Millstone Nuclear Power Station, Unit No. 3
Reporting of Potential Significant Deficiencies
In Design and Construction:
Phase-to-Phase Electric Fault in a Motor Control Center (SD-50)

In a January 16, 1984 telephone conversation between the NRC Resident Inspector, Mr. T. Rebelowski and our Mr. D. B. Vail, Northeast Nuclear Energy Company (NNECO) reported a potential significant deficiency in the construction of Millstone Unit No. 3 as required by 10CFR50.55(e). Subsequently, this was followed up with another telephone conversation with your Mr. T. Elsasser on January 17, 1984. The potential significant deficiency involves a phase-to-phase electrical fault which occurred in a motor control center (MCC) supplied by Gould, Inc. while a technician was testing with a clamp-on ammeter. The fault occurred between adjacent phases of the uninsulated cable adapters used to terminate oversized cables to MCC circuit breakers and starters.

We have received the seismic qualification data from Gould, Inc. regarding the uninsulated cable adapters which were used to terminate oversized cables to the MCC circuit breakers and starters. This information is presently being reviewed by our architect-engineer, Stone & Webster Engineering Corporation.
