Oswego, New York, consisting of about 30 people representing various utilities to discuss lessons learned. Mr. Symonds was reimbursed a portion of the cost for this trip by TVA, and travel expenses were also charged to UST&D of which (b) (7)(C) was the majority owner. A Confidential Source recalled that (b) (7)(C) and (b) (7)(C) created a company, FABSCO Inc., and that company controlled UST&D (see Attachment 1). While Mr. Symonds was at the meeting, a TVA employee telephoned Mr. Symonds to tell him the TVA Board decided to proceed with the dry

cask storage project for BFN. During a dinner that night, (b) (7)(C) announced with fanfare to everyone present the decision to award the BFN work to HI, to the celebratory sound of clinking glasses. During the dinner, Mr. Symonds' wife told (b) (7)(C) her vocation was credentialing doctors, which included conducting physicians' background checks.

On September 13, 2001, Mr. Symonds had a breakfast meeting with (b) (7)(C) at the Marriott Hotel, Huntsville, Alabama. Previously, (b) (7)(C) had discussed employment for Mr. Symonds with HI. During this meeting, (b) (7)(C) expressed concern, to avoid appearance problems, that Mr. Symonds not come to work at HI directly from TVA. Mr. Symonds would manage a construction company that appeared to be a separate entity from HI. (b) (7)(C) offered Mr. Symonds a vice-president position at HI with a salary of $175,000 per year plus one percent of the business. (b) (7)(C) suggested January 1, 2002, as the target date for Mr. Symonds to report to work at HI. Mr. Symonds considered himself a part of HI from that point on, even though he continued to work for TVA. (b) (7)(C) told Mr. Symonds they could set up a way to pay Mr. Symonds $50,000 by setting up a business through Mr. Symonds' wife for background investigation services.

During November 2001, the HI dry cask contract for SQN was supplemented to authorize HI to perform the same services at BFN. Mr. Symonds had been involved in the negotiations for the BFN contract as the BFN Technical Contract Manager.

Also in November 2001, Mr. Symonds established Krohn Enterprises, an LLC in Delaware. On December 13, 2001, a post office box was created for Krohn Enterprises, in Huntsville, Alabama, and the name "Jack Symonds" was included as a person with access to the box. A bank account was also created in the name of Krohn Enterprises. Mr. Symonds came up with the name Krohn by using the first two letters of (b) (7)(C) first name, (b) (7) and the last three letters of his own name, (b)

Further, in November 2001, Mr. Symonds and his wife made a house-hunting trip to Philadelphia, Pennsylvania. The trip was later reimbursed by (b) (7)(C) through UST&D. During this trip, (b) (7)(C) moved Mr. Symonds' employment date from January to April 2002.

Shortly after the meeting in November, Mr. Symonds and (b) (7)(C) met at a restaurant in Cherry Hill, New Jersey. (b) (7)(C) said he did not know if they were going to bring Mr. Symonds in to HI as a vice president, and said Mr. Symonds might be worth more to (b) (7)(C) by remaining at BFN during the Unit 1 restart. (b) (7)(C) then said he would pay Mr. Symonds an additional $100,000.

Subsequently, (b) (7)(C) instructed UST&D to make a payment of $50,000 to an agency that would be billing UST&D for background checks. No investigative services were rendered to UST&D, and none were provided by Krohn Enterprises. Krohn Enterprises submitted two invoices to UST&D (Attachment 2). The first invoice, dated January 15, 2002, totaled $29,212.77 and included the first "retainer" payment of $25,000 and $4,212.77 in travel expenses. The travel expenses invoiced to UST&D were for the travel expenses of Mr. Symonds' meetings with (b) (7)(C) and HI officials. The second invoice, dated February 5, 2002, was for a "retainer fee," payment of $25,000. UST&D paid Krohn Enterprises a total of $54,212.77. A review was conducted of documents obtained by the Office of the Inspector General (OIG) regarding travel by Mr. Symonds and a copy of the review is attached (Attachment 3).

In approximately January 2002, Mr. Symonds learned from TVA employee (b) (7)(C) , who replaced Mr. Symonds as the Technical Contract Manager for the HI contract, that (b) (7)(C) had been offered a job by (b) (7)(C) Mr. Symonds did not miss the fact that he was now being ignored by (b) (7)(C) while (b) (7)(C) was pitching (b) (7)(C) to work for him. Mr. Symonds prepared a letter (Attachment 4) and sent it to (b) (7)(C) as a last chance for a position with HI, although it was clear to Mr. Symonds that his job with HI was dead.

STATEMENTS BY KRISHNA SINGH

On October 12, 2006, Mr. Symonds consented to telephoning (b) (7)(C) for the purpose of recording the conversation. Mr. Symonds told (b) (7)(C) the OIG was aware of the money paid to Mr. Symonds by UST&D and was coming to interview Mr. Symonds. Mr. Symonds requested advice from (b) (7)(C) on how to handle the situation. (b) (7)(C) response was as follows:

> *Well, you know UST&D had hired your wife to do security checks. She got paid for that, right? That was the retainer paid to do the work. She did do retainer work. Why are they auditing your account? There's no, there's nothing that uh, I mean it was a clean transaction, she was in the business of checking out, you know we had some, to my knowledge, UST&D had some problems with thefts and stuff, otherwise it was checks. She paid for, you know they paid for it. But you didn't do any direct business with UST&D, did you? They won't call me because I have nothing to do with it, you know. But to the extent that I pointed to a potential source for UST&D to get the help, they ask me I'll tell them. You know, I'll tell them the straight scoop. Jack you ought to make sure that you tell them that you really have no, the funds you don't know anything about the fact, other than the fact that your wife was in the business of doing consulting services and it was payment retainer for that work, and it's a company that you don't do any business with, and you have not.*

A copy of the entire transcription is attached (Attachment 5).

A few minutes after the recording above was made, (b) (7)(C) was interviewed in his office by OIG Special Agents. During that interview (b) (7)(C) stated essentially the following.

- Sometime between 1999 and 2001, UST&D was having problems with employee thefts. He wasn't sure if it was parts being stolen or other materials, but there was a problem. (b) (7)(C) advised that he mentioned to someone that Mr. Symonds did security checks. He wasn't sure if it was Mr. Symonds, his partner or someone associated with Mr. Symonds that helped companies catch employees stealing. (b) (7)(C) may have mentioned the theft problems to Mr. Symonds and suggested Mr. Symonds call the plant manager or he may have mentioned it to plant personnel to contact Mr. Symonds, he just couldn't remember. (b) (7)(C) thought he may have put Mr. Symonds in touch with several other people. (b) (7)(C) said he could not give the specifics about how he knew Mr. Symonds was involved with catching employees stealing at factories. (b) (7)(C) did not know if UST&D used Mr. Symonds or not.

- (b) (7)(C) recalled Mr. Symonds visited HI on a couple of occasions when Mr. Symonds was on a project they were doing at BFN. If Mr. Symonds came to HI, he (b) (7)(C) would have seen him. He never requested that HI employees entertain Mr. Symonds. However, he did know that Mr. Symonds was friendly with one of HI's engineers who no longer worked for HI. (b) (7)(C) (b) (7)(C) was asked if he provided any entertainment to Mr. Symonds and said he remembered having dinner with Mr. Symonds on one occasion. He does not remember who paid for the meal but he normally offered to pay for any meal he had with someone and they normally obliged. Sometimes clients would send checks back to him for the cost of their meals. He did not recall the specifics about the meal with Mr. Symonds.

- (b) (7)(C) stated that he would not have offered any money to Mr. Symonds or Krohn Enterprises for any reason. He did not direct anyone to pay any money to Mr. Symonds or Krohn Enterprises for any reason. He did not think that Mr. Symonds would solicit money from him. He said he has a particular air about him, and no one would ask a cent from him. (b) (7)(C) said that he was a very ethical person in business dealings. (b) (7)(C) stated he could not say if someone at HI or UST&D paid Mr. Symonds, but he has never been told anything or that anyone paid Krohn Enterprises anything. (b) (7)(C) opined that Mr. Symonds was not in a position to award contracts for TVA.

OTHER BAD ACTS BY (b) (7)(C)

(b) (7)(D), Exelon Corporation provided documentation relating to an internal investigation concerning an engineer in a position to potentially influence a contract award to HI and whose wife had a business with which HI began doing business under (b) (7)(C) direction. That investigation was instituted upon the receipt of information that HI, a contractor involved in a $20,000,000 project with ComEd, an Exelon company, for dry cask storage products, had switched travel agencies and began using an agency in Northbrook, Illinois, called Cove Travel. That travel agency was allegedly owned by (b) (7)(C), a Senior Engineer at ComEd Corporate Services, who was involved in administering the project with HI. According to a ComEd Supervising Engineer, in mid-July 1997, while on an audit trip to Japan, a HI Quality Assurance Manager, stated (b) (7)(C) had sent a letter to all HI employees instructing all travel arrangements be made through a travel agency in Northbrook. This letter was followed up six months later by (b) (7)(C) diverting all travel arrangements to (b) (7)(C)). During the internal investigation (b) (7)(C) was interviewed concerning the matter and stated he had known (b) (7)(C) since late 1989 or early 1990. (b) (7)(C) was sure that (b) (7)(C) made the initial contact with him relative to Cove Travel. She then submitted a proposal which he turned over to one of the two HI personnel who handled travel arrangements for the firm. He advised that (b) (7)(C) had never put pressure on him to use Cove Travel and had never told him he would increase/decrease ComEds business with HI dependent upon the use of Cove Travel. Were this to happen, (b) (7)(C) would "kick him out," stating in his mind, for one thing, (b) (7)(C) had "zero" authority to place business and had no "clout."

(b) (7)(C) **WRITES TO INSPECTOR GENERAL AND CHIEF NUCLEAR OFFICER**

(b) (7)(C) sent a letter addressed to the TVA Inspector General, Richard W. Moore, dated November 17, 2006 (Attachment 6), during the timeframe the criminal investigations were ongoing concerning HI, (b) (7)(C) and Mr. Symonds. In that letter (b) (7)(C) stated, “Holtec International categorically asserts that the company has not provided any funds to Mr. Saimonds [sic] in any shape or form, indirectly or directly.”

(b) (7)(C) also e-mailed a letter to Karl Singer, then Chief Nuclear Officer and Executive Vice President, dated November 9, 2006 (Attachment 7). In that letter, (b) (7)(C) stated, in part, “… we do not know anything about the gentleman’s (Symonds’) interactions with UST&D.”

CONTRACT REVIEW

The OIG conducted a review of the TVA contract with HI for the purchase of dry cask storage systems for spent nuclear fuel at SQN and BFN. The purpose of the review was to assess the reasonableness of the prices TVA paid HI for certain high-dollar equipment items at BFN in comparison with the prices paid for the equipment at SQN. Specifically, the OIG reviewed the prices TVA paid HI for the four largest dollar-value cask system components: the MPC (multipurpose canister for spent fuel), HI-STORM 100 (long-term storage overpack for the MPC), HI-TRAC 125D (in-plant transfer overpack for the MPC), and the vertical crawler. TVA had paid $7,198,763 for the equipment at SQN, versus $9,186,120 at BFN, a difference of $1,987,357.

Information obtained in the review (Attachment 8) found HI may have made false statements regarding the equipment prices proposed to TVA, and it appeared TVA relied on that information to approve prices quoted for the BFN equipment. Additionally, the review found that HI had overbilled TVA at least $276,000 for the BFN vertical crawler because it did not comply with the contract's cost-plus pricing provision. The price HI quoted for the BFN crawler misrepresented its compliance with the contract.

It appeared TVA relied on the information provided by HI to justify paying the higher BFN prices rather than attempting to negotiate lower pricing for BFN. Although it is unknown if TVA could have successfully negotiated lower prices for BFN, key economic indicators and reduction in material prices between the time period when HI proposed the SQN and BFN prices indicate TVA had an opportunity to negotiate better prices. For example, the price of steel had fallen about seven percent during the period between the SQN proposal and the BFN proposal.

In summary, the OIG review found evidence that the higher prices TVA agreed to pay for the BFN MPC, the HI-STORM 100 and the HI-TRAC 125D were unreasonable. It appears HI may have misled TVA regarding its pricing and TVA did not attempt to negotiate better prices at BFN.

RECOMMENDATIONS

We recommend TVA place HI on the Supply Chain Clearance List based on the actions of (b) (7)(C) [redacted]. In addition, if you decide to take other documented action on the basis of this report, we would appreciate your sending a copy of the relevant information to this office for our file.

We would appreciate being informed within 15 days of your determination of what action is appropriate on the basis of our report. Our investigative files will be made available for review upon request.

This report has been designated “TVA Restricted” in accordance with TVA Business Practice 29, Information Security. Accordingly, it should not be disclosed further without the prior approval of the Inspector General or his designee. In addition, no redacted version of this report should be distributed without notification to the Inspector General of the redactions that have been made.

Our investigation of this matter is closed.

Plan of Merger

This Plan of Merger ("Plan") between FABSCO, Inc., a Pennsylvania corporation ("Parent"), and U S Tool & Die, Inc., a Pennsylvania corporation ("Subsidiary") shall be adopted by Parent in the manner and become effective as of the time provided below.

1. Background. Parent is record and beneficial owner of 82.47% of the issued and outstanding capital stock of Subsidiary ("Subsidiary Common Stock"). The remaining shares of the Subsidiary Common Stock are owned and held of record by those shareholders listed in the Subsidiary's corporate records as of the Plan Adoption Date (as such term is defined in Section 2 of this Plan). The Board of Directors of Parent has determined that is desirable and in the best interests of Parent and Subsidiary that Parent be merged with and into the Subsidiary on the terms and conditions set forth in this Plan and in accordance with the applicable provisions of the Pennsylvania Business Corporation Law of 1988, as amended (the "PA BCL").

2. Approval. This Plan shall become adopted ("Plan Adoption Date") upon its approval by the Board of Directors of the Parent in accordance with Sections 1922(c), 1924(b)(1)(ii), and 1924(b)(3) of the PA BCL.

3. Time and Effect of Merger.

(a) *Effective Time*. The Merger shall become effective at the close of business on the date upon which appropriate Articles of Merger (to which this Plan will be attached and incorporated therein) are filed with the Department of State of the Commonwealth of Pennsylvania ("Merger Effective Time").

(b) *Effects of Merger*. At the Merger Effective Time, Parent shall merge with and into Subsidiary, the separate existence of Parent shall cease, and Subsidiary shall be the surviving corporation (the "Surviving Corporation"), all in accordance with this Plan and the applicable provisions of the PA BCL (the "Merger"). At the Merger Effective Time and as a result of the Merger, the Surviving Corporation shall continue to exist as a domestic business corporation under the laws of the Commonwealth of Pennsylvania with all of the rights and obligations of such surviving domestic business corporation as are provided by Section 1929 and the other applicable provisions of the PA BCL. Without limiting the generality of the foregoing, as of the Merger Effective Time, all of the property (real, personal and mixed), rights, powers, privileges, immunities, licenses, permits and franchises (both of a

2002071-975

private and public nature), and restrictions, duties, and obligations of the Parent and Subsidiary shall be taken and be deemed to be transferred to and vested or continued to be vested, as the case may be, in the Surviving Corporation, without further act, agreement, approval or deed.

4. Articles of Incorporation; Bylaws. The Articles of Incorporation and Bylaws of the Subsidiary as in effect prior to the Merger Effective Time shall remain the same and continue unchanged as, respectively, the Articles of Incorporation and Bylaws of the Surviving Corporation on and after the Merger Effective Time until changed in accordance with their respective terms and the applicable provisions of the PA BCL.

5 Directors and Officers. The Officers of Subsidiary prior to the Merger Effective Time shall, as of the Merger Effective Time, be and remain, respectively, the Officers of the Surviving Corporation until their respective successors are duly elected and qualified under the Bylaws of the Surviving Corporation then in effect, or until their earlier death or until their resignation or removal in accordance with such Bylaws. As of the Effective Time, the Directors of the Surviving Corporation shall be David S. Forman, Robert L. Moscardini and Christopher P. Strock who will serve as Directors of the Surviving Corporation until their respective successors are duly elected and qualified under the Bylaws of the Surviving Corporation then in effect, or until their earlier death or resignation or removal in accordance with such Bylaws.

6. Conversion of Shares.

(a) *Conversion of Shares of Subsidiary* Subject to the provisions of Sections 7 and 8 of this Plan, except for Dissenting Shares (as such term is defined in Section 10 of this Plan), which at the Merger Effective Time shall be converted into the right to receive the consideration determined in accordance with Section 10 of this Plan and the applicable provisions of the PA BCL, each share of Subsidiary Common Stock shall, at the Merger Effective Time, without further action and by virtue of the Merger, be converted into the right to receive cash consideration in the amount of $ .75 for each share of Subsidiary Common Stock, payable in accordance with Sections 7 and 8 of this Plan, and shall no longer be outstanding and shall be deemed to be automatically canceled and cease to exist.

(b) *Conversion of Shares of Parent*. Subject to the provisions of Section 8 of this Plan, each share of capital stock of Parent ("Parent Shares") shall, at the Merger Effective Time, without further action and by virtue of the Merger, be converted into one (1) share of capital stock of the Surviving Corporation, and shall no longer be outstanding and shall be deemed to be automatically canceled and cease to exist.

7 Withholding Rights. The Surviving Corporation shall be entitled to deduct and withhold from the consideration otherwise payable under Section 6 or 10 of this Plan, as the case may be, such amounts, if any, as it is required to deduct, withhold, and remit with

200207 1- 976

respect to the making of such payment under any provision of federal, state or local tax law (a "Withholding"). Any such Withholding shall be treated for all purposes (including without limitation this Plan and the Merger) as having been paid to the Record Shareholder (as such term is defined in Section 8) in respect of which the Surviving Corporation made such Withholding and, notwithstanding anything contained to the contrary in this Plan, such Record Shareholder shall only be entitled to receive from the Surviving Corporation the consideration payable pursuant to this Plan and/or the Dissenters' Rights Provisions (as such term is defined in Section 10 of this Plan), less any Withholding, which shall be payable on such Record Shareholder's account to the applicable federal, state or local taxing authority in accordance with applicable federal, state or local tax law ("Net Merger Consideration").

8 Notice; Surrender and Payment; Rights in Subsidiary Common Stock; Etc.

(a) *Merger Notice*. As soon as practicable following the Merger Effective Time, the Surviving Corporation shall mail or cause to be mailed to each record holder or record owner, as the case may be (individually, a "Record Shareholder" and collectively the "Record Shareholders") of the shares of Subsidiary Common Stock on the Plan Adoption Date notices ("Merger Notice") advising them of and enclosing, as applicable: (i) the effectiveness of the Merger, (ii) a copy of this Plan; (iii) a form letter of transmittal and instructions regarding the surrender of their certificates formerly representing shares of Subsidiary Common Stock ("Subsidiary Certificates"), or in lieu thereof, such evidence of lost, stolen or destroyed certificate(s) and such surety bonds or other security as the Surviving Corporation may, in its discretion, require ("Required Documentation"), in exchange for the applicable Net Merger Consideration, and (iv) the notices, information and other materials required to be provided to the Record Shareholders under Section 1575 of the PA BCL.

(b) *Surrender of Subsidiary Certificates; Payment of Consideration*. After the Merger Effective Time, upon surrender of their Subsidiary Certificates, or in lieu thereof, the Required Documentation, to the Surviving Corporation with a properly completed and executed letter of transmittal (substantially in the form included in the Merger Notice) with respect to such certificates, a Record Shareholder will be entitled to receive the applicable Net Merger Consideration. Such consideration shall be delivered by the Surviving Corporation as promptly as practicable after such surrender. Except as otherwise expressly provided in Section 10 of this Plan, without the written consent of a Record Shareholder and such other documentation and other items as the Surviving Corporation in its discretion may require (a "Permitted Substitution"), no person other than a Record Shareholder shall be entitled to receive any consideration whatsoever from the Surviving Corporation as a result of the Merger. In the event of a Permitted Substitution, except in respect of the availability of Dissenters' Rights (as such term is defined in Section 10), which shall be determined in accordance with Section 10 of this Plan, such person shall be considered a Record Shareholder for purposes of this Plan and the Record Shareholder for which a Permitted Substitution was

-1-

made shall thereafter have no right to receive any consideration from the Surviving Corporation as a result of the Merger.

(c) *Rights in Subsidiary Common Stock Following Merger*. As of the Merger Effective Time, (i) the Record Shareholders, all other holders of Subsidiary Certificates, and all beneficial but not record owners of Subsidiary Common Stock prior to the Merger Effective Time, if any, shall cease to have rights with respect to such previously outstanding stock, provided, however that the Record Shareholders only shall have the right to either exchange his, her or its Subsidiary Certificates or Required Documentation, as the case may be, for the Net Merger Consideration to which such Record Shareholder may be entitled pursuant to Sections 6 and 7 of this Plan or elect their Dissenters' Rights in accordance with the Dissenters' Rights Provisions (as such terms are defined in Section 10 of this Plan), and (ii) the Subsidiary Certificates held by Record Shareholders shall be deemed to evidence only ownership of either such Net Merger Consideration or Dissenters' Rights in respect of such Subsidiary Common Stock, if so elected in accordance with the Dissenters' Rights Provisions. In no event shall the Surviving Corporation be obligated to deliver Net Merger Consideration set forth in Sections 6 and 7 or determined pursuant to Section 7 and the Dissenters' Rights Provisions to a Record Shareholder unless and until such Record Shareholder surrenders his, her or its Subsidiary Certificates or furnishes the Required Documentation, as the case may be.

(d) *Surrender of Parent Shares Certificates; Issuance of Surviving Corporation Stock*. Upon receipt by the Surviving Corporation of the certificates representing the Parent Shares or in lieu thereof Required Documentation, as the case may be, together with a properly completed and executed letter of transmittal (in the form acceptable to the Surviving Corporation) with respect to such certificates, the Surviving Corporation will issue to the Parent's shareholders certificates representing the same number of shares of capital stock of the Surviving Corporation as had been held by them in the Parent immediately prior to the Merger Effective Time.

9 Termination of Plan. This Plan may be terminated and the Merger abandoned by action of the Board of Directors of Parent at any time before the Merger Effective Time.

10 Dissenters' Rights. Each (i) Record Shareholder or (ii) subject to compliance with the provisions of Section 1573 of the PA BCL, beneficial owner of Subsidiary Common Stock that is not a Record Shareholder (either, a "Dissenter"), as the case may be, shall be entitled to exercise dissenters' rights ("Dissenters' Rights") with respect to his, her or its shares of Subsidiary Common Stock ("Dissenting Shares") as a result of the Merger, as provided in Sections 1930(a), and 1571 and the other applicable sections of the PA BCL ("Dissenters' Rights Provisions"). Notwithstanding the foregoing, a Dissenter shall forfeit his, her or its Dissenters' Rights, unless such Dissenter makes a demand pursuant to the provisions of Section 1575 of the PA BCL, at the time and place specified in the Merger Notice with respect to such shares (a "Perfected Dissenter"). A Perfected Dissenter will be entitled,

Attachment 1
Page 11 of 11

subject to compliance with Section 8 of this Plan, to the fair value (less any Withholdings) for his, her or its Dissenting Shares, which fair value will be determined in accordance with Sections 1578 and/or 1579 of the PA BCL, as applicable, and will have such other rights and be subject to such obligations as are accorded to or imposed upon him, her or it pursuant to the Dissenters' Rights Provisions; provided, however, that if a Perfected Dissenter shall subsequently deliver a written withdrawal of his, her or its demand for appraisal of such shares (with the written approval of the Surviving Corporation), then such person shall also forfeit his, her or its Dissenters' Rights. In the event that a Dissenter forfeits his, her or its Dissenters' Rights, then such shares shall thereupon be deemed to have been converted into and to have become exchangeable for, as of the Merger Effective Time, subject to the provisions of Section 8 of this Plan, the right to receive his, her or its Net Merger Consideration provided in Sections 6(a) and 7 of this Plan without any interest or other additional sums payable thereon.

11. Amendment. This Plan may be amended in any manner at any time before the Merger Effective Time by action of the Board of Directors of Parent, subject to compliance with Section 1922(b) of the PA BCL.

The Parent has adopted this Plan as of August 7, 2002.

Jack Symonds Travel Analysis
Case 12E-100

The following investigation was conducted by Intelligence Analyst (b) (7)(C) on August 10, 2006, in Knoxville, TN.

Jul 29-Aug 2, 2001
During the period of 7/29/01 – 8/2/01, Symonds and (b) (7)(C) flew to Philadelphia, PA not on duty status. The hotel is suspected to have been paid for by Holtec. TVA was direct-billed for the rental car because Symonds used his government travel card for the rental. TVA was not reimbursed by Symonds. (Title 18, Sec 287).

July 29 – August 2, 2001		Company Paying Symonds' Travel Expenses		
Flight Location: Philadelphia, PA	Expense Category	TVA	US Tool & Die	Holtec
Hotel Locations: Atlantic City, NY Philadelphia, PA On Leave from TVA	Flight	-	-	Unknown

April 1, 2002

Dear (b) (6)

It is becoming more and more difficult for you and I to engage in business conversations, although, through no fault of our own. I am also finding that I too am experiencing some of the paranoid feelings that you have previously expressed concern about. I have determined that the only way to truly communicate with you without fear of some kind of electronic eavesdropping or wiretapping or some other kind of industrial spying technique is to simply revert to a simpler time when writing a letter was the most effective way of communicating. I think that by exercising this medium we can eliminate the anxiety of worrying about what some other people might say or do about the perceptions.

Anyway, I wanted to let you know that the $50K we discussed back in September that was to be paid for activities through the end of the year 2001 has been satisfied. Now let's talk about the $100K that you said that you would pay me in 2002 to stay with TVA. I had originally sent you a proposal that we break that up into quarters which would be $25K in April, $25K in August, $25K in October and $25K in December. You did not respond to that proposal except to say that you wanted me to perform the original deal with Bob. Now that the original deal is satisfied and we are ¼ of the way through 2002, I think we should address how we are going to bill for the remaining $100K.

Krohn Inc. is alive and well and could very well prove to be the proper conduit for this transaction. (b) (6) is still the CEO and all business transactions are done through her. If you want, she can send you an RFQ on Krohn Inc. letterhead explaining the billing for services rendered. You think about it and let me know how you want to handle the evolution.

I think that now that the ice has been broken with TVA on a couple of subjects, i.e., Engineering analysis activities with (b) (6) and Feedwater Heater issues with (b) (6) you should probably offer an unsolicited proposal to perform these kinds of activities. You should address the correspondence to (b) (6) and copy (b) (6)

TVA RESTRICTED INFORMATION

(b) (6) The only thing is, they might say "come on down and give us a presentation of what you think you can offer". We should be out of the outage by the 10th of April. The bad thing is we are going to do a mid-cycle outage on U2 for 2 identified fuel leakers the last week in April. It will only last a week (we hope). Then the board meets on May 16th to determine the fate of U1. So, if you lay this all out, it looks to me like your best chance at an audience with the decision makers between now and then would be the week of April 15th or the week of May 6th. Plan accordingly.

How is the construction company business search going? Have you told (b) (6) (b) (6) not to talk to me? (I thought you may have told them to pretend I didn't exist for a while until some time had passed). I keep trying to get a hold of them and I am not getting any response.

Let's stay in touch, so that we can eliminate any misunderstandings or any miscommunications that we promised each other we would avoid at all cost.

Talk to you later my friend,

July 30, 2007

Charles A. Kandt, ET 4C-K

SPECIAL PROJECT 2007-11160 – HOLTEC INTERNATIONAL CONTRACT NO. 99999906 – REASONABLENESS OF PRICES TVA PAID FOR CERTAIN DRY CASK STORAGE SYSTEMS COMPONENTS AT BROWNS FERRY NUCLEAR PLANT

As requested by OIG Investigative Operations, we initiated an audit of Contract No. 99999906 that TVA has with Holtec International (Holtec) for the purchase of dry cask storage systems for spent nuclear fuel at Sequoyah Nuclear Plant (SQN) and Browns Ferry Nuclear Plant (BFN). The purpose of our review was to assess the reasonableness of the prices TVA paid Holtec for certain high dollar equipment items at BFN in comparison with the prices paid for the equipment at SQN. Specifically, as summarized in the following table, we reviewed the prices TVA paid Holtec for the four largest dollar-value cask system components: (1) the MPC (multipurpose canister for spent fuel); (2) HI-STORM 100 (long-term storage overpack for the MPC); (3) HI-TRAC 125D (in-plant transfer overpack for the MPC); and (4) the vertical crawler.

Summary of Price Differences for Major Components of Dry Cask Storage Systems

Description	SQN Price	BFN Price	Difference
MPC	(b) (4)		
HI-STORM 100			
HI-TRAC 125D			
Vertical Crawler			
Total			

Table 1

As discussed in detail below, information obtained in our audit found Holtec may have made false statements regarding the equipment prices proposed to TVA, and it appeared TVA relied on that information to approve prices quoted for the BFN equipment. Additionally, we found that Holtec had overbilled TVA at least $276,000 for the BFN vertical crawler because it did not comply with the contract's cost-plus pricing provision. In our opinion, the price Holtec quoted for the BFN crawler misrepresented its compliance with the contract.

CONTRACT BACKGROUND

On June 30, 2000, TVA entered into Contract No. 99999906 with Holtec to provide equipment and engineering services for a dry cask system to store SQN spent nuclear fuel.[1] On November 8, 2001, the contract was supplemented to include a similar dry cask system for BFN. As of June 20, 2007, the contract had been supplemented 37 times, and TVA had paid Holtec $31.2 million against the contract payment ceiling of $54 million. The contract term is currently set to expire on June 30, 2008.

[1] The original Contract No. P00NNQ-258310 was changed to No. 99999906 in July 2001 for conversion to the PassPort supply chain software.

The contract included fixed prices for most of the components of the cask system and for defined scopes of engineering tasks to address safety aspects of the cask system unique to the two plant sites. The contract also included cost-plus pricing for optional items including (1) construction of a storage pad for the casks at the plant site and (2) a vertical crawler heavy lifting device to move the casks from the plant to the on-site storage pad.

The OIG is investigating certain issues regarding the pricing TVA agreed to under the contract with Holtec. To support the investigation, an audit (Audit 2007-028C) of the contract was initiated to assess the reasonableness of the prices TVA paid Holtec for the four highest dollar cask system components as summarized in Table 1. To perform our review, we:

- Reviewed the contract and related supplements, correspondence, e-mails, and payment records obtained from TVA's files.
- Visited the SQN and BFN sites and interviewed the dry cask spent nuclear fuel project managers and other key personnel to obtain an understanding about the products purchased.
- Obtained copies of TVA's documentation of products received; Holtec's documentation packages for the MPC, HI-STORM 100, and HI-TRAC 125D units as required by the Nuclear Regulatory Commission for these safety-related items; and Holtec's specification document for each crawler, to more clearly define the products purchased.
- Visited Holtec's offices and reviewed cost information to obtain an understanding about Holtec's costs for the products delivered.
- Visited Lift System's (manufacturer of the vertical crawlers) offices and reviewed documentation of sales and related cost data for vertical crawlers sold to Holtec.

AUDIT FINDINGS AND CONCLUSIONS

Information obtained in our audit found Holtec may have made false statements regarding the equipment prices proposed to TVA, and it appeared TVA relied on that information to approve prices quoted for the BFN equipment. Additionally, we found that Holtec had overbilled TVA at least $276,000 for the BFN vertical crawler because it did not comply with the contract's cost-plus pricing provision. In our opinion, the price Holtec quoted for the BFN crawler misrepresented its compliance with the contract.

MPC, HI-STORM 100, and HI-TRAC 125D

Holtec's proposal (dated September 12, 2001) to add the BFN scope of work included significant price increases for the MPC, HI-STORM 100, and HI-TRAC 125D components in comparison to the prices TVA had agreed to pay for similar equipment at SQN. Our review of TVA and Holtec files found Holtec may have made false statements to TVA when it explained why the prices it had quoted for certain BFN components were higher than the SQN prices. Specifically, in a draft letter submitted to TVA, Holtec informed that:

- The HI-STORM 100 for BFN was a significantly improved model in comparison to the model proposed for use at SQN in that (1) it had a reduced height for transport through

the plant's external door, and (2) it reduced radiation exposure by about one rem per cask.

- The (lower) SQN price for the HI-TRAC 125D was the result of an arithmetic error during quoting.

Each of these statements appears to be false or at least misleading because:

(1) BFN's external door has an additional 4 feet of vertical clearance in comparison to SQN's, thus negating the need for a reduction in height for the BFN HI-STORM 100,

(2) We found no evidence that the proposed BFN HI-STORM 100 model would have had a significant reduction in radiation dose, and

(3) Holtec initially proposed a price for the SQN HI-TRAC 125D that was the same price subsequently proposed for BFN. The final SQN price resulted from a discount offered by Holtec late in the bidding process. Holtec's claim that the lower SQN price was the result of an arithmetic error rather than a discount may have created the illusion that its prices were not negotiable. (Note – Holtec's final letter transmitting a comparison of the prices did not include the statements from the draft about the HI-STORM 100. However, the letter continued to mislead the TVA negotiation team regarding SQN's low price for the HI-TRAC 125D, referring to it as "an estimating department error.")

It appeared TVA relied on the information provided by Holtec to justify paying the higher BFN prices rather than attempting to negotiate lower pricing for BFN. Although it is unknown if TVA could have successfully negotiated lower prices for BFN, key economic indicators and reductions in material prices between the time period when Holtec proposed the SQN and BFN prices indicate TVA had an opportunity to negotiate better prices. For example, the price of steel had fallen about 7 percent during the period between the SQN proposal and the BFN proposal.

In summary, we found no evidence that the higher prices TVA agreed to pay for the BFN MPC, HI-STORM 100, and HI-TRAC 125D were reasonable. Instead, it appeared (1) Holtec may have misled TVA regarding its pricing, and/or (2) TVA did not attempt to negotiate better prices at BFN.

Vertical Crawler

Contract No. 99999906 provided that the pricing for (b) (4) (b) (4) Although the price TVA paid for the SQN crawler was in accordance with the cost-plus provision, the price for the BFN crawler was not. As discussed below, TVA's price for the BFN vertical crawler should have been at (b) (4) ess than the amount quoted by Holtec. Additionally, since Holtec's price quote for BFN was (b) (4) in our opinion the quoted price was a misrepresentation by Holtec that it was complying with the contract's pricing provision.

Holtec's Cost for Vertical Crawler Supplied to BFN – The vertical crawlers provided for SQN and BFN were manufactured and sold to Holtec by Lift Systems. Although the SQN crawler

had been ordered by Holtec specifically for the SQN project, the crawler that was sent to BFN had originally been ordered by Holtec for a project it had with Hope Creek Nuclear Plant (Hope Creek). When TVA requested Holtec to provide a crawler for BFN, to meet TVA's time requirements Holtec apparently requested Lift Systems to (1) send the crawler that had been manufactured for Hope Creek to BFN and (2) manufacture another crawler for Hope Creek.

We reviewed documentation of the prices Holtec paid Lift Systems for each of the crawlers and found Holtec had paid Lift Systems (b) (4) (b) (4) (b) (4) Based on the prices Holtec paid for the two vertical crawlers, the most that should have been billable to TVA would have been (b) (4)[2]

Potential Misrepresentation by Holtec – (b) (4) (b) (4) (b) (4) the quoted price misrepresented Holtec's compliance with the contract's cost-plus provision. Additionally, Holtec may have made false statements by informing TVA the price for the BFN crawler was higher than the price of the SQN crawler because the BFN crawler (1) had enhancements that the SQN crawler did not have and (2) included expediting fees. We found the enhancements on the BFN crawler were minor and would not have materially affected Holtec's cost. Additionally, we found no evidence that Holtec incurred any expediting fees other than the higher price it paid Lift Systems for the replacement crawler for Hope Creek.

- - - - - -

Based on discussions we have had with (b) (7)(C) we understand OIG Investigations does not want Audit Operations to issue an audit report to TVA or Holtec at this time since the investigation is ongoing. Accordingly, we are providing the information in this memorandum for use in your ongoing investigation. If you need additional information, please contact (b) (7)(C) (b) (7)(C)

Ben R. Wagner
Deputy Inspector General

cc: Jack E. Brennan, ET 4C-K
(b) (7)(C)
Richard W. Moore, ET 4C-K
OIG File No. 2007-11160

[2] TVA could make an argument (b) (4) However, a legal opinion would be needed as to whether TVA could prevail at paying this lower cost since Holtec apparently had to pay a higher cost to replace the Hope Creek crawler.

I. EXECUTIVE SUMMARY

The Task Force on the Economic Development Authority's Tax Incentives (the "Task Force") is an advisory body and, pursuant to its mandate, submits this first report (the "First Report") to advise the Governor of its initial findings and recommendations.

In January 2018, Governor Philip D. Murphy directed the Office of the State Comptroller to conduct a comprehensive performance audit of the Grow New Jersey Assistance Act ("Grow NJ") and Economic Redevelopment and Growth ("ERG") tax-incentive programs (each a "Program" and together, the "Programs"), and predecessor programs, from 2010 forward, to "inform the public about the EDA's operations" and "assist lawmakers in their deliberations as to whether these programs should be reauthorized when they expire on July 1, 2019." On January 9, 2019, New Jersey State Comptroller Philip J. Degnan (the "Comptroller") issued his audit report[1] of the State's tax-incentive programs. The Comptroller's audit report revealed, among other things, that the New Jersey Economic Development Authority (the "EDA") had failed to comply with the applicable statutes and regulations and to implement key internal controls for monitoring the performance of tax-incentive beneficiaries.

In response to the Comptroller's audit report, Governor Murphy issued Executive Order No. 52, which established this Task Force with the following objectives:

1. Conduct an in-depth examination of the deficiencies in the design, implementation, and oversight of Grow NJ and the ERG tax-incentive programs, including those identified in the Comptroller's audit report, to inform consideration regarding the planning, development and execution of any future structure of these or similar tax-incentive programs; and

2. Hold public hearings and request testimony from individuals who can provide insight into the design, implementation, and oversight of these programs.

The Task Force has been authorized to call upon any department, office, division or agency of the State to supply it with data and any other information or assistance available to such agency as the Task Force deems necessary to execute its duties. Each State agency also has been required to timely cooperate with the Task Force. In addition, Governor Murphy appointed Professor Ronald Chen, as the Chairman of the Task Force, to "perform all of the functions of a duly authorized representative of the Governor" pursuant to N.J. Stat. § 52:15-7, including the ability to "subpoena

[1] A Performance Audit of Selected State Tax Incentive Programs, Jan. 9, 2019.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

and enforce the attendance of witnesses."[2] The Task Force has generally sought, in the first instance, to obtain information through witnesses' voluntary cooperation, but has also relied upon Professor Chen's subpoena power where necessary.

As described in more detail below, to fulfill its mandate, the Task Force has collected and reviewed thousands of documents—obtained from the EDA and other agencies, from companies awarded benefits under the Programs, and from other parties—and conducted 28 interviews to date. These interviews have included former and current EDA personnel and other government employees, as well as other parties with knowledge of or information about the design and administration of the Programs.[3] The Task Force has also interviewed several policy experts to provide insight on the structure and features of New Jersey's tax-incentive programs.

Although the Task Force's mandate encompasses both the Grow NJ and ERG programs, its investigation to date has focused primarily on Grow NJ. The Task Force's investigation is ongoing, and it intends to address ERG, as well as other aspects of Grow NJ, in later reports.

Given its mandate of examining the "design, implementation, and oversight" of the tax incentive programs, the Task Force began its analysis by dividing its efforts into two separate but related areas. In the first, it focused on the Programs' legislative underpinnings, examining factors relating to the design of the Programs, including whether special interests played a role in the statutory provisions. In the second, the Task Force focused on the EDA's implementation of the statutes and on its administration of the Programs. This included focus on examining the EDA's review and diligence over program applications to determine whether the EDA was employing meaningful scrutiny of those applications.

Although there is necessarily crossover among the issues encountered in these separate investigative areas, this investigative structure has enabled the Task Force to most efficiently and comprehensively examine the Programs. The description of our findings below follows this general investigative structure. The Task Force's findings are based upon the information available to the Task Force as of this date and are subject to further revision as the Task Force's investigation proceeds and additional information becomes available. In sum, the Task Force has found as follows:

---

A. Special Interests, Which Prioritized Benefits to Private Parties Rather than the State, Had a Significant Impact on the Design of the Grow NJ Statutes and Regulations

With respect to the design of the statute, special interests—in the form of a law and lobbying firm and the clients on whose behalf it apparently operated—appear to have had a significant impact on the design of the Grow NJ statute as amended by the Economic Opportunity Act of 2013 (or "EOA 2013") and its implementing regulations. As a result of those special interests, EOA 2013 was—in several ways—structured to favor certain parties while disfavoring others in certain respects. For example, a statutory provision related to grocery stores in Camden appears to have been drafted to permit a particular grocery store to obtain tax incentives, while prohibiting a competitor grocery store from obtaining such benefits. Although neither grocery store ultimately opened in Camden, the drafts of this provision highlight the significant and, in the Task Force's view, inappropriate role special interests played in crafting the statute.

In addition, the Grow NJ program was dramatically expanded by EOA 2013 in numerous respects. Principal among these amendments were provisions that allowed projects in Camden—where many of the law firm's clients had business interests—to receive awards far in excess of what would have been possible in other parts of the State. Unlike the requirements applicable in other parts of the State that Grow NJ awards be anticipated to result in a net positive benefit to the State in terms of new tax revenue, these large awards for projects in Camden could be based on "phantom" taxes that would never actually accrue and thus might not result in a gain to the public fisc.

B. The EDA Did Not Have Adequate Procedures in Place to Ensure That It Discovered Relevant Information, Including Applicant Misstatements, That Would Have Led to Rejection of Some Applications or a Significant Reduction in the Amount of Certain Awards

With respect to the administration of the Programs, the EDA had only a few formal written policies and procedures to provide guidance to the EDA employees tasked with reviewing companies' applications for tax incentives. Even more troubling, the EDA lacked any formal training to ensure those same employees had a common understanding of Program requirements or clear rules for conducting due diligence on tax-incentive applications, which often involved awards of millions of dollars. This fundamental lack of controls led to important misunderstandings over threshold requirements for applications and inconsistency within the EDA in its evaluation and application of Program requirements—including confusion over even the basic level of scrutiny to be applied to applications, with some EDA employees viewing the vetting process as a "box

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

checking" exercise, during which a company's factual assertions deserved deference, and other employees applying meaningful scrutiny.

Relatedly, the EDA did not have any protocol or written standards for conducting research in connection with companies' applications for Program benefits. As a result, at least with respect to the applications the Task Force has investigated in detail thus far, some EDA employees conducted independent research to verify aspects of applicants' factual assertions and others failed to do so, even when relevant information was readily available. For example:

- A simple internet search revealed that one company, Holtec International, had been debarred by the Tennessee Valley Authority, even though Holtec said it had never been debarred in its Grow NJ application. Although such a debarment would have been grounds for the EDA to deny Holtec's application for tax incentives, the Task Force found no evidence that the EDA discovered Holtec's debarment. Apparently unaware of the debarment, the EDA ultimately approved Holtec for a $260 million Grow NJ award.

- Another simple internet search revealed that three companies—Conner Strong & Buckelew Companies, LLC, The Michaels Organization, LLC, and NFI, L.P.—committed to move to Camden more than a year before submitting their applications for tax incentives, in which they claimed they were considering relocating to Pennsylvania as a potential alternative. Had the EDA's employees found this information,[4] the EDA may have found these applications materially misleading, and denied an award on that basis. At a minimum, armed with this information, the EDA should have calculated these awards based only on new jobs moving to Camden from outside the State, and the awards to these three entities combined would have been reduced by over $70 million.

[4] As we discuss below in Section V(C)(4)(b)(i) of this First Report, we found evidence that the then-President and Chief Operating Officer of the EDA, Tim Lizura, should have reasonably known by September 24, 2015—thirteen months before these three companies applied for tax incentives under the Grow NJ program—that these applicants had committed to the Camden project. This meant that their certifications in their applications that jobs were "at risk" of leaving New Jersey were, at best, dubious. We found no evidence that Mr. Lizura shared this information with either the Business Development Officer or Underwriter responsible for these applications. We continue to investigate this issue.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

To date, our investigation has uncovered no evidence that the EDA intentionally ignored this information, but the failure to have strict guidelines for such research made these lapses possible. Indeed, in another instance, the EDA failed to follow up on red flags (that is, concerns or cause to follow-up) in the actual application materials submitted by the applicant itself. The Cooper Health System acknowledged in its initial application materials that no jobs were at risk of leaving New Jersey and it was not considering any out-of-state locations. The EDA subsequently accepted, without any skepticism or further diligence, Cooper Health's later claim that it was considering an out-of-state relocation, and approved Cooper Health for nearly $40 million in tax incentives. The evidence shows otherwise. Had the EDA calculated Cooper Health's award based on its initial representation that no jobs were at risk of leaving the State, Cooper Health's award would have been approximately $7 million—more than $32 million lower than what it was awarded.

Although the Task Force's investigation is ongoing, below we make a number of recommendations for future legislation, as well as for the EDA's procedures in administering the Programs, based on its findings to date. By way of summary, those include:

- Designing any future legislation to ensure as much as possible that the public policy goals are applied neutrally, without favoring specific business interests;
- Assuring that persons or firms who represent tax-incentive applicants are properly registered as lobbyists under the New Jersey Legislative and Governmental Process Activities Disclosure Act;[5]
- Refraining from providing draft EDA regulations to people or firms that represent tax-incentive applicants outside the public notice-and-comment procedure under the New Jersey Administrative Procedure Act;[6]
- Taking steps to ensure that tax incentives are structured so that they result in a net gain to the State, or, if they do not, that fact is transparent;
- Ensuring that the language of any new legislation and implementing regulations more clearly sets forth the standards to be applied in determining eligibility for tax incentives;
- Strengthening the EDA's ability to withhold all or part of an award where a company has failed to meet its commitments, and ensuring that the EDA has sufficient data to fully evaluate a company's compliance with its incentive agreement;

[5] N.J. Stat. § 52:13C-18 et seq.
[6] N.J. Stat. § 52:14B-1 et seq.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

- Requiring the EDA to implement formal written policies and procedures governing all aspects of the Programs and their administration and to undertake to formally train its staff in how to review Program applications and monitor compliance;
- Requiring the EDA to use an experienced professional services firm to conduct a background check on each applicant and its affiliates and senior executives; and
- Strengthening the EDA's process for conducting diligence into an applicant's claim that it intends to locate out of state absent the award of tax incentives from New Jersey.

In addition to examining the design and administration of the Programs, the Task Force has established an accelerated recertification program, or "ARP," pursuant to which companies can voluntarily submit information to establish that they have been and remain in compliance with all Program requirements. We did this for two reasons: (1) we desired to streamline our work to focus on the most serious issues; and (2) if the EDA did an inadequate job vetting applications, but the applicant had business records to demonstrate its compliance with Program requirements, the EDA's oversight lapses for these applications would not have had a negative impact on the public fisc. Currently, 53 companies have pursued participation in the ARP.[7]

Finally, although our focus has been and shall remain on the EDA, our investigation necessarily involves a review of companies' tax-incentive applications to determine how the EDA administered the Grow NJ and ERG programs. As a corollary to our work, the Task Force has uncovered several instances where Program beneficiaries have—whether intentionally or not—failed to comply with Program requirements, either by submitting inaccurate information in their applications or by subsequently falling out of compliance. The Task Force has obtained some voluntary terminations of awards, and has referred others to the State Treasury or either law enforcement agencies, the EDA, or both, which may result in, among other things, steps to suspend or terminate these awards. The aggregate value of the awards that were either voluntarily terminated or may be subject to such suspension/termination actions exceeds $500 million.

II. INTRODUCTION TO THE PROGRAMS

New Jersey currently has two principal tax-incentive programs: Grow NJ and ERG. A brief summary of both programs follows.

[7] Of these companies, the Task Force has identified several companies that present threshold issues, which must be resolved before the company can proceed with the ARP. The Task Force is working with these companies to obtain additional information before it makes a final decision regarding their participation in the ARP.

State of New Jersey

PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

Grow NJ is generally intended to incentivize the creation of new jobs in the State or the retention of existing jobs that, absent the provision of tax incentives, would be eliminated or relocated outside New Jersey. To qualify for tax incentives under Grow NJ, a company must agree to make a minimum capital investment in a business facility—for example, the company may construct a new office building or rent new office space—at which the company agrees to create a minimum number of new jobs or retain a minimum number of existing jobs that, absent the tax incentives, would be eliminated or relocated out of state.[8] The Grow NJ program is intended to incentivize a company's capital investment and job creation or retention, together often referred to as a "project" by the company To qualify for the tax incentives, the company is usually required to demonstrate that, unless the incentives are provided (in the language of the statute, "but for" the incentives), the company's jobs would be eliminated or located outside New Jersey.[9]

ERG is generally intended to incentivize commercial and residential real estate development in qualifying locations in the State. To qualify for tax incentives under ERG, applicants are required to demonstrate a project financing gap—the costs that remain to be financed after accounting for all other sources of capital. [10]

The Task Force's investigation to date has focused on the Grow NJ program.

III. INVESTIGATIVE PROCESS

In this initial phase of its investigation, the Task Force sought to go beyond the scope of the Comptroller's audit as required by Executive Order No. 52. To that end, the Task Force sought to examine the design of the Programs and, further, to identify and investigate internal-control deficiencies in the EDA's administration and implementation of the Programs. To accomplish these aims, the Task Force established an investigative process for two separate, but related, work streams:

A. First Work Stream: The Design of the Tax-Incentive Programs

To carry out its examination of the design of the Programs, the Task Force needed to examine the history of the statutes relevant to the Programs. These statutes included:

---

[8] *See* N.J. Stat. § 34:1B-244(a).
[9] *See* N.J. Stat. § 34:1B-244(d). The statute has different provisions that apply to projects in Camden and Atlantic City, which replace the "but for" test that is applicable in other parts of the State with an alternative "material factor" test. These provisions are discussed below.
[10] *See* N.J. Stat. §§ 52:27D-489e, 52:27D-489c ("project financing gap" definition).

Governor

- The New Jersey Economic Development Authority Act, which in 1974 created the EDA as a state governmental agency and defined its authority.[11]
- The New Jersey Economic Stimulus Act of 2009 (the "ERG Act"), which created the ERG program in 2009, to be administered by the EDA.[12]
- The Grow New Jersey Assistance Act (the "Grow NJ Act"), which created the Grow NJ program in 2012, also to be administered by the EDA.[13]
- The New Jersey Economic Opportunity Act of 2013 ("EOA 2013"), which significantly revamped and expanded both the Grow NJ and ERG programs in 2013.[14]
- Multiple subsequent statutory amendments that revised the Grow NJ and ERG programs in relatively more minor ways between 2013 and the present.

Since the Governor's investigatory power is limited to the Executive Branch,[15] the Task Force did not affirmatively investigate the Legislature itself or its passage of these statutes, beyond what is available in the public domain. However, the statutes collectively create and define the Programs and, in addition, set out the parameters of the EDA's lawful discretion in its administration of them. As such, it is both within the Task Force's mandate—and necessary to the Task Force's mission—to analyze all pertinent aspects of the controlling statutory design, as embodied in the relevant statutes.

The Task Force began its analysis of the statutory design and history with publicly available documents, including the current versions of the statutes themselves and proposed and enacted bills and legislative statements.[16] The Task Force also reviewed and analyzed certain non-public evidence bearing upon the statutory design. During the investigation, the Task Force obtained draft

[11] P.L. 1974, c. 80 (current version codified at N.J. Stat. § 34:1B-1 et seq.).

PHILIP D. MURPHY
Governor

versions of the EOA 2013 bill dated June 21, 2013.[17] The draft reflected revisions made in "track changes" mode and included metadata showing the author of each respective revision. The Task Force also acquired and analyzed a substantial number of documents from governmental sources, including the EDA. In many cases, these documents provided further evidence concerning relevant context surrounding the statutory design and the parties who impacted it.[18] The Task Force also spoke to witnesses who provided context concerning the special interests that affected the statutory design in various respects.

Through review and analysis of these public and non-public materials, the Task Force acquired significant information concerning the design of the Programs and the limitations on the EDA's discretion in its administration of them. The Task Force received evidence demonstrating that the EDA opposed some of these statutory provisions and in certain instances advocated for alternative provisions. However, because they were enacted into law, the EDA was required to faithfully administer them, irrespective of whether they were justifiable as sound policy.

The Task Force also analyzed the design and history of the EDA's implementing regulations for the Programs. Like other governmental agencies tasked with the administration of government programs, the EDA is authorized by New Jersey law to promulgate regulations that interpret the statutes implemented by the agency, including the Grow NJ and ERG Acts. While agency regulations must be faithful to the laws they implement, they may provide additional rules beyond those expressly set out by the statutes—in this way, agency regulations serve to effectively "fill in the gaps" in the statutes. The New Jersey Administrative Procedure Act (the "APA") sets out certain procedures that New Jersey agencies, including the EDA, must follow when promulgating regulations.[19] The APA requires a so-called "notice-and-comment" process in which agencies, before issuing final regulations with the force of law, must first provide the public with notice of the regulations they are considering and receive and consider comments from interested members

---

[17] One of these draft versions was in the EDA's files. In addition, the Task Force learned that a law firm likely had additional versions of the draft legislation. Although this firm initially promised full cooperation with the Task Force, it subsequently declined to produce these versions without a subpoena.

[18] This investigation revealed that certain persons appeared to have engaged in unregistered lobbying in New Jersey, in apparent violation of the New Jersey Legislative and Governmental Process Activities Disclosure Act, N.J. Stat. § 52:13C-18 et seq. The Task Force referred this matter to appropriate law enforcement authorities, as previously disclosed.

[19] *See* N.J. Stat. § 52:14B-1 et seq.

Governor

of the public. The Task Force has investigated the EDA's processes in this respect, primarily through analysis of documents and information provided by the EDA.

B. Second Work Stream: EDA's Administration of the Tax-Incentive Programs

To carry out its examination of the EDA's administration and implementation of the Programs, the Task Force established an Investigative Process to methodically identify, collect, review, and analyze pertinent information and data. The Task Force began by conducting a linear investigation of the Grow NJ and ERG application processes, from pre-application discussions through approval to annual certification and credit of the tax incentive awards. We examined these processes both by looking at the EDA's internal processes and files and by gathering information about, and from, the companies that were awarded incentives under the Programs.[20] At the onset of our investigation, we met with Friedman Kaplan Seiler and Adelman LLP ("Friedman Kaplan"), counsel for the EDA to get an overview of the EDA's processes and procedures. We then deepened our understanding of the processes and applicants—and various issues with them—through interviews of relevant personnel (both from within the EDA and outside the EDA) and review of relevant documents. As discussed below, the initial scope naturally expanded as the Task Force acquired, reviewed, and analyzed relevant evidence bearing on the EDA's processes and individual companies.

1. Background Meetings

The Task Force requested to meet with the EDA, State Treasury, and the State Comptroller's Office immediately after its inception to better understand the interplay of various State agencies involved in the process. At the initial meeting referenced above, Friedman Kaplan provided a high-level overview of the application process from pre-application through certification of a tax-incentive grant. Friedman Kaplan has continued to work cooperatively with the Task Force to produce documents and information and to review and assess the internal processes and controls within the EDA as they relate to the tax-incentive programs.

The Task Force also met with members of the Treasury Department's Division of Taxation (the "Treasury"). The Treasury provided an overview of its role in the administration and implementation of the Programs. Beyond a general overview, Treasury explained the

[20] Although we have begun our investigation of the certification and credit-award processes, our investigation thus far has largely been focused on the earlier stages of the approval process.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

documentation, memoranda, and certifications it reviews and approves before awarding a tax credit to a Program applicant.

The Task Force interviewed State Comptroller Philip Degnan and members of his audit team with the goal of obtaining a better understanding of the Comptroller's findings regarding the EDA's processes and procedures. Comptroller Degnan and his team provided an overview of their audit and findings and have continued to work collaboratively with the Task Force to provide information and offer consultation with respect to the Comptroller's audit.

The Task Force requested ongoing cooperation with the EDA and the State Comptroller's Office and for both entities to ensure that they were preserving relevant documents. The EDA, Treasury, and Comptroller's office have provided the Task Force with numerous documents in response to our requests. The bulk of the documents the Task Force has obtained have come from the EDA. Thus far, the Task Force has obtained over 1,069,789 pages of materials from the EDA and is continuing to conduct a strategic review of these materials.

2. Definition of Scope and Document Preservation and Collection

The Task Force worked collaboratively with the EDA to compile a list of all companies that have been certified to receive a Program award and did in fact receive a tax credit. Based on these parameters, there were 106 projects in the Task Force's initial scope. The Task Force subsequently expanded the scope of its investigation to include certain additional companies that had been approved for a tax-incentive award but that had not yet received tax credits. Those companies are discussed in more detail below.

a) Document Preservation and Company Outreach

The Task Force sent document preservation directive letters to companies that were identified as within its initial scope. The preservation notice informed the companies that the Task Force may seek information and documents relevant to the Programs and that the companies should take affirmative steps to ensure that all relevant documents would be preserved. To date, the Task Force has sent preservation letters to 116 companies.[21] In addition, the Task Force sent preservation notices to additional entities identified as related to Program applications and legislative design. In order to understand the EDA's review process for Program applications, the Task Force sought to identify what business records and documents existed, which would bear on company applications and certifications, even if the EDA chose not to request such documentation. The EDA has broad

[21] This includes companies that did not fall within the Task Force's initial scope but were later added to the investigative work stream based on leads obtained during the investigation.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

authority to request additional information from applicants,[22] but did not use this express authority in every case.

The Task Force reached out to each company to confirm (a) that the company had received the preservation directive; and (b) that the company was taking requisite steps to comply with the directive. The Task Force made contact with a majority of the companies. However, there is still a small number of companies that have not been reached due to inaccurate contact information, dissolution of the company, or failure of the company to respond.

b) Refinement of Scope

In order to methodically review the EDA's oversight of Program applications, as discussed below in detail, the Task Force created an "accelerated recertification program" ("ARP"). In the ARP, the Task Force is providing companies an opportunity to demonstrate that they (a) are in compliance with the Programs and (b) applied for tax incentives in good faith. For companies that successfully recertify through the ARP, the Task Force has agreed not to request further documents or information.

The Task Force segregated processes for companies enrolled in the ARP from the remaining companies (the "Non-ARP Group"). As of the date of this report, there are 63 companies in the Non-ARP Group. For these companies, the Task Force is conducting a thorough investigation of the EDA's oversight of these applicants. We also interviewed a number of witnesses, who provided information concerning relevant misconduct by individuals associated with Program applicants.

The Task Force initially focused on Program applications where a "red flag" had been raised through our initial document review and interviews. In this regard, a draft of EOA 2013 edited by Parker McCay, a law and lobbying firm that represented several clients whose interests, as discussed below, were impacted by EOA 2013 played an important role in our focus. Because those drafts were edited by a private law and lobbying firm, which seemed to be adding special provisions to the bill to benefit particular clients, the Task Force viewed this as a serious "red flag" for those clients who certified that their jobs were "at risk" of leaving the State. The Task Force was skeptical that a client, on the one hand, would consult with their lawyer about—what amounted to—special legislation for their benefit but, on the other hand, was seriously considering a move

[22] *See* N.J. Admin. Code §§ 19:31-18:5 (Grow NJ) and 19:31-4.4 (ERG) (setting forth application submission requirements and providing that the EDA may request "any other necessary and relevant information as determined by the [EDA] for a specific application").

OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

out of the State knowing it could receive very significant awards through the inclusion of those provisions.

c) Company and Third-Party Production of Documents

The Task Force has also obtained relevant documents from companies in the Non-ARP Group, from consultants and lawyers retained by companies in connection with their Program applications, and from additional parties with relevant information. The Task Force sought voluntary cooperation from all companies, individuals, and related entities, but when necessary, the Task Force recommended that Professor Chen issue subpoenas to obtain relevant documents.

3. Witness Interviews

In addition to the initial interviews described above, the Task Force has conducted numerous interviews of individuals relevant to is mandate. The Task Force has interviewed 12 current EDA employees. The employees interested were involved in the application pre-approval process at the officer, manager, and director levels as well as individuals in Human Resources, Operations and tax credit transfer positions. The Task Force has interviewed 2 former EDA employees who held senior leadership positions, Tim Lizura, the former President and Chief Operating Officer, and Maureen Hassett,[23] a former Senior Vice President of Finance and Development.

The Task Force also reached out to non-EDA individuals and potential witnesses identified as having information relevant to the Programs or to award recipients. Thus far, the Task Force has interviewed 14 non-EDA witnesses.

IV. LEGISLATIVE FOCUS: THE DESIGN AND IMPLEMENTATION OF THE TAX-INCENTIVE PROGRAMS

A. Initial Findings

As further discussed below, the draft versions of the EOA 2013 bill dated June 21, 2013, reviewed in conjunction with publicly available versions of the bill and other documents and information in the Task Force's possession, indicated that certain special interests played a key role in numerous provisions that were ultimately enacted into New Jersey law, and which, when administered by the EDA, would provide significant benefits to those special interests. Certain aspects of the Grow NJ program's design are difficult to justify from a rational policy perspective and can be understood only as the result of a process in which certain favored private parties were

[23] Ms. Hassett is currently working with the Treasury Department, but is still employed by the EDA.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

permitted to shape the legislation to their benefit—and further, in some cases, to disfavor potential competitors.

The Task Force has found that the same special interests who successfully impacted the legislative design of the Programs were also afforded privileged status with respect to the Programs' implementing regulations. The EDA provided these special interests with early information about the regulations the agency was considering, prior to the notice provided to other members of the public, and permitted them to provide private feedback—which, in some instances, the EDA accepted and incorporated into the regulations. Moreover, the influence exerted by these special interests over this process was not disclosed to the public.

Thus, the Task Force's investigation to date has found that special interests succeeded in molding both the Programs' legislation and implementing regulations in their favor. The result is that New Jersey's tax-incentive programs have not been "neutral" in their design but have rather been structured in respects both large and small to favor the business interests of favored parties, sometimes in ways of debatable merit from a public policy standpoint. This is troubling for many reasons, including that the New Jersey Constitution contains certain prohibitions on "special legislation."[24] These constitutional prohibitions, the New Jersey Supreme Court has explained, were intended to combat "the propensities of legislatures to indulge in favoritism."[25] Given the findings discussed below, there may be reasonable questions as to whether New Jersey's current tax-incentive laws are compatible with constitutional requirements.

Some will certainly note that the problematic examples described below center on projects located in the City of Camden. The Task Force should not be misunderstood as disagreeing in any way about the desirability—indeed the necessity—of the State finding ways to encourage substantial reinvestment and growth in Camden, and in helping it meet the substantial challenges that it faces. Reinvestment in Camden has rightly been a priority for governors from both major political parties for decades. But as laudable as that *end* is, it does not necessarily justify, without any question or limitation, every conceivable *means* to accomplish it. "Shoehorning" the priority of *capital investment* in Camden in the Grow NJ program, the priority of which is the equally desirable but very different goal of *job growth*, has led to confusion in eligibility criteria, mismatched metrics of accountability, and lack of enforcement of the program requirements by the very agency that is responsible for monitoring it. Allocation of scarce public resources must inevitably involve some inquiry into the relationship, and resulting efficiency, between ends and

[24] N.J. Const., art. IV, § VII, ¶¶ 7-9.

PHILIP D. MURPHY
Governor

means, and the absence of that logical nexus has been painfully evident in the course of the Task Force's work.

1. Influence by Special Interests in Grow NJ's Legislative Design

The Grow NJ program was created in 2012 by the Grow NJ Act.[26] Compared to the version of Grow NJ that exists today, the original iteration of the program was relatively modest. Individually, the maximum awards available to program beneficiaries were far smaller than the maximum awards now possible under the current version of Grow NJ. Collectively, the original Grow NJ program provided a programmatic cap of up to $200 million in tax credits that the EDA could approve.[27] The current version of Grow NJ, by contrast, has no such programmatic cap, which has allowed tax incentive approvals to balloon to the point that billions are now outstanding. Indeed, under the current version of Grow NJ, multiple companies have been individually approved for awards in excess of $200 million in tax incentives, meaning that each of these companies by itself exceeded the maximum programmatic cap under the original iteration of the Grow NJ program.

The original version of Grow NJ existed for less than two years before it was significantly revamped and expanded by EOA 2013. The initial EOA 2013 bill was introduced in the New Jersey General Assembly on January 14, 2013 as Assembly Bill Number 3680. The Assembly passed the bill on May 20, 2013, and sent it to the Senate.

The Task Force has received evidence and information demonstrating that, during this period when EOA 2013 was before the Senate, certain special interests became involved in the drafting process—namely, the Parker McCay P.A. law and lobbying firm based in Mount Laurel, Hamilton, and Atlantic City, which drafted large swaths of the bill in various respects that appear to have been intended to benefit the firm's clients. Based on evidence and information in possession of the Task Force, Philip A. Norcross, Parker McCay's Managing Shareholder and Chief Executive Officer, and Kevin D. Sheehan, another partner of the firm, both worked on the drafting of the bill. Among other apparent intended beneficiaries of Parker McCay's drafting work was the Conner Strong & Buckelew insurance brokerage firm, headed by its Executive Chairman, George E. Norcross, III—the brother of Philip A. Norcross. Several years after EOA 2013 was enacted, on March 24, 2017, Conner Strong & Buckelew was approved for an $86 million award to relocate its

[26] P.L. 2011, c. 149.
[27] The EDA was also statutorily permitted to raise the programmatic cap if it would determine that doing so was "reasonable, justifiable, and appropriate."

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

offices to Camden. An award of that size would have likely been impossible if not for statutory amendments that Parker McCay played a pivotal role in incorporating into the legislative design.

The Task Force has received two Microsoft Word draft versions of the bill, both dated June 21, 2013—one draft dated several hours earlier than the other one—with revisions in "track changes" mode. The metadata in these documents appear to attribute many, but not all, of the revisions in the bill to Mr. Sheehan of Parker McCay.[28] In addition to this metadata, other documents and information in the Task Force's possession further corroborate that Mr. Sheehan, with the potential influence of Mr. Norcross, drafted these changes to the bill.

On June 24, 2013, the Senate Budget and Appropriations Committee favorably reported its amended version of the bill, which incorporated many of the bill revisions that were drafted in whole or in part by Parker McCay and reflected in the June 21, 2013 working drafts. As a result of these changes, the bill dramatically expanded in both length—the version of the bill favorably reported by the Senate committee was double the length of the bill that had been passed by the Assembly—and substantive scope. Numerous provisions were added to the bill expanding the availability of tax incentives under the Grow NJ program.

On June 27, 2013, the Senate passed its version of the EOA 2013 bill, incorporating many of Mr. Sheehan's revisions, and returned the bill to the Assembly. That same day, the Assembly concurred in the amended bill, with additional amendments, and returned it to the Senate. The Senate passed the amended bill on August 19, 2013, sending it to the Governor. Governor Chris Christie conditionally vetoed the bill on September 9, 2013, recommending limited revisions. The Assembly and the Senate both concurred in Governor Christie's recommended revisions and returned the bill to him. The EOA 2013 was finally enacted into law on September 18, 2013. The provisions of the bill drafted in whole or in part by Parker McCay largely survived this iterative process and were included in the final bill enacted into law.

Several of the most important or otherwise notable aspects of Grow NJ's amendments under the EOA 2013 are discussed below. These amendments, each of which Parker McCay appears to have had some role in drafting, are illustrative of some of the ways Grow NJ's statutory design following the enactment of the EOA 2013 was structured to favor chosen special interests in ways both large and small, sometimes arguably to the detriment of the public interest. It is important to

[28] These draft versions of the bill are attached as Exhibits 1 and 2. The authorship information in the metadata is not visible in these exhibits.

PHILIP D. MURPHY
Governor

note that the EOA 2013's changes to the Grow NJ program were innumerable and complex, and most will not be discussed in this First Report.

a) Tax Incentives for Grocery Stores in Camden

Grow NJ, both in its original and current iterations, has generally precluded tax incentives for retail businesses.[29] The EOA 2013 included several provisions, however, drafted in part by Parker McCay, which expressly authorized the EDA, as an exception from the otherwise applicable exclusion for retail projects, to award tax incentives to companies that would build grocery stores in Camden. The policy basis to incentivize development of grocery stores in Camden is readily apparent, because Camden has for decades been described as a "food desert" in which there are insufficient grocery stores to serve the city's residents.[30]

However, notwithstanding the indisputable need to increase food access in Camden, the EOA 2013 did not allow tax incentives for all or even most potential grocery stores that could be built in the city. Instead, the EOA 2013 amended the Grow NJ statute to allow tax incentives for a "full-service supermarket or grocery store" *only* if it would be "at least 50 percent" of a larger retail development "of at least 150,000 square feet."[31] Therefore, the grocery store itself must be at least 75,000 square feet at a minimum to qualify for tax incentives. For reference, the average American grocery store size around this time was reported to be approximately 46,000 square feet—far below the minimum threshold size required to qualify for tax incentives under Grow NJ as amended by the EOA 2013.[32] If the goal was to alleviate the lack of local food access for Camden residents, an ostensible policy justification for limiting the incentives to supersized grocery stores, while

---

TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

excluding such incentives for grocery stores of average or even large sizes that would also provide Camden residents with increased food access, is not obvious.[33]

The Task Force's investigation to date has found that the cause of this statutory limitation appears to have not likely been considerations of the public interest, but rather the private business interests of one of Parker McCay's clients. In March of 2013, before the EOA 2013 was enacted, the owners of several grocery stores in New Jersey and a development firm announced that they had partnered in a joint venture to open a ShopRite grocery store in Camden, which would anchor a larger retail shopping center.[34] Mr. Sheehan and Mr. Norcross of Parker McCay represented the retail project, which, when completed, was planned to be over 150,000 square feet, with at least 50 percent occupied by the grocery store. Meanwhile, around this same time, another developer had separate plans to build a different retail development in Camden that would also be anchored by a grocery store. This competitor retail development was planned to be smaller, such that it would not qualify for tax-incentive subsidies under the EOA 2013 amendment, while the retail development that Parker McCay represented would.

It should be noted that both projects ultimately failed, and neither grocery store was built. The Task Force has received evidence demonstrating that the project Parker McCay represented initiated efforts to receive tax incentives from the EDA, but the project collapsed before any award was approved.[35] The competitor project, which was necessarily disqualified for tax incentives as a result of this EOA 2013 amendment, also failed.

---

[33] EDA's former President and Chief Operating Officer Tim Lizura testified at the Task Force's May 2, 2019 public hearing that "[y]ou can make an argument" for tax incentives for grocery stores of any size in Camden, but with respect to this limitation, "it didn't offend us that that was the provision that was there." b) The Alternative Approach to Award Calculation for Incentivized Camden Projects

As a general rule, the Grow NJ Act provides that the size of a tax incentive award is determined by a relatively straightforward formula that is tied to the number of new jobs created by the company in New Jersey and/or the number of existing jobs retained by the company in New Jersey that, absent the tax incentive award, would be relocated out of state or eliminated.[36] First, a "base" amount per job—ranging from between $500 to $5,000 annually—is determined based on certain statutorily defined factors (primarily the location of the project).[37] Second, any applicable statutorily defined "bonus" amounts are applied to increase the total award per job.[38] For example, jobs in a "targeted industry" (the EDA is statutorily authorized to determine which industries are "targeted") are eligible to receive an increase of $500 annually per job.[39] Under this statutory formula, the maximum possible award per job is $15,000 annually.[40]

However, provisions of the EOA 2013, drafted in part by Parker McCay, amended the Grow NJ statute to set out an additional, alternative approach to award calculation exclusively for incentivized projects located in Camden. Under these provisions, the award calculation for Camden projects is effectively decoupled from the number of jobs created or retained by the company, and is instead tied to—and, unless capped by an applicable statutory limitation, equal to—the size of the company's capital investment in the project.[41] These provisions have allowed companies that agreed to make large capital investments in projects located in Camden to qualify for awards far exceeding the amounts that would have otherwise been permitted.

For an illustration of the difference between the statutory formula approach under Grow NJ for award calculation and what is often referred to as the "Camden alternative" approach, consider a hypothetical project in which a company will invest $100 million to build a new office building in New Jersey at which the company plans to hire 250 new employees. Under the formula approach applicable to projects in most of the State, with a maximum annual per-job award of $15,000, as

---

build a 130,000-square foot headquarters on the site. . . . No explanation has been provided for why the ShopRite project collapsed.").

[37] *See* N.J. Stat. § 34:1B-246(b).

[38] *See* N.J. Stat. § 34:1B-246(c).

[39] *See* N.J. Stat. §§ 34:1B-246(c), 34:1B-243 ("targeted industry" definition).

[40] *See* N.J. Stat. § 34:1B-246(d).

[41] *See* N.J. Stat. § 34:1B-246(d) (subsection beginning, "Notwithstanding anything to the contrary set forth herein and in the provisions of subsections a. through f. of this section . . .").

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

discussed above, the largest possible award for the company would be $3.75 million each year ($15,000 x 250 jobs). Over the ten-year term for awards under Grow NJ, the maximum award would be $37.5 million ($3.75 million x 10 years). If the project were in Camden, however, and subject to the Camden alternative approach to award calculation, the company could receive an award of $100 million, equal to the size of the anticipated costs to build the new office building—over twice the size of the maximum award available in other parts of the State.

Numerous Parker McCay clients have benefited from the Camden alternative approach to award calculation. As noted previously, Parker McCay client, the Conner Strong & Buckelew insurance brokerage firm, was approved by the EDA on March 24, 2017 for an $86 million award to relocate 268 jobs from the company's existing offices to a new office tower to be built on the Camden waterfront. Pursuant to the Camden alternative provisions of EOA 2013, this award was based on the claimed anticipated costs of the office tower's construction. Under the formula approach to award calculation, the company could have potentially, in the best possible circumstances for it, qualified for a maximum award of $40.2 million ($15,000 x 268 jobs x 10 years).

The Task Force has not conducted an economic analysis of the approaches to award calculations under Grow NJ and therefore has made no finding concerning whether the increased size of Camden alternative awards is sensible as a matter of public policy. Indeed, given the enormous challenges facing Camden, one of New Jersey's poorest cities, an up-front decision by the State to appropriate substantial resources—through the normal procedures for allocating State resources—to invest in the capital infrastructure would have been completely understandable.

However, while there are certainly rational policy justifications for providing incentives for capital projects located in Camden, the Camden alternative approach in the EOA 2013, which do so in the context of an enhanced tax-incentive program ostensibly dedicated to job growth, has been criticized as excessive by a number of parties given the potentially large cost to the State, and even many of its defenders have said that it may need to be appropriately reconsidered in future legislation. For example, a July 2018 report (the "Rutgers Report") by Will Irving, Michael L. Lahr, and Ray Caprio of the Edward J. Bloustein School of Planning and Public Policy at Rutgers, the State University of New Jersey, which analyzed data concerning Grow NJ awards approved by the EDA to date, found that the average cost in tax incentives per job incentivized by the formula approach was $55,888, while the average cost per job under the Camden alternative approach was

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

$340,000—over six times more.[42] The Rutgers Report recommended that the Camden alternative approach "be revised to tie awards more closely to the employment created by these firms."[43]

Additionally, it should be noted that the "capital investment" definition in the statute, which, as described above, effectively operates to define the expenditures for which companies are eligible to receive recompense via tax credits, is extremely broad. The statute defines "capital investment" with respect to projects in Camden to include, among other things, any and all "development, redevelopment, and relocation costs."[44] The result is that a broad range of expenditures in Camden by Grow NJ beneficiary companies may be effectively reimbursed via tax credits—notably, including expenditures for which the public interest in state subsidization is debatable. For example, the new office tower on the Camden waterfront for which Conner Strong & Buckelew was approved for an $86 million award included a rooftop helipad, the construction of which is within the scope of the statutory "capital investment" definition. Whether Grow NJ was intended to enable the State to subsidize helipads for corporate executives can reasonably be questioned.

c) Expansion of Capital Expenditures Eligible for Tax Credits

As discussed above, the "capital investment" definition in the Grow NJ statute effectively operates to define the expenditures for which companies with projects in Camden are eligible to receive recompense via tax credits. It appears that Kevin Sheehan of Parker McCay had a role in amending the statute's "capital investment" definition in two ways apparently intended to benefit the firm's clients.[45]

First, Mr. Sheehan appears to have amended the definition to include, as an eligible expenditure, "pier, wharf, [or] bulkhead . . . construction or repair."[46] This amendment was likely intended to benefit several Parker McCay clients, including Conner Strong & Buckelew, that, as discussed in Section V(C)(4)(b) of this First Report, had plans to construct a new office tower on a pier on the Delaware River waterfront of Camden. As a result of this amendment, these clients would be allowed to receive tax credits for any such construction or repairs on the pier.

[42] Rutgers Report at i–ii. The Rutgers Report is available on the EDA's website, at https://www.njeda.com/pdfs/NJEDA-Final-Incentives-Report_Governor.aspx.
[43] Rutgers Report at iii.
[44] *See* N.J. Stat. § 34:1B-243 ("capital investment" definition).
[45] In addition, it is notable that the "capital investment" definition was expanded to include expenditures on "professional services." However, the metadata does not reflect that Kevin Sheehan made that amendment.
[46] *See* N.J. Stat. § 34:1B-243 ("capital investment" definition).

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

Second, Mr. Sheehan appears to have also amended the "capital investment" definition to include "site acquisition" as an eligible expenditure if purchased within 24 months prior to the Grow NJ application, thereby allowing the firm's clients with planned projects in Camden to potentially receive tax credits for real estate that the company purchased before even applying to the EDA for the tax incentives.[47] This amendment has a clear tension with the overarching purpose of tax-incentive programs, which are intended to incentivize companies to make decisions that they have not already made and would not make absent the incentive. This provision, by contrast, affords tax credits for company decisions already made—that is, real estate already purchased. Precisely because of this tension, the EDA's former President and Chief Operating Officer Tim Lizura testified at the Task Force's May 2, 2019 public hearing that this provision "was always a challenge to administer" and he "never really understood the policy behind it."[48]

d) Phantom Taxes in the Net Benefit Test

Under the Grow NJ Act, every tax-incentive award must be anticipated to "yield a net positive benefit to the State."[49] In this context, the "benefit to the State" means tax revenues collectible by the State as a result of the fruition of the project for which the tax incentives were awarded—that is, tax revenue that the State would not collect in the absence of the tax incentives. For example, consider construction work in New Jersey that would not occur unless tax incentives are provided. If the incentives are awarded and the construction is commenced, any taxes collected by the State as a result of such incentivized construction, such as property taxes on the developed property and sales taxes on the building materials used in the construction, are "benefits to the State." Because of this so-called "net benefit" requirement under the Grow NJ Act, tax incentives under the Program are sometimes said to effectively "pay for themselves." That is, if the statute operates as intended, the State will collect tax revenue at least in the amount that the State "spends" on tax incentives, meaning that there is no loss to the public fisc.

---

[47] Although the text of this provision has been revised by subsequent statutory amendments, Mr. Sheehan's amendment remains in substance in the current law. *See* N.J. Stat. § 34:1B-243 (defining "capital investment" in pertinent part: "In addition to the foregoing, in a Garden State Growth Zone [including Camden], the following qualify as capital investment: . . . site acquisition if made within 24 months of application to the [EDA]").

[48] Hr'g Tr. (May 2, 2019) at 228:11-230:19. As for why the provision would allow tax credits for site acquisition up to two years prior to the Grow NJ application but not earlier periods, Mr. Lizura said that he did not know of a policy reason for the distinction. *Id*. at 233:6-14.

[49] N.J. Stat. § 34:1B-244(a)(3).

OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

However, the EOA 2013's amendments to the Grow NJ program included certain provisions that significantly undermined the net benefit requirement for projects in Camden. Pursuant to these provisions, the net benefit calculation "may utilize" the value of certain taxes that would otherwise accrue but were exempted from payment by operation of other provisions of law.[50] In other words, the Grow NJ Act was amended to provide that the net benefit calculation for projects in Camden may include "phantom taxes" as ostensible "benefits to the State" even if the State will never collect those taxes. As a result of these provisions, the "net positive benefit to the State" that is purportedly required by the law may be rendered illusory.[51]

The bill drafts in Microsoft Word format in the Task Force's possession, both dated June 21, 2013, do not contain these provisions, which were apparently not yet incorporated into the bill as of this date.[52] Therefore, the Task Force does not have a document with metadata that indicates the author of these provisions. However, the Task Force is in possession of email correspondence between government officials who were involved in the EOA 2013's drafting that refers to "the 'phantom tax' notion for NBT that Phil and Kevin laid out in [the] original bill draft."[53] Because Parker McCay represented numerous clients with project plans in Camden, these provisions would have allowed these companies to potentially receive large Grow NJ awards—pursuant to the Camden alternative approach provisions discussed above—without the State receiving a corresponding net positive benefit.[54]

---

[50] N.J. Stat. § 34:1B-244(a)(3)(b).

[51] At the Task Force's May 2, 2019 public hearing, the EDA's former President and Chief Operating Officer Tim Lizura was asked whether these provisions "allowed projects to get through even though they weren't paying for themselves." Mr. Lizura responded, "I would say that's a pretty accurate statement." Hr'g Tr. (May 2, 2019) at 257:9-15.

[52] We have been advised that a law firm has additional versions of drafts of EOA 2013 from this time period. The Task Force has attempted to obtain these drafts through voluntary cooperation from that firm. To date, we have not been successful.

[53] Exhibit 3. The EDA's Tim Lizura, who received this email, testified concerning the email's reference to "Phil": "I assume that's Phil Norcross." Hr'g Tr. (May 2, 2019) at 251:3-19.

[54] Mr. Lizura testified that he recalled the following companies with approved Grow NJ awards as having benefited from the phantom tax provisions: Holtec International, Philadelphia 76ers, L.P., American Water (American Water Works Company, Inc., American Water Works Service Company, Inc., and American Water Enterprises, Inc.), Subaru of America, Inc., Conner Strong & Buckelew Companies, LLC, The Michaels Organization, LLC, NFI, L.P. When asked whether Parker McCay represented all of those companies, Mr. Lizura responded, "I recall they represent[ed] some, some role in most of those." Hr'g Tr. (May 2, 2019) at 257:16-258:14.

e) The Material Factor Test Applicable to Camden Projects

For incentivized projects in most parts of New Jersey, it is indisputable that, for a company to receive Grow NJ tax incentives for existing jobs in New Jersey, those jobs must be at risk of leaving the State or being eliminated. This is clearly set out in the statutory text, which requires companies to establish that "but for" the provision of tax incentives, the jobs would be relocated out of state or eliminated:

> "[T]he business's chief executive officer, or equivalent officer, shall submit a certification to the [EDA] indicating: (1) that any existing full-time jobs are at risk of leaving the State or being eliminated; (2) that any projected creation or retention, as applicable, of new full-time jobs would not occur but for the provision of tax credits under the program; and (3) that the business's chief executive officer, or equivalent officer, has reviewed the information submitted to the [EDA] and that the representations contained therein are accurate . . . ."[55]

As discussed above, the Task Force reviewed the June 21, 2013 EOA 2013 bill drafts.[56] The metadata in these documents appear to show that Kevin Sheehan of Parker McCay amended the above-quoted language to add a provision expressly stating that the risk of an out-of-state relocation "shall not be required with respect to projects in [Camden]." Mr. Sheehan proposed to amend the provision as follows:

> "[T]he business's chief executive officer, or equivalent officer, shall submit a certification to the [EDA] indicating that: (i) any existing full-time jobs are at risk of leaving the State or being eliminated; (ii) that any projected creation, or retention as applicable, of new full-time jobs would not occur but for the provision of tax credits under the program; and, (iii) that the business's chief executive officer, or equivalent officer, has reviewed the information submitted to the [EDA] and that the representations contained therein are accurate, **provided however, item (i) shall not be required with respect to projects in [Camden]**. . . ."[57]

---

[55] N.J. Stat. § 34:1B-244(d).
[56] Exhibits 1 and 2.
[57] Additionally, in the current version of the statute, there is also language that makes this provision apply to projects in Atlantic City as well as to projects in Camden. The Atlantic City language was

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

(Emphasis added).

On Friday, June 21, 2013, at 8:12 PM, an aide to then-Governor Chris Christie, Colin Newman, who was involved in EOA 2013's drafting, sent an email to several senior EDA officials—Tim Lizura, Maureen Hassett, and Michele Brown—attaching a working draft of the bill containing the above-quoted amendment by Mr. Sheehan of Parker McCay.[58] Mr. Newman noted in the email that the bill draft presented certain "issues" that needed to be discussed over the weekend.[59] On Sunday, June 23, 2013, at 10:31 PM, Mr. Newman sent an email to Mr. Lizura and Ms. Hassett, stating that they needed to prepare "compromise language" with respect to the above-quoted provision.[60] Mr. Newman proposed language that would have restored the requirement that, for projects in Camden, there be a risk of out-of-state relocation to receive tax incentives for retaining jobs.[61] Throughout the morning and afternoon of Monday, June 24, 2013, Mr. Newman, Mr. Lizura, and Ms. Hassett proceeded to iteratively draft additional versions of proposed compromise language, while appearing to complain that the other side of the negotiations continued to produce "unsatisfactory" counterproposals.[62]

By the afternoon of June 24, 2013, the negotiating parties appear to have agreed to compromise language that rejected the "shall-not-be-required" language that Mr. Sheehan had drafted and replaced it with a "material factor" test that was ultimately enacted into law, and is still embodied in the version of the statute in force now. That material factor test is as follows:

> "[T]he business's chief executive officer, or equivalent officer, shall submit a certification to the [EDA] indicating: (1) that any existing full-time jobs are at risk of leaving the State or being eliminated; (2) that any projected creation or retention, as applicable, of new full-time jobs would not occur but for the provision of tax credits under the program; and (3) that the business's chief executive officer, or equivalent officer, has reviewed the information submitted to the [EDA] and that the representations contained therein are accurate, provided however, that **in satisfaction of the provisions of paragraphs (1) and (2) of this subsection, the certification**

---

added in 2014 statutory amendments. Because the current discussion concerns EOA 2013's amendments, which did not yet apply to Atlantic City, we omit that language here.

[58] Exhibit 4.
[59] Exhibit 4.
[60] Exhibit 5.
[61] Exhibit 5.

> **with respect to a project in [Camden[63]] . . . shall indicate that the provision of tax credits under the program is a material factor in the business decision to make a capital investment and locate in [Camden]** . . . ."

(Emphasis added).[64]

Thus, the statute provides that, for projects in Camden to be eligible for tax incentives, the company must be facing a "business decision" concerning where to "locate." One option must be Camden, and the provision of tax incentives must be a "material factor" in the company's decision to locate there. However, the statutory text *does not specify one way or the other* whether the "business decision" concerning the company's location (a) must be between Camden versus an out-of-state location or (b) may be between Camden versus another New Jersey location. No court has yet had occasion to interpret this clause and resolve this statutory ambiguity concerning whether tax incentives are available for intra-state relocations to Camden when no potential out-of-state relocation is considered. From the Task Force's perspective, the former interpretation—that is, that tax incentives for projects relocating to Camden, like tax incentives for projects relocating elsewhere, are available only if the company is considering a potential out-of-state location—is likely the better interpretation. This is so for at least two reasons. First, the New Jersey Supreme Court has repeatedly taught that "the furtherance of legislative purpose is the key to the interpretation of any statute,"[65] and here, the Grow NJ statute expressly states that a purpose of the program is to "preserve jobs that currently exist in New Jersey but which are in danger of being relocated outside of the State."[66] The statute does *not* say that its purpose is to incentivize the relocation of jobs to Camden from elsewhere in New Jersey, even if those jobs are not at risk of

---

[63] The statutory text that is replaced here with the bracketed "Camden" notation for ease of readability is the following: "a Garden State Growth Zone that qualifies under the 'Municipal Rehabilitation and Economic Recovery Act,' P.L.2002, c. 43 (C.52:27BBB-1 et al.)." Camden is the only municipality that fits that definition, as it is "the only municipality affected by the provisions of the [Municipal Rehabilitation and Economic Recovery Act]." PHILIP D. MURPHY
Governor

leaving the State. It would further the statute's express purpose, therefore, to construe the out-of-state requirement that is applicable to projects in the rest of the State to also apply to Camden.[67] Second, if the statute were to be interpreted as intended to incentivize the relocation of jobs to Camden from other parts of New Jersey, a question would arise as to whether the statute would be unconstitutional because it would favor Camden over other parts of the State and, as such, arguably be an impermissible "private, special or local law."[68] Statutory interpretations that avoid such serious constitutional questions are typically favored.[69] For these reasons,[70] if a New Jersey court

---

[67] *Cf. Murray v. Plainfield Rescue Squad*, 210 N.J. 581, 592 (2012) ("We do not view the statutory words in isolation but in context with related provisions so as to give sense to the legislation as a whole.").

[68] *See* N.J. Const., art. IV, § VII, ¶ 7 ("No general law shall embrace any provision of a private, special or local character.") and ¶ 9(6) ("The Legislature shall not pass any private, special or local laws . . . [r]elating to taxation or exemption therefrom."); *Mooney v. Bd. of Chosen Freeholders of Atl. Cty.*, 122 N.J. Super. 151, 154 (Law. Div.), *aff'd*, 125 N.J. Super. 271 (App. Div. 1973) ("[L]ocal and special laws rest on a false or deficient classification in that . . . they create preference and establish inequalities; they apply to persons, things or places possessed of certain qualities or situations, and exclude from their effect other persons, things or places which are not dissimilar in these respects.'") (internal quotation marks and citation omitted). While the Legislature may in some cases adopt special laws if there is prior public notice (¶ 8), the prohibition in ¶ 9(6) against special laws "[r]elating to taxation or exemption therefrom" is absolute.

[69] *See, e.g.*, *Silverman v. Berkson*, 141 N.J. 412, 417 (1995) ("Unless compelled to do otherwise, courts seek to avoid a statutory interpretation that might give rise to serious constitutional questions.").

[70] Additionally, it is also notable that, whether the EDA is applying the "material factor" test that is applicable to Camden or the "but for" test that is applicable to the rest of the State, in both cases the statute directs the EDA to consider the same evidence concerning the company's potential relocation sites: "When considering an application involving intra-State job transfers, the [EDA] shall require the business to submit the following information as part of its application: a full economic analysis of all locations under consideration by the business; all lease agreements, ownership documents, or substantially similar documentation for the business's current in-State locations; and all lease agreements, ownership documents, or substantially similar documentation for **the potential out-of-State location alternatives**, to the extent they exist. Based on this information, and any other information deemed relevant by the [EDA], the [EDA] shall independently verify and confirm, by way of making a factual finding by separate vote of the [EDA]'s board, the business's assertion that the jobs are actually at risk of leaving the State, and as to the date or dates at which the [EDA] expects that those jobs would actually leave the State, or, with respect to projects located in [Camden] . . ., the business's assertion that the provision of tax

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

were to construe this "material factor" provision, the Task Force believes the court would more likely than not conclude that an out-of-state location is required for projects in Camden.[71] Putting our view aside, whatever the Legislature intended, any representations Grow NJ applicants made to the EDA concerning their potential out-of-state relocation were required to be truthful, so falsely stating that jobs were at risk of leaving the State and, accordingly, that an out-of-state alternative was under consideration would be highly problematic.[72]

In any event, whether or not a risk of an out-of-state relocation is strictly required under the statute for projects in Camden, it is indisputable, based on provisions of the Grow NJ Act and EOA 2013 separate and apart from those discussed here, that whether or not such an out-of-state relocation is contemplated is a critical factor bearing upon the potential size of any award. This is because of Grow NJ's "net benefits" requirement, which mandates that every Grow NJ award be anticipated to result in a net benefit to the State in terms of new tax revenue.[73] For companies relocating existing jobs from somewhere within New Jersey to Camden, those jobs create no new "benefit" to the State, since the "benefits" test is state wide and those jobs would yield no new tax

---

credits under the program is a material factor in the business's decision to make a capital investment and locate in [Camden] . . . before a business may be awarded any tax credits under this section." N.J. Stat. § 34:1B-244(d) (emphasis added). If a potential out-of-state alternative location were not required for projects in Camden, it is difficult to understand why the statute directs the EDA to consider evidence of the company's "potential out-of-state location alternatives" ("to the extent they exist") in the same manner as if EDA were considering a project outside Camden, where there is no question that an out-of-state location alternative is required.

[71] The "material factor" provision applicable to Camden, in the Task Force's view, is likely best understood as intended to reduce the required showing for the at-risk nature of the jobs: outside Camden, the CEO has to certify that but for the tax incentives jobs would leave the State (that is, the tax incentives are a determinative factor in the company's decision); by contrast, in Camden, the CEO has to certify that the tax incentives are a material factor in locating the jobs in Camden rather than in another state (that is, the tax incentives are an important factor in the company's decision but are not necessarily determinative).

[72] *See* N.J. Stat. § 34:1B-244(d) (requiring an applicant's CEO or other equivalent officer to certify that he or she "has reviewed the information submitted to the [EDA] and that the representations contained therein are accurate"). For criminal penalties under New Jersey law potentially applicable to misrepresentations in connection with Grow NJ applications, *see* N.J. Stat. §§ 41:3-1 (perjury), 2C:28-2 (false swearing), 2C:28-3 (unsworn falsification), 2C:21-3(b) (fraud relating to public records), 2C:20-4 (theft by deception), 2C:21-7(h) (deceptive business practices).

[73] *See* N.J. Stat. § 34:1B-244(a)(3) (requiring Grow NJ awards to "yield a net positive benefit to the State").

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

revenue.[74] Put another way, New Jersey accrues tax revenue from those jobs whether or not they are relocated, since in either case they are in the State. Based on this principle, when in-state jobs are relocated to Camden and no potential out-of-state alternative is contemplated, the "benefit" calculation is minimal, and the potential tax incentive award must be reduced as a result.[75] Thus, if a company falsely certified that its jobs were "at risk" of leaving the State—when they were not at risk—such a representation would likely affect the size of the company's potential award, and, as such, would surely be material.[76]

We hasten to note that the above discussion relates to the Grow NJ statute itself—not to the EDA's administration of the law, which is covered later in this First Report. Here, the Task Force notes that with respect to the "material factor" provision of the statute, there is a notable ambiguity, which, as shown by the evidence above, may have been by design—as a compromise between, on the one hand, those parties who advocated for the statute to expressly provide that a risk of out-of-state relocation "shall not be required" for projects in Camden, and, on the other hand, those parties who advocated for the statute to require a showing that jobs were at risk of out-of-state relocation.[77]

---

[74] This principle, which is inherent in the notion of a state-wide "benefits" test, is expressly set out in EDA's regulations for Grow NJ, which provide in pertinent part: "Retained employees in a project in [Camden] . . . shall not be included [in the benefits calculation] unless the business demonstrates that the award of tax credits will be a material factor to retain the employees **in the State** . . . ." N.J. Admin. Code § 19:31-18.7(c) (emphasis added).

[75] This issue is discussed further below, in Section V(C)(2)(b) of this First Report.

[76] As EDA's former President and Chief Operating Officer Tim Lizura explained at the Task Force's May 2, 2019 public hearing, "the net benefit test was a statewide test, and that would suggest, or would then require that the jobs would be at risk of leaving New Jersey in order to include [the] economic impact of those jobs under the net benefit test. If there was not a risk of leaving the state, we would include all the other drivers of the net benefit test except the economic activity from the employees, which is the largest driver of the economic output." Hr'g Tr. (May 2, 2019) at 262:8-18).

[77] In 2014, this provision of the Grow NJ Act was again amended to provide that Atlantic City would be treated in the same manner as Camden. Therefore, under the current version of the statute, companies may be eligible for Grow NJ benefits when the tax incentives are a "material factor" in the company's decision to locate in either Camden or Atlantic City. The statutory ambiguity discussed in this section with respect to Camden applies likewise with respect to Atlantic City.

2. Influence by Special Interests in EDA's Implementing Regulations for Grow NJ

After EOA 2013 was enacted in September of 2013, it fell to the EDA to promulgate regulations to implement the law's amendments to the Grow NJ program. As described previously, New Jersey law required the EDA to use a "notice-and-comment" process in connection with its issuance of such regulations—that is, to provide public notice of the regulations it was considering and to receive and consider comments from interested members of the public in response to such proposals. However, the Task Force has received information and documents that appear to show that—before the EDA publicly announced any proposed regulations—Kevin Sheehan of Parker McCay privately lobbied the agency to adopt provisions favorable to the firm's clients. At least one of these requests was incorporated in the EDA's first publicly proposed regulations, which the agency announced on January 6, 2014.

Grow NJ, as previously noted, generally excludes retail businesses from eligibility for tax incentives.[78] Parker McCay represented The Cooper Health System—the parent of Cooper University Hospital in Camden—in connection with its Grow NJ application. If the hospital were to be deemed a retail business, it would be ineligible for tax incentives under the statute. (From a policy perspective this exclusion is sensible, since a retail business—especially a hospital dedicated to serving a local community—is unlikely to make a business decision to move out of state absent tax incentives.) On December 10, 2013, Mr. Sheehan sent an email to the EDA's then President and Chief Operating Officer Tim Lizura: "[I]n reviewing the qualified business facility definition in the [regulations] that we discussed, my suggestion would be to add a sentence at the end of the definition to say: a university research hospital shall not be considered final point of sale retail. Thanks."[79] The EDA incorporated the request into its initial January 6, 2014 regulatory proposal as well as its final regulations adopted on December 15, 2014, and the provision remains in effect in the regulations in force now.[80] The Cooper Health System—deemed eligible for tax incentives pursuant to this regulation—would later be approved by the EDA for an approximately $40 million award. Meanwhile, the EDA does not appear to have disclosed that, outside of the public notice-

[78] *See* N.J. Stat. § 34:1B-243 (generally excluding "business[es] that [are] . . . engaged in final point of sale retail" from the definition of the "qualified business facilit[ies]" that are eligible for tax incentives).
[79] Exhibit 9.
[80] *See* N.J. Admin. Code § 19:31-18.2 (in the "qualified business facility" definition, carving out "university research hospital[s]" from the scope of ineligible "business[es] . . . engaged in final point of sale retail business").

Governor

and-comment period, its regulations had been amended in response to the request of a private party, apparently to assist a specific client.

3. Inadequate Statutory Requirements to Ensure Job Requirements Are Consistently Met

The current statutory requirements and EDA regulations governing reporting requirements and required annual jobs reports for companies to receive awards are inadequate to ensure that companies are consistently creating or retaining the required number of jobs and achieving the aims of Grow NJ. Based on the language of the regulations, a company need only submit an annual report, certified by the company's chief financial officer or equivalent, showing that it created or retained the required number of jobs for the last tax year before the credit amount is approved and issued. There is no additional certification requirement to ensure that these jobs are maintained to further the aims of economic growth and job creation. In essence, a company could create the number of jobs required in its agreement, certify, receive the first tenth of its overall credit, and then eliminate or fail to retain the required number of jobs immediately after receiving its credit while still retaining the award for the full year.

Indeed, in one instance, World Business Lenders, LLC ("WBL"), moved to New Jersey from another state in July 2016. WBL's award was contingent on its promise to bring a specific number of jobs into New Jersey, and its Incentive Agreement provided that it would remain in New Jersey for fifteen years. By October 2016, WBL had hired enough employees to meet the employment numbers set forth in its Incentive Agreement. WBL's submission to the EDA showed that it had satisfied the employment numbers set forth in its Incentive Agreement in October 2016. In the beginning of December 2016, the EDA certified to the Division of Taxation that the company was eligible for its overall tax credit certificate of approximately $16 million. At the beginning of January 2017, however, the company laid off a significant number of its employees, sending its job numbers well below the number required to continue to qualify for a tax-incentive grant. The EDA learned of the mass layoffs through news reports. The company subsequently submitted a report showing that it had met the required employment numbers for November and December 2016. Therefore, despite having seen indications that the company had terminated its employees after satisfying the requirements to receive its tax credit for 2016, the EDA asked the Division of Taxation to issue the company the first tenth of its overall credit, amounting to approximately $1.6 million. The company received this award even though it had been located in New Jersey for only six months, had submitted only three months of employment data, and had laid off a significant number of employees shortly after qualifying for the first year of its award.

The Task Force is still investigating this issue and has not reached any conclusion regarding the company's conduct or intent in connection with its application, and the company has maintained

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

that it acted entirely in compliance with Grow NJ's requirements. Regardless, the Grow NJ regulations did not specifically require that the company prove that it maintained the agreed-upon number of jobs for a full twelve-months, did not require that it be located in New Jersey for a full year in order to receive a full year's award, and did not have a mechanism requiring that a company maintain a minimum number of jobs after the award was issued in order to retain its award. The company was not certified to receive the second tenth of its award in 2017 because it did not employ the required number of employees for that tax year.

V. EDA: THE ADMINISTRATION OF THE TAX-INCENTIVE PROGRAMS

In its examination of the EDA's implementation and administration of the Programs, the Task Force set out to: (1) further examine and assess the EDA's process and control failures, including in the EDA application-approval process, from pre-application through approval and certification; (2) evaluate the effectiveness of existing EDA policies and procedures relating to the roles and responsibilities of individual EDA officers, EDA staff training, and EDA officers' understanding of the purpose, implementation, requirements, and administration of the Grow NJ and ERG tax incentive programs; (3) assess the administration of the tax incentive programs and subsequent monitoring of grant recipients; and (4) determine whether or not external or internal pressures were brought to bear on the EDA in connection with its application approval, compliance, monitoring, and certification processes, as well as its rulemaking processes relating to the Programs.

A. Overview of the Application-Approval Process

In order to evaluate any problems relating to the Programs' design, implementation, or administration, the Task Force had to begin with an understanding of the relevant statutes and of the EDA's tax-incentive application and administration process, from application through the annual award of tax-incentive grants. As noted previously, the Task Force focused primarily on Grow NJ during the initial phase of its investigation. A high-level overview of the Grow NJ process is below:[81]

1. Pre-Approval Process: Application Review and Board Approval

Companies learn of EDA tax-incentive programs and make initial contact with the EDA through various channels. The EDA receives potential application referrals through a customer care telephone line, through the Business Action Center ("BAC"), which is housed within the New

[81] Although there is significant overlap between the Grow NJ and ERG processes, particularly in the pre-application through approval stages, the differences in the Grow NJ and ERG Program requirements result in divergent approaches to the administration of these Programs. We will provide an overview of the ERG process in a later report.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001

PHILIP D. MURPHY
Governor

Jersey Department of State, and through Choose New Jersey, a 501(c)(3) non-profit whose mandate is to act as the marketing arm of the State and attract out-of-state and international businesses to New Jersey. BAC personnel frequently work with EDA officers to attract and obtain program applicants, and the BAC has historically been the biggest driver of application lead referrals to the EDA. Separately, the EDA's Community Development Officers ("CDOs") and Business Development Officers ("BDOs")[82] are also charged with developing business relationships and recruiting potential applicants. Indeed, a BDO's year-end performance is evaluated, in part, on their outreach efforts as well as whether they have met yearly goals in the volume of applications submitted to the EDA. Potential applicants may also directly contact the EDA to obtain information about the Programs. In addition, applicants are often represented by consultants, lawyers, lobbyists, or real-estate agents, and those representatives may also reach out directly to EDA personnel prior to the submission of a tax-incentive application.

Before submitting a Program application, a potential applicant often has an initial meeting or conversation with EDA personnel—typically a BDO—in order to discuss the applicant's business, needs, and Program requirements. Potential applicants occasionally meet with members of the EDA's senior leadership team in addition to or in lieu of meeting with a BDO. Pre-application dialogue between Program applicants and the EDA is not required, but in practice, often precedes formal submission of a company application by weeks or months.

A company formally submits its application through the EDA's electronic application system. At that time, the company pays an application fee and a BDO is assigned to the application. Often, it is the same BDO that worked with the company pre-application. The BDO is responsible for conducting an initial review of the application and assisting the applicant—or "client"—in ensuring that the applicant has submitted all required documentation prior to transmittal of the application file to Underwriting. BDOs must consult their Program Manager and Managing Director for application reviews before the application is submitted to the Underwriting group.

During the underwriting phase, underwriters are responsible for conducting due diligence and vetting an application to ensure it sufficiently meets all Program requirements and to address any outstanding concerns. Although underwriters bear the primary responsibility for conducting due diligence and follow-up with applicants, they often include the assigned BDO in correspondence to the applicant as the face of the relationship. Among other factors, underwriters

[82] These roles and titles within the EDA are now consolidated and currently all Community Development Officers ("CDOs") are now referred to as Business Development Officers ("BDOs"). For the sake of consistency, the Task Force's First Report will refer to both CDOs and BDOs at various times as BDOs.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

assess the applicant's submitted cost benefit analysis[83] and conduct the required net benefits analysis.[84] Underwriters are also responsible for drafting project summary memoranda, which are presented during "Project Review Meetings." At those meetings, the assigned underwriter presents the application to EDA personnel and members of the New Jersey Attorney General's Office. The EDA staff discusses and raises any issues or concerns related to the application, which the assigned underwriter answers or addresses directly with the applicant as follow-up.

After the Project Review meeting, the underwriter presents the application to the Incentive Committee of the EDA Board, after which the Incentive Committee either does or does not recommend an application for approval by the Board. Although an application may proceed to Board review without a recommendation by the Incentive Committee, more often, the applicant will withdraw its application if the Incentive Committee does not recommend approval.

If the Incentive Committee recommends that the EDA Board approve an application, the application is presented during an EDA Board meeting for approval. EDA Board meetings are conducted on a regular basis and are open to the public. Prior to the Board Meeting, EDA personnel provides the EDA Board with memoranda detailing the project applications that are subject to review and approval at the upcoming meeting. If the Board votes on an application and it is approved, the Governor has ten days to veto the approval. Board-approved projects are required to pay a non-refundable fee of 0.5% of the approved award amount, capped between $50,000 to $500,000, prior to final approval.

Depending on the complexity of the application, the full review process may last a number of months. EDA employees said that, in the early period of Grow NJ's administration, they often processed applications in one or two months, but now, although they can process more complete applications in as little as two months, it could take several months to a year to process others.

---

[83] The EDA requires Grow NJ applicants to submit "Cost Benefit Analysis" (or "CBA") forms with their applications. These forms compare the costs of the applicant's proposed New Jersey site and the applicant's alternative site. The purpose of the form is to demonstrate that the applicant's proposed New Jersey location is more expensive than the alternative location—and thus, tax incentives are required to offset the higher costs.

[84] As discussed in further detail herein, the EDA conducts a net benefit analysis ("NBA") to determine that every Grow NJ award is anticipated to "yield a net positive benefit to the State" of at least 110%, with the exception of Camden, where the requirement is 100%.

2. Post-Approval Process: Closing Services, Monitoring, and Certification

After Board approval, the EDA executes an approval letter and the project moves to Closing Services, during which a conditions of approval officer monitors the project to ensure that any conditions imposed on the project have been met. The conditions of approval, outlined in the approval letter, may include, for example, site plan approval, site control, committed project financing, eligible minimum capital investments, and updated status reports. Once the conditions have been met, Closing Services prepares an Incentive Agreement in consultation with the New Jersey Attorney General's Office. Once the Incentive Agreement is executed, a closing date is set. After closing, the company may receive a tax award the following year, provided it can certify that the project has met all the conditions of the Incentive Agreement in the prior year.

Once the closing process is complete and an Incentive Agreement has been executed, the project is transferred to the Portfolio Management and Compliance[85] group for monitoring and annual certification. Projects have three years to certify that they have met all the conditions and requirements of the Program and Incentive Agreement, with the possibility of up to two six-month extensions of time. Once a project certifies to the EDA that it has met all conditions and requirements of the Program and Incentive Agreement, the EDA's Portfolio Management and Compliance group then certifies the same to the Department of Treasury. The Treasury Department then issues the tax-incentive award. Projects are required to certify their compliance on an annual basis to obtain their tax-incentive award, which is distributed evenly in increments of 1/10th of the total award, across a ten-year period.

If the Portfolio Management and Compliance Group determines that a project is non-compliant with its Incentive Agreement or the Program requirements, the tax incentive award is subject to potential forfeiture, recapture, or recoupment.

B. EDA-Related Litigation

In the early stages of the Task Force's investigation, the Task Force discovered a whistleblower complaint, *Veyis Sucsuz v. New Jersey Economic Development Authority, John J. Rosenfeld, Michele Brown, Fred Cole, Anne Cardello, and John Does 1-10*,[86] filed on May 11, 2015 in New Jersey Superior Court, Mercer County, by a former EDA underwriter, Veyis "David" Sucsuz. Mr. Sucsuz was employed at the EDA for over ten years until his termination in September 2014. He began at the EDA as a legal assistant in lending services and later became an underwriter,

[85] The Portfolio Management and Compliance Group was reorganized and renamed in late 2018 and previously existed as the Finance & Development – Post-Closing Financial Services Group.
[86] No. MER-L-001083-15 (Super Ct., Mercer Cty. filed May 11, 2015).

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

responsible for the review and processing of Grow NJ and ERG incentive award applications, among other incentive programs.

In his complaint, Mr. Sucsuz alleged employment discrimination claims in addition to claims that he witnessed misconduct in connection with Grow NJ and ERG incentive program approvals, and that he was fired when he resisted directives from senior management to alter or promote applications that should have otherwise been rejected. Among other claims of misconduct by both applicant companies and individuals within the EDA, Mr. Sucsuz alleged, both in his complaint and under oath in deposition testimony, that certain applicants to the Grow NJ Program provided fabricated or "phantom" out-of-state locations.[87] Mr. Sucsuz alleged that in some instances, applicants fabricated an alternate out-of-state location to conceal a pre-existing intention to locate or expand in New Jersey. Mr. Sucsuz alleged that such applicants were nevertheless approved for Grow NJ tax incentive grants. Mr. Sucsuz further alleged that he was directed by his supervisor to alter or manipulate cost inputs for the cost benefit analysis or net benefit test in order to qualify applicants that would not have otherwise qualified with the cost inputs provided. He alleged that when he refused to alter the cost inputs, his supervisor would do it himself.

The case ultimately went to jury trial, which began on April 30, 2018 and lasted eight days. The jury announced its verdict on May 10, 2018. While Mr. Sucsuz did not ultimately prevail on his retaliation claim, the jury unanimously found that Mr. Sucsuz had a reasonable belief that the EDA violated a law, rule or regulation in the processing of application for loans, grants and tax incentives, and had proven by a preponderance of the evidence that he performed a "whistleblowing" activity as defined by the New Jersey Conscientious Employee Protection Act ("CEPA").

Despite testimony at the May 2, 2019 hearing by a Senior Vice President of Operations for the EDA that Mr. Sucsuz's allegations "identif[ied] potential fraud or misrepresentation in the application[s] submitted to the EDA for tax incentive programs" and also "focused on the EDA's review and approval of tax incentive awards,"[88] the EDA took no action to investigate any of Mr. Sucsuz's whistleblower allegations. While the Task Force has taken no position on the accuracy

[87] As discussed in Section V(C)(2)(b) of this First Report, for incentivized projects in most parts of New Jersey, it is indisputable that, for a company to receive Grow NJ tax incentives for existing jobs in New Jersey, those jobs must be at risk of leaving the state or being eliminated. Thus, where jobs are not at risk of elimination, applicants must demonstrate an alternate out-of-state location. In any event, any proposed alternate out-of-state locations must be legitimate and comparable.
[88] Hr'g Tr. (May 2, 2019) at 58:18-59:2.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

or truthfulness of Mr. Sucsuz's allegations, the Task Force has taken steps to investigate Mr. Sucsuz's various claims, which will be detailed in a later report.[89]

We also found that the EDA lacks the proper internal controls with respect to the processing and review of internal whistleblower complaints. During the second day of the Task Force's public hearing, we heard testimony from a Senior Vice President of Operations at the EDA, Fred Cole, who admitted to a failure within the EDA to investigate a former EDA underwriter's whistleblower complaints regarding various failures within the EDA with respect to tax incentive applications. At the May 2, 2019 public hearing, Mr. Cole acknowledged that the whistleblower allegations implicated conduct related to the EDA's tax-incentive programs, specifically that the allegations "identif[ied] potential fraud or misrepresentation in the application submitted to the EDA for tax incentive awards" and "also focused on the EDA's review and approval of tax incentive awards."[90] Yet, Mr. Cole testified that neither he nor anyone else at the EDA conducted an internal investigation into the allegations of fraud and misconduct. The Task Force takes no position on the accuracy or truthfulness of the whistleblower allegations. However, the EDA's processes failed when it took no steps to investigate the whistleblower claims which, as Mr. Cole admitted, could have had merit and, if true, could have carried significant financial ramifications.

In addition to the EDA's failure to conduct an internal investigation into the former EDA employee's whistleblower allegations, the EDA further failed to disclose this litigation to the Office of the Comptroller during its 2018 audit despite an affirmative obligation to disclose pending claims and litigation against the EDA. Indeed, the EDA's failure to disclose occurred despite the fact that members of its senior leadership team were deposed shortly before and during the beginning stages of the Comptroller's audit in late 2017 and early 2018 and despite the fact that the trial took place in April 2018 while the Comptroller's audit was ongoing. In fact, at the conclusion of the Comptroller's audit on January 3, 2019, Mr. Cole signed a management representation letter to the Comptroller's office, representing that, for the ten years prior and through the close of the Comptroller's audit, the EDA was not aware of any allegations of fraud or suspected fraud affecting

---

[89] During its investigation, the Task Force made several attempts to contact Mr. Sucsuz for testimony but was ultimately unsuccessful. The Task Force first attempted to obtain Mr. Sucsuz's voluntary testimony by contacting him through his former counsel; however, when Mr. Sucsuz failed to return the Task Force's requests to meet, the Task Force requested the issuance of a subpoena from Professor Chen. After several attempts to serve Mr. Sucsuz, the Task Force ultimately effectuated proper service of two subpoenas for both deposition and public hearing testimony on Mr. Sucsuz. He nevertheless failed to appear at both the date set for his deposition and the May 2, 2019 public hearing of the Task Force.

[90] Hr'g Tr. (May 2, 2019) at 58:18-59:2.

Governor

the EDA received in communications from employees or former employees and had disclosed all details concerning any pending claims, assessments and litigation against the EDA of which the EDA was aware and which would have a significant impact on financial operations.[91] EDA representatives are unable to offer an explanation for their failure to disclose the whistleblower litigation and a basis for its false representations to the Comptroller that it had, in fact, disclosed all relevant and pending claims and litigation.

C. Initial Findings

1. Lack of Written Policies and/or Procedures

The Task Force sought to review all of the EDA's written policies and procedures relating to the Programs. In seeking that information, the Task Force discovered that in the immediate years following the passage of EOA 2013, from approximately 2013 through 2017, the EDA had virtually no written policies or procedures regarding its process for reviewing and approving applications.[92] Although some practices and procedures have recently been memorialized in written memoranda to senior leadership and the Board, the EDA continues to lack a sufficient set of formal written policies and procedures to disseminate to personnel and ensure a consistent application review and approval processes.

Furthermore, to the extent policies have been memorialized by the EDA, we do not believe, based on the inconsistency of responses received from EDA employees when asked about such documents, that those policy documents have been consistently and comprehensively distributed amongst EDA personnel. For example, several BDOs were unaware of existing BDO checklists or flowcharts when shown during interviews. Indeed, most of the current EDA employees interviewed did not recall reviewing or receiving a training manual, memorandum, or set of written policies relating to the EDA tax incentive program approval process.

The EDA also lacks sufficient written policies detailing the roles and responsibilities of specific positions within the EDA. The Task Force received a "Grow NJ Processing Steps" chart, which was finalized in April 2015, identifying the EDA employee responsible for each step in the Grow NJ application process. However, several of the EDA employees that the Task Force interviewed had never seen this document. Moreover, the chart does not provide detail or guidance

[91] Exhibit 10.
[92] The EDA does have a few written policies, including on the net benefit test and the factors (including the possibility an out-of-state location) affecting that test.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

on how to execute each step outlined and therefore does not provide guidance as to the roles and responsibilities for personnel.

The Task Force observed that BDOs and underwriters rely primarily on basic "checklists" implemented in 2014, which set forth the documentation required for a complete application. These checklists, however, do not provide guidance on how EDA personnel are expected to review or analyze required documentation, which would be more helpful to the guide the process. Rather, they require only that the BDOs and underwriters confirm that the Program applicant submitted required documentation before the application was transmitted to the Underwriting group. As indicated, they do not offer guidance on what is considered adequate documentation. It appears, moreover, that at least some EDA employees believed the documents listed on the checklists were not all required to proceed with an application: a senior underwriter responsible for ERG applications described the ERG checklist, which identified "Items required prior to submission to underwriting" as including both required items and items that would be "nice to have." That same underwriter told us that, for example, the Chief Executive Officer ("CEO") Certification is a "nice to have" item from this checklist, despite the clear regulatory requirement for a CEO Certification under the ERG Act.[93]

2. Failure to Comprehensively Train EDA Staff

The effect of the EDA's lack of written policies and procedures was exacerbated by its failure to comprehensively train its staff while onboarding and during promotions and role transfers, or on an ongoing basis. The EDA did not comprehensively train its staff regarding: (1) the requirements and responsibilities of roles within the EDA; (2) the Programs' requirements; (3) amendments to the Programs' requirements; and (4) the EDA's implementation of the Programs' requirements. Indeed, each of the employees the Task Force interviewed confirmed that he or she did not receive any formal training when onboarded to the EDA; they also did not receive any formal training following a promotion or transfer to a new role. Rather, training was "on the job" and involved shadowing senior management and/or colleagues. In some cases, employees stated that they were provided with the relevant statutes and instructed to "familiarize themselves" with the provisions.

EDA employees also did not receive comprehensive training regarding the statutory requirements of the Programs and the Programs' subsequent amendments. Some senior EDA employees recalled that, after the EOA 2013 was passed, employees attended a training seminar or

[93] The regulations governing ERG expressly require, as part of the Program's application submission requirements, a "written certification by the chief executive officer, or equivalent officer for North American operations." N.J. Admin. Code § 19:31-4.4.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

seminars with the New Jersey Attorney General's Office that provided an overview of the Programs and guidelines. However, all the interviewees indicated that the EDA did not provide subsequent trainings when new statutory amendments were passed. Although some EDA personnel recalled that senior leadership briefed EDA personnel regarding statutory and regulatory amendments and changes to the EDA's tax-incentive Programs during Pipeline Meetings, others indicated that although they might have received a copy of a regulatory amendment and had an opportunity to ask questions, they did not recall receiving formal notice or follow-up training when regulatory changes took place. Indeed, two senior underwriters stated that, when statutory or regulatory requirements were amended, underwriters simply reviewed the amended language and learned how to enforce the new amendments "on the job."

Furthermore, EDA personnel were not adequately trained to review and analyze information and documentary evidence applicants were required to submit. For example, employees did not receive training on how to review and identify problems with lease agreements, letters of intent, or requests for proposals that are consistently submitted with project applications to support proposed project locations. EDA employees generally seemed completely unaware of the kinds of documents a business would generate if it were seriously considering a move of its facilities to another state, and some appeared to be reluctant to "ask too many questions."[94] We discuss some examples of the impact of those failures in Section V(C)(4) of this First Report below.

Finally, given the critical importance of screening applications for potential misconduct, some training in fraud detection is critical for program underwriters. Not only did the Task Force determine that the EDA provided no such training at any time, up to the present, many EDA employees we interviewed expressed the view that their vetting required them to take information at "face value."

[94] At the Task Force's May 2, 2019 public hearing, John Boyd, a principal at a corporate site selection firm in New Jersey, testified that for a relocation of several hundred office employees, companies typically conduct a serious analysis to select the ideal location. The process often includes meetings with employees from multiple departments (including accounting, legal, human resources, and communications), memoranda and reports, and multiple site visits. Mr. Boyd testified at the Task Force's hearing that he "agree[d]" that, to determine whether a company was sincere in its considerations of a potential relocation site, there should be "a lot of documentation of [the company's] deliberations" that "the company should be able to produce." *See* Hr'g Tr. (May 2, 2019) at 101:9-107:17.

TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

a) Inconsistent Understanding of Roles and Responsibilities

The EDA's failure to comprehensively train its staff has resulted in an inconsistent understanding of the roles and responsibilities of specific positions within the EDA. The Task Force observed that among the BDOs we interviewed, there was a broad range in the understanding of their responsibilities. All BDOs interviewed understood their role as business developers and advocates for the applicants or "clients." However, several BDOs expressed the belief that their review of applications did not require independent verification of information and required only "perusing the application" for "red flags" or "glaring errors" that would potentially disqualify an applicant. Their supervisors, on the other hand, expected their officers to also conduct preliminary due diligence on the submitted documentation and conduct independent diligence in the form of internet-based searches on the applicant, including the business, its senior leadership, and the applicant's exposure to legal risks. Unfortunately, because of a complete lack of policies concerning how to conduct internet and other public searches for such information and what to look for, the quality of such diligence varied from BDO to BDO, and application to application. Indeed, as noted above, we found important information through simple internet-based searches which BDOs missed completely, including potentially disqualifying information.[95] BDO supervisors expected BDOs to review application materials and address as many potential issues or questions in order to present a complete application to Underwriting. Although some BDOs believed their role was to both assist and scrutinize the applicant, all the BDOs understood that it was primarily the underwriter's responsibility to conduct due diligence, investigate, and verify information provided by the applicant.

Nearly all of the underwriters interviewed understood their responsibility to conduct due diligence and investigate and verify information applicants provided; however, at least one senior underwriter understood the role to be that of a "processor" who "checks off the boxes." The same underwriter believed that the underwriters needed to review applications to ensure the required documentation and materials had been submitted but did not need to assess whether applicants' representations were truthful. This approach is inconsistent with the underwriters' gatekeeping role: the underwriters are the primary means to ensuring that applications comply with the Programs' requirements.

[95] However, the Task Force did observe other instances where BDOs did perform sufficient due diligence and identified one company's failure to disclose on its application potentially relevant lawsuits. The EDA eventually resolved the initial non-disclosure with the company.

b) Inconsistent Understanding of the Program Requirements Concerning Camden and Atlantic City

The EDA personnel interviewed thus far have, in some important areas, exhibited inconsistent, incomplete, or inaccurate understandings of certain Program requirements, specifically with respect to (a) the circumstances in which Grow NJ applicants are required to demonstrate a risk that their jobs may be relocated outside of New Jersey and (b) the effect such a relocation risk may have on the terms of any tax incentives award.

As discussed in Section IV(A)(1)(e) of this First Report, the Grow NJ Act expressly states that a "purpose of the [Grow NJ] program is . . . to preserve jobs that currently exist in New Jersey but which are in danger of being relocated outside of the State."[96] In most cases, Grow NJ applicants are indisputably required to demonstrate to the EDA, in order to qualify for tax incentives, that they are considering an out-of-state relocation. However, because of an ambiguity in the statute's text, it is arguable that tax incentives may be available (although only in a reduced amount, for reasons discussed below) for relocating existing New Jersey jobs to Camden or Atlantic City, even when no potential out-of-state relocation is contemplated.[97] The EDA has on one occasion approved tax incentives for a company that relocated from within New Jersey to Atlantic City even though that company was not contemplating a possible out-of-state relocation—thus, the company was approved for tax incentives even though its jobs were not "in danger of being relocated outside of the State."

Whether or not an out-of-state relocation is strictly required under the statute for projects in Camden or Atlantic City to receive tax incentives, it is indisputable, based on a separate provision of statute, that whether or not such an out-of-state relocation is contemplated is a critical factor bearing on, at a minimum, the potential size of any award. As discussed previously, the Grow NJ Act requires that every tax incentive award be anticipated to "yield a net positive benefit to the State."[98] In this context, the "benefit to the State" means tax revenues collectible by the State as a result of the fruition of the project for which the tax incentives were awarded—tax revenue, that is, that the State would not collect in the absence of the tax incentives. Under the statute, no tax incentive award under the Grow NJ program may be larger than the anticipated benefit to the State. If the anticipated benefit is smaller than the award that for which the applicant would otherwise be

[96] N.J. Stat. § 34:1B-244(a).
[97] As discussed previously, EOA 2013 introduced this provision with respect to Camden, and the statute was amended again in 2014 to have the provision apply to Atlantic City as well.
[98] N.J. Stat. § 34:1B-244(a)(3).

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

eligible, then the award must be reduced. For example, if an applicant would otherwise be eligible for a $50 million award for a project in Camden, but the EDA anticipates that the project will yield only $10 million in resultant tax revenue to the State, then the applicant's award must be reduced to $10 million only rather than $50 million.

A company's certification that jobs are at risk of leaving the State—and thus that it is considering an out-of-state alternative—may have a critical and material effect on the net benefit test, particularly with respect to income taxes that accrue from employment. The net benefit test required by the Grow NJ Act is a statewide test that assesses benefits to the State as a whole—rather than to a particular locality within the State. When an applicant's jobs are already in New Jersey, any income taxes related to those jobs are factored into the net benefits calculation only if the jobs are at risk of being relocated out of state. There, the provision of tax incentives, which keeps the jobs in the State, provides a clear benefit to New Jersey. By contrast, if an applicant is not considering moving out of state, and a job will exist somewhere in New Jersey in any event, there can be no benefit to the State as a whole. Thus, the EDA's implementing regulations for Grow NJ provide that, for projects in Camden and Atlantic City, "[r]etained employees . . . shall not be included [in the net benefits calculation] unless the business demonstrates that the award of tax credits will be a material factor to retain the employees in the State . . . ."[99] This rule is also set forth in several EDA policy documents.

Some EDA employees demonstrated a limited understanding of these issues. At least two EDA employees believed that, as administered by the EDA, projects moving to Camden did have to show jobs were at risk of leaving the State.[100] Some were unclear about whether the possibility of an out-of-state relocation is strictly required as a matter of threshold eligibility (rather than a factor in award size) for projects in Camden or Atlantic City, and did not know whether the EDA had ever processed applications concerning projects in Camden or Atlantic City for which no potential out-of-state relocation was contemplated. Although the existence of a potential out-of-state relocation clearly has an effect on the net benefit test and, therefore, on the size of any potential

[99] N.J. Admin. Code § 19:31-18.7(c).
[100] *See* Hr'g Tr. (May 2, 2019) at 135:9-20 (testimony of David Lawyer, the EDA's managing director of underwriting since May 2017: "Q. And for companies that were, at the time of their application, they were already in New Jersey, does every Grow applicant need to show that the jobs were at risk, as the program was administered, does every applicant have to show that the jobs were at risk of moving out of the state? A. That is my understanding. Q. And that is true even where an application proposes to move jobs intrastate from a city outside of Camden to Camden? A. That is my understanding, yes.").

State of New Jersey

PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

award, at least one EDA employee misapprehended this rule. Given that the risk of jobs leaving the State is a core element of the Grow NJ program, it is important for all EDA employees responsible for processing Grow NJ programs to fully understand the pertinent issues, and EDA employees should have a firmer understanding of them.

3. Due Diligence Failures

The Task Force has found that the EDA's due diligence practices in connection with review of applications have generally been insufficient. Program applicants are required to make a number of representations in connection with their applications, both about the applicant itself and about the circumstances under which they are seeking tax incentives. Because these representations are critical to determining whether the applicant is eligible for the tax incentives requested, it is important to conduct sufficient due diligence to detect fraud, misrepresentations, or error.

Many EDA employees we interviewed did not believe independent verification of an application's accuracy or truthfulness was warranted because the EDA required an applicant's CEO to certify under penalty of perjury that the representations contained in the application were accurate and that the CEO had taken steps to ensure that the application materials were complete. However, if the answers provided by an applicant are taken at face value, without any effort to cross-corroborate or verify through public sources, applicants could easily present and certify false, misleading, or inaccurate information to the EDA without consequence.

Some EDA employees stated that they conducted internet searches regarding applicants and their senior personnel to identify potential red flags and issues, but it appears that those searches, when conducted at all, were insufficiently broad and failed to identify key information that should have raised red flags or at least warranted follow-up questions to applicants. For example, the Grow NJ application requires applicants to state whether the applicant has ever been debarred by any state or federal governmental department, agency, or instrumentality. Under the EDA's regulations, such a debarment could constitute grounds for the EDA to deny an application for tax incentives.[101] One company, Holtec International, represented in its application—certified by its CEO—that it had no prior history of debarment.[102] In fact, however, Holtec had previously been debarred by the Tennessee Valley Authority, a congressionally chartered corporation of the United States. The EDA then approved Holtec for a $260 million award under Grow NJ. Had the EDA conducted cursory internet research, it could have found that Holtec's answer was inaccurate. Yet EDA

Governor

personnel failed to independently uncover Holtec's misrepresentation when it approved Holtec's award, one of the largest tax incentive awards in New Jersey history.[103]

Although Holtec's undisclosed debarment was potentially disqualifying, other examples abound where readily available information—if the EDA had found it—would have at least merited follow-up questions to program applicants. However, even more concerning were examples found where EDA personnel did, in fact, conduct internet searches that yielded red flags, including relevant lawsuits involving the company, but EDA failed to investigate and conduct further due diligence that could have uncovered material misrepresentations. For example, NFI, L.P. ("NFI"), submitted its Grow NJ application on October 24, 2016. It asserted that in exchange for Grow NJ tax incentives, it would continue to employ 670 employees in New Jersey rather than move the jobs to Philadelphia. NFI submitted a chart of affiliates identifying the related companies, which included NFI Industries, Inc., National Freight, Inc., and NFI Interactive Logistics, LLC. As part of its application, NFI was required to answer a series of background questions related to legal matters. The application asked whether the "applicant, any officers or directors of Applicant, or any Affiliates (collectively, the 'Controlled Group') [had] been found guilty, liable or responsible in any Legal Proceeding for any of the following violations or conduct." NFI answered "No" for each listed question, which included offenses indicating a lack of business integrity or honesty, such as fraud, and violations of the governing hours or labor, minimum wage standards, and prevailing wage standards laws. While the EDA may have a timeframe that it considers relevant for legal proceedings, the actual application does not indicate that a company should limit disclosures to a period of five or ten years. Therefore, each company is presumed to have disclosed all legal proceedings relevant to the disclosure questions regardless of whether EDA would find it impactful on a company's eligibility.

The Task Force has reviewed the application and full company file of NFI and found that the EDA was aware of at least three lawsuits related to NFI.[104] In its Grow NJ transmittal form,

---

[103] Last month, Holtec acknowledged that it did not disclose its prior debarment in its application and sought to amend its application. The EDA has since suspended Holtec's tax-incentive award, pending further investigation.

[104] First, an Equal Employment Opportunity Commission action in which NFI paid $45,000 to settle gender-discrimination allegations about unequal pay; second, a Department of Labor action in which NFI was ordered to pay 350 workers over $1 million in back wages for misclassifying them as exempt from overtime; and third, a Department of Labor action in which NFI was ordered to reinstate a trucker and pay him $276,870 after he alleged he was fired for refusing to make a trip that would have violated federal "hours of service" restrictions.

which is an internal request for application review, an EDA BDO, listed four articles highlighting these three lawsuits under the section "Google Search of Applicants/Owners." Our review of correspondence indicates that on October 24, 2016, the EDA BDO sent an email to Mr. Sheehan of Parker McCay, who represented NFI, asking for an explanation and status of the three cases she found based on her internet search. On October 31, 2016, Mr. Sheehan responded with a brief explanation and stated that NFI disputed each claim but settled "to avoid protracted and costly litigation." The EDA BDO referred the issue and lawsuits to an EDA Senior Legislative Officer. In her correspondence, the EDA BDO highlighted for the EDA Legislative Officer that NFI answered "No" for the legal questions on their application. Based on a review of the correspondence, it appears that the EDA Legislative Officer directed the EDA BDO to request the settlement agreements from Mr. Sheehan and had further communications with Mr. Sheehan regarding details and his initial concerns regarding lawsuits involving NFI.

While the Task Force appreciates that the EDA BDO conducted initial diligence, it believes that further diligence would have unveiled a criminal conviction and guilty plea by affiliate Interactive Logistics, Inc. d/b/a NFI Interactive Logistics, Inc. and at least two additional legal proceedings.[105] The Task Force reviewed publicly available documents indicating that in November 2005, an NFI-related entity, Interactive Logistics, Inc. d/b/a NFI Interactive Logistics, Inc., pled guilty to three counts of wire fraud for defrauding Anheuser-Busch.[106] In addition, the Task Force reviewed publicly available documents related to lawsuits alleging violations of wage and hours laws. The Task Force finds this concerning on numerous grounds. It further highlights potential misrepresentations by NFI, and Sidney Brown, NFI's CEO who certified on its behalf, that all information contained within the company's Grow NJ application was true. Second, it is concerning that—after the EDA questioned Mr. Sheehan and NFI about the discovered lawsuits—neither he nor Brown was forthcoming about the criminal conviction or additional lawsuits, especially those of a nature required to be disclosed on the EDA application. Finally, from an EDA perspective, the Task Force believes that in-depth due diligence would have found the publicly available lawsuits. While the EDA Legislative Officer identified the need to review the settlement agreements in the lawsuits that were found, neither he nor the EDA BDO seemed appropriately concerned that at the crux of the matter, NFI's application contained potential misrepresentations

and a potentially fraudulent CEO certification. Even more, despite learning this, the EDA approved NFI's application for an approximately $80 million award.

4. Deficiencies in Assessing Applicants' Alternative Relocation Sites

The Task Force has investigated applicants' consideration of locations outside of New Jersey. Because a core goal of the Grow NJ program is "to preserve jobs that currently exist in New Jersey but which are in danger of being relocated outside of the State,"[107] Grow NJ applicants are required to provide information about the locations in New Jersey and other states to which they are considering relocating.[108] The Task Force's investigation to date has found clear deficiencies in the EDA's evaluation of applicant submissions about these alternative sites. In some instances, Grow NJ applicants have made representations about a potential out-of-state alternative site that should have raised serious red flags about whether the applicant genuinely intended to move out of state, but the EDA failed to take any action to investigate the issue.

The Task Force has examined the EDA's processing of several applications of Program awardees thus far, and that investigation is ongoing. The Task Force selected certain applications to prioritize for investigation if it received information about red flags in connection with a particular application or applicant—for example, if a whistleblower indicated that there were potential concerns with a company's application or compliance with Program requirements. In some instances, however, the Task Force did not initially intend to include certain companies in its priority review, but information arising during the Task Force's investigation alerted it to potential issues that should be further examined.

As noted previously, the draft versions of the EOA 2013 that included revisions from Parker McCay were, from the Task Force's perspective, a very significant red flag. The Task Force remains skeptical that a company whose lobbyist had placed special provisions for its benefit in the tax-incentive legislation would have a legitimate business plan to move jobs to a different state. Indeed, three of these companies—Conner Strong & Buckelew Companies, LLC ("CSB"), The Michaels Organization, LLC ("TMO"), and NFI—had publicly committed to moving to Camden on September 24, 2015—thirteen months prior to their Grow NJ applications, which would seem

PHILIP D. MURPHY
Governor

to directly belie their claim that they were considering an out-of-state move. Yet, although the Parker McCay-edited version of the EOA 2013 had, we have determined, been shared with the EDA's then President and Chief Operating Officer, Tim Lizura, we saw no evidence that Mr. Lizura considered these applications with any skepticism or alerted the BDOs and underwriters reviewing the applications to apply any heightened scrutiny themselves. We thus worried that the process may have been compromised.[109] We therefore made our review of the EDA's oversight of some of these applications a key priority.

To compound our concerns, on March 11, 2019, the Executive Chairman of CSB and member of the Board of Trustees of The Cooper Health System ("Cooper Health"), George Norcross, III, published an Op-Ed on *NJ.com*. In the Op-Ed, Mr. Norcross stated, among other things, that the Programs' tax credits were intended to "convince firms to move to Camden," but "were **not intended** to entice firms that were leaving the state to remain." (Emphasis added).[110] Mr. Norcross's contention caught the Task Force's attention because, in point of fact, every application for an in-state company that proposed a move to Camden did, in fact, certify that jobs were "at risk" of leaving the State (except one that had planned to eliminate jobs if denied tax incentives), including applications from entities with affiliations to Mr. Norcross, including CSB and Cooper Health.[111] We also learned that TMO and NFI were affiliated with Mr. Norcross in that their applications were related to CSB's application. The Op-Ed thus raised a concern about whether any of these companies had not, in fact, been considering moving out of the State at the time they applied for tax incentives under Grow NJ. The Task Force decided to review the applications for those companies and—even on a cursory review—additional concerns arose, and the Task Force determined that an examination of the EDA's oversight of these applications was appropriate.

Thus, we reviewed the applications of Cooper Health, CSB, TMO, and NFI, to examine whether the EDA gave any meaningful scrutiny to their certifications that jobs were at risk of leaving New Jersey and whether they had viable out-of-state locations that were bona fide, suitable,

---

[109] To date, we have found no direct evidence that Mr. Lizura's actions and inactions were motivated by any corrupt intent.

[110] George E. Norcross, III, *George Norcross: We need tax incentives to continue to rebuild Camden*, NJ.COM, March 11, 2019, http://s.nj.com/okKoUPg.

[111] Although Cooper Health's application indicated that jobs were not at risk of leaving the State, it subsequently informed the EDA during the course of EDA's processing of its application that—in fact—it was considering an out-of-state move to Philadelphia. These circumstances are described more fully below. The EDA did not require Cooper Health to submit a revised application, nor did it require a new certification from Cooper Health's CEO.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

and available.[112] After conducting this review, we found that the EDA's scrutiny of these four entities' applications was inadequate in several material respects and that, as a result, the EDA failed to discover significant problems with those applications. We describe below EDA's deficiencies in assessing these four applications.

a) The Cooper Health System

On November 7, 2014, Cooper Health applied to the EDA for tax incentives under the Grow NJ program. Just over a month later, the EDA approved Cooper Health for a tax-incentive award of $39,990,000, in exchange for Cooper Health's relocation of certain back-office operations from various existing sites in Cherry Hill and Mt. Laurel, New Jersey to Camden, New Jersey. During the EDA's processing of Cooper Health's Grow NJ application, Cooper Health represented to the EDA that it was considering relocating its operations to Philadelphia, Pennsylvania as an alternative to Camden. Based on this representation, an internal EDA memorandum recommended awarding the tax incentives to Cooper Health to "make New Jersey more competitive." However, there is significant evidence, described below, that Cooper Health's purported alternative location in Philadelphia was illusory, and the EDA failed to sufficiently investigate that possibility based on the information in its possession.

Cooper Health's tax credits were for its relocation of certain administrative functions to One Federal Street, Camden, New Jersey, in a building often referred to as the "L-3 Building." Internal Cooper Health documents indicate that Cooper Health favored the L-3 Building in Camden as a relocation site as early as March 2014, months before its November 2014 application for tax incentives: on March 28, 2014, Douglas Shirley, Cooper Health's CFO, sent an email to John Sheridan, Cooper Health's President and CEO: "I have the proposal . . . and it is very rich! From a cash flow and balance sheet [sic] the L-3 is the best deal by a long shot. No other option can touch it, so you need to be okay with this option before we go out with it."[113] In addition, an internal Cooper Health document dated April 1, 2014, entitled "Potential Cooper Office Options," contains a chart of three possibilities for Cooper Health's office, including the L-3 Building in Camden and two other potential locations—both also in Camden.[114] The chart does not list any potential Philadelphia location. The EDA did not request contemporary business records from Cooper Health concerning relocations it was considering, so it did not have the benefit of these documents.

---

[112] The Task Force has examined several other applications for these same purposes but has not found other instances—at this stage—where serious concerns were apparent.

When Cooper Health initially applied to the EDA for tax incentives on November 7, 2014, it did not claim that it was considering relocating out of state. The application asked: "Are any jobs listed in the application at risk of being located outside of New Jersey?" Cooper Health answered "No."[115]

On November 8, 2014, the day after Cooper Health's application was filed, Cooper Health's representative, Kevin Sheehan of the Parker McCay law and lobbying firm, sent an email to an EDA employee that processes Grow NJ applications, copying EDA's Tim Lizura, to "give . . . a heads up that Cooper Hospital filed its GrowNJ application." Mr. Sheehan added, "As you review the application, if you need anything, let me know."[116]

A few days later, on November 10, 2014, the EDA employee responded to Mr. Sheehan with a list of several items the EDA needed, including a completed "Cost Benefit Analysis" (or "CBA") form.[117] The EDA's CBA forms are used by Grow NJ applicants to list certain information about the potential relocation sites the applicant is considering, and to show the difference in costs between, on the one hand, the more expensive New Jersey location for which the applicant is seeking tax incentives, and, on the other hand, the less expensive alternative location that the applicant will ostensibly relocate to if denied tax incentives in New Jersey. Responding to the EDA employee's request for a CBA form, Cooper Health's Vice President of Real Estate and Facilities, Andrew Bush, copying Kevin Sheehan, submitted to EDA on November 11, 2014, a CBA form that compared the costs of the L-3 Building in Camden, for which Cooper Health sought tax incentives, to the costs of Cooper Health's existing facilities in Cherry Hill and Mt. Laurel, New Jersey—not to the costs of any out-of-state alternative site.[118] In other words, the CBA form was consistent with Cooper Health's representation on its application that no jobs were at risk of being relocated outside of New Jersey, since the CBA listed only in-state locations as under consideration.

Two days later, on November 13, 2014, the EDA employee sent an email to Parker McCay's Mr. Sheehan: "I need to talk to you about Cooper, what time do you have today or tomorrow to talk?"[119] Mr. Sheehan responded later that day: "I have [sic] here for the rest of the day today. Let me know what time works for you."[120] Later that night, Mr. Sheehan wrote to the EDA employee

PHILIP D. MURPHY
Governor

again, under the subject line "Cost benefit." Mr. Sheehan wrote: "They are working on it. Will get to you ASAP."[121]

Several days later, on November 18, 2014, Mr. Sheehan sent an email to the EDA employee with an updated CBA form for the Cooper Health application.[122] That revised form compared the costs of the L-3 Building in Camden not, as previously, to the costs of Cooper Health's existing locations in New Jersey, but instead to the costs of a claimed alternative location at 1900 Market Street in Philadelphia.[123] The CBA form stated that the purported 1900 Market Street location was 120,000 sq. ft. and cost $23.50 per sq. ft. to rent.[124] In other words, the revised CBA form effectively communicated to the EDA that Cooper Health was considering potential relocation sites in Camden or in Philadelphia. The Task Force interviewed the EDA employee who had these communications with Cooper Health and its representative, Mr. Sheehan. The EDA employee said that he did not recall the phone call with Mr. Sheehan, but he insisted that he would not have suggested to Cooper Health that it should claim to be considering an out-of-state relocation when it was not sincerely considering one. The EDA employee stated that he believed Cooper Health was in fact considering an out-of-state relocation.

Once all necessary documents for Cooper Health's Grow NJ application were submitted, the application was transferred to an EDA underwriter. On November 24, 2014, the EDA underwriter assigned to the application sent an email to Mr. Bush seeking "back-up on the proposed terms for each of the locations, NJ and PA, ie term sheets, letters of intent and/or draft lease agreements."[125] The underwriter, in other words, asked Cooper Health to provide documentation of the Camden and Philadelphia locations that purportedly were under consideration for relocation.

Several days later, on December 1, 2014, Cooper Health's Mr. Bush wrote to the EDA underwriter: "Sorry for the delay in the response. . . . I am touring alternate locations in PA on Wednesday and hope to have term sheets by the end of the week."[126] The underwriter responded: "Thanks, it is very important that I have some back-up to the lease terms as presented in the Cost Benefit analysis – it's all verbal at this point?"[127] Mr. Bush replied: "All quoted numbers are verbal

Governor

from prospective landlords in Pennsylvania. I expect to have proposals to justify the numbers by the end of the week."[128]

On December 5, 2014, Mr. Bush sent the EDA underwriter, copying the EDA employee who had previously communicated with Cooper Health, and Parker McCay's Mr. Sheehan, a lease proposal from a real estate broker, dated that same day, for space in Centre Square in Philadelphia.[129] The proposal was for 113,756 sq. ft. in the building at 1500 Market Street, in Philadelphia's Centre Square, offered for either $22 or $24.75 per rentable sq. ft. depending on the terms of the lease. Mr. Bush explained in his cover email that the lease proposal was from a prospective Philadelphia landlord, and noted that "**[t]he terms are slightly more aggressive than those presented in the cost benefit analysis meaning that there is more of a burden to Cooper to remain in NJ**." (Emphasis added).[130] The Task Force interviewed the EDA employees who received this email from Mr. Bush. Both EDA employees told the Task Force that, based on Mr. Bush's representation that there was a "burden to Cooper to remain in NJ" because of the purported cost savings from relocating to Philadelphia, Cooper Health was sincerely considering relocating there.[131]

---

[128] Exhibit 22. The Task Force has interviewed both the BDO and the underwriter responsible for the Cooper Health application. Both have indicated, credibly in our view, that they believed Cooper Health's representations that it was considering an out-of-state location as an alternative to Camden. Although Cooper Health has now publicly asserted that "the EDA, not Cooper, initiated requests for comparable leases of Philadelphia properties," both have denied this assertion. *See* Thomas W. Rubino, *Cooper Health official says the company's tax incentive award is appropriate, justified and legitimate*, NJ.COM, June 12, 2019, https://www.nj.com/opinion/2019/06/cooper-health-official-says-the-companys-tax-incentive-award-is-appropriate-justified-and-legitimate.html.

[129] Exhibit 23.

[130] Exhibit 23.

[131] Cooper Health's CEO certification, signed by the health system's CEO, Adrienne Kirby, was dated November 11, 2014—that is, prior to Cooper Health's November 18, 2014 submission of the CBA form with a purported Philadelphia alternative location at 1900 Market Street, and also prior to Cooper Health's December 5, 2014 submission of the lease proposal for 1500 Market Street in Philadelphia. Cooper Health did not submit a new CEO certification to EDA after it changed its application in this respect. Because Cooper Health has declined to cooperate with the Task Force's investigation, the Task Force has been unable to determine what Ms. Kirby did or did not know or believe concerning Cooper Health's relocation deliberations at the time she executed the certification.

PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

The EDA underwriter prepared a Confidential Memorandum of Analysis, dated December 9, 2014.[132] The memorandum stated that Cooper Health had demonstrated that "rental costs in Camden are higher than leasing comparable space in Philadelphia, PA . . . . As a result, [Cooper Health] has applied for Grow NJ tax credits to offset these costs and make New Jersey more competitive."[133] In the "Conclusions" section of the memorandum, the underwriter stated that Cooper Health's jobs were "at risk of being located outside of New Jersey" and that the grant of tax credits under the Grow NJ program would be "a material factor in the company's decision."[134] The EDA underwriter also prepared a Project Summary memorandum, which similarly stated that Cooper Health was considering alternative relocation sites in Camden and Philadelphia, that hundreds of New Jersey jobs were "at risk of being located outside the State," and that Grow NJ tax credits would be "a material factor in the applicant's decision to make a capital investment and locate in Camden."[135] Under the "Conditions of Approval" section of the memorandum, it stated as Condition No. 1 that Cooper Health "has not . . . committed to remain in New Jersey."[136] The memorandum concluded by recommending that EDA's Board "approve the proposed Grow New Jersey grant to encourage Cooper Health System to locate in Camden."[137] The memoranda were provided to EDA's Board and, on December 9, 2014, the Board voted to approve Cooper Health to receive almost $40 million in tax incentives.

The Task Force has found evidence that the claimed alternative site in Philadelphia was not a genuine alternative site but, rather, was created solely for the purpose of submitting evidence of an alternative site to the EDA, thereby bolstering Cooper Health's claim for tax incentives. On November 25, the day after the EDA underwriter had sent an email to Cooper Health's Andrew Bush asking for "back-up" for the locations described on Cooper Health's CBA form, including the Philadelphia location, Mr. Bush emailed a real estate broker, Jon Sarkisian at the CBRE brokerage firm, under the subject line "favor."[138] Mr. Bush's email asked the broker to produce a term sheet for a "credible" rental location in Philadelphia that would match the space (120,000 sq. ft.) and cost

($23.50 per rentable sq. ft.) specifications of the Philadelphia location described in the CBA that Cooper Health had submitted to the EDA on November 18, 2014:

> As part of our EDA application we need a term sheet for a potential location outside of NJ.
>
> I need a **credible location that is LESS expensive than L3**. I think that Center Sq may be the right comp – the building is listed by CBRE Given that this building is within the CBRE family – can you get me a term sheet for 120k sf? **Quietly? No probability of us moving to Center Sq, so I don't want to make too much noise**
>
> I need a full service number of $24/sf or less to make the numbers work. Space can be as-is for 10 or 15 year term.
>
> Let me know
>
> Thanks
>
> Andy

(Emphasis added).[139] The obvious reference is that Mr. Bush was asking Mr. Sarkisian to provide a sham term sheet that could be supplied to the EDA as evidence of its bona fide intent to relocate outside New Jersey, when in fact Cooper Health had no such intention.

Although obviously the EDA was not copied on that email, Cooper Health's application file contained numerous red flags that should have called into question the sincerity of its statement that it was considering relocating to Philadelphia and that the cost differential between the two proposed locations presented a "burden to Cooper to remain in NJ."[140] Cooper Health's initial application did not claim any possibility of an out-of-state relocation—and, indeed, expressly disclaimed the possibility. Only after the application was submitted to the EDA did Cooper Health provide purported evidence of an out-of-state location and claim that there was a "burden . . . to remain in NJ." Even at that point, Cooper Health made inconsistent representations about the Philadelphia site in question, first citing one address (1900 Market Street), and then citing another (1500 Market

[139] After Mr. Bush sent the request to Mr. Sarkisian for a "credible" location, Mr. Sarkisian responded later that day, noting that he had received the email as well as a voicemail from Mr. Bush. Mr. Sarkisian added, "I like [sic] to speak to you the numbers may not come in the area that you thought. Call me in the office tomorrow." Mr. Bush responded, "Will do." Exhibit 26.

Street). Those facts should have alerted the EDA underwriter to a potential problem, prompting additional diligence. However, the EDA failed to further investigate the facts to ensure that Cooper Health was genuinely considering relocating to Philadelphia, and that the location was bona fide, suitable, and available.

The EDA Board approved Cooper Health for an almost $40 million award on December 9, 2014.[141] The Task Force requested that the EDA recalculate the award that Cooper Health could have received if it had communicated to the EDA, as it had communicated to the real estate broker, that there was "[n]o probability"[142] of Cooper Health relocating to Philadelphia instead of Camden. Based on a recalculated net benefits analysis, the EDA concluded that Cooper Health would have qualified for only a $7.15 million award at most. Therefore, the failures in the EDA's processing of Cooper Health's Grow NJ application appear to have resulted in over $32 million in improperly approved tax incentives, putting aside the potential ramifications of Mr. Bush's apparent misrepresentation.

b) Conner Strong & Buckelew, The Michaels Organization, and NFI

CSB, TMO, and NFI submitted Grow NJ applications on October 24, 2016.[143] The three companies sought tax incentives in connection with joint plans to move into a new office tower on the Delaware River waterfront of Camden, New Jersey (the "Camden Tower"). Floors 15 through 18 of the Camden Tower (110,161 sq. ft.) were allocated to CSB, floors 12 through 14 (101,511 sq. ft.) were allocated to TMO, and floors 9 through 11 (101,511 sq. ft.) were allocated to NFI. The Camden Tower was to be constructed by the Liberty Property Trust development firm.

i) Background Context

Although CSB, TMO, and NFI submitted their Grow NJ applications to the EDA in October 2016, the EDA was aware of their plans to relocate to Camden long before then.

In September 2014, more than two years before the companies filed their applications, senior EDA management held a meeting with Philip Norcross of Parker McCay and several

[141] Cooper Health could have potentially qualified for a larger award, but during EDA's processing of the application, Cooper Health removed a number of jobs from the application to keep the award under $40 million. Under EDA policy, awards over $40 million require additional scrutiny and processing time.

representatives from Liberty Property Trust. The purpose of the meeting, as described in an email setting it up, was to discuss "a large office building on the Camden Waterfront."[144]

A year later, on September 24, 2015, CSB's Executive Chairman, George E. Norcross, III, sent an email attaching a press release to the EDA's then President and Chief Operating Officer Tim Lizura discussing Liberty Property Trust's plans for the Camden waterfront, including the Camden Tower. The press release listed "local leaders who have **committed** to investing in the project either personally or through their firms," including "George E. Norcross, III, Executive Chairman, Conner Strong & Buckelew," "John O'Donnell, President, The Michael's Organization," and "Sidney Brown, Chief Executive Officer, NFI, and his family." (Emphasis added).[145]

That same day, then-Governor Chris Christie, then-Mayor Dana Redd, and others hosted a major press conference announcing the Camden waterfront development at the Camden Aquarium. George Norcross attended the event. At the event, a reporter for *NJTV News* asked Mr. Norcross, "It's been reported that you're going to put $50 million into the project, is that true?" He responded, "It's absolutely true. I **committed** to do this when I was trying to persuade one of the biggest real estate concerns in the country to become part of this effort, and we all thought that was going to be a credible act, and we're putting our money where our mouths are, and we're looking forward to being a part of it." (Emphasis added).[146] Press coverage around that time indicated that CSB, TMO, and NFI were expected to relocate to the new Camden development.[147]

Internal emails from the EDA show that Mr. Lizura attended the press event, at which he spoke to at least one reporter and one representative from Liberty Property Trust, the developer of the project.[148] But, later, when the companies were preparing their applications for tax incentives

Governor

based on representations that they were considering out-of-state locations and requested an initial assessment of the net benefits test, an EDA employee indicated that he planned to run the test assuming that no jobs were at risk of leaving the state—and Mr. Lizura directed the employee to run a preliminary assessment as if the jobs were at risk.

Specifically, on August 31, 2016, Kevin Sheehan of Parker McCay sent an email to an EDA BDO requesting that preliminary award calculations be run for CSB, TMO, and NFI.[149] The BDO forwarded Mr. Sheehan's email to an EDA underwriting supervisor, Director of Bonds and Incentives John Rosenfeld, saying: "[These] are all the applicants that may go into the LPT [Liberty Property Trust] space at the Camden Waterfront. All three would like to know what their award could potentially be before focusing their efforts on an application for this space, especially since it's expensive."[150] When Mr. Rosenfeld ran the numbers for two of the three companies later that day, he explained the results internally to others at EDA as follows: "I would advise caution on these numbers but, based on the extremely limited information involved, it looks like these applicants COULD have a Net Benefit of approximately $36.8M and $43.3M respectively."[151]

A few days later, the assigned EDA BDO copied Mr. Lizura into her email chain with Mr. Rosenfeld, saying as follows: "Hi John, are these [calculations] including the new and retained job numbers that are listed below? Also Tim has requested to see the reports so he can review them as well, thanks!" Mr. Rosenfeld replied that he did not include any credit for income taxes related to jobs retained in New Jersey, because he had "assumed that this was a situation where the jobs would stay where they are in NJ without the award . . . ." Mr. Lizura flatly told Mr. Rosenfeld, "**The retained jobs are at risk. Can you run them as such**." (Emphasis added).[152]

Mr. Lizura's instruction to Mr. Rosenfeld to assume that the jobs were at risk, given the well-publicized commitment made by Mr. Norcross at the press conference that he attended, certainly invites skepticism. In an interview with the Task Force, Mr. Lizura said that he was merely instructing Mr. Rosenfeld to run the assessment using the numbers that Mr. Sheehan had provided and was not making a factual statement about whether the "retained jobs" were "at risk." He further indicated that, at that stage, he deferred to Mr. Sheehan about whether the jobs were "at risk" because Mr. Sheehan knew the tax-incentive programs well and understood their requirements. Mr. Lizura also stated that he viewed the statements in the September 2015 press

[149] Exhibit 33.

release and press conference that CSB, TMO, and NFI had "committed" to the Camden waterfront development project only as a commitment to invest in the real estate project, and that he was not aware of whether CSB, TMO, or NFI had committed to relocate to Camden at any point before their applications were filed.[153] Given the statements a year earlier that the very companies applying had "committed" to Camden, the Task Force believes that these applications should have been scrutinized, particularly given the size of the awards at stake. Indeed, despite his instruction to Mr. Rosenfeld to defer to Mr. Sheehan's numbers about at-risk jobs, Mr. Lizura indicated during this interview with the Task Force that he instructed his team to pay particular attention to the applications because they involved companies related to Mr. Norcross. Mr. Lizura did not, however, identify any particular steps he asked the team to take to scrutinize the applications, and the Task Force has found no evidence of any. In any event, Mr. Rosenfeld, after re-running the test based on Mr. Lizura's instruction, said: "With the at risk jobs, they both get to about $88.8M in net benefit . . . ."[154] The final awards were granted based substantially on that calculation.

ii) The Applications

When CSB, TMO, and NFI submitted their Grow NJ applications on October 24, 2016, notwithstanding the prior public reports that the three companies had already "committed" to relocating to Camden, the companies all stated that they were considering a potential relocation to Philadelphia as an alternative.[155] Specifically, each company stated "Yes" in response to the application's question of whether jobs were at risk of being located outside of New Jersey and listed "Pennsylvania" as in competition with New Jersey for the jobs.[156] Each company stated, in virtually identical language, that the company's "business is expanding and requires additional space. If the credits are not awarded, the business will seek to relocate at a less expensive location outside of New Jersey."[157] Each company's application stated that the company had retained real

[153] Even if CSB's, TMO's, and NFI's only "commitment" was to invest in the real estate project, and not to relocate their offices there, as Mr. Lizura claims to have believed, it nonetheless is difficult to understand why a different understanding would not emerge once the companies filed their applications and indicated their intent to relocate there. The EDA had the authority to request documentation from CSB, TMO, and NFI that would have revealed the nature of the "commitment" the companies had made and when they made it, but the EDA failed to exercise such authority.

estate brokers "to identify Class A office space in Philadelphia."[158] Real estate proposal letters from real estate brokers for Philadelphia space for each company were attached to the applications.[159] However, TMO's and NFI's proposal letters for space in Philadelphia had already expired by the time the applications were filed. (CSB's proposal letter did not specify an expiration date.)

On November 18, 2016, the EDA underwriter assigned to the three companies' applications sent an email to Kevin Sheehan of Parker McCay, who represented all three companies, to ask whether the companies still had valid offers for space in Philadelphia, because the real estate proposal letters submitted with the companies' applications appeared to have expired.[160] The underwriter followed up ten days later, also asking Mr. Sheehan to clarify how many employees at the three companies were at risk of moving out of New Jersey.[161] Mr. Sheehan replied that "[a]ll employees are at risk in all 3 companies."[162] On November 30, 2016, Mr. Sheehan sent the EDA underwriter a new real estate proposal letter for CSB, dated December 1, 2016, outlining a proposal for space in Philadelphia.[163] The December 1, 2016 real estate proposal differed significantly from the prior real estate proposal that CSB had submitted with its application. The initial proposal offered approximately 150,000 sq. ft. of space on the third through seventh floors, and the eleventh and twelfth floors, of the building located at 1601 Market Street in Pennsylvania.[164] CSB's new letter offered the company "approximately 110,000" sq. ft. of space on the third through seventh floors and the thirteenth floor of the building. The letter stated that it would expire on December 31, 2016.[165]

Two months later, on March 1, 2017, Mr. Sheehan sent the EDA underwriter new real estate letters for NFI and TMO, outlining proposals for both companies for space at 1500 Spring Garden Street in Philadelphia.[166] Both real estate proposals differed from the initial, expired proposals that the companies submitted with their applications in respects, but the changes with respect to TMO's proposals were significant. TMO's initial real estate proposal, dated August 30, 2016, had offered

the company 103,491 sq. ft. of space on the second floor of 1500 Spring Garden Street.[167] The proposal further stated that, in the alternative, TMO was offered 103,710 sq. ft. of space on the first and seventh floors of the building.[168] TMO's second real estate proposal, dated February 28, 2017, offered the company 95,928 sq. ft. of space divided between the basement level, two separate suites on the first floor, a suite on the seventh floor, and another suite on the twelfth floor.[169] The proposal letter also stated that the space on the seventh floor—which comprised approximately a third of the total space offered to TMO—was "encumbered by a Right of First Offer in favor of [another company]."[170] Both NFI's and TMO's real estate proposal letters stated that they would expire on March 24, 2017.[171]

The differences between CSB's, NFI's, and TMO's first and second sets of real estate proposal letters for Philadelphia are summarized below:

Company	**CSB**		**NFI**		**TMO**	
Address	**1601 Market Street**		**1500 Spring Garden Street**		**1500 Spring Garden Street**

The EDA underwriter prepared Project Summary memoranda based on the information provided by the companies.[178] Each company's memorandum stated that the company was considering between relocation in the Camden Tower or an alternative location in Philadelphia, that their New Jersey jobs were "at risk of being located outside the State," and that Grow NJ tax credits would be a "material factor" in the company's decision whether to locate in Camden.[179] Under the "Conditions of Approval" section of each memorandum, it stated as Condition No. 1 that the company "has not . . . committed to remain in New Jersey."[180] Each memorandum concluded by recommending that EDA's Board "approve the proposed Grow New Jersey grant to encourage [the respective company] to locate in Camden."[181] The memoranda were provided to EDA's Board and, on March 24, 2017, the Board voted to approve CSB, TMO, and NFI for total tax incentive awards of almost $245 million—$86,239,720 for CSB, $79,378,750 for TMO, and $79,377,980 for NFI.

The Task Force has discovered evidence appearing to indicate that the three companies did not genuinely consider Philadelphia as an alternative location to Camden. In August 2016, only a few months before submitting their applications, and almost a year after the press conference during which their "commitment" to the Camden project was reported, Kevin Sheehan appears to have reached out to a real estate broker, Ken Zirk at CBRE, to solicit offers for real estate in Philadelphia. After the initial outreach, the companies collaborated to obtain proposals for Philadelphia real estate to submit to the EDA, and NFI led the efforts on behalf of all companies.

On August 26, 2016, NFI's Chief Financial Officer, Steven Grabell, sent an email to TMO's Chief Financial Officer, Joseph Purcell, and CSB's Chief Financial Officer, John Muscella, to explain that he had authorized the real estate broker "to proceed full speed ahead with getting a proposal for 1500 Spring Garden."[182] NFI's Mr. Grabell wrote that the building located at 1500 Spring Garden Street was large enough for both NFI and one other company to obtain proposals from, and further, the real estate broker had "identified an additional possibility for 95,000 square feet at 1601 Market" that the third company "could use."[183]

Several days later, on August 29, 2016, NFI's Mr. Grabell wrote to Mr. Zirk, the real estate broker, to ask when the companies would be getting term sheets for the 1500 Spring Garden and 1601 Market properties in Philadelphia.[184] Later that day, Mr. Zirk sent one proposal letter, for NFI alone, for 1500 Spring Garden Street.[185] That evening, Parker McCay's Mr. Sheehan wrote to the group of CFOs for the three companies and the broker, noting that the proposal was for NFI and asking, "Is there one for Michaels?"[186] In response, NFI's Mr. Grabell stated: "Enough space for Michael's in that building as well. **I think it would be a little suspicious to ask for a duplicate**. Any thoughts?" (Emphasis added).[187] TMO's Mr. Purcell responded and wrote that he had understood that all three of the companies were "going with the 1500 Spring Garden Property."[188] However, in view of the concern that it would be "a little suspicious" for multiple companies to claim the same alternative location in Philadelphia, TMO's Mr. Purcell wrote that he would be willing for TMO "to go with" a different location in another city entirely—Fort Washington, Pennsylvania, instead of Philadelphia—if one of the other two companies requested it.[189] NFI's Mr. Grabell replied that "1500 Spring Garden has space for 2 of us, but not 3. That is why we reached out to 1601 Market."[190] Mr. Grabell asked Mr. Zirk whether he would "feel comfortable getting a similar quote for Michael's for 1500 Spring Garden?"[191] Mr. Zirk responded that he would discuss with the landlord's broker "tomorrow first thing."[192] TMO ultimately obtained a

---

tenant from? How would we not have known about a 100,000 SF prospects [sic]?" The broker responded with a lengthy explanation, noting, among other things, that CSB's "principal, George Norcross, is a major political figure in South Jersey & very well connected locally." The broker wrote to the landlord that CSB "had been attempting to [relocate to] Camden with Liberty Property Trust but the deal apparently got too expensive & they didn't get the tax breaks/incentives that they were seeking," so CSB had decided to move the jobs to Philadelphia instead. Exhibit 46. In fact, however, CSB had not yet applied for tax incentives in New Jersey at that point, let alone been rejected for them.

proposal letter for 1500 Spring Garden, and CSB obtained a proposal letter for 1601 Market Street, which both companies submitted with their applications in October 2016.

Although the EDA did not have access to the companies' emails with the real estate broker, which the Task Force obtained, there were nonetheless clear red flags in CSB's, TMO's, and NFI's EDA application and in the public record that should have caused EDA personnel to question the three companies' statements that they were considering relocating out of the State. As discussed above, there were public statements, of which senior EDA leadership was aware, indicating that the three companies had already "committed" to relocate to Camden long before they claimed to be considering relocating to Philadelphia. Despite these public statements, EDA leadership appear to have instructed EDA staff that the companies' jobs were "at risk."

In addition, at the Task Force's public hearing on May 2, 2019, the current Managing Director of the EDA's the Underwriting department, David Lawyer (who did not work on these applications and was not responsible for the Grow NJ program at the time they were processed) testified that it was "unusual" for companies to submit expired proposal letters with their tax incentive applications, and the fact that the letters had expired when they were submitted "casts doubt on whether that site [was] available."[193] Mr. Lawyer also testified that the changes to the amount and the configuration of the space in TMO's alternative-site proposal, as well as the fact that a significant portion of the space was encumbered by a right of first offer, raised red flags about the sincerity of the company's consideration of the property.[194] Mr. Lawyer testified that, in his view, the issues with CSB's, TMO's, and NFI's real estate proposals raised serious questions, "because . . . there's a pattern."[195] Similarly, John Boyd, an expert in corporate site selection, testified that it is common for companies considering relocation to negotiate for extended offer periods to provide adequate time to assess the suitability of potential real estate.[196] That these companies did not do so but instead submitted expired real estate offers, therefore, was a red flag. Mr. Boyd further testified that in his experience, barring extraordinary circumstances like emergency relocation after a natural disaster, companies never want office space spread out over noncontiguous floors of a building of the sort TMO was purportedly considering, spread out across

Governor

four separate floors, including the building's basement.[197] The EDA staff, however, took no action to further investigate based on these and other red flags.

In 2017, the EDA approved CSB, TMO, and NFI for almost $245 million in tax incentive awards collectively—approximately $86.2 million for CSB, $79.4 million for TMO, and $79.4 million for NFI. The Task Force requested the EDA recalculate the awards the three companies could have received if they had communicated to the EDA that they were not considering any potential relocation to Philadelphia instead of Camden—which, based on the evidence discussed above, appears to have likely been the truth. Based on recalculated net benefits analyses, the EDA concluded that CSB's award would have stayed the same ($86.2 million), that TMO would have qualified for only a $60.8 million award at most (rather than $79.4), and that NFI would have qualified for only a $27.2 million award at most (rather than $79.4). Therefore, the EDA's failure to investigate the red flags in these companies' applications could have resulted in over $70 million in improperly approved tax-incentive awards.

5. Lack of Proper Reporting Channels

The EDA does not have official reporting channels in place for the processing, review and recording of internal or external complaints about Program awardees or applicants and does not maintain a "hotline" or reporting line for outside parties to report potential misconduct related to the EDA's tax incentive or other programs. The absence of such reporting mechanisms makes it more likely that misconduct—whether on the part of EDA employees or companies—will be missed.

Several EDA employees we interviewed suggested that external complaints or tips should be elevated to an individual in Human Resources or the Deputy Attorney General, but there was no official reporting line or process for ensuring that all complaints and tips were carefully considered and escalated to the appropriate individuals. Nor was there an official record of such complaints or tips maintained within the EDA. Two BDOs we interviewed recalled outreach from FBI agents regarding a potentially fraudulent application. Those BDOs recalled that the information was generally "disseminated" amongst the directors and Deputy Attorney Generals, but there was no formal system for tracking flagged companies. In another instance, a local contact advised a BDO Program Manager that a Grow NJ awardee had recently fired 80 employees—or 30% of its workforce. The Program Manager who received this notice recalled that he referred the information to the Director of Portfolio Management and Compliance but was not involved in any further action. The Managing Director of Business Development indicated that there was no policy regarding how to treat this type of information but believed the information would have been "socialized" within

[197] Hr'g Tr. (May 2, 2019) at 109:11-110:8.

PHILIP D. MURPHY
Governor

the EDA and referred to the Portfolio Management and Compliance group if it involved a tax incentive grant recipient. Although we believe that, in the latter example, the information ultimately reached the appropriate individuals, an express policy regarding the steps required to process and record this type of information would substantially improve the EDA complaint processing to ensure that information from outside parties regarding potential misconduct is not missed.

VI. THE ACCELERATED RECERTIFICATION PROGRAM (THE "ARP")

A. Introduction

As discussed above, in order to fully investigate the administration of the Programs, the Task Force undertook to examine the EDA's processing of awards for companies that applied for and received tax-incentive credits under the Programs. Given the findings of the Comptroller's audit, moreover, the Task Force has sought to determine whether each company in scope was compliant with applicable statutory, regulatory, and administrative requirements when the EDA approved its application and when it received tax credits under Grow NJ or ERG. To facilitate an investigation and review process that promotes resource efficiency, collaboration with companies, and expedient processing for compliant companies, the Task Force established the ARP. During its initial outreach and communications with companies in scope, the Task Force received overwhelming interest in the ARP. As a result, the Task Force announced the ARP during its first public hearing on March 28, 2019.

Without an expedited process of the sort provided by ARP, the Task Force would have conducted a broader investigation into each company's award. This could have included expansive document requests, interviews of relevant company personnel, and extensive document and data review. As an alternative, the ARP provides companies a streamlined process to proactively establish that they are in compliance with the Programs' requirements. If a company declined to participate in the ARP, or if the Task Force deemed it ineligible, the company's award is subject to the broader investigative process necessary to carry out the Task Force's mission.

B. ARP Participant Companies

The Task Force deems companies eligible for the ARP if the company (1) completes and submits an initial affidavit (the "ARP Initial Affidavit") and (2) the Task Force has not received or identified information suggesting misconduct, fraud, or other non-compliance with applicable requirements with respect to the company's application for, approval for, or issuance of tax incentives.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

The Task Force requires each company's CEO, or equivalent personnel, to execute the ARP Initial Affidavit, which provides additional company information to the Task Force. The ARP Initial Affidavit requires companies to describe their efforts to comply with the Task Force's document preservation directive and to identify document custodians and third parties that may possess relevant documents. Companies must also agree to voluntarily and promptly produce relevant documents to the Task Force. As of the date of this Report, 53 companies have pursued participation in the ARP. Despite the overwhelming participation in ARP, we note that approximately 8 otherwise eligible companies expressly declined to participate in the ARP. We appreciate that each company operates under a different set of resources, frameworks, and stakeholders. Therefore, we emphasize that at this time, we cannot— and have not—drawn any conclusions about companies that did not elect to participate in the ARP.

There have been several instances where companies sought inclusion into the ARP, but their eligibility is still under consideration by the Task Force for myriad reasons. In some instances, the Task Force has become aware of concerning information regarding the company's application or award. For example, for a number of companies, the Task Force has learned through independent evidence and information that the company's assertions regarding its intention to relocate are questionable. In these cases, proposed jobs may not have actually been at risk of leaving or locating outside of New Jersey, contrary to the companies' representations to the EDA. The Task Force reserved the option to investigate further before allowing the companies in question to participate in the ARP.

For other companies, the Task Force has become aware of information suggesting that these companies committed to locate in New Jersey before they submitted their EDA application. In other circumstances, the Task Force is aware of information suggesting misrepresentations or misconduct in connection with the jobs requirements of the award. In these cases, the Task Force reserved the ability to further investigate and review written responses and assertions made to the EDA to determine whether a company's application contained misrepresentations.

Several companies that exhibited threshold issues of the sort described above submitted the ARP Initial Affidavit. In the interest of transparency and continued cooperation, the Task Force contacted these companies to discuss obstacles to their ability to participate in the ARP. In many instances, companies were not deterred by this message and have continued to work with the Task Force to provide requested documents and information. The Task Force is reviewing this information before confirming the companies' categorization going forward.

Finally, there is a tranche of companies that the Task Force disqualified or deemed ineligible for ARP participation. The Task Force has disqualified companies where the Task Force has

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

identified a reasonable basis to believe that further investigation may reveal instances of misconduct, fraud, violations of applicable requirements, or other issues suggesting the company's lack of good faith. Separately, the Task Force may also disqualify companies where they fail to comply with the Task Force's requests or the ARP requirements.

C. ARP Process

In order to establish a process that would enable it to determine whether a company was in compliance with Program requirements, the Task Force carefully reviewed related statutes, EDA regulations and requirements, and met with key EDA personnel to determine exactly what it means "to be compliant." Thereafter, the Task Force created a framework for information requests, document collection, and interviews that would provide adequate information for the Task Force to review and make a determination of compliance with Program requirements. The Task Force has taken care to continue an open dialogue with each participating company to better understand the company's framework, business, and key stakeholders. Accordingly, while the Task Force has established a process for the ARP, it also is working collaboratively with each company, with an understanding that each company's documentation, application, and purported needs for the tax incentives vary significantly.

From a process perspective, once companies submit the ARP Initial Affidavit and are deemed eligible by the Task Force, the Task Force requests certain written responses, with supporting documents where necessary ("Verifying Documents"), related to each company's application. The Task Force's ARP for Grow NJ requires the company to submit additional documentation related to the company's good faith business plan to relocate or locate in New Jersey, its plan for new or retained full-time jobs, and its expenditures comprising its capital investment. The Task Force's ARP for ERG requires submission of documentation related to the project's financing gap and development and the project developer's good standing. While the ARP requires documentation beyond what the EDA requested, these requests are narrowly tailored to identify representative materials that will allow the Task Force to examine the company's application and award.[198] As part of the review process, the Task Force engages in open communication with the company for clarifications, context, and additional information.

A company must provide a final affidavit from its CEO, or equivalent personnel, ("Verification Affidavit") and the requested Verifying Documents. To assist companies, the Task Force provides a template Verification Affidavit that the company tailors to its specific

[198] For example, to assess the company's good faith intentions to locate to New Jersey, the Task Force requests contemporaneous business records or communications discussing the relocation plan and the suitability of the proposed alternative site.

Governor

circumstances. Thereafter, the company submits a draft affidavit. The Task Force reviews the information supplied to determine whether the company applied for its tax-incentive in good faith and with accurate information; met the application's requirements; and complied with the program requirements for each and every subsequent year it participated in the Programs. If the Task Force can make these determinations based on the information the company provides, the Task Force will accept a final Verification Affidavit. Upon successful completion of ARP, the Task Force will send a verifying closing letter ("Closing Letter"), confirming the company's successful re-certification.[199]

D. Initial Findings

The ARP process has provided the Task Force with opportunities to identify deficiencies with the Programs' designs and with the EDA processes to implement the Programs. By engaging with companies in the ARP and by collecting, reviewing, and analyzing information and data from the company's internal deliberations, the Task Force has been able to evaluate the requirements and EDA regulations from the company perspective.

Based on this examination, the Task Force has determined that both the existing legislation and the EDA requirements are ambiguous in certain respects that has impacted the EDA's ability to ensure consistency in how these requirements are applied across project applicants.[200] Some examples include:

- **EDA verification of cost benefit analysis**: An ARP company explained that after it submitted its application materials and cost benefit analysis, the EDA did not request any support for the line-item estimates in the company's cost benefit analysis, which showed that New Jersey was more expensive than the proposed alternate location. The company agreed that at the time of its application, the EDA had no verification that the line items in

[199] However, the Task Force's Closing Letter has no binding effect on any other agency or office of the State of New Jersey. Moreover, should the Task Force become aware of credible reason to believe there was misconduct, the Task Force reserves the right to make such information known to other law enforcement agencies.

[200] We understand that the EDA has, in the last year or so, begun to implement solutions to these deficiencies through its own processes and approval requirements.

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

its proposed estimate were accurate and not exaggerated, estimated, or manipulated in any way.[201]

- **Clear legislative guidance and definitions for award bonuses categories**: After another ARP company submitted its initial application to the EDA, the EDA questioned whether it qualified as a technology business for the purposes of an award bonus. Under the Grow NJ statute as amended by EOA 2013, "technology" is a "targeted industry" such that qualifying "technology" companies are eligible for an additional grant of up to $500 annually per job.[202] However, neither the Grow NJ statute, nor EDA's implementing regulations, nor any policy documents maintained by EDA define what constitutes a "technology" company. Based on the Task Force's review, the Task Force found that EDA employees struggled over the appropriate characterization for the company.

- **EDA requirements related to applicants' submissions regarding potential alternative locations**: The EDA has not consistently required applicants to submit the same materials regarding the viability of the proposed alternative site.

VII. RECAPTURE

The Task Force seeks to achieve not only recommendations for the tax-incentive programs prospectively but to recommend recapture of improperly credited taxpayer dollars. These recommendations and efforts for recapture have involved cooperation and coordination with several areas of New Jersey State government, including the EDA, the Department of Taxation, and the New Jersey Attorney General's Office.

A. Statutory Recapture Process

The current Grow NJ legislation specifically sets forth language identifying the EDA's authority to recapture tax-incentive awards under certain circumstances.

Under the Grow NJ Act, applicants must enter into an incentive agreement with the EDA before the awardees receives any tax credits. One of the required provisions of this incentive agreement is that the applicant commits to remaining in its New Jersey facility for a minimum period of time. Typically, this period would include a ten-year term, during which the company

[201] The Task Force closely examined supporting information provided by the company, including the actual costs accrued after the company successfully received its grant and moved to New Jersey, and found no indication that the proposed analysis was made in bad faith.
[202] *See* N.J. Stat. §§ 34:1B-246(c)(8), 34:1B-243 ("targeted industry" definition).

PHILIP D. MURPHY
Governor

receives its award amount as annual credits, plus an additional five years after all annual credits are issued.[203] The statute further requires that if the company fails to honor this commitment, the EDA may recapture all or part of the tax credits awarded, although EDA retains the discretion to recognize the period of time that the company complied with the award requirements.[204]

B. Task Force Recommendations for Recapture

The Task Force has instituted its own processes to recommend recapture of tax-incentive awards and to assist the EDA with its recapture of tax-incentive awards.

When companies have indicated a willingness to cooperate and disclose any potential non-compliance, the Task Force has offered, and will continue to recommend and connect the company with the State Treasury for settlement. The Task Force considers such settlement recommendations based on the company's specific factual circumstances. However, for the Task Force to consider a settlement recommendation, the company must be willing to agree to several terms. First, the company must voluntarily terminate its tax-incentive award, including taking all steps that the EDA requires for the company to terminate its award. Second, the company must repay the value of the tax-incentive benefit already claimed. Third, if it becomes aware of credible evidence of criminal misconduct relating to the tax-incentive programs, the Task Force reserves its right to make such information known to other enforcement authorities. Finally, any settlement agreement with a State agency does not bind any other agency or office of the State of New Jersey. Companies that settle do not admit to any liability.

Separate from potential settlements, the Task Force has also referred, and will continue to refer, certain companies and awards to the EDA to consider whether additional credits should issue or whether previously received credits should be recaptured. The Task Force may also refer companies to appropriate law enforcement authorities for further investigation. Should law enforcement authorities pursue a criminal investigation and charges, this could generate sufficient evidence that a company's award was improperly awarded.

---

[203] *See* N.J. Stat. Ann. § 34:1B-243 (defining the "eligibility period" as "the period in which a business may claim a tax credit," beginning with the first year the company certifies for a credit but that the term will be no longer than 10 years); *Id.* (defining "commitment period" as "1.5 times the eligibility period").

TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

Currently, the Task Force has referred a number of applicants for suspension /or termination of their tax-incentive awards or obtained voluntary termination. In all, the aggregate amount of the grants at issue exceeds $500 million.

VIII. RECOMMENDATIONS

Executive Order No. 52 called for the Task Force to offer advice concerning the future of New Jersey's tax-incentive programs. Although the Task Force's work remains ongoing, its investigation and analysis to date have revealed certain deficiencies in the design, implementation, and oversight of the Programs now in place. Based on its findings, the Task Force offers the following recommendations with respect to the State's current and future tax-incentive programs, which will be supplemented as the Task Force's work continues.

Recommendation 1: The Task Force's investigation to date has found that special interests have had a significant hand in molding the current Programs' legislation and implementing regulations in their favor. As a result, in certain respects, the Programs have not been "neutral" in their design but have instead been structured to favor the business interests of certain parties, and in some cases to disfavor other parties. Future tax-incentive legislation should be designed to ensure that legitimate public policy goals are applied neutrally, without favoring specific business interests.

Recommendation 2: Future tax-incentive legislation should be transparent with respect to the benefits or costs of the programs. Under the current Grow NJ program, all tax incentive awards are statutorily required to "yield a net positive benefit to the State."[205] Based on this statutory provision, the State should profit from the program. However, this requirement is undermined by provisions of the statute allowing the benefits calculation to include the value of certain taxes that the State will never actually collect. By allowing such so-called "phantom taxes" to be included in the benefits calculation, the "net positive benefit to the State" that is supposed to be required by the law may be rendered illusory, obfuscating the potential costs of the tax incentives and contributing to public confusion.

Recommendation 3: To further promote transparency and public understanding, the goals of future tax-incentive legislation should be clearly defined, and the program should be structured to effectuate those explicit goals—not other unspecified aims. Currently, the Grow NJ Act expressly states that a "purpose of the [Grow NJ] program is . . . to preserve jobs that currently exist

[205] N.J. Stat. § 34:1B-244(a)(3).

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

in New Jersey but which are in danger of being relocated outside of the State."[206] However, as discussed in Section IV(A)(1)(e) of this First Report, certain provisions of the Grow NJ Act are sufficiently vague that companies may be able to receive tax credits for relocating existing jobs in New Jersey to Camden or Atlantic City, even if the jobs were never "in danger of being relocated outside the State." Tax incentives in these circumstances clearly do not advance the statutory aim of preserving jobs in the State. If it was also an intended purpose of Grow NJ to incentivize the relocation of existing jobs from other parts of New Jersey to Camden or Atlantic City, it would have aided public understanding to set out this purpose explicitly in the statute, along with the other intended purposes.

Recommendation 4: Relatedly, the Task Force's examination has found that the current statutory text for the Programs contains ambiguities in certain respects. This is illustrated by the issues relating to the "material factor" test that applies to projects in Camden and Atlantic City. It also applies in other areas: for example, as discussed in Section VI(D) of this First Report, there was one instance in which it was unclear whether a company qualified under certain provisions of Grow NJ for "technology" companies—a statutory term that is not defined in the law. Ambiguities in statutory text are inevitable. However, when such ambiguities arise in the administration of a statute, the responsible agency should both determine the resolution of the issue and further publicize its decision so that the rules are clear and known and are applied consistently. When the EDA addresses statutory ambiguities such as this one, it should embody its decisions in published rules (whether in the form of regulations, formal policies, or other guidance documents) that are available to the public.

Recommendation 5: Future legislation should be designed to ensure that the EDA can better control whether companies that meet the employment or other requirements for only a small portion of their commitment period are eligible to receive their full annual award. It should also include provisions ensuring that companies cannot receive a full year's award without meeting the requirements for a full year, and without providing a full year's worth of data to prove their compliance.

Recommendation 6: The EDA should issue comprehensive written policies and procedures to guide its employees in administering the Programs and should implement formal internal training mechanisms with respect to all aspects of the current Programs and any future tax-incentive programs. Although the Task Force fully appreciates that the Programs are complex and often amended, the Task Force's investigation to date has nonetheless found undeniable

[206] N.J. Stat. § 34:1B-244(a).

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

deficiencies in certain EDA employees' understandings of the applicable requirements in various respects. The EDA's shortfall in the issuance of regulations and policy and guidance documents likely contributed to these deficiencies, as it limited the resources available to these employees.

Recommendation 7: As described above, the Task Force, third parties, and the media have all discovered significant and adverse information about program applicants, much of which required very little effort. Thus, it seems quite clear that—whatever the EDA's underwriters are doing in the way of independent research on applicants—the work has been deficient. Moreover, the notion of awarding applicants millions, tens of millions, or even hundreds of millions of dollars in tax incentives without a rigorous background check on the company, its officers, and affiliates defies common sense. Thus, we strongly urge that any new legislation include a provision directing the EDA to use a qualified professional services firm to conduct rigorous background checks.

Recommendation 8: With respect to the specific issue of assessing an applicant's representation that the applicant is considering locating outside of New Jersey, the Task Force's investigation to date has found clear deficiencies in the EDA's assessments. There have been instances in which Grow NJ applicants have made representations concerning the possibility of an out-of-state location that should have raised serious red flags concerning the applicant's sincerity, and yet the EDA failed to take any action to investigate the issue. As discussed above, the Grow NJ Act explicitly states that a "purpose of the [Grow NJ] program is . . . to preserve jobs that currently exist in New Jersey but which are in danger of being relocated outside of the State."[207] If tax incentives are awarded to incentivize a company to stay in the State when the company never actually intended to leave, then public funds are essentially wasted. The Task Force has found, however, that the EDA's administration of the Grow NJ program has in many ways not sufficiently appreciated this principle. The EDA should improve its performance with respect to this aspect of the program, including by providing clear guidance and training to employees on how to conduct such assessments and instructing them on the importance of this issue. The EDA should provide its employees with a clear framework to apply in assessing applicant representations concerning alternative locations.

Recommendation 9: Grow NJ applicants are required to include certifications, signed by the company's CEO (or an equivalent officer), representing that the CEO "has reviewed the information submitted to the [EDA in connection with the application] and that the representations contained therein are accurate."[208] However, issues may arise when a company modifies its

[207] N.J. Stat. § 34:1B-244(a).
[208] N.J. Stat. § 34:1B-244(d).

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001

PHILIP D. MURPHY
Governor

application at some point after it is submitted, but does not submit a new CEO certification attesting to the truthfulness of the new information. The EDA should have a formal policy or regulation requiring the submission of a new CEO certification whenever an application is materially changed after its submission.

IX. NEXT STEPS

As we noted at the outset, the Task Force is continuing its investigation. It will continue to review documents it has received in response to requests to the EDA and third parties, and to interview witnesses to gain a deeper understanding of any flaws in the design, implementation, or administration of the programs. Among other things, the Task Force intends to:

- Hold further public hearings in which the public will have the opportunity to share its views and perspectives;
- Focus its investigation on the design, implementation, and administration of the ERG Program;
- Continue its investigation of the EDA's oversight over Grow NJ and ERG applications;
- Consider additional ways to make the application and compliance verification process more robust;
- Continue the re-certification process for companies participating in the ARP; and
- Continue its efforts to recapture tax-incentive awards where warranted and, as necessary, make additional referrals to the appropriate enforcement authorities.

In addition, the Task Force will examine the impacts of certain aspects of the Programs that may differ from other states' programs, from prior New Jersey tax-incentive programs, or from best practices described by policy experts. In that regard, the Task Force intends to further examine the policy recommendations made by two of the experts that testified during the first day of the public hearings, Josh Goodman, Senior Officer for State Fiscal Health, at The Pew Charitable Trust, and Jon Whiten, Deputy Director of State Communications at the Center on Budget and Policy Priorities. In particular, the Task Force intends to explore:

- Whether the State should consider targeting its tax incentives to businesses that will increase the State's economic growth by serving national and international markets, rather than local markets;
- Whether the State should shorten the timeframes for receiving tax incentives, in an effort to spend less on incentives while achieving the same impact, and to enable it to better predict the costs and benefits of awarding incentives to businesses;

State of New Jersey
OFFICE OF THE GOVERNOR
PO BOX 001
TRENTON, NJ 08625-0001

PHILIP D. MURPHY
Governor

- Whether the Programs' approach to awarding tax incentives in distressed areas sufficiently benefits the residents of those areas and what steps, if any, could be taken to fine tune New Jersey's approach to using tax incentives to help economically distressed areas to ensure that residents of distressed areas actually benefit from tax incentives targeted at improving the economy in distressed areas;
- Relatedly, whether to revise the method for calculating the net benefit to the State for companies moving to distressed areas;
- Whether capping the tax incentives by setting annual cost limits would improve the Programs, and what other options for increasing fiscal protections might be undertaken;
- Whether New Jersey should regularly conduct independent evaluations of the effectiveness of the tax incentives programs and to establish systems mandating greater oversight and annual evaluations of the Programs; and
- Whether the State should limit or prohibit the transfer of tax credits awarded under the Programs.

The Task Force will also seek the input of additional policy experts to the extent they have views on these issues.

EXHIBIT 27

Internal reports contradict regulators' public findings over San Onofre spent fuel

sandiegouniontribune.com/news/watchdog/story/2019-09-22/internal-reports-contradict-nrc-public-findings-

September 22, 2019

When a 50-ton cask filled with radioactive waste got wedged 18 feet above the bottom of its concrete silo back in August 2018, work crews at the San Onofre nuclear plant were able to lower the container to its intended resting place after nearly an hour.

Majority plant owner Southern California Edison halted plans to transfer millions more pounds of spent nuclear fuel from wet to dry storage while federal regulators investigated what happened and made sure the process was safe.

Federal inspectors found many of the waste-filled canisters had been scraped and scratched as they were lowered into the interim storage facility. Even so, the U.S. Nuclear Regulatory Commission allowed the waste transfer program to resume in July.

Documents recently obtained by The San Diego Union-Tribune show that an agency field inspector reviewing the August 2018 incident issued internal reports noting that the canisters were designed — and certified — to be lowered into the storage vault without any scratches.

NRC inspector Lee Brookhart wrote that the required final safety analysis report and the certificate of compliance and technical specifications call for no scratches on the caskets.

"The original FSAR (final safety analysis report) statement for no scratches mirrored the CoC/TS (Certificate of Compliance and Technical Specifications) design basis that no scratches would ensure the code adherence," Brookhart wrote in March.

NRC officials did not respond Friday to questions about those internal reports. An Edison spokesman said the utility is fully compliant with federal regulations and the reloading work has been proceeding safely.

Edison spokesman John Dobken said Friday the utility is following federal rules.

"There's another process available for licensees: 72.48," Dobken said, referring to the U.S. Code of Federal Regulations section that allows a licensee to make changes in procedures or design of the casks used to store spent nuclear fuel. "That's what we used to account for the incidental contact going forward," he said.

The regulation is here:
https://www.nrc.gov/reading-rm/doc-collections/cfr/part072/

Dobken said that the company visually inspected eight of the canisters and found no evidence that the scratches would prevent the containers from safely storing spent nuclear fuel.

The canisters Edison is relying on to store spent fuel are licensed to be use for two decades.

The current plan calls foreventuallymoving the canisters away from San Diego once a more permanentstoragesite is agreed to. But critics of the process worry that the scratches outside so many of the canisters could make them difficult to move.

“If you have scrapes, scratches and gouges, that is a trigger for cracks to start,” said Donna Gilmore, an activist in San Clemente who runs a community group called San Onofre Safety.

Brookhart, the NRC inspector, concluded in March that a formal design change would be required to allow the canisters to remain in service.

Instead of pursuing changes to the approved canister design process, Edison relied on a different safety standard to argue that its existing method are compliant and safe.

Brookhart did not agree that a different methodology would satisfy the requirements of the canisters’ previous certification.

“I just don’t see how that meets CoC,” the NRC inspector said. “... Essentially the change (in methodology) is adding an alternative to the code to not have to do inspections and repair these new defects.”

Brookhart’s supervisors at the regulatory agency did not embrace the inspector’s conclusions. On July 15, the commission allowed Edison to restart the fuel transfer program and move forward with decommissioning the plant.

“The licensee implemented an oversight program to ensure that contractors conducted decommissioning work activities in accordance with procedural requirements as well as license expectations,” the NRC said in a report to an Edison vice president, Doug Bauder.

“The licensee implemented operational, radiological and housekeeping programs to ensure safe storage of spent fuel,” senior regulators concluded.

San Diego attorney Michael Aguirre, who has filed several lawsuits aimed at stopping the burial of 3.6 million pounds of nuclear waste in the beach north of Oceanside, said the internal reports show that the NRC disregarded its own inspector in favor of Southern California Edison.

“These decisions should be based on professional inspectors and not on lobbyists and political players at the NRC,” Aguirre said. “It underscores why the downloading has to stop because it is interfering with the ability to transfer the canisters to a safer location.”

Questions over the interim storage of nuclear waste at San Onofre have persisted since the plant was closed in 2012. At least 8 million people live within 50 miles of the plant and many of them are scared that the site could present a public health threat.

Under U.S. law, the U.S. government is responsible for the permanent storage of the San Onofre waste — as well as all of the other spent nuclear fuel in North America. But for decades, federal officials have been unable to agree on a permanent storage facility.

The San Onofre decommissioning plan calls for moving the waste into about 80 heavy concrete canisters by the end of next year so Edison can dismantle the rest of the shuttered plant and return the property to its owner, the U.S. Navy.

Two years ago, Edison agreed to make “commercially reasonable” efforts to relocate the San Onofre waste to settle a lawsuit Aguirre filed in 2015.

EXHIBIT 28

Spent Fuel Storage in Pools and Dry Casks Key Points and Questions & Answers

On this page:

  - How does the NRC conduct oversight of Licensees?
  - How does the NRC verify that canisters are properly loaded in accordance with their NRC Certificate of Compliance?
  - How can the fuel or internal components be inspected on canisters with welded lids?
  - How would welded stainless steel canisters be repaired if necessary?

- Questions and Answers – Waste Confidence & Future Plans
  - How long is spent fuel allowed to be stored in a pool or cask?
  - What is the plan for storage of spent nuclear fuel going forward? Will on-site storage continue to be the way for the foreseeable future?
  - These casks are already pretty old and could be storing spent fuel for decades to come. How can you protect them from deteriorating over time, especially from effects that have been seen at other nuclear installations such as alkali-silica reaction or chloride-induced stress corrosion cracking?

Questions and Answers – General

What is spent nuclear fuel?

"Spent nuclear fuel" refers to fuel elements that have been used at commercial nuclear reactors, but that are no longer capable of economically sustaining a nuclear reaction. Periodically, about one-third of the nuclear fuel in an operating reactor needs to be unloaded and replaced with fresh fuel.

TOP

Why does spent fuel need to be cooled?

Spent fuel continues to generate heat because of radioactive decay of the elements inside the fuel. After the fission reaction is stopped and the reactor is shut down, the products left over from the fuel's time in

the reactor are still radioactive and emit heat as they decay into more stable elements. Although the heat production drops rapidly at first, heat is still generated many years after shutdown. Therefore, the NRC sets requirements on the handling and storage of this fuel to ensure protection of the public and the environment.

TOP

Why not require real time radiation monitoring or EPA RadNet monitors around an independent spent fuel storage installation (ISFSI)?

The regulations require that an independent spent fuel storage installation (ISFSI) must have the capability for continuous monitoring of the storage confinement system in a manner such that the licensee will be able to determine when corrective action needs to be taken to maintain safe storage conditions. For dry spent fuel storage, periodic monitoring is sufficient, provided that periodic monitoring is consistent with the dry spent fuel storage cask design requirements. The monitoring period must be based upon the spent fuel storage cask design requirements. Therefore, the NRC determined that adequate radiological monitoring capabilities already exist at licensed facilities.

All ISFSIs have multiple radiation monitors to ensure they meet NRC dose limits. This is typically accomplished using multiple thermoluminescent dosimeters (TLDs) on the ISFSI fence. These TLDs are regularly monitored. The results of the monitoring program are one of many items, procedures, and operations reviewed by NRC staff. NRC staff inspection reports are made publicly available, unless they contain classified, safeguards, or sensitive information.

TOP

How are licensees required to fund dry storage facilities?

Licensees are required to set aside funding for the management of spent fuel after a plant permanently shuts down until the fuel is transferred to the Department of Energy (DOE) for final disposal. Although the annual costs for continued storage are manageable, cumulative costs will continue to increase.

Under 10 CFR 50.54(bb), licensees are required to obtain approval from the Commission concerning the program by which they intend to manage the irradiated fuel. This includes all plans to provide funding for the management of the fuel at the reactor until title and possession of the fuel is transferred to DOE for permanent disposal in a repository.

The NRC has requirements in 10 CFR 72.22(e) for license applicants to show they have the necessary funds available to cover estimated construction costs, estimated operating costs over the license term, and estimated decommissioning costs. NRC staff review this at the time of initial license application and at the time of license renewal to determine if the applicant has demonstrated reasonable assurance that funding will remain available for the duration of the facility's license.

TOP

What is high burnup fuel?

Burnup is a measure of how much energy is obtained from the fission of uranium, or fuel, in the reactor. Burnup is measured in gigawatt-days per metric ton of uranium (GWd/MTU). Spent fuel is considered high burnup at a value greater than 45 GWd/MTU.

For more information, see the Backgrounder on High Burnup Spent Fuel

TOP

Could high burnup fuel degrade in storage?

The NRC has conducted testing through the National Laboratories and found that high burnup fuel is robust against storage and transportation loads. The inert environment inside the casks maintained during storage provides assurance that high burn up fuel will maintain its integrity under normal and accident conditions. Ongoing long-term demonstrations of loaded high burn-up fuel with other material types are being conducted by the U.S. Department of Energy and Electrical Power Research Institute (EPRI), and are expected to confirm the previous laboratory testing.

For more information, see the following:

- NUREG-2224 – Dry Storage and Transportation of High Burnup Spent Nuclear Fuel
- High Burnup Dry Storage Cask Research and Development Project: Final Test Plan

TOP

What were the inspection results of the canisters located at the Diablo Canyon ISFSI?

The assessment of the conditions on the Diablo Canyon canisters are described in the Electrical Power Research Institute report EPRI-3002002822 and the Sandia National Laboratories report SAND2014-16383. The canister surfaces appeared in good condition with no signs of degradation or corrosion. Researchers noted a mixture of dust and pollen, along with sodium chloride (NaCl) and some magnesium sulfate (MgSO4) on the surface of the canisters. Sodium chloride can cause corrosion in some metals, but it is unlikely given the environment the casks are in.. Using temperature and humidity data from the Vandenberg weather station, the time required for chloride induced stress corrosion cracking (CISCC) to corrode through the cask would be greater than 1,800 years. NRC staff will continue to monitor the situation to ensure such corrosion does not become a problem. Another CISCC-inducing compound, magnesium chloride (MgCl2), was not present on the Diablo Canyon canisters. The conclusion section of the SANDIA report explains limitations for the sample collection and analysis.

Additional information is available in the following EPRI and Sandia reports:

- EPRI-3002002822
- SAND2014-16383
- Susceptibility Assessment Criteria for Chloride-Induced Stress Corrosion Cracking (CISCC) of Welded Stainless Steel Canisters for Dry Cask Storage Systems

TOP

Questions and Answers – Spent Fuel Pool Safety

What do you look at when you license a fuel storage facility? How do I know it can withstand a natural disaster?

The NRC's requirements for both wet and dry storage can be found in Title 10 of the Code of Federal Regulations (10 CFR), including the general design criteria in Appendix A to Part 50 and the spent-fuel

storage requirements in Part 72. The staff uses these rules to determine that the fuel will remain safe under anticipated operating and accident conditions. There are requirements on topics such as radiation shielding, heat removal, and criticality. In addition, the staff reviews fuel storage designs for protection against:

- natural phenomena, such as seismic events, tornados, and flooding
- dynamic effects, such as flying debris or drops from fuel handling equipment and drops of fuel storage and handling equipment
- hazards to the storage site from nearby activities

TOP

How do you know the fuel pools are safe? Does the NRC inspect these facilities, or just the reactor itself?

NRC inspectors are responsible for verifying that spent fuel pools and related operations are consistent with a plant's license. For example, our staff inspects spent fuel pool operations during each refueling outage. We also performed specialized inspections to verify that new spent fuel cooling capabilities and operating practices were being implemented properly.

TOP

What would happen to a spent fuel pool during an earthquake? How can I be sure the pool wouldn't be damaged?

All spent fuel pools are designed to seismic standards consistent with other important safety-related structures on the site. The pool and its supporting systems are located within structures that protect against natural phenomena and flying debris. The pools' thick walls and floors provide structural integrity and further protection of the fuel from natural phenomena and debris. In addition, the deep water above the stored fuel (typically more than 20 feet above the top of the spent fuel rods) would absorb the energy of debris that could fall into the pool. Finally, the racks that support the fuel are designed to keep the fuel in its designed configuration after a seismic event.

TOP

Can spent fuel pools leak?

Spent fuel pools lined with stainless steel are designed to protect against a substantial loss of the water that cools the fuel. Pipes typically enter the pool above the level of the stored fuel, so that the fuel would stay covered even if there were a problem with one of the pipes. The only exceptions are small leakage-detection lines and, at two pressurized water reactor (PWR) sites, robust fuel transfer tubes that enter the spent fuel pool directly. The liner normally prevents water from being lost through the leak detection lines, and isolation valves or plugs are available if the liner experiences a large leak or tear.

TOP

How would you know about a leak in such a large pool of water?

The spent fuel pools associated with all but one operating reactor have liner leakage collection to allow detection of very small leaks. In addition, the spent fuel pool and fuel storage area have diverse

instruments to alert operators to possible large losses of water, which could be indicated by low water level, high water temperature, or high radiation levels.

TOP

How can operators get water back in the pool if there is a leak or a failure?

All plants have systems available to replace water that could evaporate or leak from a spent fuel pool. Most plants have at least one system designed to be available following a design basis earthquake. In addition, the industry's experience indicates that systems not specifically designed to meet seismic criteria are likely to survive a design basis earthquake and be available to replenish water to the spent fuel pools. Furthermore, plant operators can use emergency and accident procedures that identify temporary systems to provide water to the spent fuel pool if normal systems are unavailable. In some cases, operators would need to connect hoses or install short pipes between systems. The fuel is unlikely to become uncovered rapidly because of the large water volume in the pool, the robust design of the pool structure, and the limited paths for loss of water from the pool.

TOP

Do U.S. nuclear power plants store their fuel above grade? Why is this considered safe?

For boiling water reactor (BWR) Mark I and II designs, the spent fuel pool structures are located in the reactor building at an elevation several stories above the ground (about 50 to 60 feet above ground for the Mark I reactors). The spent fuel pools at other operating reactors in the U.S. are typically located with the bottom of the pool at or below plant grade level. Regardless of the location of the pool, its robust construction provides the potential for the structure to withstand events well beyond those considered in the original design. In addition, there are multiple means of restoring water to the spent fuel pools in the unlikely event that any is lost.

TOP

How are spent fuel pools kept cool? What happens if the cooling system fails?

The spent fuel pool is cooled by an attached cooling system. The system keeps fuel temperatures low enough that, even if cooling were lost, operators would have substantial time to recover cooling before boiling could occur in the spent fuel pool. Licensees also have backup ways to cool the spent fuel pool, using temporary equipment that would be available even after fires, explosions, or other unlikely events that could damage large portions of the facility and prevent operation of normal cooling systems. Operators have been trained to use this backup equipment, and it has been evaluated to provide adequate cooling even if the pool structure loses its water-tight integrity.

TOP

What keeps spent fuel from re-starting a nuclear chain reaction in the pool?

Spent fuel pools are designed with appropriate space between fuel assemblies and neutron-absorbing plates attached to the storage rack between each fuel assembly. Under normal conditions, these design features mean that there is substantial margin to prevent criticality (i.e., a condition where nuclear fission would become self-sustaining). Calculations demonstrate that some margin to criticality is maintained for a variety of abnormal conditions, including fuel handling accidents involving a dropped fuel assembly.

TOP

Questions and Answers – Dry Cask Safety

What is dry cask storage?

Dry cask storage allows spent fuel that has already been cooled in the spent fuel pool for several years to be surrounded by inert gas inside a container called a cask. The casks are typically steel cylinders that are either welded or bolted closed. The steel cylinder provides containment of the spent fuel. Each cylinder is surrounded by additional steel, concrete, or other material to provide radiation shielding to workers and members of the public.

TOP

What is an "ISFSI"?

An independent spent fuel storage installation, or ISFSI, is a facility that is designed and constructed for the interim storage of spent nuclear fuel. These facilities are licensed separately from a nuclear power plant and are considered independent even though they may be located on the site of another NRC-licensed facility.

TOP

What kind of license is required for an ISFSI?

NRC authorizes storage of spent nuclear fuel at an ISFSI in two ways: site-specific or general license. For site-specific applications, the NRC reviews the safety, environmental, physical security and financial aspects of the licensee and proposed ISFSI and, if we conclude it can operate safely, we issue a license. This license contains requirements on topics such as leak testing and monitoring and specifies the quantity and type of material the licensee is authorized to store at the site. A general license authorizes storage of spent fuel in casks previously approved by the NRC at a site already licensed to possess fuel to operate a nuclear power plant. Licensees must show the NRC that it is safe to store spent fuel in dry casks at their site, including analysis of earthquake intensity and tornado missiles. Licensees also review their programs (such as security or emergency planning) and make any changes needed to incorporate an ISFSI at their site. Of the currently licensed ISFSIs, 48 are operating under general licenses and 15 have specific licenses.

TOP

How does the NRC determine that a dry storage system is safe?

Before approving any dry storage system and issuing a Certificate of Compliance or a license, the NRC staff conducts a thorough engineering review to ensure the system design meets all necessary safety requirements. Dry storage systems must be designed to protect the public and workers from radiation exposure. In addition, dry storage systems must be able to withstand credible natural disasters and accidents. The NRC staff's dry storage system reviews are documented in safety evaluation reports, which are publicly available in the NRC Agencywide Documents Access and Management System (ADAMS). The NRC staff also conducts quality assurance inspections of vendors who design and manufacture the storage systems and operating spent fuel storage facilities to ensure compliance with the NRC's safety requirements.

For more information, see NUREG/BR-0528

TOP

What are the requirements for the selection and use of a dry storage system at an NRC licensed commercial power reactor site?

A licensee's selection of a dry cask storage system is based on the operational needs of a specific reactor site (A list of approved casks can be found in 10 CFR 72.214). A licensee must first determine whether a particular system addresses the storage site's parameters, including analyses of potential earthquake intensity and tornado missiles. A licensee must provide reasonable assurance that the location's conditions meet the necessary safety requirements for adequate protection. The evaluation requirements for a dry storage system user can be found in 10 CFR 72.212.

TOP

What Risk Assessments have been conducted for dry storage systems?
The NRC and the Electrical Power Research Institute (EPRI) have performed risk assessments for dry storage systems. These analyses considered the release of radioactive gases and found the radiation doses to be below NRC's safety requirements. The NRC staff also evaluated a post-accident release of radioactive gases from breached storage canisters that contain damaged fuel assemblies. EPRI has also conducted a risk assessment regarding the radiological risks to the public during the life cycle of a bolted spent fuel cask. NUREG-1864 assesses a comprehensive list of initiating events, including dropping the cask during handling, and external events during onsite storage (such as earthquakes, floods, high winds, lightning strikes, accidental aircraft crashes, and pipeline explosions). All of these studies concluded that the risks of the public receiving a dose above regulatory limits is very low.

For more information, see the following:

- NUREG-1864
- EPRI Technical Report 1002877

TOP

How do the NRC requirements ensure that dry storage systems do not release radioactive material and expose workers and members of the public to radiation?

The NRC requires dry storage systems to meet NRC safety requirements at all times, including during or after a design basis accident. A design basis accident is any event that could significantly affect the storage system. Accident conditions include events such as fuel rod rupture and air flow blockage, as well as natural phenomena like earthquakes, burial under debris, lightning strikes, and other phenomena (e.g., seiches, tsunamis, and hurricanes). Different accident conditions are evaluated as appropriate depending on the storage cask's location. NRC requirements in 10 CFR 72.104 define annual dose limits for normal operations and anticipated events, while requirements in 10 CFR 72.106 define dose limits for a design basis accident. These dose limits do not pose a significant safety concern to workers or the public, and are a fraction of the average annual dose received from background radiation.

TOP

How are dry storage systems inspected?

Nondestructive examination (NDE) methods for the inspection of canisters already exist and have been used in the nuclear industry for decades. These NDE methods include visual testing (VT), Eddy current testing (ECT), and Ultrasonic testing (UT). ECT utilizes magnetic fields to identify cracks and defects. Similarly, UT utilizes sound waves as the method for detection. Together, the three methods can detect and characterize potential aging effects like localized corrosion. Methods to apply existing NDE techniques to stainless steel canisters have been developed, and currently are being tested by both the Electrical Power Research Institute (EPRI) and dry storage system manufacturers.

Additional information is available in the following EPRI reports:

- EPRI-3002008234
- EPRI-3002010617
- EPRI-3002010621

TOP

What can remote visual testing be used to detect?

Remote visual testing (RVT) is a nondestructive way to detect cracking, corrosion, wear and component failures. The ability of RVT methods to detect cracking was reviewed and documented in NUREG/CR-7246. Crack size was found to be an important feature that limits the detection of cracks by RVT. Very small cracks are harder to detect using RVT. Detection by RVT is also challenged when cracks are located in the proximity of surface features, such as grinding marks or weld ripples. RVT is still a viable inspection method despite its limitations. Because the detection of CISCC cracks on canisters using RVT could be challenging, the example aging management programs developed by NRC staff and aging management guidance developed by the Electrical Power Research Institute (EPRI) have relied on indications of localized corrosion, such as pitting, that can be reliably detected using visual testing methods.

For more information, see the following:

- NUREG/CR-7246
- NUREG-2214
- EPRI-3002008193

TOP

How does the NRC conduct oversight of Licensees?

Licensees are responsible for operating their facilities safely. The NRC verifies licensees' compliance with safety regulations through its inspection program. This includes inspections of operating facilities and cask vendors. The frequency of these inspections is based on the licensee's performance and the presence of activity (cask loadings, extreme weather conditions, etc.). The NRC requires prompt corrective action by the licensee if a safety problem or failure to comply with requirements is discovered. Enforcement action may follow depending on the severity of the inspection findings.

For more information on how specifically inspections are done, see the NRC Inspection Manual, Manual Chapter 2690

TOP

How does the NRC verify that canisters are properly loaded in accordance with their NRC Certificate of Compliance?

Before the licensee has loaded a single canister, the NRC inspects the licensee's spent fuel loading procedures by observing and assessing the implementation of those procedures during a "dry run" rehearsal before actual loading is performed. The NRC also observes the initial cask loading. This means the very first cask loaded by a licensee is always observed. NRC inspectors generally observe and review licensee's identification, parameters, and characteristics of each fuel assembly. Verification is also performed through review of procedures that lead to the selection and verification of fuel assemblies prior to each loading. After the first loading has been observed, inspectors will periodically observe future cask loadings to ensure canisters are still being properly loaded. If a misloading is identified the licensee must immediately conduct an evaluation to show the NRC the loading still meets the acceptance criteria. In no misloading case has there ever been a safety concern.

TOP

How can the fuel or internal components be inspected on canisters with welded lids?

At this time there are no methods available for inspecting the internal components of welded stainless steel canisters once they are loaded. Several measures are taken during the loading process to ensure there will be no need to re-open a welded canister. Each canister is leak tested prior to use to ensure the inert helium environment will remain inside the canister. The inert environment prevents the stored spent fuel from degrading and eliminates the need to inspect the fuel or the interior of the canister. If there is a safety need to open a welded canister, there is a procedure approved by NRC staff in the dry storage system's safety analysis report.

TOP

How would welded stainless steel canisters be repaired if necessary?

In the unlikely event that a canister repair would be needed, corrective actions would be performed on a case-specific basis for the affected dry storage system component. Corrective actions may be proposed to mitigate an identified degradation before the canister integrity is compromised, or to bring a canister back into compliance if the degradation has compromised the canister integrity. The licensee would propose corrective actions to the NRC in either case, and NRC staff would evaluate whether the corrective actions are sufficient to preserve the intended safety functions of the dry storage system and maintain compliance with the regulations of 10 CFR Part 72. Proposed repair methods also require demonstration and compliance with an NRC-approved quality assurance program.

TOP

Questions and Answers – Waste Confidence & Future Plans

How long is spent fuel allowed to be stored in a pool or cask?

NRC regulations do not specify a maximum time for storing spent fuel in pool or cask. The agency's “waste confidence decision" expresses the Commission's confidence that the fuel can be stored safely in either pool or cask for at least 60 years beyond the licensed life of any reactor without significant environmental effects. At current licensing terms (40 years of initial reactor operation plus 20 of extended operation), that would amount to at least 120 years of safe storage.

However, it is important to note that this does not mean NRC "allows" or "permits" storage for that period. Dry casks are licensed or certified for 20 years, with possible renewals of up to 40 years. This shorter licensing term means the casks are reviewed and inspected, and the NRC ensures the licensee has an adequate aging management program to maintain the facility.

TOP

What is the plan for storage of spent nuclear fuel going forward? Will on-site storage continue to be the way for the foreseeable future?

The U.S. policy for nuclear waste management, as set forth in the Nuclear Waste Policy Act, is for permanent disposal of spent fuel in a deep underground geological repository. Decades of scientific research supports the use of a repository for disposal of spent fuel. Federal responsibility for siting and building a repository remains national policy. The NRC acknowledges the challenges encountered over the years in siting and licensing the proposed repository at Yucca Mountain. The Commission remains confident that a repository will be built. The Commission does not consider that accumulated spent fuel will be stored permanently at current or former reactor sites and does not endorse permanent storage at reactor sites.

Although the NRC considers that 25 to 35 years is a reasonable timeframe for repository development, it acknowledges that there is sufficient uncertainty in this estimate that the possibility that more time will be needed cannot be ruled out. International and domestic experience have made it clear that technical knowledge and experience alone are not sufficient to bring about the broad social and political acceptance needed to construct a repository. The time needed to develop a societal and political consensus for a repository could add to the time to site and license a repository, or overlap it to some degree.

TOP

These casks are already pretty old and could be storing spent fuel for decades to come. How can you protect them from deteriorating over time, especially from effects that have been seen at other nuclear installations such as alkali-silica reaction or chloride-induced stress corrosion cracking?

Dry cask storage systems have been used at U.S. nuclear power plants for more than 30 years with an excellent safety record. Part of the reason for that success is the robust design of the systems. Another reason is proper care and maintenance, including implementation of aging management programs (AMPs) required by the NRC.
The NRC conducted an extensive review of the materials used in dry cask storage systems, looking at how these materials might degrade over time. This review was documented in NUREG-2214. The NRC reviewed specific dry cask storage system designs, and the environments in which the systems operate. The report describes the scientific methods used to determine the likely effects of aging on the storage systems, and what might cause those effects. It also includes examples of generic AMPs licensees may use to develop their own programs. Additional guidance on aging management for dry storage systems was published in NUREG-1927. NRC inspectors examine a licensee's AMPs to verify that any potential degradation is quickly identified, and corrective actions taken to ensure the storage cask continues to function properly.

Two ways dry storage systems could possibly degrade over time are alkali-silica reaction (ASR) on concrete, and chloride-induced stress corrosion cracking (CISCC) of welded stainless steel canisters. No ASR has been reported on a dry storage system to date, though it is something licensees must include in

their AMPs. NRC staff research on CISCC concluded that the risk is not credible during the first 20 years of operation because of the long time needed for cracks to grow through the stainless steel canister wall. After 20 years, CISCC is covered by the AMP. The Electrical Power Research Institute (EPRI) has also conducted a thorough assessment of the potential for CISCC in dry storage system canisters.

TOP

How are the long-term impacts of onsite storage of spent fuel analyzed, and what measures are taken to minimize potential impacts on public health and safety?

All storage systems approved by the NRC have been reviewed to ensure they meet all the regulatory safety requirements. These requirements address the credible hazards from natural disasters and accidents that the spent fuel storage systems may encounter. Long term, the NRC requires dry storage system users to have Aging Management Programs (AMPs) to ensure safety. NUREG-1927 and NUREG-2214 provide more detailed information about aging management activities for dry storage systems. These guidance documents will continue to be updated as necessary.

NRC staff also conduct an environmental review of each independent spent fuel storage installation (ISFSI) to comply with the National Environmental Policy Act (NEPA). The NRC's NEPA requirements are in 10 CFR Part 51. In 2014, NRC staff evaluated the environmental impacts of continued storage of spent fuel. This evaluation is documented in NUREG-2157 and shows that the long-term storage of spent fuel has a low environmental impact.
For more information, see the following:

- NUREG-1927
- NUREG-2214
- NUREG-2157

TOP

After a plant is decommissioned there will be no infrastructure to handle the repackaging of spent fuel if the storage systems need replacement. Is there a plan for this contingency, and what are the safety implications of reopening the storage cask?

Storage casks should not be opened unless there is a specific safety need. Most welded stainless steel canisters are designed to be transportable inside a specifically designed transportation overpack. This allows fuel to be transported without directly handling the fuel. The canisters are leak tested and this assures that the helium environment will be maintained inside the canister. A helium environment is important because helium is an inert gas, meaning it does not undergo chemical reactions. If safety issues are identified, it is the responsibility of the licensee to propose corrective actions, and the NRC's responsibility to ensure these actions maintain the safety functions of the storage system. Each specific dry storage system has specific procedures for opening the canister outlined in the dry storage system or the independent spent fuel storage installation (ISFSI) safety analysis report. These procedures are reviewed by NRC staff.

TOP

Questions and Answers – Security

What about security? How do you know terrorists won't use all of this waste against us?

For spent fuel, as with reactors, the NRC sets security requirements and licensees are responsible for providing the protection. We constantly remain aware of the capabilities of potential adversaries and threats to facilities, material, and activities, and we focus on physically protecting and controlling spent fuel to prevent sabotage, theft, and diversion. Some key features of these protection programs include intrusion detection, assessment of alarms, response to intrusions, and offsite assistance when necessary. Over the last 20 years, there have been no radiation releases that have affected the public. There have also been no known or suspected attempts to sabotage spent fuel casks or storage facilities. The NRC responded to the terrorist attacks on September 11, 2001, by promptly requiring security enhancements for spent fuel storage, both in spent fuel pools and dry casks.

TOP

How are dry storage systems canisters at ISFSIs protected against terrorism such as the September 11, 2001 terrorist attacks using hijacked airplanes?

The best defense against hijacked airplanes is airport security, enforced by the Department of Homeland Security's (DHS) Transportation Safety Administration. DHS, the U.S. military, and the intelligence community are responsible for the defense of the country. The NRC regularly works with these agencies to assess the threat environment, and is always ready to alert its licensees if a specific, credible threat is identified.

Security requirements at NRC-licensed facilities are based on the potential threat level and the potential consequences of an event. The NRC details the security requirements for physical protection of spent fuel storage in 10 CFR Part 73 and 10 CFR Part 72. Further orders also provide additional security measures. Protection from, and responses to, security-related events are addressed in the licensee's NRC-approved Physical Security Plan, which is not publicly available. An independent spent fuel storage installation (ISFSI) licensee must comply with the security requirements which are implemented in their approved Physical Security Plan.

Over the past 20 years, there have been no known or suspected attempts to sabotage, or steal radioactive material from storage casks at ISFSIs, or to directly attack an ISFSI. Nevertheless, the NRC is continually evaluating threats to stay best prepared. Licensees are routinely inspected to ensure they are following their NRC-approved Physical Security Plan. NRC staff have conducted security assessments for ISFSIs using several storage cask designs that were representative of most currently certified designs. The resulting assessments formed the basis for the NRC's conclusion that there was no need for further security measures at ISFSIs beyond those currently required.

For more information, see Frequently Asked Questions About Security Assessments at Nuclear Power Plants.

TOP

Questions and Answers – Emergency Planning

Are potential seismic effects considered in the assessment of canisters for continued operation? –EP

Yes, approved canister designs used at a specific independent spent fuel storage installation (ISFSI) location address the credible seismic hazards of that location. The canisters must maintain containment of the spent fuel under the predicted seismic loads for each location. In addition, the radiation exposure limits, thermal limits, confinement barrier integrity, structural performance, and nuclear criticality safety

must be maintained. These requirements continue throughout the life of the dry storage systems and are maintained and verified by aging management activities and inspections.

TOP

What are the emergency plans for nuclear waste at an ISFSI in the case of mishandling, leaks, natural disasters or acts of terrorisms?

An emergency plan for an independent spent fuel storage installation (ISFSI) is required by 10 CFR 72.32(c). The emergency plan identifies the actions to be taken to address a release and make the consequences less severe, regardless of the event. However, there is no credible accident scenario involving dry cask storage that would result in widespread consequences outside the facility boundary. That's because unlike operating power reactors, dry cask storage systems do not have the thermal or kinetic energy to spread radioactive contamination over a large area in the highly unlikely event a storage canister is breached. Emergency plans for ISFSIs are publicly available in ADAMS. Protection from and responses to security-related events are addressed in a licensee's NRC-approved Physical Security Plan, which are not publicly available.

For more information, see Frequently Asked Questions About Emergency Preparedness and Response.

TOP

What emergency plans are required for spent fuel storage facilities at nuclear power plants undergoing decommissioning or sites that have completed decommissioning?

Decommissioning reactors continue to be subject to the NRC's emergency planning requirements. For some period of time after the licensee ceases reactor operations, offsite emergency planning will be maintained. This period of time depends on when the reactor was last critical as well as site-specific considerations. Offsite emergency planning may be eliminated when the fuel has been removed from the reactor and placed in the spent fuel pool, and sufficient time has elapsed, such that there are no longer any postulated accidents that would result in offsite dose consequences large enough to require offsite emergency planning. There would be no requirement to maintain offsite systems to warn the public. Onsite emergency plans will be required for both the spent fuel pool and the Independent Spent Fuel Storage Installations, but offsite plans will not be required. If, however, an operating plant is located at the same site as the decommissioning plant, the emergency preparedness plans will still be in effect for the operating plant.

Although offsite emergency planning at a decommissioned site may no longer be required, licensees maintain offsite contacts since any emergency declaration requires notification of state and local officials as well as the NRC. In addition, due to the typically reduced staffs at a decommissioning facility they may rely even more on offsite assistance for fire, security, medical or other emergencies. These reduced EP requirements would remain in effect as long as fuel is onsite.

(Note: This general description also applies to emergency planning for specifically licensed ISFSIs; those requirements are spelled out in detail in 10 CFR 72.32.)

Subject: [External_Sender] Latest products posted to the reading room

All,

SONGS has just posted the following products to the CERTREC Electronic Reading Room for your review:

1. The MPC Visual Assessment Report
2. A revised HI-2188437 to incorporate results of the Visual Assessment Report
3. A change to the 72.212 evaluation to evaluate incidental contact wear for ASME Code Compliance, and
4. An associated 72.48 evaluation.

If files are sorted by "name" in the reading room, they will be grouped together alphabetically under "Post Visual Assessment..."

In addition, Al asked me to pass along the latest version of our statement on Code Compliance, previously transmitted to you on Monday. The response has been updated, and is attached to this email.

Please let me know if you have any questions regarding this.

Thanks,
Mark
(949) 368-6745

NRC Review Question Response Form

Note 1: Complete a separate form for each inspector question.

Note 2: The item tracking number will be generated when the record is entered into the inspection database.

Question Title: Clarification of ASME Section 3 in Licensing Basis

Tracking Number: 11A AR Number: 0319-53473-3 Date Initiated: 03/21/2019

Holtec Support Required: Yes__ or No ___

Question description:

Appendix B Technical Specification 3.3 requires, that the AMSE BPVC, 2007, is the governing Code for the MPC. Additionally, Appendix B Table 3-1 tie the canister and FSAR to the requirements of ASME Section III in many areas.

The original FSAR statement for no scratches mirrored the CoC/TS design basis that no scratches would ensure the code adherence to ASME Section III.

Now under 72.48, a design change is needed to deviate to allow scratches. But instead of using ASME BPVC code criteria to inspect the canister and properly disposition the defects which would maintain conformance to the code, the calculation utilizes Archard's wear equation to bound the condition. I just don't see how that meets CoC.

Now I understand, how SCE has argued, it is not a methodology. I think it is more of CoC and Appendix B change, myself. Essentially, the change is adding an alternative to the code to not have to do inspections and repair these new defects. Alternatives to the code can only be done via license amendment. Or maybe per TS Appendix B 3.3.2.

NB-4131 "Material originally accepted on delivery in which defects exceeding limits of NB-2500 are known or discovered during the process of fabrication or installation is unacceptable. The material may be used provided the condition is corrected in accordance with the requirements of NB-2500

ASME Section III NB-2538, "Elimination of Surface Defects" requires that defects are required to be examined by either magnetic particle or liquid penetrant method to ensure that the defect has been removed or reduced to an imperfection of acceptable size."

Instead of doing that (which I understand is impossible) which would maintain code compliance, the 72.48 deviates using a calculational method to bound the defect. The only "method" that should be used to disposition these defects is some method allowed or described in the BPVC code or the licensee would need an alternative to the code to maintain compliance with the regulatory licensing basis.

NRC Review Question Response Form

Requested Clarification (If needed): None

SONGS / Holtec Response:

NOTE: For clarity, the NRC question (comment) is separated by paragraph and a response to each is provided.

NRC Comment 1

Appendix B Technical Specification 3.3 requires, that the AMSE BPVC, 2007, is the governing Code for the MPC. Additionally, Appendix B Table 3-1 tie the canister and FSAR to the requirements of ASME Section III in many areas.

Response to Comment 1

It is agreed that the ASME BPVC, 2007 is the governing code for the MPC and that C of C Appendix B, "Approved Contents and Design Features," Table 3-1 ties the canister and FSAR to the requirements of Section III in many areas. However, other sections of the code apply as well and the relationship is described below.

Section III is the construction code portion of the ASME B&PV Code. It assumes that the other parts of the Code are also involved as appropriate. ASME Code material specifications are in Section II. They are selected in accordance with Section III. NDE is generally performed in accordance with Section V. Welding is performed in accordance with Section IX. Preservice examinations required by the component specifications to be done by the manufacturer are often performed in accordance with Section XI. Typically, the primary jurisdiction of the Section III construction code ends when a component is stamped. Because the MPC is not actually stamped, Holtec considers jurisdiction of Section III ends when the MPC leaves the manufacturer. Although Appendix B of the C of C is silent on which Section of the ASME Code applies during inservice inspections, use of Section XI, as selected by Holtec, is typical throughout the nuclear industry and is not prohibited by the C of C. Therefore, the ASME Code Section XI has jurisdiction after the MPC leaves the manufacturer.

NRC Comment 2

The original FSAR statement for no scratches mirrored the CoC/TS design basis that no scratches would ensure the code adherence to ASME Section III.

Response to Comment 2

There is no indication in the CoC, its Appendices (Technical Specifications or Approved Contents and Design Features), or NRC SER that the statement in Chapter 9 of the FSAR related to no risk of scratching was considered in the NRC's evaluation of the ASME Code compliance of the MPC.

There is no violation of ASME Section III requirements, nor any cause for repair activities, stemming from minor scratches or wear marks that result from incidental contact between the MPC and the CEC internal features during download operations at site.

HI-STORM UMAX FSAR Rev. 4: 9.5.vii states

> *Because the MPC insertion (and withdrawal) occurs in the vertical configuration with ample lateral clearances, there is no risk of scratching or gouging of the MPC's external surface (Confinement Boundary). Thus the ASME Section III Class 1 prohibition against damage to the pressure retaining boundary is maintained.*

The Section III requirements for pressure containing plate materials is that surface defects will be removed (NB-2538). In NCA-9000, *defective material* is defined as material that does not meet specified requirements. Similarly a defect is defined in general as a rejectable flaw and a flaw is defined as an imperfection or unintentional discontinuity that is detectable by visual, surface or volumetric methods (Section XI Glossary, IWA-9000 (1992)).

A scratch, if it occurred during installation, would not be a defect requiring repair per the Code. A scratch is a non-conformance and the engineering disposition concluded that scratches are not rejectable due to potential effects on peak stresses, as explained in HI-2188437. This is because localized scratches or wear marks are only capable of producing peak stresses, which are only objectionable from a fatigue or brittle fracture standpoint. The HI-STORM UMAX and FW FSARs (Table 3.1.10 of both address fatigue and HI-STORM FW FSAR Section 3.4.5 for brittle fracture) explain why neither fatigue nor brittle fracture present any risk to a MPC.

A scratch would not be rejectable due to interference with material testing in NB-2000 since all of these tests would be completed prior to canister delivery.

Therefore, the only remaining cause (without further analysis) of rejection of a scratch located on the exterior of the canister wall generated during installation would be a condition where the amount of localized wall thinning was below an allowable wall thickness based on Section III.

If a scratch during installation occurs, it can, under Section XI jurisdiction, either be dispositioned as a scratch (i.e., since it not a planar flaw) by reverting back (in accordance with IWA-3100 (b)) to the Construction Code, which would be Section III; or, if desired, be dispositioned by Section XI, Table IWB-3514-1, as if it were a planar flaw (which is more conservative than Section III). The information supplied by SCE and Holtec to date is not intended to disposition any indication; but, to provide assurance that any potential scratches will remain well within ASME Code allowable limits. So the SONGS canister scratch could be acceptable down to a minimum allowable wall under Section III. And the Holtec MPC with 0.500 inch wall could, if desired, allow a scratch as if a planar flaw that was up to 10% of nominal wall thickness (an allowed wall of 0.450 inches).

This means that the 0.625 inch nominal wall for a SONGS canister could, using engineering judgment, be reduced without further analysis by 0.175 inches to 0.450 inches, which is an allowable wall based on the licensed 0.500 inch baseline UMAX MPC as discussed in HI-2188437.

A scratch that might be formed during incidental contact of an MPC wall with the divider shell inside the cavity enclosure container during downloading would not result in a rejectable flaw condition, considering the large allowable margin for such localized thinning. This is based on engineering judgment and operational experience. Knowledge of basic wear principles with two soft materials having incidental contact under light lateral loads and many years of operating experience with acceptable canister loading of horizontal canisters inform this judgment. Scratches of a light nature, though somewhat likely, present no risk since the impact is negligible.

NRC Comment 3

Now under 72.48, a design change is needed to deviate to allow scratches. But instead of using ASME BPVC code criteria to inspect the canister and properly disposition the defects which would maintain conformance to the code, the calculation utilizes Archard's wear equation to bound the condition. I just don't see how that meets CoC.

Response to Comment 3

ECO-5021-042 is not a design change. It is a proposed change to clarify the HI-STORM UMAX FSAR. The ECO and supporting 72.48 are explicit in this regard. They further note that they are evaluated as if they were a design change to assure a more comprehensive documented review.

A change is not required to allow scratches since the FSAR statement that there is no risk of damage to the ASME Section III Class 1 pressure retaining boundary that might result from scratching remains valid.

It is not necessary to conclude that the intent of the FSAR was to state that no scratches would occur since incidental contact could occur. More likely the intent was to note that, compared to other designs with much higher contact loads and no clearance, there was negligible risk that shallow scratches in the vertical designs would be rejectable. When SCE and Holtec were asked (after the August 3, 2018 event) to justify this engineering judgment, accepted engineering practices were used for the estimation of scratches as well as laboratory tests and canister inspections. This was not a required calculation for design purposes, but the use of standard engineering explanations, all of which substantiated the initial judgment.

NRC Comment 4

Now I understand, how SCE has argued, it is not a methodology. I think it is more of CoC and Appendix B change, myself. Essentially, the change is adding an alternative to the code to not have to do inspections and repair these new defects. Alternatives to the code can only be done via license amendment. Or maybe per TS Appendix B 3.3.2.

Response to Comment 4

It is not correct to call these slight scratches "defects". By the definition of the ASME code, a defect is a flaw that is rejectable. None of these scratches approach criteria that require removal or repair. That judgment has been substantiated by accepted wear laws, first principles,

laboratory tests, operating experience, and examination of installed loaded canisters that this judgment was and still is valid.

As noted in the Response to Comment 4, questions regarding the judgment arose from various stakeholders following the hang-up of the MPC on August 3, 2018. It was apparently presumed that the lateral loads during passage of the MPC into the cavity enclosure container must be higher than previously considered. After assessing the actual loads and their effect on the surfaces of the canister, the original judgment was validated.

NRC Comment 5

NB-4131 "Material originally accepted on delivery in which defects exceeding limits of NB-2500 are known or discovered during the process of fabrication or installation is unacceptable. The material may be used provided the condition is corrected in accordance with the requirements of NB-2500.

Response to Comment 5

SCE and Holtec agree with this ASME Code requirement. It is appropriately implemented by the fabricator as an attribute of the manufacturing process and its controls. Appropriate documentation is provided to Holtec and SCE certifying compliance with FSAR invoked requirements of the ASME Code.

As previously noted, no defects (i.e., rejectable flaws) were discovered or are anticipated during the process of installation. Therefore no corrections are required per NB-2500.

NRC Comment 6

ASME Section III NB-2538, "Elimination of Surface Defects" requires that defects are required to be examined by either magnetic particle or liquid penetrant method to ensure that the defect has been removed or reduced to an imperfection of acceptable size."

Response to Comment 6

No defects (rejectable flaws) have been identified that have resulted from scratches or are expected to result from scratches due to incidental contact during down-loading. The bounding scratches estimated in response to the various inquiries are theoretical projections not identified flaws.

This is consistent with the judgment in the FSAR, and validated by the means explained above. The requirement of NB-2538 might have removed a scratch during construction if it interfered with the ability to complete the surface or volumetric material examinations of the pressure boundary material.

Once this had been completed and the canister delivered, a similar surface defect occurring during installation would not need to be removed because these material examinations had already been completed.

NRC Review Question Response Form

NRC Comment 7

Instead of doing that (which I understand is impossible) which would maintain code compliance, the 72.48 deviates using a calculational method to bound the defect. The only "method" that should be used to disposition these defects is some method allowed or described in the BPVC code or the licensee would need an alternative to the code to maintain compliance with the regulatory licensing basis.

Response to Comment 7

As previously noted no "defects" due to incidental contact are anticipated. The calculational methods are tools to estimate potential scratch depth and are in no way a means to disposition any defect; real or projected.

Neither the identification nor removal of shallow scratches, wear or rub marks due to installation is required to maintain compliance with ASME Section III or the ASME B&PV Code generally.

Gentlemen:

SUBJECT: ISSUANCE OF ERRATA TO FINAL ENVIRONMENTAL STATEMENT (SAN ONOFRE NUCLEAR GENERATING STATION, UNITS 2 AND 3)

The Nuclear Regulatory Commission has issued the enclosed errata to the Final Environmental Statement (FES) related to the San Onofre Nuclear Generating Station, Units 2 and 3. Although implicit in the FES, this errata clarifies the staff's consideration of reasonable alternatives to the proposed action. The enclosed discussion should be added to Section 10.1.

Sincerely,

Frank J. Miraglia

ERRATA

FINAL ENVIRONMENTAL STATEMENT

SAN ONOFRE NUCLEAR GENERATING STATION, UNITS 2 AND 3

ALTERNATIVES TO THE PROPOSED ACTION

During the construction permit stage, the staff analyzed alternative sites, plant designs, and methods of power generation, including the alternative of not adding the production capacity. The staff concluded, based on its analysis of these alternatives, as well as on a cost-benefit basis, that additional capacity was needed that a nuclear-fueled plant would be environmentally acceptable, and that SONGS, at a specified site and of a specified design, were acceptable from both economic and environmental perspectives. Since that time, construction of SONGS has been nearly completed and many of the economic and environmental costs associated with the construction of the facility have already been incurred and must be viewed as "sunk costs" in any prospective assessment.

The staff believes that the only reasonable alternative to the proposed action of issuance of operating licenses for SONGS appropriately considered at this stage is denial of the operating licenses for the facility, thereby not permitting the addition of the essentially built generating capacity to the applicant's generating system. Alternatives such as construction of the units at another site, extensive modifications to the facility, or construction of facilities utilizing different energy sources would each require additional construction activity with its accompanying economic and environmental costs. Therefore, unless major safety or environmental concerns resulting from operation of SONGS are revealed that were not evident and considered during the construction permit review, these alternatives are unreasonable as compared to operating the already constructed facility. No such concerns have been identified with respect to operation of SONGS.

The continued need for the capacity to be generated by SONGS is discussed in section 8 of this FES.

Accordingly, the staff concludes that the preferrable alternative is operation of SONGS.

Final Environmental Statement

related to the operation of
San Onofre Nuclear Generating Station,
Units 2 and 3

Docket Nos. 50-361 and 50-362

Southern California Edison Company
San Diego Gas & Electric Company
The City of Riverside
The City of Anaheim

U.S. Nuclear Regulatory Commission

Office of Nuclear Reactor Regulation

April 1981

SUMMARY AND CONCLUSIONS

This Environmental Statement was prepared by the U.S. Nuclear Regulatory Commission, Office of Nuclear Reactor Regulation (hereinafter referred to as the staff).

1. The action is administrative.

2. The proposed action is the issuance of Operating Licenses jointly to the Southern California Edison Company (SCE) and the San Diego Gas and Electric Company (SDG&E) for the startup and operation of Units 2 and 3 of the San Onofre Nuclear Generating Station, adjacent to San Onofre Unit 1, located on the Pacific coast in the State of California, County of San Diego (Docket Nos. 50-361 and 50-362).

   The City of Anaheim, California, and the City of Riverside, California, have recently been added as co-holders of the Construction Permits for San Onofre 2 and 3, and will soon request to be included as applicants for Operating Licenses. The four groups are co-owners of the facility, and are referred to herein as the applicant.

   Both units will employ pressurized water reactors to produce up to 3410 thermal megawatts (MWt) each. Steam turbine-generators will use this heat to provide a net power output of up to 1106 electrical megawatts (MWe) each. The exhaust steam will be cooled by once-through flow of water pumped from the Pacific Ocean and returned to it through a diffuser-type system.

3. The information in this statement represents the second assessment by the staff of the environmental impacts associated with the San Onofre Nuclear Generating Station, Unit Nos. 2 and 3, pursuant to the requirements of the National Environmental Policy Act (NEPA) of 1969 and 10 CFR Part 51 of the Commission's Regulations. After receipt of an application (1970) to construct this plant, the staff carried out a review of impacts that would occur during the construction and operation of this plant. This evaluation was issued as a Final Environmental Statement in March 1973. As a result of this environmental review, a staff safety review, an evaluation by the Advisory Committee on Reactor Safeguards, and a public hearing in San Diego, California during January 16-24, 1973 and May 14-22, 1973, and in San Clemente, California, during March 13-15, 1973, the U.S. Atomic Energy Commission (AEC) [now Nuclear Regulatory Commission (NRC)] issued permits in October 1973 for the construction of Units 2 and 3. As of December 1980, Unit 2 was approximately 97% complete and Unit 3 was approximately 68% complete. The applicant has applied for licenses to operate the nuclear units and has submitted the required safety and environmental reports to support this application (March 1977). The staff has reviewed the activities associated with the proposed operation of these units and their potential impacts, both beneficial and adverse, are summarized as follows:

   a. Cooling water heated to about 11°C (20°F) above inlet temperature will be discharged from each unit to the Pacific Ocean at a rate of about 53 m^3/s (846,000 gpm) (Sect. 3.2.2). The heated water may result in the destruction of at least a portion of the San Onofre Kelp Bed during the summer months. However, the long-term thermal impacts are not likely to be severe (Sect. 5.4.2.1) and violations of the state thermal standards are unlikely (Sect. 5.3.1).

   b. An impact on aquatic resources may occur in the cooling water intake structure through entrainment of plankton and impingement of fish. These losses are not expected to have a significant impact on the overall biotic populations in the area.

   c. Chemical effluents from Units 2 and 3 should cause only minimal impact in the area of the discharge, and no significant impact on the aquatic biota in the Pacific Ocean (Sect. 5.4.2.2).

   d. The program for operation and maintenance of transmission lines has been designed to reduce environmental impact. Existing transmission lines and towers will be used where possible. About 7.2 ha (17.8 acres) will be occupied by new towers, access roads, and switchyards (Sect. 2.2.2).

   e. About 16 ha (40 acres) of coastal land which could otherwise have been used primarily for recreation or maintained as wildlife habitat will be occupied by Units 2 and 3 (Sect. 2.2.2).

f. The removal of approximately 1.4 km (0.85 mile) of beach from unrestricted public use, as required by the Construction Permit, is a significant cost of operation.

g. No detectable impacts are anticipated from releases of radioactive materials as a consequence of normal operation (Sect. 5.5.1.6).

h. The risk associated with accidental radiation exposure is very low (Sect. 7).

i. Nothing of known local historic or archaeological interest will be disturbed on the plant site by the operation of Units 2 and 3. A survey along the transmission right-of-way evaluated 41 archaeological sites; of these 23 will be nominated for inclusion in the National Register of Historic Places (Sect. 5.2).

4. The following Federal and State agencies were asked to comment on the Draft Environmental Statement:

- Department of Agriculture
- Department of the Army (Corps of Engineers)
- Department of Commerce
- Department of Energy
- Department of the Interior
- Department of Health, Education and Welfare
- Department of Housing and Urban Development
- Department of Transportation
- Environmental Protection Agency
- Federal Energy Regulatory Commission
- Advisory Council on Historic Preservation
- California Department of Health (Water Pollution Control Commission, Air Pollution Control Commission, Occupational Health Office)
- California Department of Natural Resources
- California Department of Parks and Recreation

Comments on the Draft Environmental Statement were received from the following:

- Department of Agriculture, Economics, Statistics, and Cooperatives Service
- Department of Agriculture, Science and Education Administration
- Department of Agriculture, Soil Conservation Service
- Department of the Army, Corps of Engineers
- Department of Commerce
- Department of Energy, Federal Energy Regulatory Commission
- Department of Health, Education and Welfare
- Department of Housing and Urban Development
- Department of the Interior
- Environmental Protection Agency
- Mr. Marvin I. Lewis
- Rourke and Woodruff Law Offices
- Richard J. Wharton
- Union of Concerned Scientists
- Southern California Edison Company
- Frank H. Grundel
- San Diego Association of Governments

Copies of these comments are appended to this Final Environmental Statement as Appendix A. The staff has considered these comments, and the responses are located in Section 11.

5. This Final Environmental Statement was made available to the public, to the Environmental Protection Agency, and to other specified agencies in April 1981.

6. On the basis of the analysis and evaluation set forth in this statement, and after weighing the environmental, economic, technical and other benefits against environmental costs and after considering available alternatives at the construction stage, it is concluded that the action called for under NEPA and 10 CFR Part 51 is the issuance of operating licenses for Units 2 and 3 of the San Onofre Nuclear Generating Station subject to the following conditions for the protection of the environment:

   (A) License Conditions
   Before engaging in activities that may result in a significant adverse environmental impact that was not evaluated or that is significantly greater than evaluated in this Environmental Statement, the licensee shall provide written notification of such activities to the Office of Nuclear Reactor Regulation and receive written approval from that office before proceeding with such activities.

   (B) Significant Environmental Technical Specification Requirements

      (1) If, during the operating life of the Station, effects or evidence of potential irreversible damage are detected, the licensee will provide to the staff an analysis of the problem and a proposed course of action to alleviate the problem.

      (2) The licensee will carry out the operational environmental monitoring programs outlined in Section 6.

LIST OF TABLES

FOREWORD

This environmental statement was prepared by the U.S. Nuclear Regulatory Commission, Office of Nuclear Reactor Regulation (hereinafter referred to as the staff) in accordance with the Commission's regulations, 10 CFR 51, which implement the requirements of the National Environmental Policy Act of 1969 (NEPA).

The NEPA states, among other things, that it is the continuing responsibility of the Federal government to use all practicable means, consistent with other essential considerations of national policy, to improve and coordinate Federal plans, functions, programs, and resources to the end that the Nation may:

- Fulfill the responsibilities of each generation as trustee of the environment for succeeding generations.
- Assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings.
- Attain the widest range of beneficial uses of the environment without degradation, risk to health or safety, or other undesirable and unintended consequences.
- Preserve important historic, cultural, and natural aspects of our national heritage, and maintain, wherever possible, an environment that supports diversity and variety of individual choice.
- Achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities.
- Enhance the quality of renewable resources and approach the maximum attainable recycling of depletable resources.

Further, with respect to major Federal actions significantly affecting the quality of the human environment, Sect. 102(2)(C) of the NEPA calls for preparation of a detailed statement on:

(i) the environmental impact of the proposed action;

(ii) any adverse environmental effects which cannot be avoided should the proposal be implemented;

(iii) alternatives to the proposed action;

(iv) the relationship between local short-term uses of man's environment and the maintenance and enhancement of long-term productivity; and,

(v) any irreversible and irretrievable commitments of resources which would be involved in the proposed action should it be implemented.

An environmental report accompanies each application for a construction permit or for a full-power operating license. A public announcement of the availability of the report is made. Any comments by interested persons on the report are considered by the staff. In conducting the required NEPA review, the staff meets with the applicant to discuss items of information in the environmental report, to seek new information from the applicant that might be needed for an adequate assessment, and generally to ensure that the staff has a thorough understanding of the proposed project. In addition, the staff seeks information from other sources that will assist in the evaluation and visits and inspects the project site and surrounding vicinity. Members of the staff may meet with state and local officials who are charged with protecting state and local interests. On the basis of all the foregoing and other such activities or inquiries as are deemed useful and appropriate, the staff makes an independent assessment of the considerations specified in Sect. 102(2)(C) of the NEPA and 10 CFR Part 51.

This evaluation leads to the publication of a draft environmental statement, prepared by the Office of Nuclear Reactor Regulation, which is then circulated to Federal, state, and local governmental agencies for comment. A summary notice of the availability of the applicant's environmental report and the draft environmental statement is published in the Federal Register. Interested persons are also invited to comment on the proposed action and on the draft statement.

After receipt and consideration of comments on the draft statement, the staff prepares a final environmental statement, which includes a discussion of questions and concerns raised by the comments and the disposition thereof; a final benefit-cost analysis, which considers and balances the environmental effects of the facility and the alternatives available for reducing or avoiding adverse environmental effects with the environmental, economic, technical, and other benefits of the facility; and a conclusion as to whether - after the environmental, economic, technical, and other benefits are weighed against environmental costs and after available alternatives have been considered - the action called for, with respect to environmental issues, is the issuance or denial of the proposed permit or license or its appropriate conditioning to protect environmental values. This final environmental statement and the safety evaluation report prepared by the staff are submitted to the Atomic Safety and Licensing Board for its consideration in reaching a decision on matters in controversy regarding the application. The same format as used in the Draft Environmental Statement is used in this Final Statement to facilitate its review.

This environmental review deals with the impact of operation of San Onofre Nuclear Generating Station Units 2 and 3 (SONGS 2 & 3). Assessments that are found in this statement supplement or modify those described in the Final Environmental Statement (FES-CP) that was issued in March 1973 in support of issuance of construction permits for the units. The information found in the various sections of this Statement updates the FES-CP in four ways: (1) by identifying differences between environmental effects of operation (including those which would enhance as well as degrade the environment) currently projected and the impacts that were described in the preconstruction review, (2) by reporting the results of studies that had not been completed at the time of issuance of the FES-CP and that were required by the NRC staff to be completed before initiation of the operational review, (3) by evaluating the applicant's preoperational monitoring program and by factoring the results of this program into the design of a postoperational surveillance program and into the development of environmental technical specifications, and (4) by identifying studies being performed by the applicant that will yield additional information relevant to the environmental impacts of operating SONGS 2 & 3.

Copies of this statement are available for inspection at the Commission's Public Document Room, 1717 H Street, N.W., Washington, D.C.; the Mission Viejo Branch Library, 24851 Chrisanta Drive, Mission Viejo, California; and the NRC Office of Inspection and Enforcement, 1990 N. California Boulevard, Walnut Creek, California. Copies of this statement may be obtained as indicated on the inside front cover. Mr. Dino C. Scaletti is the NRC Project Manager for this statement. Mr. Scaletti may be contacted at (301) 492-8443.

1. INTRODUCTION

1.1 HISTORY

On May 28, 1970, the Southern California Edison Company and the San Diego Gas and Electric Company filed an application with the Atomic Energy Commission (now Nuclear Regulatory Commission) for permits to construct San Onofre Nuclear Generating Station Units 2 and 3 (SONGS 2 & 3). Construction Permits Nos. CPPR-97 (Unit 2) and CPPR-98 (Unit 3) were issued on October 18, 1973, following reviews by the AEC regulatory staff and the Commission's Advisory Committee on Reactor Safeguards, as well as a public hearing before an Atomic Safety and Licensing Board in San Diego and San Clemente, California on January 16 to 24, March 13 to 15, and May 14 to 22, 1973. An additional session of the hearing was held in Los Angeles, California on May 19, 20, and 21, 1976. The conclusions reached in the staff's environmental review were issued in a Final Environmental Statement (FES-CP) in March 1973.

As of December 1980, construction of Unit 2 was about 97% complete and construction of Unit 3 was about 68% complete. Each unit has a pressurized-water reactor that will produce up to 3410 MWt and a net electrical output of up to 1106 MWe.

In November 1976 Southern California Edison Company and San Diego Gas and Electric Company submitted an application including a Final Safety Analysis Report (FSAR) and Environmental Report (ER) requesting issuance of operating licenses for Units 2 and 3. These documents were docketed on March 22, 1977, and the operational safety and environmental reviews were initiated at that time.

The City of Anaheim, California, and the City of Riverside, California have recently been added as co-holders of the Construction Permits for San Onofre 2 and 3 and will soon request to be included as applicants for Operating Licenses. The four groups are co-owners of the facility and are referred to herein as the applicant.

1.2 PERMITS AND LICENSES

The applicant has provided a status listing of environmentally related permits, approvals, licenses, etc., which are required from Federal, regional, state, and local agencies in connection with the proposed project (ER, Sect. 12). The staff has reviewed that listing. An amendment to the permit from the California Coastal Commission may be required to obtain approval for the modified exclusion area plan. The staff is not aware of any other potential non-NRC licensing difficulties that would significantly delay or preclude the proposed operation of the plant.

2. THE SITE

2.1 RESUME

The staff visited the SONGS site in May 1977 primarily to determine what changes had occurred at the site and in surrounding areas since the preconstruction environmental review in late 1972. In addition, more detailed information about the operation of SONGS 2 & 3 was obtained as a result of this visit.

Population distribution estimates have been updated and extended to the year 2020. The major land use change has been the construction of the plant itself. Transmission line routes have undergone some changes.

An updated description of the surface-water hydrology is given in Sect. 2.3.1.

The section on meteorology has been revised to include the results of recent observations.

Considerable additional field work and sampling is reflected in the description of terrestrial and aquatic ecology in Sect. 2.5.

2.2 REGIONAL DEMOGRAPHY AND LAND USE

2.2.1 Population change

Population for 1976 by sectors within 80 km (50 miles) of the plant and the projected population estimates to the year 2020 are provided in Tables 2.1-2 through 2.1-15 of the ER. The population within a 16-km (10-mile) radius of the site in 1976 was 57,241. By 1980 this population was expected to increase to 67,547 – an annual growth rate of 4.2% (ER, Sect. 2.1.3.2.1). The major cities in the area and their 1975 populations are San Clemente (20,794), 6.4 km (4 miles) northeast; San Juan Capistrano (13,658), 16.8 km (10.5 miles) northwest; Oceanside (54,900), 27.2 km (17 miles) southeast; and San Diego (1,518,000), 81.6 km (51 miles) southeast. Table 2.1 provides 1976 population data by sector within 16 km (10 miles) of the site.

Table 2.1. Population by sector and distance with 10 miles of San Onofre site (1976)

Sector	Distance (miles)						
	0 to 1	1 to 2	2 to 3	3 to 4	4 to 5	5 to 10	Total 0 to 10

SE	0	0	0	0	0	1,000	1,000
SSE	0	0	0	0	0	0	0
Total	0	1388	5284	7832	9598	33,139	57,241

Source: ER, Table 2.1-2.

(To convert miles to kilometers, multiply by 1.6.)

Table 2.2 presents projected population and annual growth rates within 16 km (10 miles) of the plant between 1976 and 2020. The total percentage change in population for the area between 1976 and 2020 is projected to be 99.4%. These projections are based on surveys made by the Southern California Association of Governments, the Comprehensive Planning Organization of San Diego County, the California State Department of Finance, and the applicant (ER, Sect. 2.1.3.2.3).

Table 2.2. Projected population and annual growth rate within 16 km of the San Onofre site

Year	Projected population	Annual growth[a] (%)		Change (%)
1976	57,241	4.2		
1980	67,547			
1980	67,547	2.9		
1990	89,521			
1990	89,521	0.3	1.6	99.4
2000	91,949			
2000	91,949	1.0		
2010	101,945			
2010	101,945	1.1		
2020	114,139			

[a]Compounded annually.

Source: Adapted from ER, Table 2.1-8.

2.2.2 Changes in land use

Since issuance of the FES-CP in 1973, the construction of SONGS 2 & 3 is the only major change in land use in the site vicinity. Site preparation required the excavation of 16.39 ha (40.5 acres) of the San Onofre Bluffs, which otherwise could be used primarily for recreation. Most of this material was deposited on 34 ha (84 acres) at Japanese Mesa, a relatively flat area just north and across Interstate 5 from the site on Camp Pendleton Marine Base (ER, Sect. 4.1.2). In addition, about 304.8 m (1000 ft) of beach front has remained closed except as a passageway during the construction period (ER, Appendix 12-B, p. 7).

The area within an 8-km (5-mile) radius of the site occupies parts of two counties. The part of this area that lies in Orange County is entirely within San Clemente. The predominant land use in San Clemente is single family residential, light commercial, and recreational. Industrial land use in San Clemente is limited to light industry only. Because the available developable land is steep, future development in that area is expected to be slow with only low residential densities permitted by the city (ER, Sect. 2.1.4.3.1). In San Diego County, the 8-km (5-mile) radius area lies within Camp Pendleton Marine Base. About 95% of Camp Pendleton is unimproved land that is used for military purposes, recreation, and conservation (FES-CP, Sect. 2.2.2). Figure 2.1-12 of the ER provides a detailed land use map of the area within an 8-km (5-mile) radius of the site.

Heavy-haul components for the plant arrive by barge or by vessel at the Del Mar Boat Basin near Oceanside, about 22.5 km (14 miles) south of the site (ER, Suppl. 2, Item 37). The haul route, which was not available at the time the FES-CP was issued, required that a road be cut through the bluffs between the beach and Highway 101, about 11 km (7 miles) north of the Del Mar Boat Basin (ER, Suppl. 2, Item 37).

The description of the transmission lines as presented in Sect. 3.7 of the FES-CP has been modified (Sect. 3.2.5). No new rights-of-way were required: about 5.2 ha (12.8 acres) will be used for new tower bases and for access-road extensions, and 2 ha (5 acres) of land will be covered by the Talega Substation (ER, Suppl. 2, Item 36). Three changes in land use adjacent to the San Onofre–Santiago transmission line route have occurred since the issuance of the FES-CP: (1) construction of a paved road immediately adjacent to a significant portion of the proposed transmission line, (2) bulldozing of a firebreak adjacent to the transmission line on Camp Pendleton Marine Base, and (3) active operation of a large aggregate borrow site adjacent to the line in a third location (ER, Appendix 6A).

2.2.3 Changes in the local economy

Construction activity peaked in late 1979 with an estimated work force of about 3000. The applicant has estimated, after discussions with officials of the labor unions represented at SONGS 2 & 3, that 20%, or about 600 workers, relocated to the southern California area from other parts of the country (ER, p. S.2-167). Although all union craft workers at the site were hired from unions located within a 96-km (60-mile) radius of the site, all of the workers who relocated were travel card members who were assigned by the local unions to SONGS 2 & 3 after the local list was exhausted. Because the construction workers lived throughout the metropolitan areas of San Diego, Orange County, and Los Angeles, the impact of the workers' income was diffuse.

From 1974 through 1976 the applicant estimated that about $4.1 million was spent within a 48-km (30-mile) radius of the site for materials and services. These expenditures accounted for about 0.2% of the total forecast plant cost (ER, p. S.2-174).

2.3 WATER USE

2.3.1 Surface-water hydrology

The only significant water resource in the vicinity of SONGS is the Pacific Ocean. A few streams are located near the site, but these are intermittent.

The currents in the San Onofre vicinity are a superposition of many effects. This current system can be decomposed into individual components. The two most persistent components are the California Current and the tides.

The California Current is evident close to shore and north of Point Conception. However, south of this point the coastline recedes to the east, and water is available for entrainment from the east side of the current. This entrainment tends to make the California Current more diffuse south of Point Conception. Furthermore, the effect of this entrainment in addition to upwelling, winds, and baroclinic instabilities[1] can produce a counter-rotating eddy through the Channel Islands which is known as the Southern California Eddy; the nearshore northward flowing current is the Southern California Countercurrent. Observations indicate that this eddy can exist year-round; however, it is strongest in the fall and in the early winter.

Tides along the California coast are a mixed type with diurnal and semidiurnal components. The diurnal period lasts about 25 hr, and the semidiurnal period is about half the duration of the diurnal. As a result of tidal rotation, flood tide flows up the coast and ebb tide flows down the coast. A more detailed discussion of the tides in the San Onofre vicinity can be found in Sect. 2.6.3 of the FES-CP.

The total near-shore current is the sum of the large-scale current systems, the tides, and other effects such as local winds and offshore storms. The net result is a highly complex current structure that is quite variable in speed and direction. An additional complication is stratification. During the winter when vertical homogeneity exists, near-shore currents are fairly uniform with depth. However, during the summer the presence of the thermocline divides the water column so that only certain components of the net flow are uniform with depth. These components, such as tides, are driven over the entire water column. Surface driving forces (the wind) will penetrate the epilimnion; however, the thermocline represents a barrier to these stresses reaching the hypolimnion. The wind energy is then concentrated in the epilimnion, resulting in an increased intensity of wind-driven flow which can dominate all other components. In contrast, the hypolimnion is relatively free of wind effects and, therefore, is strongly influenced by the tides. The net result is a two-layered flow regime in which the flow in the two layers is only weakly correlated. This already-complicated flow structure can be altered by large amplitude internal waves. The breaking of these waves provides periodic vertical mixing.

A survey of the currents in the San Onofre area was conducted in 1972 by Intersea Research Corporation.[2] Data from this study have been analyzed by Koh and List.[3] From this analysis the following summary information has been extracted.

1. A net drift current can occur in a number of directions; however, the onshore/offshore component of the drift is necessarily smaller than the longshore component.

2. The longshore component of the drift changes direction every 3 to 6 days with downcoast flow typically having a longer duration.

3. The magnitude of the longshore drift is less than 30 cm/sec (0.6 knot).

4. The onshore/offshore component of drift is less than 15 cm/sec (0.3 knot).

5. An upcoast component of drift usually is associated with an onshore component of drift, and vice versa.

6. Both components of tidal flow are typically 10 cm/sec (0.2 knot).

The most detailed study of natural temperature variations in the San Onofre vicinity is that of Koh and List.[3] This study was based on daily temperature measurements from 1966 through 1970 taken at the ends of piers at Balboa, San Clemente, Oceanside, and La Jolla. These data were separated into three frequency ranges - low, middle, and high. The low-frequency component represents data averaged over two months, and it reflects seasonal variations. After removal of these low frequencies, the data were averaged over one week. This is the middle-frequency band, which represents variation within periods from one week to two months. The residual data, the high-frequency band, represents daily to weekly fluctuations. Figure 2.1 is a plot of temperature vs time for the three frequency bands and the raw data for San Clemente. The temperature ranges from 12.1°C (54°F) to 22.9°C (73°F). The low-frequency curve shows an annual temperature cycle with a maximum in midsummer and a minimum in midwinter.

As part of their analysis, Koh and List performed a correlation study among the temperature records from the various locations. Both the low- and middle-frequency ranges showed very high correlations at zero lag time between Oceanside and San Clemente. This indicates that the mechanisms influencing these frequency components have a length scale greater than the distance between the two sampling locations. Therefore, temperature variations at San Onofre within periods of one week or longer can be represented adequately by the corresponding temperature variations at either San Clemente or Oceanside. The correlation of the high-frequency components between these two stations is very weak, indicating that short-term temperature fluctuations are a spatially localized phenomenon. This fact is substantiated by near-surface-temperature measurements made from a moving boat which show that horizontal temperature variations of 1.1°C (2°F) over 1.6 km (1 mile) are not uncommon off the coast of southern California.[3]

An additional feature of the thermal structure in the San Onofre vicinity is vertical stratification. During the winter this region is, in general, isothermal over the water column. As warming progresses, a vertical temperature gradient is established and reaches a maximum in late summer. This natural gradient has been as much as 0.55°C/m (0.3°F/ft).

Ocean salinity in the San Onofre vicinity shows little spatial variation. An annual salinity cycle does exist as a result of annual cycles in the local meteorology and large-scale current systems. During this cycle, salinity typically ranges from 33 to 34 ppt, with the minimum occurring in winter and the maximum occurring in summer.

2.3.2 Groundwater hydrology

The average elevation of the water table at the beach line is +1.5m (+5 ft) mean lower low-water level (MLLW) with a slope of less than 1%; inland, the gradients range from 2 to 8% toward the ocean. Some groundwater can be obtained from the San Onofre Groundwater Basin, and it is used at Camp Pendleton Marine Base, but it is not a resource used by the Station. The Station obtains its domestic supply of freshwater from the Tri-Cities Municipal Water District.

2.3.3 Water quality

Dissolved oxygen concentration in southern California coastal waters ranges from about 5 to 13 mg/liter. Observations at the site vary from 5.4 to 10.0 mg/liter (2 to 3.6 grains/gal). The pH of southern California surface waters varies from 7.5 to 8.4 with a mean of about 8.0.

Measurements of coliform concentrations at the site were made during the period 1967 to 1975. Most of the measurements gave a mean probable number (MPN) of 4 to 43 colonies/100ml (1 to 13 colonies/oz). Only two measurements exceeded 43, and these occurred in 1972 and both gave a MPN value of 460 (140).

Turbidity in the vicinity of the site is due primarily to the suspension of bottom material in the surf zone. Outside the surf zone, turbidity generally decreases as distance from shore increases. Typical depths of Secchi Disc visibility range from 2 to 5 m (6.5 to 16 ft).[4] The vertical variation of turbidity is often quite complex, with alternating layers of clear and turbid water. Visible plumes of turbidity have been observed occasionally on the ocean surface in the vicinity of the Unit 1 offshore discharge structure. These plumes have been observed and, depending on ambient conditions, are caused by the intake and subsequent discharge of naturally turbid water and the entrainment of naturally turbid water into the discharge stream as it moves towards the surface (ER, Sect. 2.4.3.8.2).

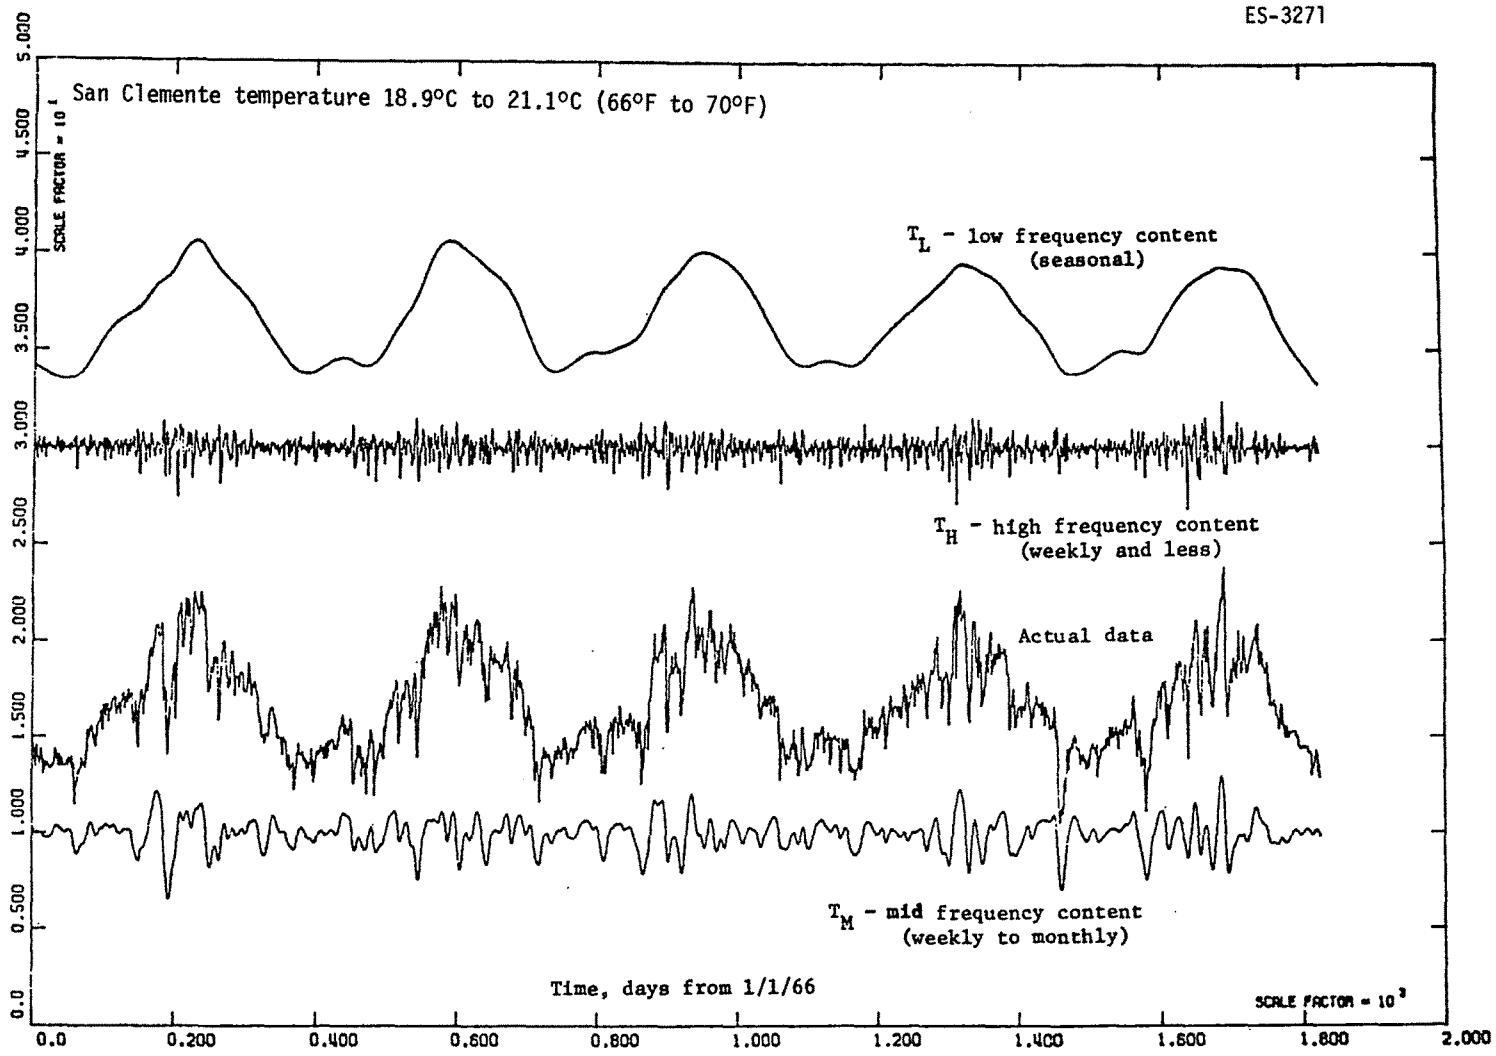

Fig. 2.1. Daily temperatures and decompositions into various frequency bands at San Clemente. Source: R. C. Y. Koh and E. J. List, *Report to Southern California Edison Company on Further Analysis Related to Thermal Discharges at San Onofre Nuclear Generating Station*, Sept. 30, 1974, Fig. 3.2.

2.3.4 Storm runoff

The probable maximum 1-hr thunderstorm rainfall is 17.8 cm (7.0 in). Much of the country to the north and east of the Station site drains into the San Onofre Creek, which flows into the ocean 2 km (1-1/4 miles) northwest of the site. The land immediately east of the site now drains into a 3.7-m-wide (12-ft-wide) ditch that parallels Interstate Highway 5 (I-5) just east of the Station. Both lanes of I-5 also drain into this ditch, which discharges into San Onofre Creek. Storm runoff from the hills above the site drains through one 182-cm-(72-in.-) and one 107-cm-(42-in.-)diam culvert that run north along the highway right-of-way and then turn under the site to the beach. The culverts and channel are designed for the runoff associated with a 1% chance (100-year) storm. To preclude flooding at the site during the occurrence of a probable maximum thunderstorm, an earthen dike will be constructed to the east side of I-5 to divert runoff and debris from the foothills area to San Onofre Creek.

2.4 METEOROLOGY

2.4.1 Regional climatology[5-9]

The climate of the coastal regions of southern California is strongly influenced by the Pacific Ocean. Summers are relatively cool with daytime temperatures averaging only in the low-to-mid-20s (°C) (70°F); daytime seabreezes are frequent. Outbreaks of hot, dry desert air from east of the coastal mountains (Santa Ana winds) may intrude onto the coastal plain several times each year, primarily in the fall, but temperatures exceed 32°C (90°F) usually less than five days annually. The proximity to the Pacific Ocean also results in mild winters, with daytime highs in the upper teens (°C) (60s°F) and nighttime lows around 5 to 10°C (40s°F). Temperatures below freezing are rare.

Precipitation along the coastal plain averages around 250 mm (10 in.) annually. The rainfall is very seasonally dependent with 85% of the total occurring from November through March; almost no rain falls during the summer months. Average relative humidities range from about 80% during the early morning hours of summer and fall, down to around 55% during winter afternoons.

2.4.2 Local meteorology[5,6,8,9]

The San Onofre site is located on the relatively narrow coastal plain, near the mouth of San Onofre Canyon. Coastal bluffs, nearby hills and valleys, and the Pacific Ocean contribute to the complexity of the site topography. Within 8 km (5 miles) of the site, elevations range from 525 m (1725 ft) above sea level [about 5.5 km (3.5 miles) east of the site] to sea level along the Pacific Ocean.

To assess the local meteorological characteristics of the San Onofre site, climatological data from San Diego, California [80 km (50 miles) southeast of the site]; from Los Angeles, California [95 km (60 miles) northwest]; and data collected onsite are available. These data are reasonably representative of the climatological conditions expected in the vicinity of the site.

In the site area, average daily maximum and minimum temperatures range between 25°C (77°F) and 18°C (64°F) in August, the warmest month, and between 18°C (65°F) and 8°C (46°F) in January, the coolest month. The extreme maximum temperature recorded was 44°C (111°F) at San Diego in September 1963; the extreme minimum temperature was -5°C (23°F) at Los Angeles in January 1937.

The area receives about 250 mm (10 in.) of rain annually; December, January, and February — the wettest three-month period — averages about 150 mm (6 in.), and June, July, and August combined averages less than 2.5 mm (0.1 in.). The maximum 24-hr rainfall recorded among these stations is 157 mm (6.2 in.) at Los Angeles in January 1956. Snowfall is a rarity, with a trace [less than 0.25 mm (0.01 in.)] being the most ever recorded. Heavy fogs [visibility of 0.4 km (0.25 mile) or less] occur on about 30 to 40 days each year along the coast with about half of the occurrences during October through January.

Windflow at the site has a strong diurnal dependence primarily due to the land-sea breeze effect. During daytime hours the windflow has a predominant onshore directional component, whereas at night windflow tends toward a seaward direction. Table 2.3 shows the wind direction with the greatest frequency of occurrence for each hour of the day for the three-year period of January 25, 1973, through January 24, 1976, as measured at the 10-m (33-ft) level of the onsite meteorological tower. Figure 2.2 shows the directional frequency of onsite winds. About 25% of the total windflow over the site was from the northeast and north-northeast (principally nighttime offshore flow); 19% of the flow occurred from the west and west-northwest (daytime onshore flow). Winds were calm [windspeeds less than 0.34 m/sec (0.75 mph)] less than 1% of the time at the 10-m (33-ft) level.

ES-4081

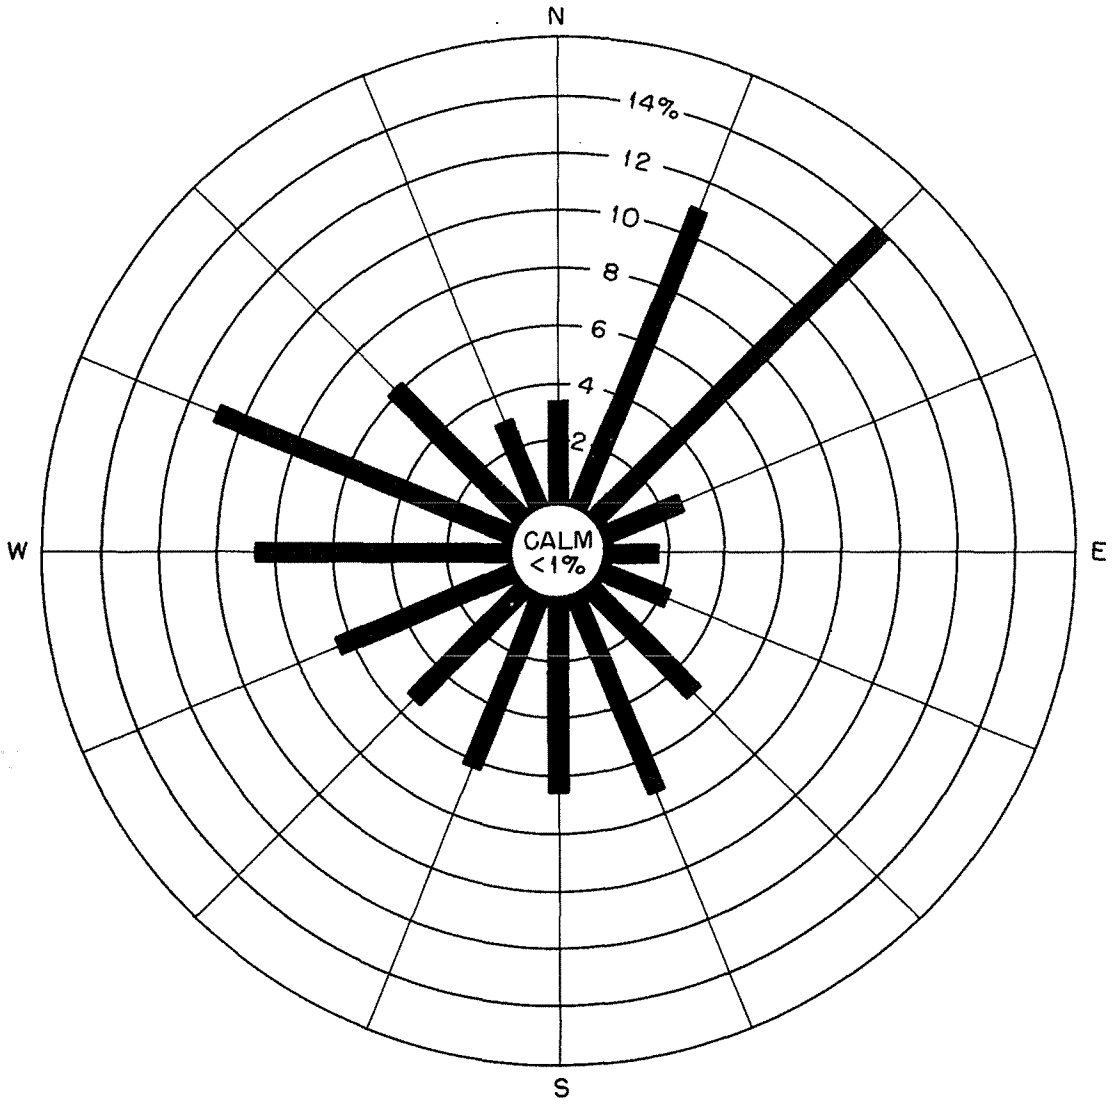

Fig. 2.2. Directional frequency of wind at the San Onofre site. Onsite data at 10 m (33 ft) above ground level, Jan. 25, 1973 through Jan. 24, 1976. Bars show the direction from which the wind blows. Calms are those winds with hourly average speeds less than 0.34 m/sec (0.75 mph).

Table 2.3. Wind direction with greatest frequency of occurrence by time of day at San Onofre Nuclear Generating Station

Data measured at 10-m (33-ft) level of onsite meteorological tower

Hour (AM)	Wind direction	Frequency (%)	Hour (PM)	Wind direction	Frequency (%)
1	NE	28	1	WNW	25
2	NE	26	2	WNW	27
3	NE	27	3	WNW	27
4	NE	28	4	WNW	27
5	NE	30	5	WNW	22
6	NE	30	6	WNW	16
7	NE	25	7	NW	14
8	NE	19	8	NE	13
9	S	12	9	NE	16
10	W	17	10	NE	20
11	W	20	11	NE	23
Noon	WNW	22	Midnight	NE	25

2.4.3 Severe weather[5-13]

Although infrequent, thunderstorms, tornadoes, tropical cyclones, and dust storms can affect the site area. Thunderstorms occur less than 5 days annually. Tropical storms are also rare in the site area, with a storm entering the region less than once every 10 years. The "fastest mile" of wind recorded at Los Angeles was 28 m/sec (62 mph) (March 1952). Snow, glaze, and hail are almost nonexistent in the site vicinity.

Between 1952 and 1975, 23 tornadoes and 21 waterspouts were reported within a 34,000-km^2 (13,000-mi^2) area containing the site. Staff analysis of these tornado data indicates that the mean path area of a tornado in this region is about 0.3 km^2 (0.1 mi^2). Using the methods of Thom, this results in a recurrence interval of 70,000 years for a tornado or waterspout at the plant site.

Dust storms are relatively infrequent within the site region; between 1940 and 1970, dust or blowing dust and sand reduced visibility to under 11 km (7 miles) about 1 hr annually. About 8 days each year there is a high meteorological potential for air pollution.

2.4.4 Atmospheric dispersion[5,6,14,15]

Southern California Edison Company (SCE) has provided joint frequency distributions of wind speed and direction by atmospheric stability class, based on the vertical temperature gradient, collected onsite during the period January 25, 1973 to January 25, 1976. The distributions were for wind speed and direction measured at both the 10- and 40-m (33- and 131-ft) levels with the vertical temperature difference between the 6.1- and 36.6-m (20- and 120-ft) levels. SCE has also conducted a tracer test program to assess the atmospheric dispersion in the landward directions at the San Onofre site. Section 6.2.5 describes the onsite meteorological program and the tracer test program.

The staff has made reasonable estimates of average atmospheric dispersion conditions for SONGS 2 & 3 using an atmospheric dispersion model for long-term releases; this model is based on the "Straight-Line Trajectory Model" described in Regulatory Guide 1.111. The onsite tracer tests showed that ground-level relative concentrations normalized by windspeed were similar whether the source of release was elevated or ground level; thus it was assumed that all plant releases were from ground level. The calculations also include considerations of intermittent releases during more adverse atmospheric dispersion conditions than indicated by an annual average calculation as a function of total duration of release. The calculations include an estimate based on the criteria outlined in Regulatory Guide 1.111 of maximum increase in calculated relative concentration and deposition due to the spatial and temporal variation of the airflow not considered in the straight-line trajectory model. Radioactive decay of effluents and depletion of the effluent plume were also considered as described in Regulatory Guide 1.111.

In the evaluation, we used meteorological data collected onsite between January 25, 1973 and January 24, 1976. All releases were evaluated using joint frequency distributions of wind speed and direction measured at the 10-m (33-ft) level by atmospheric stability [defined by the temperature difference between the 36.6- and 6.1-m (120- and 20-ft) levels]. Data recovery for this time period was 88%.

Table 5.1 presents the calculated values of relative concentration (χ/Q) and relative deposition (D/Q) for specific points of interest.

2.5 SITE ECOLOGY

2.5.1 Terrestrial ecology

The FES-CP describes the terrestrial ecology of the San Onofre site (FES-CP, Sect. 2.8.1). Field work for this description, however, was conducted only during November 1971 and contained very little quantitative data. Consequently, the issuance of the construction permit was subject to the applicant's expansion of its current environmental monitoring program "to determine environmental effects which may occur as a result of site preparation and construction of Units 2 and 3, and to establish an adequate preoperational baseline by which the operational effects of Units 2 and 3 may be judged" (FES-CP, p. iv). In response, the applicant conducted terrestrial ecological studies for a period of 1 year on a 0.61-ha (1.5-acre) quadrat located immediately south of Units 2 and 3 construction site (ER, Appendix 2A). This monitoring program documented seasonal changes in the biotic communities over a 1-year time span and fulfilled the recommendations of NRC Regulatory Guide 4.11.

About 80% of the study area is in a natural plant community of coastal sage scrub, and the remaining 20% has been disturbed by man-related activities. Total cover on the study area ranged from 81 to 98%. The greatest cover was found in February, decreasing toward midsummer. Vegetative diversity in the coastal sage scrub community was relatively low; California sagebrush (Artemesia californica) was the dominant species (65% relative cover). Coyote bush (Baccharis pilularis) ranked second in the study area (9% relative cover) but had higher relative cover in the disturbed areas than in the climax stand. The applicant's survey suggests that surface disturbances significantly alter the composition of the coastal sage scrub community by encouraging the invasion of exotic perennial and annual plant species, especially mustards and grasses. Establishment of these plants occurred only in areas that have been disturbed (ER, Appendix 2A). As expected for this very small study area (0.61 ha), no endangered plant species were observed.

Fauna observed within the study area included 5 species of reptiles, 12 species of mammals, and 36 species of birds; no amphibians were sighted. None of the species observed in the study area are threatened or endangered as defined by the U.S. Department of the Interior[16] (ER, Sect. 2.2.1.2).

The endangered animal species[16] whose ranges include the vicinity of the plant and associated transmission lines are listed in Table 2.4. Two of these species have been observed by the applicant. The California brown pelican has occurred several times on the beach adjacent to the construction area (ER, Sect. 2.2.1.2), and the California least tern has a nesting colony located near the Del Mar Boat Basin, a facility used by the applicant to move heavy components (see Sect. 2.2.2).

Examination of the geographical distributions[17,18] of the 266 endangered plant species in California[19] indicates that 26 of these species occur in those counties (Orange and/or San Diego) traversed by the transmission lines (Table 2.5). No endangered plant species, however, were observed during the applicant's biological study of the San Onofre-Santiago transmission line route.[20] Biological surveys of the other transmission line routes have not been conducted, but no habitats adjacent to or within the transmission line right-of-way have been classified by state or Federal authorities as being critical to any endangered species (ER, Suppl. 1, Item 22).

2.5.2 Aquatic ecology

The aquatic ecology of the site was described in the FES-CP issued in March 1973, and was based on descriptive data obtained from literature concerning the southern California coast. The FES-CP site description contained minimal baseline information on spatial and temporal differences in species occurrences and population densities. The data obtained since issuance of the FES-CP is primarily from three sources: (1) a thermal effects study performed jointly by Environmental Quality Analysts, Inc., and Marine Biological Consultants, Inc., in 1973 using data and results obtained from 1964-72 by Bendix Marine Advisers, Inc., and Intersea Research Corporation.[21] (2) the SONGS 1 Environmental Technical Specifications (ETS) monitoring program begun in November 1974, conducted by the Lockheed Aircraft Service Company's Department of Marine biology,[22-27]

Table 2.4. Endangered animal species[a] whose ranges include Orange and San Diego counties, California

Common name	Scientific name	Habitat	Reason for decline
California brown pelican	*Pelecanus occidentalis californicus*	Pacific coast from Canada to Mexico	Egg shell thinning due to pollutants such as DDT
California least tern	*Sterna albifrons brownii*	Pacific coast from S. San Francisco Bay, California, to S. Baja, California	Loss of nesting habitat (sandy beaches) due to increased human activity
American peregrine falcon	*Falco peregrinus anatum*	Coast and higher mountains inland	Egg shell thinning due to DDT; human disturbance
Southern bald eagle	*Haliaeetus leucocephalus leucocephalus*	Estuarine areas and inland around large lakes, reservoirs, and wetlands	Disturbance of nesting birds; illegal shooting; loss of nest trees; contamination of food chain by persistent pesticides
Light-footed clapper rail	*Rallus longirostris levipes*	Coastal salt marshes	Destruction of its natural habitat by filling for housing and industrial use, marine development, and water pollution destroying food species and/or habitat

[a]U.S. Department of the Interior, "Endangered and Threatened Wildlife and Plants," 41 F.R. 47180–47198.

Table 2.5. Endangered plant species of Orange and San Diego counties, California

Plant name[a]		Habitat and geography[a]
Scientific	Vernacular	
Acanthomintha ilicifolia	San Diego thornmint	Clay depressions on mesas and slopes; coastal sage scrub, chaparral; SW San Diego County
Arctostaphylos glandulosa var. *crassifolia*	Thickleaf manzantia	Sandy mesas and bluffs; chaparral; coast of San Diego County
Aster chilensis		Dry banks, grassy fields, etc., sea level to 5000 ft; many plant communities; mountains of San Diego County to Santa Barbara County
Astragalus tener titi	Coastal dunes rattleweed	Sandy places near the coast; coastal strand; near San Diego
Berberis nevinii	Nevin's bayberry	Sandy and gravelly places below 2000 ft; coastal sage scrub, chaparral; San Diego County
Brodiaea filifolia	Thread-leaved brodiaea	Heavy clay soil below 2000 ft; coastal sage scrub, chaparral; San Diego County
Brodiaea orcuttii	Orcutt's brodiaea	Near streams and around vernal pools and seeps, up to 5500 ft; chaparral; Yellow Pine Forest, San Diego County
Chorizanthe orcuttiana	Orcutt's chorizanthe	Sandy places; coastal sage scrub; San Diego County
Cordylanthus maritimus ssp. *maritimus*	Salt marsh bird's beak	Coastal salt marsh; Lower California to Oregon
Dicentra ochroleuca	Yellow dicentra	Occasional in dry disturbed places below 3000 ft; chaparral; Santa Ana and Santa Ynez mountains
Dichonda occidentalis	Western dichondra	Mostly dry sandy banks in brush or under trees; coastal sage scrub, chaparral, southern oak woodland; coastal San Diego and Orange counties
Dudleya multicaulis	Many-stemmed dudleya	Dry stony places below 2000 ft; coastal sage scrub, chaparral; San Onofre Mountain, Orange and San Diego counties
Dudleya stolonifera	Laguna Beach dudleya	Cliffs in coastal sage scrub; canyons near Laguna Beach, Orange County
Eryngium aristulatum var. *parishii*	San Diego coyote-thistle	Vernal pools; chaparral; San Diego region
Ferocactus viridescens	San Diego barrel cactus	Dry hills; coastal sage scrub, valley grassland; around San Diego, NW Lower California
Galium angustifolium ssp. *borregoense*		Creosote bush scrub; Borrego Valley, E. San Diego County
Githopsis filicaulis (last reported in 1884)	Mission Canyon blue-cup	Mission Canyon, San Diego
Hemizonia conjugans	Otay tarweed	Mesas; coastal sage scrub; SW San Diego County
Hemizonia floribunda	Tecate tarweed	Dry slopes and valleys below 3500 ft; coastal sage scrub, chaparral; S. San Diego County, N. Lower California
Limnathes gracilis var. *parishii*	Parish slender meadow-foam	Moist lake shores and wet places from 4500 to 5000 ft; Yellow Pine Forest; Cuyamaca and Laguna mountains
Monardella linoides ssp. *viminea*		Rocky washes below 1000 ft; coastal sage scrub, chaparral; SW San Diego County
Monardella macrantha var. *halli*	Hall's monardella	San Gabriel and San Bernardino mountains to Cuyamaca and Santa Ana mountains
Nolina interrata	San Diego nolina	Dry slope; chaparral; W. of Dehesa School, 8 miles east of El Cajon, San Diego County
Orcuttia californica var. *californica*	California orcuttia	Drying mud flats; valley grassland; San Diego County
Poa atropurpurea	San Bernardino bluegrass	Meadows and grassy slopes from 6000 to 7000 ft; Montane Coniferous Forest; San Diego County
Pogogyne abramsii	San Diego pogogyne	Beds of dried pools; chaparral, coastal sage scrub; mesas from San Diego to Miramar

and (3) the Annual Report to the California Coastal Commission, August 1976-1977, by the Marine Review Committee,[28] a special study group established by the California Coastal Commission to estimate the consequences of operating SONGS 2 & 3. Because the ETS program contains the most recent data, included seasonal fluctuations in species occurrences and population densities, and evaluated the effects of SONGS 1 operation on the local marine environment, the description of the site aquatic ecology that follows is based on these data (obtained from November 1974 through December 1976). SONGS 2 & 3 are adjacent to SONGS 1, on the same site. Additionally, the effects of SONGS 1 operation are now a part of the environment of SONGS 2 & 3 and should therefore be included in a complete description of the site ecology.

The biotic communities relevant to an adequate description of the site ecology are the plankton, nekton, benthic, kelp, and intertidal communities.

2.5.2.1 Plankton

Bimonthly plankton sampling was conducted four times in 1975 and six times in 1976 at seven stations along the 10-m (33-ft) contour from 2.4 km (1.5 miles) upcoast to 6.7 km (4.2 miles) downcoast of the SONGS 1 intake/ discharge line (Fig. 2.3).

Phytoplankton

1975 Data. The 84 phytoplankton taxa recorded in the 1975 surveys are similar to those found in previous studies.[25] The phytoplankton was dominated numerically by dinoflagellates. Prorocentrum micans was the most abundant species, constituting 30 to 90% of the samples.[22] Other abundant organisms included Prorocentrum spp., Ceratium sp. A, and Ceratium sp. B. Several species of Peridinium and Dinophysis were also present. The number of taxa per station within each survey was relatively uniform. A complete list of phytoplankton taxa recorded during 1975 is given by station and survey in Appendix VIII, Table 2, p. 217 of ref. 25.

Chlorophyll α concentrations ranged from 0.24 to 2.32 mg/m^3 (0.004 to 0.04 grains/250,000 gal) during the four 1975 surveys.[25] Differences in chlorophyll α concentrations between stations were not significant. Differences were significant, however, between depths and between surveys; chlorophyll α concentrations were significantly greater at the 8-m (26-ft) depth, and the mean concentrations of September were significantly greater than those of the other survey months - May, July, and November.

Phaeopigment concentrations ranged from 0.08 to 1.23 mg/m^3 (0.076 to 0.174 grains/250,000 gal) during the four 1975 surveys.[25] Station differences were not significant, but differences in mean concentrations between surveys and between depths were significant. As with chlorophyll α, phaeopigment concentrations were greater at 8 m (26 ft) than at 1 m (3.3 ft), and the September survey showed the highest phaeopigment concentrations of all four surveys.

1976 Data. In 1976, 128 species or higher taxa of phytoplankton were reported from the six surveys conducted (Table II-2, pp. 11-13 of ref. 26). These taxa consisted of species when identifiable and higher taxa (genera, families, etc.) when identification to the species level could not be made. The taxa representing greater than 30% of any given sample by number were Nitzschia spp. (March and November), an unidentified pennate diatom (January, March, July, September, and November), Gonyaulax spp. (January and March), and Prorocentrum micans (May).[27]

Normal vertical distribution patterns were observed in 1976, as in 1975, with higher concentrations of chlorophyll α and phaeopigments again measured in the lower half of the 10-m (33 ft) water column. However, relatively high values of chlorophyll α were found during the January and May surveys in 1976, whereas in 1975, chlorophyll α concentrations were moderate in May and high in September. Also in contrast to 1975, there was no consistent vertical separation of diatoms from dinoflagellates.

Slightly higher surface temperatures at plankton stations nearest SONGS 1 during some surveys had no apparent effect on the distribution and abundance of phytoplankton; rather, distribution and abundance were apparently the result of natural spatial and temporal variation.[27]

Zooplankton

1975 Data. Zooplankton species encountered in the four 1975 surveys were common to the neritic waters of southern California.[22] A master species list of zooplankton found in the surveys is presented in Appendix VIII, Table 2, p. VIII-30 of ref. 22. The most common group consisted of copepodids of Acartia spp., usually accounting for more than 50% of the total number of individuals sampled.[22] Other species that commonly occurred in the samples were Paracalanus parvus copepodids, Oikopleura spp., Evadne nordmanni, Labidocera trispinosa copepodids,

ES-4187

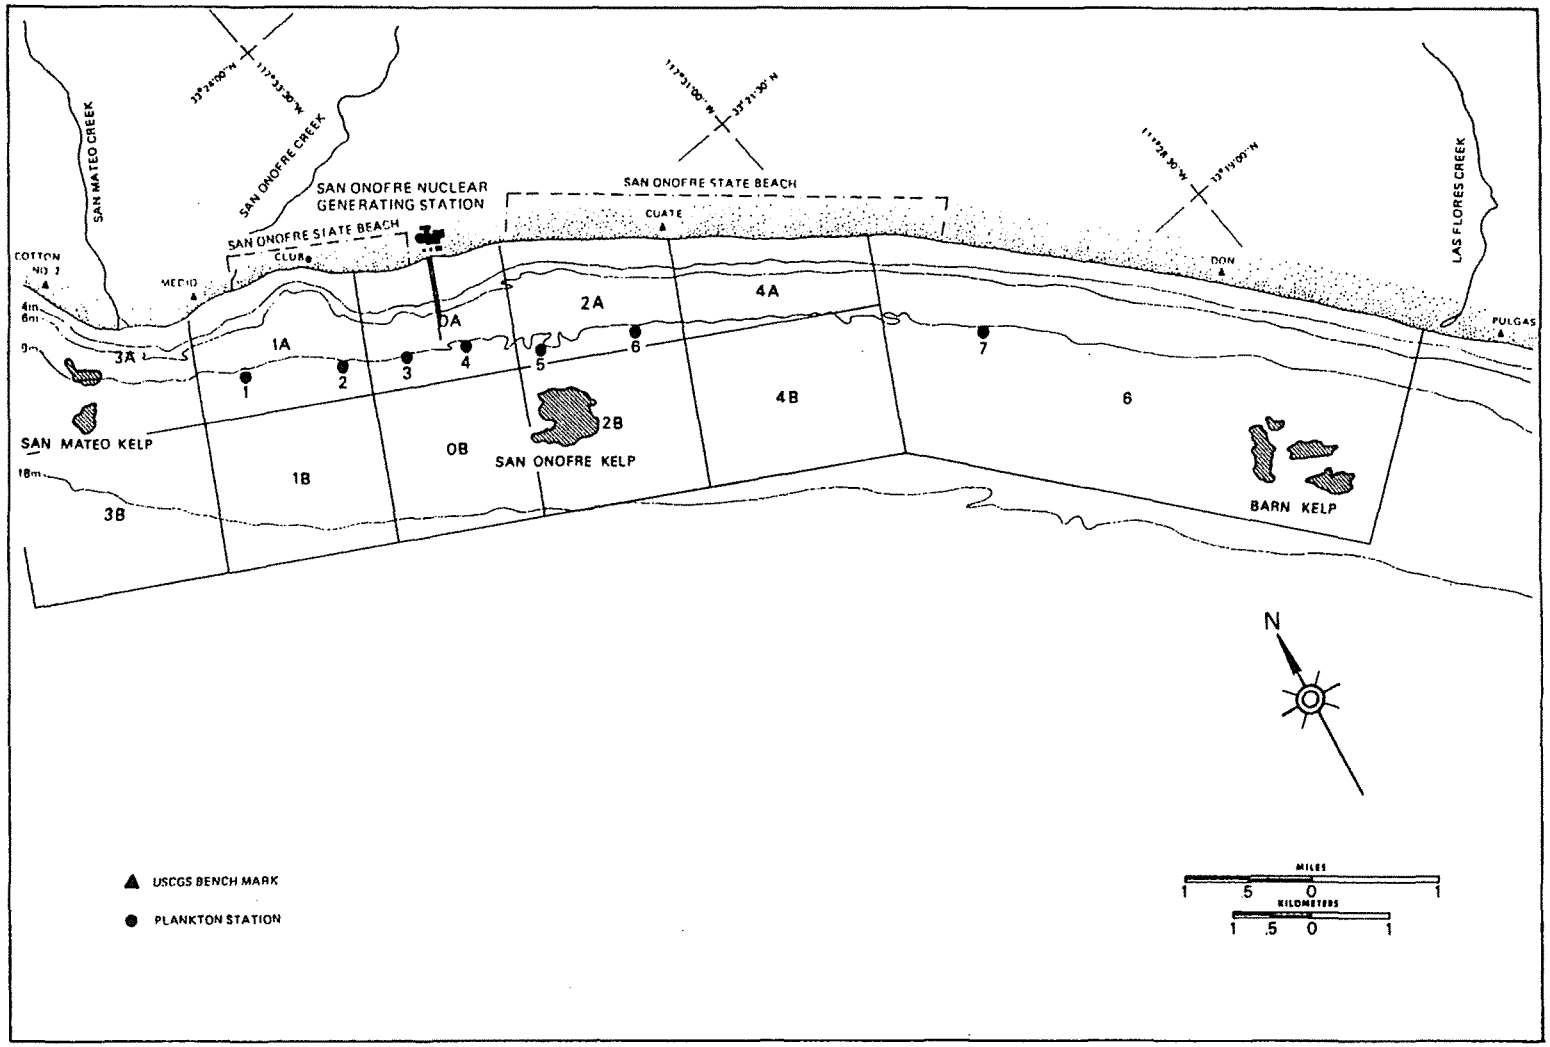

Fig. 2.3. Environmental Technical Specifications plankton station locations and environmental surveillance zones, San Onofre Nuclear Generating Station Unit 1. Source: Lockheed Center for Marine Research, *San Onofre Nuclear Generating Station Unit 1, Environmental Technical Specifications, Annual Operating Report, Vol. IV, Biological Data Analysis — 1976*, June 1977.

Sagitta euneritica, and Acartia tonsa. Less abundant species were adult Paracalanus parvus, cyphonautes larvae, Acartia clausi, and Clausocalanus spp. copepodids. Other species present usually accounted for less than 1% of any sample.[22]

Sampling stations were best differentiated by the distribution of five species: Sagitta euneritica, Corycaeus amazonicus, Oithona spp. copepodites, euphausiid larvae, and Podon polyphemoides. A clear separation of the stations, however, was not obtained, which suggests that no strong processes in the area acted to partition the environment.[25]

Total abundance per sampling station ranged from 600 to 10,900 per m^3 (568 to 10,322 per 250,000 gal) (Fig. 2.4), and total number of taxa ranged from 36 to 65 during the four surveys of 1975.[25] The number of taxa at station 4 near the SONGS 1 discharge was significantly higher than at all the other stations (Fig. 2.4).

1976 Data. In 1976, 115 species or higher taxa were reported from the six surveys performed (Table II-2, pp. 7-10 of ref. 26). Sixteen taxa were considered predominant because they were numerically dominant (number one in rank) during at least one survey, or because they represented more than 1% of the total number of individuals during the year.[27] These sixteen taxa constituted 90% of the total individuals recorded for the year.[27] The seasonal distribution of each of these taxa during the 1976 surveys is shown in Fig. 2.5. Significant differences were found among stations for all but five of the taxa, and significant differences were found between depths for all but six of them. All of these taxa exhibited significant differences among surveys.

Normal vertical distribution patterns were also observed in 1976, as in 1975, with higher concentrations of zooplankton observed in the lower half of the 10-m (33-ft) water column.

Although higher concentrations of zooplankton were measured near SONGS 1 in 1975, no effect of SONGS 1 was indicated by the 1976 studies. Even though water temperatures during the 1976 November survey (when SONGS 1 was off-line) were unusually warm for the season, the distribution and abundance of zooplankton, as with the phytoplankton, were apparently the result of natural spatial and temporal variation.[27]

2.5.2.2 Nekton

1975 Data

Quarterly nekton sampling was conducted in 1975 at six stations – three stations in the area of the SONGS 1 discharge (zone OA) and three stations about 6706 m (22,000 ft) downcoast (zone 6) (Fig. 2.6). The downcoast stations (zone 6) acted as control areas not under the influence of the SONGS 1 discharge.

A total of 3206 individuals representing 49 species or higher taxa were taken during the four 1975 surveys.[25] The most abundant fish was the queenfish (Seriphus politus), which accounted for nearly twice the number of individuals in the year's catch than the second most abundant species. Other abundant fish were the walleye surfperch (Hyperprosopon argenteum), white croaker (Genyonemus lineatus), spotfin croaker (Roncador stearnsii), jacksmelt (Atherinopsis californiensis), and white surfperch (Phanerodon furcatus). Fourteen species were both abundant and common. Five of the 14 species displayed significant differences in their distributions between zones; four of these – jacksmelt, white seabass (Cynoscion nobilis), white croaker, and queenfish - were significantly more abundant in zone OA, and the pile surfperch (Damalichthys vacca) was more abundant in zone 6.

The variability observed in abundance between zones was influenced significantly by the distribution of four species: white seabass, white croaker, white surfperch, and California corbina (Menticirrhus undulatus). The white seabass and white croaker were significantly more numerous in zone OA, and the California corbina and white surfperch were significantly more numerous in zone 6.

The number of individuals and number of taxa also varied significantly among surveys. However, the degree of similarity of species composition within zones did not differ significantly from the degree of similarity between zones.

1976 Data

A taxonomic summary of the 1976 nekton sampling data by station and by survey can be found in Table III-4, pp. 17-18 of ref. 26. A total of 46 species was reported from these surveys. Seven species – queenfish, white croaker, white surfperch, walleye

surfperch, black croaker (Chilotrema saturnum), spotfin croaker, and half moon (Medialuna californiensis) were captured in both zones.[27] As a group, these seven species accounted for 81.3% of the total catch for the year.[27] The first five of these species were tested for significant differences between zones and among surveys. Only the queenfish and white croaker showed a significant difference between zones, being significantly more abundant in zone OA than in zone 6. The remaining three species did not differ significantly between zones.

In contrast, six predominant species in 1975 (bottom nets) contributed 82.3% of the individuals collected.[25] Of the predominant species netted in both years, only the queenfish and white croaker were significantly more abundant in zone OA than in zone 6 during both years of the survey.

The spatial distribution of the queenfish, white croaker, and white surfperch differed significantly among the 1976 surveys. Temporally, the queenfish was found to be most abundant during the December survey and least abundant during the March survey. The white croaker was significantly more abundant during the December and March surveys than during the September and June surveys, and the white surfperch was significantly more abundant in the December catch than during all of the other 1976 surveys.

Significant differences were observed in the number of species between zones, with the number in zone OA being significantly greater than the number in zone 6. Four species best discriminated between zones OA and 6: white seabass, white croaker, yellowfin croaker (Umbrina roncador); and white surfperch.

There was also a significant difference among survey periods, with the number of species taken in March being significantly less than the number taken during all of the other surveys, which were not significantly different from each other.

The significant difference found in both number of individuals and number of species among surveys in 1976 was also found in 1975 although no obvious trend in species diversity was revealed (Fig. 2.7). On the other hand, a high similarity within zones existed during 1976; the 1975 data indicated similar but less distinct patterns.

The data suggest that the areas sampled in the two zones may support somewhat different nekton communities. Physical differences between the zones which may also affect the nekton results include the presence of the intake and discharge structures at SONGS 1 and riprap material in zone OA, general differences in substrate type and composition between the zones, turbidity, and the presence of a dense stand of the phaeophyte Cystoseria spp. in the area of the zone OA nekton stations. Temperature data collected during bimonthly cruises and nekton surveys revealed no obvious differences between zones, which indicates that temperature is not an important factor.

Fisheries statistics

Commercial and sport fisheries catch data for 1974 from the California Department of Fish and Game statistical blocks in the vicinity of SONGS 1 (Fig. 2.8) revealed that the number of fish per block ranged from 16,601 in block 737 to 123,246 in block 756.[27] With the exception of block 801, all of the blocks examined measured an increase in catch per unit effort between 1973 and 1974. However, the magnitude of the increase was small in comparison to the decrease shown by all of the blocks over the past 13 years.

The 1974 commercial catch reported a total of 46 taxa from the five blocks surrounding San Onofre.[27] The only taxon common to all five blocks was the Pacific bonito (Sarda chiliensis). Each of the five blocks yielded catches at about the expected level, based on the size of the blocks and the amount of coastline encompassed.[27]

2.5.2.3 Benthos

1975 Data

Three surveys conducted in 1975 at 11 benthic stations (Fig. 2.9) revealed a total of 160 species or higher taxa of epibenthic macrobiota (Tables X-1 to X-11, pp. X-12 to X-43 of ref. 22). The taxa represented members of 11 major taxonomic groups. Within zones not associated with kelp beds (zones OA and 6), the flora was dominated by rhodophyte taxa throughout the year. Mollusks were the dominant fauna during April and October, whereas molluscan and chordate taxa occurred in similar numbers during the July sampling period. Rhodophytes were also the dominant floral component and mollusks were the dominant faunal component of the kelp bed biota at all kelp bed stations during all survey periods.

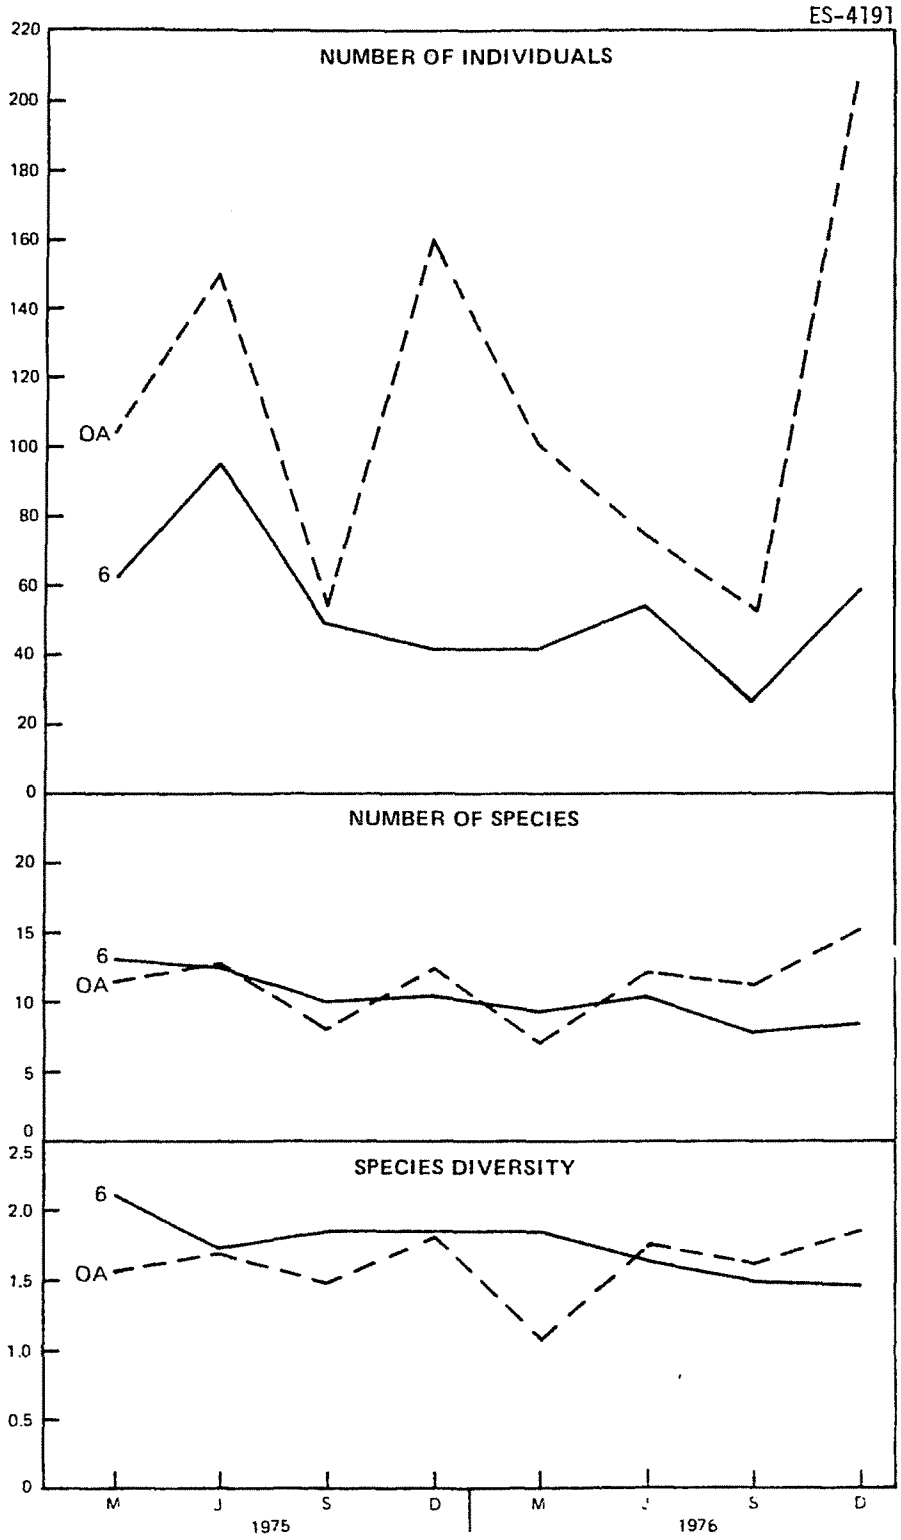

Fig. 2.7. The mean number of individuals and species per net by zone and species diversity of zones OA and 6 by survey during 1975 and 1976. Source: Lockheed Center for Marine Research, *San Onofre Nuclear Generating Station Unit 1, Environmental Technical Specifications, Annual Operating Report, Vol. IV, Biological Data Analysis — 1976*, June 1977.

The species whose distribution best discriminated between zones OA and 6 were the anthozoan Muricea californica, which occurred mostly in zone 6; the rhodophyte Prionitis spp., which was absent from zone 6; the holothuroid Parastichopus parvimensis, which occurred only in zone 6; and the gastropod Astrea undosa, which was observed only in zone OA.

The trophic composition based on the number of taxa of the two zones not associated with kelp beds (zones OA and 6) was similar among these zones and was dominated by suspension feeders and by primary producers during all surveys (Table 2.6).

Kelp bed stations were best distinguished by four taxa: the gastropod *Cypraea spadicea*, which occurred only at San Onofre Kelp Bed; the anthozoan *Corynactis* spp., which occurred predominately at San Mateo and Barn kelp beds; the annelid *Spiochaetopterus costarum*, which did not occur at San Onofre Kelp Bed; and the white abalone, *Haliotis sorenseni*, which occurred only at San Onofre Kelp Bed. Twelve taxa were considered predominant at kelp bed stations: *Chelyosoma productum*, *Conus californicus*, *Corallina/Haliptylon*, *Corynactis* spp., Crustose corallines (unident.), *Dioptra* spp., *Leucilla nuttingi*, *Lytechinus pictus*, *Mitrella carinata*, *Muricea californica*, Pagurids (unident.), and *Rhodymenia* spp.

Trophic composition based on the number of taxa at the kelp bed stations was similar among stations and was dominated by suspension feeders (e.g., barnacles, which feed by filtering out suspended material) and primary producers (algae) during all surveys (Table 2.7).

Table 2.7. Trophic composition (percent) of benthic taxa at San Mateo (SMK), San Onofre (SOK), and Barn (BK) kelp beds based on the number of taxa of each trophic type present during 1975

Trophic types	April 10–18			July 15–18			October 13–17		
	SMK	SOK	BK	SMK	SOK	BK	SMK	SOK	BK
Primary producers	22	19	24	26	21	25	30	18	26
Suspension feeders	49	36	41	38	36	59	43	38	45
Grazers	2	17	9	8	12		7	10	4

1976 Data

Diving surveys of the epibenthic macrobiota were conducted quarterly during 1976 at the same 11 benthic stations. A total of 159 species or higher taxa, which were members of 11 major taxonomic groups, were identified during the four surveys.[27] A taxonomic summary of these data by station and by survey is presented in Tables IV-1 and IV-2, pp. 21-28 of ref. 26. Zones 0A and 6 contained twelve predominant taxa whose combined abundance accounted for 84.3% of the total percent cover and 65.1% of the total enumerated individuals.[27] Seven of the twelve predominant taxa consisted of large taxonomic categories that were not field identifiable to a lower taxon. These seven taxa included parvosilvosa, unidentified ectoprocts, unidentified crustose coralline algae, and unidentified hydroids, rhodophytes, pelecypod siphons, and pagurids. These large taxonomic groups totaled 72% of the total percent cover and 20% of the total enumerated individuals for the entire year's data.[27] The magnitude of the abundances of these large taxonomic groups may be somewhat misleading, however, because each of these categories can contain members of several different species.[27]

The predominant taxa identified to at least the generic level consisted of *Rhodymenia* spp., *Bryopsis hypnoides*, *Diopatra ornata*, *Muricea californica*, and *Patiria miniata*. The distribution of these taxa among zones and stations is presented in Table V-12, p. 68 of ref. 27. The abundance of all of these taxa differed significantly between zones; *Rhodymenia* spp. and *Patiria miniata* were significantly more abundant in zone OA, whereas *Bryopsis hypnoides*, *Diopatra ornata*, and *Muricea californica* were significantly more abundant in zone 6. None of these taxa differed significantly among surveys.

A greater degree of similarity in both species composition and abundance was found within zones than between zones. Distribution of the anthozoan *Murica californica* and the rhodophyte *Prionitis* spp. contributed the greatest to the differences between zones OA and 6 in both years. Also in both 1975 and 1976, *M. californica* and the polychaete *Diopatra ornata* were significantly more abundant in zone 6. Species composition of the San Onofre Kelp Station was generally more similar to zone OA stations than to the other kelp bed stations; this is much the same as the 1975 survey data.

No significant differences existed between zones or kelp bed stations in the distribution of taxa among trophic levels during 1975 or 1976.

Aerial infrared kelp survey

An aerial infrared kelp survey revealed that both Barn and San Onofre kelp beds showed a slight increase in total area during 1975 (Fig. 2.10). All of the kelp beds increased in size between February and May 1976 (Fig. 2.10). During the period May to September 1976, Barn and San Onofre kelp beds underwent an 80 and 92% decrease respectively.[27] At the time of the November 1976 survey, Barn Kelp Bed had increased to 77% of the area it had covered during the May survey, whereas San Onofre Kelp Bed again underwent a slight decrease.[27] San Mateo Kelp Bed remained essentially the same. The same general trends were encountered during mapping of the kelp beds by electronic positioning during 1975 and 1976 as part of the construction surveillance program for SONGS 2 & 3.
