## P R O C E E D I N G S

1  
2 JUDGE BRENNER: Good morning. Are there  
3 any preliminary matters before we continue the  
4 County's cross-examination? Has the dispute over  
5 documents gone away or does it still exist?

6 MR. DYNNER: Judge Brenner, I spoke  
7 yesterday with counsel for LILCO and we're confined,  
8 given the amount of time we had. We confined our  
9 discussion to the documents we've requested on the  
10 pistons and the crankshafts because they're most  
11 immediately needed. We have agreed --

12 JUDGE BRENNER: The only ones I mention  
13 right now are pistons.

14 MR. DYNNER: Yes. I was about to say to  
15 the extent the documents exist we reached an  
16 agreement on their being furnished and we expect to  
17 get them a little bit later this morning

18 JUDGE BRENNER: All right. I cut you off.  
19 Does that statement apply to crankshafts also?

20 MR. DYNNER: Yes, sir.

21 JUDGE BRENNER: All right.

22 I won't worry about any others unless and  
23 until you tell me I'll have to worry. But if I'm  
24 going to have to worry could I expect you to give me  
25 more than one minute's notice, because I'll have to go back

waga

1 and do some more homework.

2 Off the record for a minute.

3 (Discussion off the record.)

4 JUDGE BRENNER: Do you have a time  
5 estimate you can give us, a reliable time estimate?

6 MR. DYNNER: Yes, sir. I believe that I  
7 will be able to finish the cross-examination on the  
8 pistons by tomorrow afternoon, assuming that the  
9 witness's answers are directed towards answering the  
10 questions and not repeating the direct testimony.

11 JUDGE BRENNER: You say tomorrow  
12 afternoon. You mean the end of the day tomorrow?

13 MR. DYNNER: It's hard for me to be more  
14 precise but, yes —

15 JUDGE BRENNER: That's a long time. I  
16 didn't expect your estimate to be that long, frankly.

17 MR. DYNNER: I hope it will go faster  
18 than that. I hope to be as realistic an estimate as  
19 I can under the circumstances.

20 JUDGE BRENNER: We have your estimate. I  
21 don't know if we'll give you that much time. We'll  
22 discuss the situation again at the end of the day  
23 today. Maybe even earlier than the end of the day  
24 today, depending on circumstances.

25 Why don't you proceed. Orient me in your

waga

1 cross plan.

2 MR. DYNNER: Start on page 11 of the  
3 cross plan where we left off yesterday.

4 Whereupon,

5 DAVID O. HARRIS,

6 DUANE P. JOHNSON,

7 ROGER L. MC CARTHY,

8 FRANZ F. PISCHINGER,

9 CRAIG K. SEAMAN,

10 LEE A. SWANGER,

11 and

12 EDWARD J. YOUNGLING

13 were called as witnesses on behalf of the Applicant  
14 and, having been previously duly sworn, were  
15 examined and testified as follows:

16 CONTINUED CROSS-EXAMINATION

17 BY MR. DYNNER:

18 Q. Gentlemen, yesterday we were discussing  
19 matters concerning the peak firing pressures in the  
20 EDG's and I'd like to have a few follow-up questions  
21 on that subject matter.

22 If you will, for a moment, please turn to  
23 Exhibit P-5 which is the gas pressure versus crank  
24 angle document in LILCO's exhibits.

25 JUDGE BRENNER: Mr. Dynner, excuse me a

waga

1 moment. I left those exhibits in the other room.

2 Q. Dr. Pischinger, given this document,  
3 would it be possible for you to calculate its BMEP  
4 of the engine on the basis of this document?

5 DR. PISCHINGER: Not on this document  
6 because the accuracy -- if you think of paper  
7 distortion and so on, it is impossible.

8 Q. Well, let me say --

9 JUDGE BRENNER: I can't hear you, doctor.  
10 You've got to bring the microphone closer. Could  
11 you repeat the answer again.

12 DR. PISCHINGER: Excuse me. This  
13 document is -- cannot be the basis of evaluation of  
14 the BMEP. One reason is distortion of the paper.  
15 You cannot -- the accuracy is not enough. It's just  
16 to show the principal shape of the pressure trace.  
17 Of course, digitalized data which are the background  
18 of such a drawing will enable to give the BMEP.

19 Q. If you had the original tracing of this  
20 document, would you be able to calculate roughly  
21 what the BMEP of the engine was? By roughly I mean  
22 within two percent?

23 DR. PISCHINGER: Yes.

24 Q. Given the distortion of this document in  
25 the Xerox copy, do you think you'd be able to

waga

1 calculate the BMEP from this document within two or  
2 three percent?

3 DR. PISCHINGER: No.

4 Q. Excuse me, may I finish, please, with the  
5 follow-up, before you have your discussion?

6 Dr. Pischinger, given the distortions  
7 shown on this paper, approximately what would be  
8 your estimate of the percentage, plus or minus  
9 percentage of accuracy, of a calculation of the BMEP  
10 of the engine from this document?

11 DR. PISCHINGER: There is one second  
12 reason why this is not possible from this paper,  
13 because the accuracy and the scale of the degrees of  
14 crank angle needed for such a calculation is not  
15 there.

16 If you shift one or two degrees of crank  
17 angle which you cannot read easy from such a paper,  
18 there is a lot of shift in the value, more than ten  
19 percent.

20 Q. More than ten percent shift?

21 DR. PISCHINGER: Yes. Maybe there was a  
22 mean effective pressure. We are talking on mean --

23 Q. Brake mean effective pressure is BMEP?

24 DR. PISCHINGER: Brake mean -- well, of  
25 course, what you can read from this is the indicated

waga .1 pressure that's here. Of course. Wait a minute.

2 Maybe I should clarify.

3 JUDGE BRENNER: Wait a second. There was  
4 no question. I don't know what you want.

5 MR. ELLIS: I'm sorry, Judge Brenner, I  
6 thought Dr. Pischinger was finished. He's not and I  
7 was just going to remind Mr. Dynner that Dr. Swanger  
8 was eager to say something.

9 DR. PISCHINGER: Yes. Maybe I should  
10 define the difference between the indicated mean  
11 effective pressure and -- they had indicated mean  
12 pressure and mean effective pressure. The mean  
13 effective pressure is a mean pressure which can be  
14 calculated from braking the engine and relating --  
15 relating the braked torque to the swept volume. The  
16 diagram itself only can give you a reading of the  
17 gas work from which you can calculate the indicated  
18 mean pressure, and the difference between the two is  
19 friction work of -- within the engine.

20 Of course, engines of such size, the mean  
21 friction pressure has a certain value that you can  
22 get out of experience and try to take into account.

23 MR. DYNNER: Dr. Swanger, did you want to  
24 add something now?

25 DR. SWANGER: Professor Pischinger has

waga 1 addressed my concerns.

2 BY MR. DYNNER:

3 Q. Do you have copies of the digitalized  
4 data that you referred to?

5 A. Yes. Certainly. This was digitalized.

6 Q. Do you know where that data is located,  
7 anywhere on the panel?

8 MR. YOUNGLING: We have it right here.

9 MR. DYNNER: Could the County be  
10 furnished with a copy of that digitalized data?

11 MR. YOUNGLING: Surely.

12 MR. ELLIS: Judge Brenner, I'd like to  
13 object to that request. I think it comes late. He  
14 hasn't done it and asked questions concerning it or  
15 shown that it's material and what we've seen in the  
16 last day is discovery all over again here at the  
17 hearing stage, and I would object to production of  
18 any further documents, especially after talking to  
19 Mr. Dynner to reach an agreement with him.

20 JUDGE BRENNER: I'm shocked. This is  
21 something even beyond the listing that we -- we  
22 wasted all that time discussing conference calls  
23 yesterday.

24 MR. DYNNER: We had assumed when we saw  
25 this document that it was a complete and accurate

waga

1 document and that at any time that would be able to  
2 to be generated from it and we have just learned  
3 from this cross-examination that in order to make  
4 those calculations according to Dr. Pischinger there  
5 would have to be some other data which indicates  
6 that this document by itself does not accurately  
7 represent what it purports to represent in the  
8 testimony because in order to have accurate data,  
9 there could be variations by as much as ten percent  
10 given the way this document is reproduced.

11 And one would need the digitalized data  
12 and I don't -- it's not something we could have been  
13 able to find out during discovery and it's not  
14 something that we were able to know about in advance.

15 I think it's follow-up from the  
16 cross-examination answers.

17 JUDGE BRENNER: Give me a moment. We're  
18 not going to require LILCO to turn that data over to  
19 you. This is information that should have been  
20 obtained by you on general discovery, certainly  
21 after the testimony was filed.

22 Moreover, it doesn't come within my view  
23 of the Appeal Board's balances in the Clinton case,  
24 which case I alluded to yesterday. There's been no  
25 showing that this is so particularly material that

waga

1 if at this time it isn't obtained there is some void  
2 in the record.

3 The witnesses have been able to answer  
4 questions about the subject and if you would have  
5 desired to have some of this data in an attempt to  
6 undercut the witness's expert testimony on the  
7 subject, you should have obtained that by now.

8 We don't have a situation here where the  
9 witnesses said "I simply can't answer your questions  
10 unless I have the data." nor do we have a situation  
11 where what we have presented in the testimony is  
12 just a sampling of some conclusions without -- and a  
13 lack of recollection by the witness as to how the  
14 data was averaged or otherwise looked at, which was  
15 the situation I perceived yesterday.

16 We've got the answers. If you would like  
17 to challenge the witness's judgment as to what the  
18 conclusions are and what's represented, it's up to  
19 the County to do little homework before walking in  
20 here, and the information was available from which  
21 it could have been apparent to the County, as  
22 apparent as it is now, as to what is presented in  
23 the testimony and the exhibits.

24 So your request is denied. If LILCO  
25 wants to turn it over, that's their business. If we

waga

.1 get to the findings and you show us contrary to our  
2 view now that there's a void in the record on a  
3 material point, well, LILCO has the burden to prove  
4 and they will then suffer the consequences of that.

5           Apparently they're not worried about that  
6 on this point, given their objection. Let's proceed  
7 with the question.

8           BY MR. DYNNER:

9           Q.     Gentlemen, at the top of page 19 of your  
10 testimony, there's a statement "Measurements were  
11 also taken simultaneously at the pressure cocks at  
12 the side of the cylinder using a Kiene gage to  
13 measure the cylinder firing pressure. Exhibit P-5  
14 is the pressure crank angle diagram developed by  
15 FaAA."

16                   It's true, isn't it, that Exhibit P-5  
17 pressure diagram was not developed from the  
18 measurements taken using the Kiene gage that are  
19 referred to in the immediately prior sentence; isn't  
20 that true?

21           DR. SWANGER: The measurements depicted  
22 in Exhibit P-5 were taken with the Piezo electric  
23 transducer which is placed in the air start valve in  
24 cylinder number seven.

25           Q.     So it's true then that the P-5 diagram

waga

.1 was not developed from the measurements referred to  
2 in the sentence at the top of page 19.

3 DR. SWANGER: I believe that's what I  
4 just said, yes, P-5 was developed by the other  
5 technique, by the Piezo electric transducer in the  
6 air start valve.

7 Q. Yesterday I believe I asked you whether  
8 you could tell me what the measurements were that  
9 were referred to in the first sentence at the top of  
10 page 19 and you were unable to do so.

11 Have you since been able to refresh your  
12 recollection as to what those measurements are?

13 DR. SWANGER: I was able to refresh my  
14 recollection on this point by speaking with Dr.  
15 David Mercaldi of Failure Analysis  
16 Associates who was the test director for the tests  
17 performed at the end of December and in early  
18 January.

19 He was able to refresh my recollection  
20 that a better gauge than a Kiene gage was used for  
21 the auxiliary measurements. In fact, it was a Piezo  
22 electric transducer operating on the same principal  
23 as the Piezo air start valve which was attached to  
24 the pressure cocks on the sides of the cylinders.  
25 And that data from these more accurate, more

waga

.1 reliable Piezo electric transducers was  
2 simultaneously recorded on the magnetic tape that  
3 recorded data during that test.

4 I believe that Professor Pischinger  
5 further address this in discussing the relative  
6 accuracy of the Piezo electric transducer relative  
7 to the Kiene gage.

8 Q. My question, do you know what those  
9 measurements are now?

10 MR. ELLIS: Which measurements, if I  
11 could have the question clarified?

12 MR. DYNNER: Measurements referred to at  
13 the first sentence at the top of page 19 as we've  
14 been discussing.

15 DR. SWANGER: No. We don't have that at  
16 any time at a hearing.

17 DR. PISCHINGER: May I, perhaps, for  
18 clarification, add something. I used at the time --  
19 I'd to make sure what this Kiene gage is because  
20 that are different makes of such sort of gages.

21 This is a pressure gage which only gives  
22 the peak -- the varied peak pressure reading and --  
23 of, of course, accuracy is lower compared to a  
24 quartz transducer which gives the whole pressure  
25 traced for each individual cycle and the functions

waga

.1 that way that pressure — mechanical pressure  
.2 reading device is pumped up by the gases out of the  
.3 cylinder to the degree of the highest pressure which  
.4 is present.

.5 That means it tends to show the highest  
.6 peak pressure of — during a lot of cycles. So it  
.7 has a tendency to do some overemphasizing of higher  
.8 pressures.

.9 Q. Dr. Pischinger, what do you mean that it  
10 overemphasizes the peak pressures?

11 DR. PISCHINGER: During — following  
12 cycles in a diesel engine, the peak pressure is not  
13 always the same, and if you get a reading from a  
14 quartz transducer, you can follow these variations.  
15 Here you cannot follow. You get the very maximum  
16 reading one value.

17 In addition, the piping needed which is,  
18 in such a gage tends to be — rise to a higher  
19 pressure because of the reflection of the pressure  
20 wave. The rising pressure in the cylinder is a very  
21 quick rising pressure during combustion which generates a  
22 pressure wave into the piping and it's well-known  
23 that the reflection of this pressure wave gives a  
24 higher pressure than which is present in the  
25 cylinder; but these Kiene gages are very useful when

waga

1 comparing the reading in different cylinders. So  
2 they are used to compare cylinder one, two, six --

3 Q. Did you mean, Dr. Pischinger, Kiene gages  
4 or were you talking -- I thought you were talking  
5 about the Piezo electric transducer?

6 DR. PISCHINGER: Yes, the Kiene gages.  
7 The Kiene gage is usually used to compare the  
8 pressure level in the different cylinders of the  
9 multi-cylinder engine. It has a -- if there's a  
10 deviation, large deviation, then this could be a  
11 sign of overfueling one cylinder or underfueling.

12 Q. I'm confused, Dr. Pischinger. Is the  
13 instrument that you've been describing as giving  
14 only the highest maximum peak firing pressure the  
15 Kiene gage -- or is it the Piezo electric transducer?

16 MR. ELLIS: I object to that question. I  
17 think it mischaracterizes his testimony. It can't  
18 mischaracterize --

19 JUDGE BRENNER: He's asking -- it's the  
20 Kiene gage, Mr. Dynner, as we said.

21 Q. And the Piezo electric transducer in your  
22 judgment is more accurate than the Kiene?

23 DR. PISCHINGER: Yes. This is general  
24 knowledge, written in a lot of textbooks.

25 MR. YOUNGLING: The Kiene gage is

waga

1 basically used by the operations personnel as a  
2 maintenance diagnostic tool to assess the general  
3 pressures in the engines. It's also used to  
4 implement the recommendations of TDI that the peak  
5 firing pressures between any two cylinders be no  
6 more than 200 pounds. It's certainly not the kind  
7 of instrument to be used in an analysis like this.

8 JUDGE BRENNER: Dr. Swanger, answer 25 is  
9 yours in the testimony. Can you tell me, given the  
10 question there, what the importance to you as a  
11 witness answering the question was, including the  
12 fact that the measurements were also taken  
13 simultaneously at the pressure cocks using the Kiene  
14 gage?

15 DR. SWANGER: The significance of that is  
16 the plural of pressure cocks. The simultaneous  
17 readings which were, with the Piezo electric  
18 transducer were taken on all eight of the cylinders  
19 by moving the Piezo -- we had two Piezo electric  
20 transducers -- by moving them from cylinder to  
21 cylinder to demonstrate that the measurements taken  
22 with the air start valve in cylinder number seven  
23 were characteristic of all the cylinders and,  
24 therefore, could be used as a basis for analysis.

25 MR. SEAMAN: Excuse me, Judge. Perhaps I

waga

.1 could add one thing to that.

2           Maybe it's important to put into  
3 perspective why we use this Piezo electric  
4 transducer. There were concerns expressed by our  
5 test personnel regarding --

6           JUDGE BRENNER: I know. You told us  
7 yesterday. I didn't mean to cut you off but once  
8 in a while we remember the testimony from the day  
9 before. Don't let that stop you when you think  
10 we're not remembering it.

11           Dr. Swanger, for the diagram in Exhibit  
12 P-5, is that from just the Piezo electric transducer  
13 which was used directly in the chamber?

14           DR. SWANGER: Yes, this is from the Piezo  
15 electric transducer we have been referring to that  
16 was installed in the air start valves which is  
17 directly in the combustion chamber.

18           JUDGE BRENNER: Dr. Pischinger, in  
19 discovering relative accuracies referred to a quartz  
20 gage, is the Piezo transducer referred to in answer  
21 25 a quartz gage?

22           DR. SWANGER: Yes. It is. Quartz is one  
23 of the materials that exhibits the Piezo electric  
24 effect. That is, it develops a electromotive force  
25 across it which subjects it to pressure, and thus we're

waga

.1 using the quartz gage and Piezo electric gage  
.2 interchangeably.

.3 BY MR. DYNNER:

.4 Q. Gentlemen, I direct your attention to  
.5 page 19, question 36, where you referred to the  
.6 County's Exhibit 46 document 6, as detailing the  
.7 measurements of the TDI furnished in factory tests.

.8 Does the County's exhibit contain all of  
.9 the peak firing pressure measurements provided to  
10 LILCO as a part of the TDI instruction manuals?

1.1 DR. SWANGER: Which County exhibit are  
1.2 you referring to, Mr. Dynner?

1.3 MR. DYNNER: As stated in your testimony  
1.4 46, document 36.

1.5 MR. YOUNGLING: Mr. Dynner, TDI provided  
1.6 factory data on the engines.

1.7 I do not know whether this is a complete  
1.8 duplication of all that data. I would have to check  
1.9 that.

2.0 BY MR. DYNNER:

2.1 Q. Mr. Youngling, in the next question,  
2.2 question 27, beginning on page 19 and going to 20,  
2.3 on the top of page 20 you refer to LILCO Exhibit P-9  
2.4 as including firing pressures measured before and  
2.5 after the crank shaft replacement.

waga

.1                    Does Exhibit P-9 include all of the  
.2                    measurements taken for the peak firing pressures  
.3                    during the pre-operational qualification tests, or  
.4                    is it only a sampling?

.5                    MR. YOUNGLING: These are the data which  
.6                    are required to be taken as part of the official  
.7                    pre-operational testing program. Other Kiene gage  
.8                    measurements were taken in restoring the engine  
.9                    after the rebuilding operation.

10                   Excuse me. I'd just like to say that  
11                   those additional data were taken as part of the  
12                   set-up of the engine and making sure that it was  
.13                   timed and properly balanced.

.14                   Q.        Were those additional data part of the  
15                   pre-operational activity?

.16                   MR. YOUNGLING: No, sir.

.17                   Q.        So is it your testimony that Exhibit P-9  
18                   does include all of the peak firing pressure data  
19                   taken during the pre-operational tests?

20                   MR. YOUNGLING: These are the data  
21                   required to meet the requirements of the  
22                   pre-operational test documents.

23                   Q.        And it's all of those measurements that  
24                   were taken; is that correct? There weren't any more  
25                   during the pre-operational tests?

waga

.1 JUDGE BRENNER: Mr. Dynner, it seems to  
.2 me this question and the question before, is getting  
.3 repetitious. We've got the situation and you are  
.4 causing him to repeat his immediately preceding  
.5 answer.

.6 MR. DYNNER: I don't think that's the  
.7 answer to the question. I am just trying to get  
.8 clear whether this is all of the test at any time  
.9 that the firing pressure is taken or whether it's  
10 just representation. I don't think he's answered  
11 that.

.12 JUDGE BRENNER: I thought he did, but  
.13 we'll give it one more shot in deference to the  
.14 possibility that you're right.

.15 MR. YOUNGLING: The pre-operational test  
.16 documents required that a certain number of data be  
.17 taken. These sheets that you have represent those  
.18 requirements.

.19 MR. DYNNER: I still don't know what you  
20 said. You said they represent. Are they all of the  
21 data or are they part of the data? Yes or no.

22 MR. YOUNGLING: They are all of the data  
23 that needed to be taken.

24 MR. DYNNER: Thank you.

25 Q. All that was taken or all that needed to

waga 1 be taken?

2 MR. YOUNGLING: All that needed to be  
3 taken as part of the pre-operational test documents.

4 Q. Are they all the data that was taken as  
5 part of the --

6 JUDGE BRENNER: Mr. Dynner, he said he  
7 had other data. I mean, you got that in the first  
8 question or two. The reason I'm interrupting is to  
9 point out areas where you're spending too much time  
10 so if you run out of time on areas you didn't get to,  
11 it's going to be your fault.

12 He said this was the data for the  
13 pre-operational test requirements.

14 Now, you may have some disagreement as to  
15 how much data he should have reported for the pre-op  
16 test requirements and you can probe that. You may  
17 have some interest in what the other data showed and  
18 you can probe that. He said there's other data.

19 BY MR. DYNNER:

20 Q. Gentlemen, on page 20, question 28, you  
21 referred to static experimental procedures  
22 considering pressures as high as 2,000 psig.

23 Did the finite element analysis performed  
24 on the AE piston skirt consider pressures as  
25 high as 2000 psi?

waga

1 DR. HARRIS: The finite element analysis  
2 that was performed was a linear elastic analysis.  
3 Once you have the results for one pressure it is  
4 applicable to any other pressure and we did a  
5 benchmark calculation at 1,670 psig, but the results  
6 obtained can be applied to any other pressure and  
7 indeed the results have been applied to numerous  
8 other pressures including pressures as high as 2,200  
9 psi.

10 Q. Dr. Harris, when you say that it's linear,  
11 is that an arithmetical progression?

12 DR. HARRIS: Could you please define for  
13 me what you mean by an arithmetical progression?

14 Q. Well, is the linear — if you have the  
15 figure for 1600 psi, for example, you just draw a  
16 straight line and go up the graph to a higher psi.

17 DR. HARRIS: Let me rephrase.

18 Q. Let me rephrase the question for you, Dr.  
19 Harris. What do you mean by a linear progression?  
20 Could I have your answer please and then you can  
21 consult with your colleagues.

22 DR. HARRIS: I believe I said a linear  
23 relationship, not a linear progression.

24 Q. Could you describe what you meant by a  
25 linear relationship.

waga

1 DR. HARRIS: By that I mean if you plot  
2 the peak stress as a function of the pressure on the  
3 piston, you obtain a straight line. This is  
4 somewhat complicated by the crown skirt interaction  
5 and you can get a change of the slope of the line  
6 when the gap closes as was discussed in the thermal  
7 distortion report of the failure analysis as  
8 provided. When you get a change of slope, you call  
9 that a bilinear relationship, two straight line  
10 segments.

11 Q. Does this linear relationship mean that  
12 if you know or if you have calculated stress at 1600  
13 psi that you can easily figure what the stress will  
14 be at 2,000 psi?

15 May I have your answer and then your  
16 colleagues can consult with you.

17 JUDGE BRENNER: Well, Mr. Dynner, help me  
18 out. Why isn't that the kind of question that we  
19 can just direct to the whole panel for efficiency?

20 MR. DYNNER: We could but I'm exploring  
21 what Dr. Harris's testimony is describing, the  
22 linear relationship and how it works.

23 JUDGE BRENNER: That went beyond just his  
24 definition and it will be efficient to let them get  
25 together on something like that. When you need to

waga

1 eliminate, you certainly can, but if you don't have  
2 to. It would be efficient not to.

3 DR. HARRIS: Could you please refresh my  
4 memory by repeating the question.

5 DR. HARRIS: Knowing the proper bilinear  
6 relationship, you can calculate the stresses at  
7 2,000 psi from information obtained at 1600 psi.  
8 It's a combination of the linear relationship  
9 obtained from the finite element analysis and the  
10 crown skirt interaction analysis that tells you when  
11 the slope changes and by how much it changes. These  
12 two put together give you the bilinear relation  
13 between the stress and pressure that can be used to  
14 calculate the stress at any pressure.

15 Q. Now —

16 DR. MC CARTHY: Just one thing I want to  
17 add, in completeness to the last answer. It's the  
18 stress at any pressure as long as the — there's no  
19 permanent deformation of the cylinder. This is a  
20 linear elastic model and even up to 2,200 psi there  
21 was no plastic deformation or any permanent set in  
22 the cylinders. All the linear cylinders were  
23 perfectly accurate even up to that pressure.

24 DR. HARRIS: My statements were all in  
25 regards to a linearly — to a stress calculated

waga

.1 using linear elasticity theory and are not to be  
.2 extrapolated over to additions of which you can get  
.3 plastic deformation in the material. That's another  
.4 aspect of the problem that I was not addressing in  
.5 my earlier answer.

.6 Q. What do you mean by plastic deformation?

.7 DR. HARRIS: Deformation that occurs  
.8 within the material that permanently changes the  
.9 shape of the material even on a low — in this  
10 particular instance it's a very localized phenomena.

11 Q. Is a crack, an example of plastic  
12 deformation?

13 DR. HARRIS: Not to my way of thinking it  
14 is not.

15 Q. Now, in your answer to question 28, still  
16 at page 20, you stated that the static experimental  
17 procedures considered pressures as high as 2,000  
18 psig. By that do you mean strain gage readings that  
19 were actually taken at TDI?

20 DR. HARRIS: By that I mean strain gage  
21 readings were taken at various pressures including  
22 pressures as high as 2,000 psig.

23 Q. And when were those readings taken  
24 approximately?

25 DR. HARRIS: When in time?

waga

.1 Q. Yes.

2 DR. HARRIS: Roughly February 1984.

3 Q. In your answer 28, you referred to  
4 figures 3-5 through 3-8 of the piston report.

5 It is stated that these figures were  
6 included in Exhibit P-10.

7 Now, how does that information which  
8 concerns, I believe, among other things, rosette,  
9 how does that information get translated into  
10 Exhibit P-14 which is entitled strain readings and  
11 calculated stresses for AE piston skirt for the  
12 complete stud boss rosettes at 1600 psig with a  
13 conventional crown.

14 MR. ELLIS: Judge Brenner, I know the  
15 question assumed that something was -- maybe it's  
16 true and I don't know, but the question assumes that  
17 certain data on P-10 is -- I think he said  
18 translated or transformed to P-14 and I didn't hear  
19 any testimony about that.

20 JUDGE BRENNER: The witness can handle  
21 that by his answer.

22 DR. HARRIS: Mr. Dynner, a more correct  
23 interpretation of the relationship between exhibits  
24 P-14 and P-10 is that Exhibit P 14 provides you with  
25 the strain gage data from rosette C, D, E, F and H.

waga .1 so we have five different rosettes here.

.2           The first three rows of Exhibit P-14  
.3 provide the strain readings at 1600 psig obtained  
.4 directly from the measurements. The strain readings  
.5 at each location consisted of readings from a  
.6 three-arm rosette, a three-arm rosette being a group  
.7 of strain gages that are put down at the same point  
.8 in different orientations.

.9           The results of measurements from this  
10 three-arm rosette then provide you with sufficient  
11 information to completely characterize the stresses  
12 at that point.

13           The first step in the calculation is to  
14 transform the measured strains, the Epsilon sub Z,  
15 Epsilon sub theta and Epsilon 45 to  
16 the principal strains which is Epsilon I and  
17 Epsilon II. This is accomplished through standard  
18 techniques in the strength of materials for the  
19 treatment of strains in solids.

20           Then knowing the principal strains you  
21 can calculate the principal stresses using Hook's  
22 law which is an underlying assumption in linear  
23 elasticity.

24           Taking the elastic constants and the  
25 principal strains you can then calculate the

waga

.1 principal stresses that are shown on the last two  
.2 rows of Exhibit P-14.

.3 The data which is presented in Exhibit  
.4 P-14 is only for 1600 psig so it's a small sampling  
.5 of the measurements that were taken because  
.6 measurements were taken at a large variety of  
.7 pressures.

.8 You can see on the bottom column, the  
.9 bottom row of the column headed by the letter C the  
10 number minus 43. It's also -- that is  
11 absolute value, the largest principal stress.

12 You then turn over to the plot that is  
13 provided on the first page of Exhibit P-10, and on  
14 the horizontal axis you come into 1600 psig, you  
15 go up vertically and you'll see a group of data  
16 points up there that those -- that group of data  
17 points represents redundant measurements that were  
18 made. We pressurized the crown skirt assembly a  
19 number of times to many -- pressures as high as  
20 2,000 psig to check on the reproducibility of the  
21 results.

22 If you go from the data point at 1600  
23 horizontally then over to the absolute largest  
24 principal stress, you obtain the number of about 43,  
25 which is the number that I alluded to a moment ago

waga

1 from Exhibit P-14.

2 That's the relationship between the two  
3 exhibits and as long as we're on the subject, I  
4 would like to point out the bilinear nature of the  
5 relationship between the stress and the pressure.

6 If you look at the top half of the figure  
7 that's on Page 1 of Exhibit P-10, you can see the  
8 solid line coming up from pressure equal to zero up  
9 to a thousand psig. It approximately follows the  
10 data points. At a 1000 psig the solid line changes  
11 slope.

12 If it didn't change slope, it would move  
13 along the vertical line -- the dash line. The dash  
14 line being an extrapolation of the slope from the  
15 lower pressures.

16 This shows the bilinear relationship  
17 between the stresses and the pressure, and the  
18 change in slope is associated with the closure of  
19 the gap on the outer rim between the crown and the  
20 skirt as is discussed more fully elsewhere and  
21 demonstrated by other portions of the exhibits.

22 This can be shown quite clearly by  
23 comparing the top half of the first page of Exhibit  
24 P-10 with the bottom half.

25 In the bottom half the -- you can see

waga

.1 that there is a single straight line that's solid  
.2 all the way up to 2,000 psig. This is the result of  
.3 tests that were performed using a modified crown,  
.4 and this modified crown we machine the crown back at  
.5 the outer contact ring — to a sufficient degree  
.6 that we knew that the gap would not close at 2,000  
.7 psig.

.8 We then pressurized the modified crown  
.9 skirt assembly to pressures as high as 2,000 psig  
10 and saw this linear relationship between stress and  
11 pressure, and this demonstrates then that the  
12 bilinear nature seen on the top half of this page of  
13 the exhibit is due to the gap closure, because the  
14 difference between the two halves of this page is  
15 simply the closure of the gap at the outer rim.

.16 Q. What I was curious about, Dr. Harris, or  
.17 anyone, is that if you turn — the first page of  
18 Exhibit P-10, which corresponds, incidentally, to  
19 figure 3-5 of the piston report, it refers to  
20 information from the stud boss rosette C; isn't that  
21 correct?

22 DR. HARRIS: Yes, Mr. Dynner, that is  
23 correct.

24 Q. Now, the following two pages of Exhibit  
25 10, the following three pages, I should say, which

waga

1 correspond not incidentally to figures 3-7, 3-6 and  
2 3-8 of the piston report, give the information for  
3 the rosettes R — or give the information for  
4 rosettes R, P and N, according to their titles, but  
5 Exhibit P-14 does not give any information for the  
6 rosettes R, P or N, and I was wondering why.

7 DR. HARRIS: I'd like to point out, Mr.  
8 Dynner, that the information included in Exhibit  
9 P-10 and the information included in Exhibit P-14  
10 are only a sampling of the total data that was taken  
11 during the piston testing on the AE skirt.

12 If you refer to Exhibit P-12, you can see  
13 that this exhibit shows the location of the strain  
14 gage rosettes that were applied on the AE piston  
15 skirt. There were, as you can see, there were  
16 numerous strain gage rosettes placed on this  
17 component, and data was taken from each of these  
18 rosettes, each rosette being three channels of data,  
19 that taken from each of those rosettes at a wide  
20 variety of pressures so that the volume of information  
21 obtained is quite large and the material that's  
22 included in these exhibits and also material  
23 included in the original Failure Analysis Associates  
24 piston report is only a sampling of the total data  
25 that was taken. The data that's included in the —

waga

1 in both these exhibits and in our reports we feel to  
2 be the data that is most relevant to the conclusions  
3 that we wish to draw from the experimental results.

4 Q. Well, Dr. Harris, does Exhibit P-14  
5 represent the highest stresses that were measured in  
6 any of the rosettes?

7 DR. HARRIS: The information included in  
8 Exhibit P-14 is, as I mentioned, taken at 1600 psig.  
9 Of course, at 2,000 psig where we also took data the  
10 stresses were higher.

11 Q. Sure. But my question is at 1600 psig  
12 does the data on P-14 represent the highest stress  
13 for all of the rosettes that were taken? We've got  
14 a sampling of rosettes here, and you've pointed out  
15 that there were many other rosettes including R and  
16 P and N, that I've alluded to previously, and my  
17 question is, are the stresses at 1600 psi in the  
18 rosettes that R, P or N or any of the other higher  
19 than the stresses that are shown on P-14?

20 DR. HARRIS: As shown on Exhibit P-12,  
21 which I alluded to a moment ago, this shows the  
22 location of the numerous strain gage rosettes that  
23 were placed on the skirt.

24 In table 3-1 of the piston report, which  
25 is one of the County's exhibits, Exhibit 8, page

waga

1 3-15, there is a description in words of each -- of  
2 each of the rosette locations. There were eight  
3 strain gage rosettes that were mounted on the stud  
4 boss region and the stud boss region did have the  
5 highest stresses of any location in the piston skirt.  
6 This was verified by the stress coat test as well as  
7 by the finite element analysis. A stress coat  
8 test was performed using a brittle  
9 laquer. This is a standard technique for  
10 determining the location of maximum stress in a part.  
11 The results of the stress coat test are summarized  
12 in the piston report and we can get into that, if  
13 you so desire, but to keep on the track of strain  
14 gage measurements, we had eight rosettes in the stud  
15 boss region. The results in Exhibit P-14 summarize  
16 the measurements at 1600 psig for five of these  
17 rosettes, so there were an additional three rosettes.

18           The results obtained from these  
19 additional three rosettes are summarized in table 3  
20 of County's Exhibit 8 which is on page 3-17. These  
21 three additional rosettes were rosettes in which one  
22 of the gages in the rosette element was not  
23 operative at the time the skirt was installed in the  
24 piston test fixture.

25           Please keep in mind, we had on the order

waga

1 of 50 strain gages that were mounted on this piston  
2 skirt. Out of those 50, 47 of them operated  
3 properly. Three of them did not.

4           However, we still have information on the  
5 stresses in those — from those other three rosettes  
6 because two out of the three arms were working.  
7 Using procedures that are enumerated in the piston  
8 report, we made estimates on what the stresses would  
9 be in those other three rosettes, and I might add  
10 that the other three rosettes were just redundant to  
11 the five that were complete rosettes.

12           Using the procedures that we outline in  
13 the report, we make estimates of what the principal  
14 stresses are at the locations of the rosettes that  
15 did not work, and we obtained numbers as large as in  
16 absolute value 48.4. The number 48.4 is larger in  
17 absolute value than the absolute value of any of the  
18 numbers on the bottom row of Exhibit P-14. So the  
19 answer to your question is, I believe, no, Exhibit  
20 P-14 does not give you largest stress of anywhere in  
21 the skirt, but, however, it's very close to the  
22 results that were obtained by estimates using the  
23 incomplete rosettes.

24           Q.     If you had used the 40 ksi I number  
25 rather than the 43, would it have changed your

waga

1 results at all of your — or the conclusions of the  
2 piston report?

3 DR. HARRIS: Absolutely not. It would  
4 have had no influence whatsoever. If you had used  
5 the 48 ksi instead of 43.

6 Q. Dr. Harris, other than what you've just  
7 explained about the rosettes that didn't give you  
8 correct information, on the rosettes that you did --  
9 that you were able to read, did any of them have  
10 higher strain readings than outside the boss area --  
11 outside the boss area than those within the boss  
12 area?

13 DR. HARRIS: Other than the rosettes that  
14 were incomplete, no other rosettes that were  
15 included on the piston skirt gave stresses higher  
16 than those that are reported in Exhibit P-14.

17 MR. YOUNGLING: Mr. Dynner, we'd like to  
18 consult.

19 DR. HARRIS: The three rosettes that I  
20 discussed a moment ago that are on page 3-17 of  
21 County's Exhibit 8 are incomplete results, but using  
22 the procedures that I outlined in the piston report,  
23 I consider these results to be accurate.

24 I consider all of the strain gage results  
25 to be accurate and provide representative values of

waga

.1 the stresses in the piston skirt. There were no  
.2 strain gage rosettes outside of the stud boss  
.3 regions that gave strains larger than those that  
.4 were observed in the stud boss region itself.

.5 Q. And these strain readings were all taken  
.6 at ambient temperatures; isn't that correct?

.7 DR. HARRIS: Yes. Mr. Dynner, it's true  
.8 that strain gage measurements were taken at room  
.9 temperature. Perhaps a more appropriate  
10 characterization of the test conditions were  
11 isothermal. We believe the isothermal measurements  
12 to be relevant to an operating piston for a variety  
13 of reasons. One of them is based on measurements  
14 that were made by TDI and supplied to Failure  
15 Analysis Associates that are shown in Exhibit P-11,  
16 the maximum temperature point. This exhibit shows  
17 pointwise measurements at the maximum temperature in  
18 a crown under operating conditions of an engine.

19 At the bottom of the figure you can see  
20 temperatures like 202, 205.

21 At the top of the crown you see numbers  
22 like 681, so the crown is certainly not operating  
23 under isothermal conditions. There are large  
24 temperature gradients in the crown as you can see  
25 simply by looking at these numbers.

waga

.1                    If you look at the bottom of the crown  
.2                    the numbers are like 202, 205. These changes are  
.3                    not significantly above the temperatures of the  
.4                    cooling oil that is circulated through the piston  
.5                    during operation of the engine.

.6                    Therefore, the temperature of the skirt  
.7                    during engine operation is going to be somewhere  
.8                    between the cooling water temperature and the 200  
.9                    degrees Fahrenheit everywhere in the skirt.  
10                    And the cooling water temperature is, perhaps, as  
11                    low as a 160 degrees Fahrenheit.

12                    Mr. Youngling can correct me on this if  
13                    I'm wrong. Therefore, the temperature differences  
.14                    in the skirt have to be significantly less than 40  
.15                    degrees which is very close to isothermal compared  
.16                    to the crown, which we have temperature differences  
.17                    approaching 500 degrees Fahrenheit.

.18                    Additional confirmation of the isothermal  
.19                    nature of the operation of the piston skirt in an  
.20                    operating engine is provided by the results of  
.21                    finite element calculations that had been performed  
.22                    by a variety of organizations other than Failure  
.23                    Analysis Associates, including some results that Dr.  
.24                    Pischinger could show us in regards to calculations  
.25                    and I suppose measurements of operating piston

waga

1 skirts, two piece skirts in large diesel engines.

2 MR. DYNNER: I would like to respectfully  
3 remind the witness my question was, were these  
4 readings made at ambient temperature. I did not ask  
5 you to give the history of why it's appropriate to  
6 do so.

7 My questions will take us there, but I  
8 would appreciate it if I could get some assistance  
9 in having the answers responsive to the question.

10 JUDGE BRENNER: That was a fair comment  
11 by you, Mr. Dynner, on that question and answer.  
12 Keep the question in mind and give the answers to  
13 the question and not just put in everything you  
14 think may be of interest on the subject from your  
15 perspective. We'll make Mr. Ellis work a little bit  
16 on redirect. Go ahead, Mr. Dynner.

17 BY MR. DYNNER:

18 Q. Dr. Harris, when you were describing the  
19 linear relationship of the firing pressure -- well,  
20 let me ask you, the linear relationship you were  
21 speaking of, was that the linear relationship of the  
22 firing pressure to the stress?

23 DR. HARRIS: The bilinear relationship  
24 that I mentioned earlier is the relationship between  
25 the peak firing pressure and the maximum stress in

waga

1 the stud boss region.

2 Q. Yes. Now, would that linear relationship  
3 be affected by temperature changes?

4 DR. HARRIS: That linear relationship  
5 would not be affected by temperature changes if the --  
6 in many instances that linear relationship would not  
7 be altered by temperature changes.

8 Q. Well, in what instances would it be --

9 DR. HARRIS: Under the assumptions of  
10 linear thermo-elasticity, which is the theory that  
11 we are using in this particular case, it is the  
12 theory we believe to be applicable in this case,  
13 there will also be a linear or in this particular  
14 instance bilinear relationship between the pressure  
15 and the stress.

16 Q. Regardless of temperature changes in the  
17 skirt, is it your testimony -- what I'm getting at,  
18 Dr. Harris, to try to clarify my question, is that  
19 the data that you -- that we were discussing  
20 previously that's attached as Exhibit P-10 which  
21 shows the line going up on these graphs, my question  
22 is if there had been changes in temperature, would  
23 that affect the way these lines look?

24 MR. ELLIS: Judge Brenner, I object,  
25 because the answer that he gave before shows that

waga .1 there were changes in the skirt and so the question  
2 is a hypothetical question as to which of the facts  
3 aren't here in the record, and, therefore, I don't  
4 think the question is relevant.

5 JUDGE BRENNER: I'm a little confused as  
6 to what changes he's talking about because the  
7 testimony was that, at least in Dr. Harris's view,  
8 the temperatures were basically isothermal on a  
9 particular measurement and he gave the limits of  
10 what he considers isothermal, about 40 degrees, and  
11 I'm not sure that Mr. Dynner is asking about to certain  
12 temperature deltas in the piston skirt for a given point in  
13 time of measurement or if he's talking about variation in  
14 temperatures that might occur at different firing pressures  
15 notwithstanding the fact that the range might be the same.  
16 I don't understand what you're asking. I was going to let  
17 it go because you were still following up.

18 On that basis you might want to retract the  
19 question as you asked it and ask it a little more precisely.  
20 I'm a little confused, Mr. Ellis, and I'll let him go for a  
21 question or two to see where we're headed. Maybe I'll be  
22 less confused.

23 Q. Dr. Harris, what was the temperature of the  
24 engine when these readings were taken, the  
25

waga .1 temperatures of the strain gage rosettes?

2 DR. HARRIS: Mr. Dynner, perhaps I could  
3 clarify the procedures that we used in the  
4 experimental work.

5 Q. Can you just answer the question. What  
6 was the temperature of the engine when these  
7 measurements were made?

8 DR. HARRIS: No, I can't answer that  
9 question.

10 JUDGE MORRIS: What part of the engine,  
11 Mr. Dynner? I mean, the engine is a huge thing.

12 MR. DYNNER: The pistons.

13 DR. HARRIS: At the time that -- the  
14 measurements were not performed in an actual engine.

15 Q. So the temperature of the pistons at the  
16 time these measurements were taken is under what  
17 circumstances?

18 DR. HARRIS: As I testified to a short  
19 while ago, at room temperature.

20 Q. And what is the temperature in the  
21 pistons at the time the engine is operating at full  
22 load?

23 DR. HARRIS: The operating temperature of  
24 the piston skirt is close to 200 degrees Fahrenheit,  
25 as I also testified to a short while ago.

waga

1 Q. And at 200, is it your testimony that at  
2 200 degrees Fahrenheit the strain readings would be  
3 the same as at the room temperature that you did  
4 your experiment at?

5 DR. HARRIS: Do you mean the  
6 pressure/stress relationship?

7 Q. Yes, with respect to the linear  
8 relationship that you've been talking about.

9 DR. HARRIS: The relationship between the  
10 pressure and the stresses would be the same for the  
11 skirt at 200 degrees Fahrenheit as it would be at  
12 room temperature, keeping in mind the influence of  
13 the operating performance of the engine on the  
14 thermal distortion of the crown and the closure of  
15 the gap on the outer contact ring.

16 Q. So if you go back now a minute, just to  
17 clarify on Exhibit P-14, for rosette C, where it  
18 shows at 1600 psig 43 ksi stress, it's your  
19 testimony that at 200 degrees Fahrenheit you would  
20 also get a reading of 43 or close to 43 ksi; is  
21 that correct?

22 DR. HARRIS: Under operating conditions  
23 in the engine, you have the large temperature  
24 gradients in the crown that I spoke of a moment ago.

25 When these large gradients occur in the

waga

.1 crown, the crown actually distorts due to these  
.2 large temperature gradients and closes the gap on  
.3 the outer contact ring. The effect of this is to  
.4 actually reduce the stresses at a given pressure  
.5 once the gap is closed, reduce the stresses at a  
.6 given pressure below those that would be measured  
.7 under isothermal conditions.

.8           So making the measurements at room  
.9 temperature under isothermal conditions is actually --  
10 actually provides a conservative estimate of the  
11 stresses at a given pressure.

12           So there are differences between the room  
13 temperature results and results that would be  
14 obtained on an operating piston skirt, but we can  
15 analyze these differences and we find that the  
16 cyclic stresses or the peak stresses we're talking  
17 about here are actually lower under the operating  
18 conditions.

19           Q.    Have you tested that theory by actually  
20 taking strain measurements of the piston skirt while  
21 the engine is operating?

22           DR. HARRIS:  No, we haven't, but you  
23 don't need to, and the reason you don't need to is  
24 we have the results of finite element calculations,  
25 we have the results of the isothermal strain gage

waga

1 measurements. We have studies of the interaction  
2 between crown and skirt both from our crown skirt  
3 interaction model and from the experiments that were  
4 performed with various size gaps. And putting all  
5 these pieces of information together, along with the  
6 measured temperatures and the calculations performed  
7 by use of these measured temperatures, we can  
8 calculate and analyze what the cyclic stresses would  
9 be in an operating piston. And we don't feel that  
10 it's necessary to perform actual measurements on an  
11 operating engine.

12 I might point out such measurements would  
13 be of great difficulty to perform. It would be  
14 possible to do such measurements, and perhaps Dr.  
15 Pischinger would care to comment on this regarding  
16 the difficulty and possibility of measuring stresses  
17 in the operating engines, in the piston skirt.

18 JUDGE BRENNER: If Mr. Dynner wants him.

19 DR. PISCHINGER: Yes, do you want me?

20 MR. DYNNER: Go ahead.

21 DR. PISCHINGER: We have done such  
22 measurements already. The problem is to transduce a  
23 measured value from the moving piston to standing  
24 equipment, and, of course, this apparatus which is  
25 necessary reduces accuracy of such measurements; so

waga

1 in my mind, the way which was followed up here,  
2 combination of measurement and using measured  
3 temperatures in the piston crown, is a precise way  
4 which could not be very much improved by actual  
5 measurement in a running engine.

6 Q. Dr. Pischinger, is it difficult to  
7 measure the temperature of the piston skirt while  
8 the engine is operating?

9 DR. PISCHINGER: The temperature of the  
10 piston skirt is not difficult to be measured.

11 What is difficult is to measure the  
12 strains because the strains are varying with time so  
13 you have a time variable signal which you have to  
14 transmit from the piston to any measuring equipment.

15 JUDGE BRENNER: We're going to take a  
16 break in a moment. I'm just a little confused on  
17 one point.

18 Dr. Harris, you talked about the possible  
19 difference that would occur when the gap is closed.  
20 And you said that might account for differences in  
21 the result of direction you indicated between the  
22 experiments at ambient room temperature and what you  
23 might expect in terms of stress results at an  
24 operating temperature of an engine.

25 I also inferred, perhaps wrongly, from

waga

1 some of the information and from that exhibit, LILCO  
2 Exhibit P-13, that the gap that you were talking  
3 about between the crown and the skirt, closed air  
4 pressure and, therefore, I thought that the  
5 experiments represented -- or some of the results of  
6 which are represented in LILCO Exhibit P-10, once  
7 they saw that gap closed pressure wouldn't close the  
8 gap, notwithstanding the fact that there was ambient  
9 temperature. Am I going wrong somewhere? ?

10 DR. HARRIS: No, Judge Brenner, I don't  
11 believe you are going wrong. Under ambient  
12 conditions you can close the gap simply by pressure.  
13 However, when you go to operating conditions in an  
14 engine, an additional deformation of the crown is --  
15 results from the temperature gradients in the crown  
16 so there are components -- two contributors to the  
17 deformation in the crown. One is the pressure and  
18 the other is temperature.

19 Even in the absence of any temperature  
20 gradients, the pressure alone can close the gap.

21 JUDGE BRENNER: Now, when you did the  
22 experiments, some of the results showed that there  
23 was a crown on the skirt; correct?

24 DR. HARRIS: Yes, that's correct.

25 DR. MC CARTHY: There's an additional --

waga

1 one can ask the question, apart from this, does the  
2 crown actually touch the skirt during normal  
3 operation, and it's clear from our tests that the  
4 pressure will make the crown touch the skirt. So  
5 the question is, is it touching it all the time  
6 because of thermal effects or is it only touching it  
7 occasionally for pressure effects?

8 If you know and look at operational  
9 pistons there was a substantial gap, there was  
10 close firing pressure and you would expect the crown  
11 to be hammering on the skirt and you would see a  
12 Brinelling effect on the crown skirt interaction  
13 line. If you look at the piston lines you do not  
14 see evidence of the Brinelling effects of it close  
15 up pretty well.

16 DR. HARRIS: I'd like to amplify on Dr.  
17 McCarthy's answer briefly.

18 JUDGE BRENNER: You've answered -- I've  
19 got the answer I wanted on my original question or  
20 two. Why don't we leave it at that. That's part of  
21 the problem of where we guess we might be going or  
22 what we might be thinking, and the way it's played  
23 out is to try to direct your answer to the question.

24 DR. MC CARTHY: There may be --

25 JUDGE BRENNER: Clear it up if you want

waga

1 to through your counsel. He can come back if he  
2 wants. Just on this one example I'll tell you more  
3 than I want, but I'm trying to judge and taking in  
4 questions to be concluded. I want the answers to  
5 the questions and Mr. Dynner is going to come back  
6 and talk about his time took three times as long  
7 because the answers were three times as long as  
8 necessary, and he's going to have a good case.

9           The fact I was interested in was solely  
10 whether or not I should put much stock in the fact  
11 in your testimony that the pressure results in an  
12 actual operating engine would be lower because the  
13 experimental results in P-10, some of which is also  
14 in P-14, is conservative of the sense of gap closure,  
15 and I was wondering whether there was not in fact  
16 some gap closure, even during the experiments and  
17 you've answered the question.

18           Now, if you may have something else in  
19 mind beyond that. You may think I'm confused on  
20 another point. That may you be true and you can  
21 talk to Mr. Ellis and he'll fix it up all for you.  
22 We'll be back at 10:50.

23                           (Recess 10:30 a.m.)

24           JUDGE BRENNER: Mr. Dynner, you can pick  
25 up on your cross-examination.

waga

1 BY MR. DYNNER:

2 Q. We're on page 12, Judge Brenner.

3 JUDGE BRENNER: I was able to progress  
4 from 11 or 12 this morning.

5 Q. Gentlemen, you've referred in your  
6 testimony to -- that's on page 21 of your testimony,  
7 you referred to peak temperatures in the crowns  
8 measured by DeLaval and those are set forth, you've  
9 testified, as exhibit P-11. Does the measure set  
10 forth as Exhibit P-11 represent the only crown  
11 temperature measurements that were furnished to  
12 LILCO, FaAA or the owners group by DeLaval?

13 DR. HARRIS: I don't recall precisely  
14 whether the information provided in Exhibit P-11 is  
15 the only information on crown temperatures that TDI  
16 supplied to LILCO FaAA.

17 I do know, however, that all of the data  
18 that was supplied to us was supplied to us at one  
19 time. My memory is fuzzy on this. There might have  
20 been two sets of information supplied both at the  
21 same time and the two sets were very similar to one  
22 another and the results that were used as shown in  
23 exhibit P-11.

24 MR. DYNNER: Judge Brenner, I'd like to  
25 pass out and have marked for identification a

1 document showing the temperature measurements of the  
2 crown.

3 JUDGE BRENNER: You're in the pretrial exhibits  
4 which of course we have not yet identified or entered into  
5 evidence on the record. Your last number is going to be 67,  
6 is that correct? So this is going to be 68. Diesel Exhibit  
7 68 for identification.

8 MR. ELLIS: May we know where this is from so we  
9 can identify it?

10 JUDGE BRENNER: Have you given copies to the  
11 reporter?

12 MR. DYNNER: We're going to need more copies of  
13 that, so I'm having someone make additional copies so I'm  
14 having someone go on to a related area.

15 JUDGE BRENNER: Answer Mr. Ellis's question in  
16 any event, so you can be more prepared later as to where  
17 this is coming from.

18 MR. DYNNER: This is one of the documents which  
19 was obtained during the discovery and to our knowledge it  
20 represents TDI measurements of the temperature of the crown  
21 of the AE piston

22 JUDGE BRENNER: You're going to have -- you're  
23 introducing it for identification on cross-examination.  
24 You're going to have to ask some questions so the witnesses  
25 know about it. Let's

1 hold off identifying it at this point then. When  
2 you come back I'll let you get your foundation in  
3 and then I'll hear your motion.

4 BY MR. DYNNER:

5 Q. Gentlemen, what did FaAA do, if anything,  
6 to independently verify whether or not the  
7 temperatures given by DeLaval for the crown were  
8 accurate.

9 DR. PISCHINGER: May I shortly address  
10 this? The range of temperatures given in this  
11 piston crown is very reasonable and similar to  
12 similar measurements in comparable piston crowns.  
13 So I feel that these measurements are in a  
14 reasonable scope of experience.

15 Q. What do you base that on, Dr. Pischinger?

16 DR. PISCHINGER: For instance, similar  
17 measurements by German piston manufacturers taken in  
18 engines which gives quite similar readings,  
19 comparable readings.

20 Q. What engine would that be?

21 DR. PISCHINGER: Well, this is a piston --  
22 little smaller piston, but with higher BMEP. So I  
23 rather feel if these values would deviate or should  
24 deviate they should -- should deviate, they should  
25 be in reality a little lower.

1 Q. What was the engine that you're referring  
2 to?

3 DR. PISCHINGER: I cannot give you the  
4 engine. I only can give you the piston.  
5 The diameter of the piston isn't --

6 Q. Is that the person that will take the  
7 temperature readings?

8 DR. PISCHINGER: No, it's published.

9 Q. Where is it published?

10 DR. PISCHINGER: It's published in a  
11 German -- in a German technical newspaper so that it  
12 could be made available.

13 Q. And was this engine -- what was the BMEP  
14 of this engine that you're referring to?

15 DR. PISCHINGER: This was 23 -- the  
16 highest BMEP was 23.5 bar which is -- well, a lot  
17 higher than --

18 Q. What was the RPM of that engine?

19 DR. PISCHINGER: 800. It all means  
20 severe conditions.

21 Q. How many horsepower did that engine put  
22 out?

23 DR. PISCHINGER: I don't have it in my  
24 mind. I could --

25 Q. Sorry?

1 DR. PISCHINGER: I cannot tell you at  
2 the moment.

3 Q. What was that piston made of?

4 DR. PISCHINGER: Cast iron, same  
5 material as this piston.

6 Q. Who was the manufacturer?

7 DR. PISCHINGER: Karl Schmidt.

8 DR. MC CARTHY: An additional check --

9 MR. DYNNER: I would like to follow up  
10 with Dr. Pischinger.

11 Q. What were the dimensions of that piston?

12 DR. PISCHINGER: A little smaller,  
13 possibly 300.

14 Q. And you think that -- what evidence do  
15 you have that the temperatures of that piston that  
16 you're referring to, the Karl Schmidt piston were  
17 adequate -- would be adequate for determining  
18 whether temperatures of the DeLaval EDG's piston  
19 skirts were proper?

20 DR. PISCHINGER: Well, there is a  
21 certain similarity rule that which an engine of this  
22 piston design, the same design, two part piston, the  
23 crowns from below, the same cool from below, the  
24 same way of cooling the piston, that the  
25 temperatures adjust -- the temperature field is

1 about the same.

2 What I wanted to say that if there would  
3 have been this measurement deviation to, let's say,  
4 400 degrees centigrade or 200 degrees centigrade to  
5 the maximum, I would say it's too low or too high,  
6 but this is -- this was in the reasonable region of  
7 my experience with such pistons, and also this very  
8 recently measured and published result.

9 Q. Did the Karl Schmidt piston that you're  
10 referring to have a temperature variation in the  
11 crown of over 400 degrees from the top of the crown  
12 to the bottom?

13 DR. PISCHINGER: Now we have to tell  
14 both degrees.

15 Q. Fahrenheit.

16 DR. PISCHINGER: Fahrenheit. 400  
17 degrees Fahrenheit. It's even more. It's -- sorry,  
18 I have to convert.

19 MR. ELLIS: My son is struggling with the  
20 metric system. It may spur him on to success.

21 JUDGE BRENNER: Don't tell him he can get  
22 the answer with a calculator. He'll lose his  
23 incentive.

24 DR. PISCHINGER: Yes. It's a little  
25 higher from Karl Schmidt.

1 Q. What is your number?

2 DR. PISCHINGER: Oh, it's just the same.

3 It's just the same.

4 Q. Just the same. 400 degrees Fahrenheit.

5 DR. PISCHINGER: Yes. 220 degrees

6 Celsius.

7 Q. What was the peak firing pressure of the  
8 Karl Schmidt piston.

9 DR. PISCHINGER: I don't remember but  
10 considerably higher.

11 Q. Do you feel that the comparison of this  
12 data to the Karl Schmidt piston is sufficient in your  
13 mind to verify the accuracy of the temperature  
14 measurements taken by DeLaval for the AE piston  
15 crown?

16 DR. PISCHINGER: Well, what I can say,  
17 the method that was used was a templug method  
18 which is a usual method. Karl Schmidt did it.  
19 DeLaval did it. It's the same method and this  
20 method gives you a lot of independent reading at  
21 different points of the piston crown so you do not  
22 rely on only one point, and it's very unlikely that  
23 a large set of templugs is basing wrong in such a  
24 piston all in the same direction. So I have a lot  
25 of reasons to say that these readings are reliable

1 and they are also in the range of experience of  
2 similar pistons, so I think it would be a very good  
3 pace. The only thing you can think of that DeLaval  
4 would have done this test with a completely  
5 different load, but this is unlikely in view of the  
6 temperatures and the temperature differences.

7 JUDGE BRENNER: Mr. Dynner, I've lost the  
8 thread of materiality again.

9 Why is the differences or potential  
10 greater or lesser differences in the temperatures of  
11 different portions of the piston crown relevant to  
12 anything before us?

13 MR. DYNNER: Well, because as I  
14 understand the testimony of the witnesses, they  
15 calculated or extrapolated temperatures in the  
16 piston skirt based upon the DeLaval measurements  
17 made of the temperatures in the piston crown, and  
18 we're talking now as to whether or not the  
19 temperatures of the DeLaval measured in the piston  
20 crown were or were not accurate, and were or were  
21 not validated.

22 JUDGE BRENNER: But your last series of  
23 questions for about the last ten minutes went to  
24 differences between the highest temperatures and the  
25 lowest temperatures on the crown and the testimony

1 we also have is that -- and in the view of these  
2 witnesses -- it is reasonable to take the  
3 temperature at the bottom of the crown and realize  
4 that that is somewhat higher than the coolant  
5 temperature, and to use some temperature around that  
6 or, perhaps, even a little lower for the skirt  
7 temperature, and you also have the testimony as to  
8 the variations you might expect within the piston  
9 skirt, and unless you're going to do a number of  
10 things, that is give some evidence somehow and I  
11 don't recall the County's testimony, I may be wrong,  
12 that, A, that is wrong, B, that there are some great  
13 differences at different portions of the piston  
14 skirt in temperature in contradiction of what these  
15 witnesses have testified, and, C, all that makes a  
16 difference in the way they have applied it in their  
17 finite element analysis, then we're not going to do  
18 anything with this mix of information. So there are  
19 quite a few links missing if you are talking about  
20 differences between the temperatures at the top of  
21 the crown and the bottom, in terms of any usefulness  
22 to us.

23 Do you want to comment on that?

24 MR. DYNNER: No. I'm going to try to  
25 follow up with questions that may answer the comment

1 that you made.

2 JUDGE BRENNER: I'd like you to start  
3 thinking about where you're going with some of these  
4 questions as opposed to the immediate interest that  
5 you or anybody else might have in view of the  
6 particular question in isolation.

7 BY MR. DYNNER:

8 Q. Gentlemen, concerning the calculation you  
9 made or the conclusions you reached about the  
10 temperature of the piston skirt, based upon the TDI  
11 measurements of the temperatures in the piston crown,  
12 would it have made any difference to your  
13 conclusions if there were much larger variations in  
14 the temperature between the top of the crown and the  
15 bottom of the crown than shown on Exhibit P-11.

16 DR. SWANGER: Our conclusions about the  
17 isothermal state of temperature distribution in the  
18 skirt are affected only by the temperatures at the  
19 bottom of the crown.

20 The temperature gradient across the crown  
21 would not have any effect on temperatures within the  
22 skirt. Only that portion of the crown in direct  
23 contact with the skirt would influence the  
24 temperature of the skirt, so as long as the measured  
25 temperature at the bottom of the crown is about 200

1 degrees Fahrenheit, we think that the operating  
2 temperature of the skirt would be about 200 degrees  
3 Fahrenheit.

4 DR. MC CARTHY: Now, it is important, of  
5 course, the absolute temperature gradient from the  
6 top of the crown to the bottom of the crown with the  
7 thermal distortion that's going to occur with the  
8 crown and the closure interaction, and in answer to  
9 your previous questions where you were talking with  
10 Dr. Pischinger and I didn't -- your question was  
11 what checks had we done on the numbers, and Dr.  
12 Pischinger talked about about his experience. But I  
13 did not get a chance to add to that other checks the  
14 Failure Analysis did.

15 Dr. Gail McCarthy, who is a  
16 consultant in heat transfer was asked by me to do  
17 confirmatory calculations or analytical calculations  
18 of the temperature gradient provided to us by TDI,  
19 and there are some absolute checks on the accuracy  
20 of, or reasonableness of the gradient, that is, if  
21 there's more heat flowing through the top of the  
22 piston than is being removed by the oil, you've got  
23 a problem.

24 So there's an absolute check on if your  
25 gradient is higher, more heat flows through the top

1 of the piston must be removed by the oil.

2 As I think Dr. Pischinger indicated,  
3 these numbers -- this temperature gradient might be  
4 a shade high. I think our analysis confirmed they  
5 are reasonable, perhaps a shade to the high side,  
6 because the heat flux through the pistons would  
7 account for 93 percent of the temperature loading in  
8 the oil, it's the heat load to the oil, so, once  
9 again, another independent physical bound on the  
10 reasonableness of the numbers confirms that they are  
11 in a reasonable range, perhaps a slightly higher  
12 gradient than actually exists.

13 Q. Is it your testimony on P-11 that the  
14 temperatures shown there of 205 and 202 degrees  
15 Fahrenheit at the very bottom of the crown are  
16 uniform throughout the circumference of the bottom  
17 of the crown?

18 DR. MC CARTHY: We do not have, to our  
19 knowledge, circumferential temperature measurements;  
20 however, the geometry and by the nature of steel  
21 itself, we do not believe there are any significant  
22 temperature variations.

23 There are going to be small differences  
24 introduced by the presence of the wrist pin around  
25 parts of the -- wrist pin around the periphery of

1 the piston will introduce a small assymetry into the  
2 temperature field, but nothing that would approach a  
3 level which I think one would term significant,  
4 something you'd be concerned about.

5 DR. PISCHINGER: May I add, this is the  
6 experience with this type of pistons before; there is no  
7 larger circumferential deviation in temperature.

8 That means --

9 Q. You're referring to the crown or to the  
10 skirt?

11 DR. PISCHINGER: The crown. Of course,  
12 the skirt is usually, even with those German piston  
13 manufacturers, tested as thermal, also, the same way  
14 it was done -- this is industrial habit because it  
15 has no influence of temperature and for the crown  
16 it's usually the temperatures do not vary in the  
17 circumferential direction.

18 Q. Dr. Pischinger, are you familiar with  
19 instruments produced in England by Welworthy for the  
20 measurement of stresses in a piston while the piston  
21 is operating?

22 DR. PISCHINGER: No. We have our own  
23 methods.

24 Q. When you say, "We have our own methods,"  
25 to whom were you referring?

1 DR. PISCHINGER: If anybody wants to have  
2 a piston tested, I can do this.

3 Q. Do you know how long the engine had been  
4 running when the temperature readings in the crown  
5 were made by TDI?

6 DR. HARRIS: I was not supplied precisely  
7 with that information, but I was told that the  
8 engine had been run long enough that the temperature  
9 measurements were representative of steady state  
10 conditions in the engine.

11 Q. Do you know what the load was?

12 DR. HARRIS: Yes. Approximately. The  
13 BMEP was some -- as I recall, somewhat below the 225  
14 applicable to Shoreham. As I recall, it was 213  
15 BMEP.

16 Q. Can you translate for us that BMEP of 213  
17 into what the horsepower per cylinder would be for  
18 that load, or don't you know? I'm not trying to  
19 make you do a ten-minute calculation here, but --

20 DR. HARRIS: More like a ten-second  
21 calculation.

22 Q. Judge Brenner, we have some extra copies  
23 of this exhibit marked for identification which we  
24 can now show the witness. I don't know how much  
25 I'll going to pursue in view of your remarks.

1 JUDGE BRENNER: If you're not going to  
2 pursue it, don't mark it.

3 MR. DYNNER: I haven't decided yet

4 JUDGE BRENNER: Hold off then. We've got  
5 the copies. As of now we have no exhibit identified  
6 as 68. You decide what you want to do with it and  
7 since it's cross-examination, you'd better get a few  
8 questions in before you even ask to mark it so we  
9 get the context.

10 If you want to come back to it, you can.

11 DR. HARRIS: The 213 BMEP for which the temperature  
12 measurements are applicable and the 450 rpm  
13 operating condition in the engine translates to 5.77  
14 horsepower per cylinder which for an eight cylinder  
15 engine would be 4,620 horsepower.

16 DR. SWANGER: I might point out that  
17 horsepower is 95 percent of the rated horsepower of  
18 the Shoreham engine; therefore, the thermal loading  
19 would be within five percent of the thermal loading  
20 of the Shoreham engine is at the rated horsepower,  
21 and given the heat transfer properties of the steel,  
22 I feel that the evidence shown in Exhibit P-11 is  
23 reasonable for use in Dr. Harris's calculations.

24 MR. ELLIS: Judge Brenner, if we're now  
25

1 going to introduce this piece of paper, my Xeroxed  
2 copy has some figures up at the right-hand corner  
3 that I cannot read. If Mr. Dynner can read into the  
4 record what those are --

5 JUDGE BRENNER: I don't know if we're  
6 going to do that. I don't know if he's going to use  
7 it. He had that discussion. He's got a problem and  
8 if he can't get to it before the lunch break, he can  
9 get a better copy and give it to you but if he does  
10 get it before the lunch break he'll get it for you  
11 and we'll mark it. Are you going to use it or not?

12 MR. DYNNER: I'll find out in minute.

13 JUDGE BRENNER: One at a time. Dr.  
14 Harris, what were the units for your 213 BMEP?

15 DR. HARRIS: Psig -- pounds per square  
16 inch.

17 DR. PISCHINGER: 213.

18 JUDGE BRENNER: All right, thank you.

19 If we want to convert the B bar units, is  
20 that 14.7 psi?

21 DR. MC CARTHY: 14.504. Go ahead.

22 Q. Gentlemen, we've handed you a document  
23 and it is in the bottom right-hand corner, it says  
24 DeLaval and you have crown with templugs and then  
25 under that RD-2145.

1 JUDGE BRENNER: Let's go off the record:

2 (Discussion off the record)

3 JUDGE BRENNER: Mr. Dynner, ask the  
4 questions you want to ask.

5 Q. Have any of you seen this document before  
6 that you can recall?

7 DR. HARRIS: To my knowledge, Mr. Dynner,  
8 I have not seen this document before.

9 DR. SWANGER: Nor have I, Mr. Dynner.

10 BY MR. DYNNER:

11 Q. Nobody has seen it on the panel. Okay,  
12 we're not going to use it.

13 JUDGE BRENNER: So it's never been marked.

14 MR. DYNNER: That's fine then.

15 Q. Gentlemen, instead of making this  
16 extrapolation or conclusion that you do in answer 29  
17 on page 21 concerning the temperature in the skirt,  
18 and following in 30, why didn't you just measure the  
19 temperature of the skirt during operation of the  
20 engine as Dr. Pischinger has suggested would be  
21 fairly easy to do.

22 DR. HARRIS: Because it wasn't necessary,  
23 Mr. Dynner.

24 Q. It wasn't necessary. For what reason do  
25 you make that conclusion?

1 DR. MC CARTHY: Basically, the  
2 temperatures and any possible differences from these  
3 temperatures -- were, first of all, so small, and  
4 second, so unlikely to have any even probably  
5 detectable effect on our results that it just made  
6 no sense to go forward with elaborate tests like  
7 this when the results are going to be so insensitive  
8 to temperature. First of all the elastic modulus of  
9 the material which determines the rate it stretches  
10 which are insensitive to temperature at this range.  
11 Insensitive not sensitive. Even if there is small  
12 differences in temperatures, even if there exists  
13 small differences in temperature the behavior of the  
14 material is still elastic. You have to get to  
15 temperatures in the skirt equal to those  
16 temperatures in the crown before you begin to see  
17 any measurable -- at the top of the crown, before  
18 you begin to see even measurable effects on the  
19 modulus of the material. It would effect its  
20 elasticity, affect its slope. There were no effects  
21 that would have affected our conclusions.

22 DR. SWANGER: I can go into some more  
23 detail as to the significance of these measurements  
24 as well.

25 We had made the statement that the skirt

1 is in our opinion essentially isothermal. The only  
2 concern that we would have if it were hypothesized  
3 to be not isothermal is that there might be an  
4 effect of thermal stresses in the skirt; however,  
5 the temperature in the skirt would be essentially  
6 uniform during operation of the engine. It would  
7 not fluctuate at 225 cycles per minute as do the  
8 stresses from the firing pressure. Rather  
9 the only effect it might have if it possibly exists  
10 would be a slight offset in the mean stress and no  
11 effect at all on the cyclic stress. The finite  
12 element analysis and the fracture mechanics analysis  
13 takes into account the cyclic stresses, primarily  
14 the cyclic stresses in assessment of the propagation  
15 of hypothesized cracks in these pistons. Thus even  
16 even if we relax the assumption that the skirt is  
17 essentially isothermal which we believe is a  
18 reasonable assumption, it can be demonstrated by a  
19 number of methods, it would have no effect at all on  
20 the cyclic stresses in the stud boss region or any  
21 other region of the skirt.

22 Q. Well, if you measured the temperature of  
23 the skirt in an approach of to 400 degrees, which is  
24 some of the temperatures that I see in P-11 near the  
25 top of the crown, would that have any influence or

1 effect on the stresses in the skirt that were  
2 measured by strain gages?

3 DR. SWANGER: We believe that the premise  
4 in your question, that the temperatures in the skirt  
5 could even reach 400 degrees Fahrenheit is within --  
6 without foundation.

7 The reason we believe at that premise  
8 is without foundation is that the oil coolant of the  
9 piston is very effective in that there is a large  
10 drilling up through the connecting rod which  
11 delivers copious quantities of oil into the region  
12 between the crown and the skirt and that oil then  
13 drains back out of that area and bathes the skirt in  
14 an isothermal oil bath.

15 We know that the lubricating oil  
16 temperature into the engine is 155 degrees  
17 Fahrenheit and that the maximum lubricating oil  
18 temperature out of the engine is 180 degrees  
19 Fahrenheit.

20 As Dr. McCarthy had said, our bounding  
21 calculations show that the vast majority of the  
22 thermal load on the oil, which means where the  
23 source of heat in the oil is that comes out of the  
24 engine is through the piston crown; therefore, that  
25 oil leaving the piston crown will be very close or

1 no more than 170 to a 180 degrees Fahrenheit and the  
2 skirt is bathed in this oil maintaining it  
3 isothermally.

4           If we accept what I think are the  
5 absolutely unfounded premises of your question that  
6 the skirt might reach 400 degrees Fahrenheit as Dr.  
7 Harris had testified earlier, linear elasticity  
8 still applies. The loads are still the same and the  
9 stresses in the areas would still be the same.

10           JUDGE BRENNER: Dr. Pischinger, wait,  
11 because Mr. Dynner is talking to one of his  
12 consultants.

13           In addition, I think that question was  
14 answered.

15           Mr. Dynner, unless you're going to give  
16 evidence that contradicts the two points that Dr.  
17 Swanger has answered just now, I think you'd better  
18 move on to another question.

19           MR. DYNNER: I was about to say that  
20 we're going to move to cross-examination at page  
21 three, at the bottom of page three.

22           JUDGE BRENNER: Just in case it wasn't  
23 clear, Dr. Swanger's answer which has not been  
24 contradicted by any evidence orally and by any, to  
25 my recollection, any direct written testimony, that

1 the County has provided is that the series of  
2 questions on the data and the reasonableness of it  
3 as to temperature of the crown and also the skirt  
4 does not matter for the reasons he's just indicated.  
5 The bounds on the piston skirt temperature provided  
6 by the lubricant, the oil, and also the lack of  
7 effect in his view of even the higher temperature or  
8 assumption on the finite element analysis, so that's  
9 the evidence and you're going to have to contradict  
10 that in order to ask any other questions about it,  
11 make a representation that you've got evidence that  
12 contradicts that. And you can think about that.

13 You want to try sooner rather than later  
14 to narrow the areas that are potentially in  
15 controversy, and I don't think you're doing that as  
16 quickly as you can and I have some opinions as to  
17 why that's not happening. So I'll save them in my  
18 own mind for now unless I have to give them out loud  
19 at a later point. Let's proceed.

20 BY MR. DYNNER:

21 Q. Gentlemen, referring now to testimony if  
22 you will, at page 14, of your testimony, now,  
23 regarding the fracture mechanics analysis that was  
24 performed, you stated in your testimony at the top  
25 of page 14 that the fracture mechanics analysis

1 would also determine growth behavior from any  
2 possible initial imperfections in the skirt.

3 Does your fracture mechanics analysis  
4 also predict cracked growth behavior from the  
5 initiation side of the crack into a sand inclusion  
6 or other imperfection that might occur very near to  
7 the initiation site?

8 DR. HARRIS: The fracture mechanics  
9 analysis in the AE piston skirt was performed for  
10 hypothesized cracks as deep as one half an inch.  
11 Even cracks of this extreme depth were predicted to  
12 never propagate; therefore, any initial defect of  
13 size up to a half an inch is also predicted not to  
14 propagate. I might add that a crack is very severe  
15 type of defect and the half inch depth is very large  
16 compared to any features of the microstructure or  
17 any grains of sand that were used in the casting  
18 process. I believe Dr. Swanger has some additional  
19 words that he'd like to add in this regard.

20 DR. SWANGER: Yes. My inspection and  
21 evaluation of the manufacturing techniques that I  
22 testified to yesterday allows me to conclude with a  
23 very reasonable degree of certainty that the kind of  
24 defect that is alluded to in the question could not  
25 exist in the subsurface of the highly stressed crown

1 skirt attachment boss in the AE pistons.

2 We have taken samples of material from  
3 two actual AE pistons for our mechanical properties  
4 testing, and we have sectioned AE pistons for metallographic  
5 graphic examination and in all of these cuts through  
6 the highly stressed areas of these pistons we have  
7 not found any evidence of such internal inclusions.

8 My opinion is that in a sand cast product  
9 such as the AE piston, the vast majority of any  
10 potential defects that might be attributed to the  
11 manufacturing process would occur at the surface of  
12 the piston and they would be the result of the kind  
13 of occurrences which can occur in a foundry but for  
14 which inspections were done.

15 Also, I testified why there was a grit  
16 blasting operation performed on these pistons to  
17 make such an inspection of the surface.

18 DR. JOHNSON: All the piston skirts which  
19 were supplied to Shoreham AE piston skirts supplied  
20 to Shoreham were inspected by two independent  
21 inspection methods, one, penetrant, and, one, an eddy  
22 current. In shipment to Shoreham all indications  
23 were -- all evidence and all indications were  
24 removed from the piston skirts. There were no  
25 indications by either technique of imperfections in

1 this area of the piston skirt.

2 Q. Did you say all indications were removed,  
3 Dr. Johnson?

4 DR. JOHNSON: The source of all  
5 indications were removed, yes.

6 Q. Could you explain what you meant by that

7 DR. JOHNSON: In the --

8 Q. I'd like Dr. Johnson to please answer the  
9 question.

10 JUDGE BRENNER: Yes.

11 Q. It's a follow-up to his testimony.

12 JUDGE BRENNER: Yes, Dr. Johnson, just  
13 you for now.

14 DR. JOHNSON: In the washer landing area,  
15 there were some machine indications which were  
16 ground out per TDI procedure. All of the pistons  
17 which were shipped to Shoreham had no eddy current  
18 indications, nor penetrant indications.

19 Q. What was the nature of these machine  
20 indications that you say were ground out?

21 DR. JOHNSON: They were linear  
22 indications in the lip of the washer in the landing  
23 area.

24 Q. Can eddy current and die penetrant  
25 inspection detect subsurface flaws in the casting?

1 DR. JOHNSON: Both penetrant and eddy  
2 current are not directed at subsurface flaws.

3 Q. So the two inspections that you say were  
4 carried out on all the skirts would not be able to  
5 detect any subsurface flaws; isn't that true?

6 DR. JOHNSON: Both the PT tests and the  
7 eddy current tests are sensitive to surface  
8 connected defect, not deep subsurface defects.

9 Q. So my question to you is it's true, isn't  
10 it, that those techniques would not disclose  
11 subsurface flaws, that's true, isn't it?

12 DR. JOHNSON: I believe I answered that  
13 question.

14 JUDGE BRENNER: You didn't, Dr. Johnson.  
15 I was going to make the same point that Mr. Dynner  
16 made. What's the answer to the question?

17 DR. JOHNSON: The answer to the question  
18 is that penetrant and eddy current are not designed  
19 to detect subsurface flaws.

20 JUDGE BRENNER: The question is would  
21 they detect subsurface flaws?

22 DR. JOHNSON: I do not believe so.

23 MR. SEAMAN: I would like to add one  
24 thing to that discussion.

25 Long Island Lighting Company in concert

1 with Failure Analysis and Stone & Webster and other  
2 NDE experts did consider performing in sort of  
3 subsurface or some sort of NDE that could determine  
4 subsurface flaws and, basically, due to the physical  
5 configuration of the head it's really not possible  
6 to perform adequately a volumetric inspection of the  
7 pistons in this area.

8 Q. Did you say heads, Mr. Seaman?

9 MR. SEAMAN: Excuse me, pistons.

10 Q. Is that the only way in which you could  
11 detect subsurface flaws or could you use x-ray  
12 techniques, Mr. Seaman? Or anyone?

13 DR. JOHNSON: In this particular area  
14 there is a large variation in thickness which  
15 precludes a meaningful x-ray examination of the area  
16 for subsurface defects.

17 DR. SWANGER: I'd like to follow up on  
18 the logic that went into FaAA's recommendations to  
19 LILCO about the need for nondestructive testing.

20 At the time of the purchase of the AE  
21 piston skirts, the metallurgical failure analysis of  
22 the AF piston skirts was well in progress and one of  
23 the primary features that we were looking for in the  
24 cracks in the AF skirts was to see if they were in  
25 any way associated with subsurface defects.

1 manufacturing defects or casting flaws.

2 I think that the statistics that we  
3 pointed out yesterday that 23 out of 23 AF pistons  
4 did have the cracking in them showed that that was  
5 related to the design of the piston and not to its  
6 manufacturing.

7 We investigated a number of these cracks  
8 in the AF pistons and we found coincidentally that  
9 one of the cracks did pass through a small  
10 preexisting surface-connected flaw on that AF piston,  
11 but from examination of the fractured surface we saw  
12 that even that flaw in the AF piston had no effect  
13 on the fracture mechanics.

14 Gaining this confidence in the  
15 manufacturing techniques used for both the AF and AE  
16 pistons, it contributed to our opinion that the  
17 surface related NDE inspection techniques were the  
18 appropriate ones for the AE pistons.

19 DR. HARRIS: If I could further amplify  
20 on our answer to the question, there are fracture  
21 mechanics and stress analysis reasons for  
22 concentrating on surface cracks. A crack of given  
23 size is much more severe when it's connected to the  
24 surface than when it is a subsurface defect, even  
25 given that the stress were equal throughout the

1 volume of the material.

2 The very severe stress gradients that the  
3 finite element analysis showed existed in the stud  
4 boss region tells us that the stresses are highest  
5 at the surface and, therefore, that's the region  
6 that we should be most concerned about. The  
7 stresses die out very rapidly as you progress away  
8 from the surface of the highly stressed region in the  
9 stud boss area. Therefore any subsurface defect  
10 would be less likely to grow because the stresses on  
11 them are considerably lower.

12 Q. Moving to page 4, paragraph D of the  
13 cross claim.

14 Gentlemen, if you'll turn now to page 22  
15 of your testimony, concerning the strain gage test  
16 which we've discussed previously, how many pistons  
17 were subjected to the strain gage measurements

18 DR. HARRIS: How many AE pistons?

19 Q. Yes.

20 DR. HARRIS: One. However we had each of  
21 the four stud boss regions in that one piston  
22 strain gaged. So we had redundant measurements of  
23 the strains in the stud boss region of the AE skirt.

24 Q. Is it difficult to obtain accurate  
25 measurements from the strain gaging that you did on

1 this piston?

2 MR. ELLIS: Objection. I don't know what  
3 he means by difficult. If he wants to talk about  
4 the billions that we paid for having all this done,  
5 I can address it to that or there could be -- I just  
6 don't understand what the word difficult means in  
7 this context or how it's -- whether it's material.  
8 You can ask him what the -- ask her to describe it,  
9 but I simply don't think difficult is an appropriate  
10 question.

11 JUDGE BRENNER: The question is not so  
12 imprecise that I would grant the objection.

13 However, I think in the name of  
14 efficiency, it would be helpful if you could just  
15 more precisely get to whatever it is you want to get  
16 to in some of these questions, Mr. Dynner. As an  
17 example, if you have something in mind, why don't  
18 you ask him directly about whatever it is you have  
19 in your mind. I'll leave it up to you. But don't  
20 complain to me about the length of the answers if  
21 you keep asking questions like that one. It's your  
22 move.

23 Q. Is it your testimony that the  
24 measurements of the strain gages that you took on  
25 this piston are a hundred percent accurate in their

1 readings?

2 JUDGE BRENNER: Mr. Dynner, I'm  
3 interrupting only because I hope it will be helpful  
4 for the future here. That, too, is the same type of  
5 general question, you changed the wording. If there  
6 is something you have in mind as to the accuracy of  
7 their measurements, ask them about it.

8 MR. DYNNER: Well, I tried to do that.

9 JUDGE BRENNER: You said is it difficult  
10 and then you changed difficult to the accuracy of  
11 the readings, it's still the same —

12 MR. DYNNER: I said is it difficult to  
13 obtain an accurate reading.

14 JUDGE BRENNER: That's still very  
15 generally. That's still a question to the procedure.  
16 Is there something about the procedure that you  
17 believe you can adduce evidence on that will help us?  
18 Placement of the strain gage, the —

19 Q. Is there a predictable accuracy for the  
20 strain gage measurements that you made?

21 DR. HARRIS: Like any engineering tool,  
22 the strain gages are capable of providing accurate  
23 results. In my own 20 years experience in applying  
24 experimental techniques to measurements of stresses  
25 of bodies I can confidently say that strain gage

1 techniques are capable of providing results which  
2 are of suitable accuracy for making engineering  
3 judgments. I believe that the strain gage  
4 techniques that we used are general state of the art  
5 and have been applied very widely in other  
6 industries, and have been applied very widely by  
7 myself and other people in Failure Analysis  
8 Associates. And once again I believe that the  
9 strain gage techniques are capable of providing the  
10 results of suitable accuracy for our purposes here.

11 I believe, if I had to put a number on it,  
12 I would say that the results we obtained were  
13 accurate to within approximately plus or minus five  
14 percent. I would expect accuracy actually would be  
15 better than that.

16 Q. Well, you had a concern, didn't you, as  
17 to whether you really got your strain gage down to  
18 the region where the stresses are highest in the AE  
19 piston, isn't that correct, Dr. Harris? Did you  
20 have that concern as to whether you got the strain  
21 gage down in the region where the stresses are  
22 highest in the AE piston?

23 DR. HARRIS: In the general application  
24 of strain gages to experimental stress analysis if  
25 you are looking for regions of highest stress, one

1 need always be concerned to have the strain gage  
2 down in the region of highest stress and this is  
3 precisely the reason that we did the stress coat  
4 test in order to accurately find the location of  
5 the maximum stress. Then once that region was  
6 identified, we put redundant strain gage rosettes in  
7 that region. We had eight independent measurements  
8 of the stresses and strains in the stud boss region  
9 and all eight of those measurements agreed quite  
10 well with one another which to me indicates that we  
11 were indeed close to the region, if not precisely on  
12 the region of the maximum stress in the stud boss.

13 Q. And fairly small inaccuracies in the  
14 placement of your strain gages could cause some  
15 inaccuracies in the strains that you measure. And  
16 in the strains that you want to compare with your  
17 finite element runs; isn't that true?.

18 MR. ELLIS: Object again on grounds that  
19 it is imprecise. Fairly small. I don't know what  
20 he means by fairly small.

21 JUDGE BRENNER: Well, we'll let the  
22 witness handle that one.

23 Q. May I have your answer, Dr. Harris?

24 DR. HARRIS: Inaccuracies in the  
25 placement of strain gages in the region where there

1 are high stress gradients can cause inaccuracies in  
2 the results that you obtain thereby. However, the  
3 stress coat test showed us that the region of high  
4 stress is quite small, but precisely identified it  
5 and allowed us to put the strain gages in that  
6 region. Once again we put eight rosettes and  
7 obtained eight nearly — very nearly the same  
8 results and this indeed indicated to me we hit very  
9 closely to the high stress region. There's further  
10 evidence in the finite element analysis that  
11 provides guidance in the placement of these gages  
12 but we rely primarily on the stress coat test for  
13 that purpose.

14 DR. SWANGER: The finite element analysis  
15 further gives us confirmatory evidence that the  
16 strain gages were placed in the areas of highest  
17 stress.

18 If you'll recall, we discussed yesterday  
19 the two different assumptions about two different  
20 wrist pins in the finite element model. These were  
21 two boundary conditions which were selected to be  
22 extremes of boundary conditions which bracketed what  
23 we believed to be the actual situation. The first  
24 runs were done with a rigid wrist pin, that is, one  
25 which does not deform. The second finite element done

1     which was done with a soft wrist pin, one which  
2     completely conforms its surface mathematically to  
3     the bore of the wrist pin boss.

4             We felt that the -- we know that the  
5     actual wrist pin which was used in the experiments  
6     is an elastic wrist pin which was somewhat in  
7     between these two assumptions, and the results came  
8     out the same way. The rigid wrist pin which we  
9     expected to give us high conservative values from  
10    the FEM analysis did give us high conservative  
11    values relative to the strains and stresses measured  
12    by the strain gages.

13            The other boundary condition, soft  
14    wrist pin gave us strains and stresses lower than  
15    the experimental values. Thus, we feel that both  
16    finite element runs give us confirmatory evidence  
17    that the strain gage readings were accurate for the  
18    purposes of the analysis.

19            Q.     Exhibits P-12, you testified, shows the  
20    location of the strain gages.

21            In fact, were all of the strain gages  
22    placed in the same plane?

23            DR. HARRIS: I assume you mean the same  
24    plane perpendicular to the axis of the cylinder,  
25    vertically.

1 JUDGE BRENNER: You mean the same  
2 horizontal plane?

3 Q. P-12 as I looked at it is the cutaway  
4 looking down from the top of the skirt; is that  
5 correct? So you wouldn't be able to tell from P-12  
6 whether all the strain gages were placed in the same  
7 horizontal plane.

8 DR. HARRIS: Yes, that is right. You  
9 wouldn't be able to tell from that.

10 Q. My questions is, were all in the same  
11 horizontal planes or were they on different planes?

12 DR. HARRIS: No, they were on different  
13 planes.

14 Q. What was the extent of those variations?  
15 Well, let me rephrase the question.

16 Would it matter in terms of the readings  
17 that you got whether there was any variation --  
18 whether there was a variation in the planes of the  
19 strain gage placements?

20 DR. HARRIS: Well, of course, the strain  
21 in the piston skirt depends on where you are  
22 vertically along the height to the skirt. So where  
23 you put the strain gage down is going to have an  
24 influence on the strain that you measure. The  
25 strains are not the same everywhere in the skirt

1 obviously.

2 Q. Is there someplace where you have  
3 identified the location of the strain gages up,  
4 shall I say up and down the skirt?

5 DR. HARRIS: Perhaps the clearest  
6 identification of the horizontal plane on which the  
7 strain gages were mounted is provided in the table  
8 that I discussed earlier this morning. Table 3  
9 won't help us on that answer.

10 DR. HARRIS: Well, that's the one that I  
11 was going to refer to, if you would like.

12 JUDGE BRENNER: As I understand the  
13 question, it won't help us.

14 MR. ELLIS: Could we --

15 DR. HARRIS: The rosettes in the stud  
16 boss region, B, C, D, E, F, G, H and I, were all in  
17 the same horizontal plane.

18 JUDGE BRENNER: All right. There's been  
19 a failure of communication I thought there in Mr.  
20 Dynner's opening question as to whether the strain  
21 gages --

22 DR. HARRIS: I understood the question to  
23 be --

24 JUDGE BRENNER: To all the strain gages.

25 DR. HARRIS: All the strain gages, not

1 just the one in the stud boss.

2 JUDGE BRENNER: I thought he was asking  
3 about the stud boss because that's the question I  
4 had in my own mind. Anyway, we've got the answer to  
5 that one.

6 Q. Gentlemen, if I could ask you now to turn  
7 for a moment to Exhibit P-14.

8 JUDGE BRENNER: Could I ask one question  
9 Mr. Dynner. You've got four pair, I take it each  
10 pair is in just about as close a location as you can  
11 get to strain gages; is that the way it works?

12 DR. HARRIS: Yes, Judge Brenner, that's  
13 correct.

14 JUDGE BRENNER: Am I also correct that  
15 you get three readings from each strain gage?

16 DR. HARRIS: Each rosette has three  
17 strain gages in it. And you get three -- so you get  
18 three readings, one from each gage and each rosette,  
19 and those three readings allow you you to then  
20 characterize the principal strains at that location.

21 JUDGE BRENNER: So if sometimes the  
22 dialogue here has talked about each strain gage at  
23 the stud boss region, then it's actually eight  
24 strain gage rosettes and actually 24 strain gages

25 DR. HARRIS: Yes, sir. That is correct.

1 DR. MC CARTHY: It should be clear that  
2 on each rosette the strain gages are perpendicular,  
3 and one at 45 degrees, that's what a rosette does,  
4 gives you its two principal strains and the sheer  
5 axis, 45 degree to it. It's not 24 all reading in  
6 parallel.

7 JUDGE BRENNER: Yes, thank you. Mr.  
8 Dynner. We can break for lunch now or you can ask  
9 one or two more questions.

10 (Whereupon, at 12:00 p.m., the hearing  
11 was recessed, to reconvene at 1:30 p.m. this same  
12 day.)

## AFTERNOON SESSION

JUDGE BRENNER: Good afternoon. We're back on the record. Mr. Dynner, you may proceed.

MR. ELLIS: May I raise one preliminary matter very briefly. When we discussed early on the order of proceeding and the Board asked us to reach an accommodation. The accommodation that we ultimately reached was to proceed further with pistons and then to go to crankshafts. The importance being the availability of Dr. Pischinger, central role in the crankshafts. It was my understanding, I might be mistaken, that the focus would be on Dr. Pischinger in the cross-examination initially and it looked like it was going on for some period of time that we might have to switch to crankshafts.

We are a bit concerned that at the rate of progress -- I'm not suggesting that the rate of progress should be any different. I'm just saying it's different from what I expected, and I don't mean that as a criticism of Mr. Dynner or of anybody. He cross-examined as he sees fit. But we would certainly like to suggest that we be prepared to go to crankshafts on which I think the parties have desired to cross-examine rather than more

waga

1 extensively than on pistons. We would prefer to go  
2 to that tomorrow and if we did not finish -- if we  
3 did not finish crankshafts by the end of the  
4 following week or if we did and we weren't able to  
5 get back to pistons, then we would lose Dr.  
6 Pischinger -- we would think that it's acceptable  
7 for us that Dr. Pischinger not be available for the  
8 remainder of the pistons. But it is not acceptable  
9 to us that he not be available for complete  
10 examination and, therefore, we think that starting  
11 tomorrow gives us the margin of safety and we do  
12 think we need to be conservative throughout this  
13 proceeding, given the margin of safety we need in  
14 order to finish crankshaft, given all the parties  
15 that want to cross-examine, and more questions as  
16 well.

17 JUDGE BRENNER: In general what you  
18 stated is correct, but on some of the specifics it  
19 is not quite correct only to the sense that it was  
20 not addressed. We did not say that the County would  
21 have to ask Dr. Pischinger the questions that would  
22 be asked of him first. We asked them to try to  
23 focus on him earlier, both on this subject and also  
24 on crankshafts, but you can recognize -- in advance  
25 you might recognize why that might not be possible

waga

.1 and now that we see it here at the hearing it just  
.2 reinforces my view it's not possible.

.3 His testimony interweaves the whole area,  
.4 number one, or a large part of the area number one.  
.5 Number two, you've got a situation where he's been  
.6 asked questions and now if you want to suggest that  
.7 we change subject and he might not be back on the  
.8 subject, you've got a problem because we may have a  
.9 follow-up question on items that Dr. Pischinger has  
10 supplied testimony on. Although I've interrupted  
11 from time to time with some questions, by no means  
12 has that been the Board's questions on the subjects  
13 as they've come up. We've got questions that, I  
14 believe we have questions, I believe, already, I  
15 suspect, although I'll check more thoroughly that  
16 Board members other than myself may very well have  
17 questions of Dr. Pischinger. Also, and we're not  
18 going to allow his testimony to stand part way if we  
19 don't get the opportunity to ask him our questions.

20 The Staff also may have questions of Dr.  
21 Pischinger, for all I know. That's the problem, we  
22 need to try to ask witnesses and I told you what  
23 that problem might be. We're certainly going to get  
24 to crankshafts by the beginning of next week even if  
25 we haven't finished pistons first and I believe that

waga

1 we will finish pistons this week. But I'll have to  
2 think about your suggestion of changing subjects and  
3 going to crankshafts tomorrow because I certainly  
4 didn't have that intention.

5 MR. ELLIS:: All right, Judge. Let me --  
6 I would suggest that if we're thinking about  
7 crankshafts for the four day period, Monday through  
8 Thursday of next week, I think based on my  
9 experience, I'm beginning to sound like a witness  
10 here, based on my extensive experience in these  
11 hearings --

12 JUDGE BRENNER: You have experience in  
13 the manufacturing of hearings.

14 MR. ELLIS: Design and manufacture and  
15 repair, maintenance and all the rest, and it's my  
16 opinion with a reasonable degree of legal certainty  
17 that you won't finish in those four days. And  
18 because that subject is --

19 JUDGE BRENNER: Fine. What's your  
20 solution given the problem?.

21 MR. ELLIS: My solution is to go to  
22 crankshafts tomorrow and pick up with pistons at the  
23 end.

24 JUDGE BRENNER: What do we do with Dr.  
25 Pischinger's testimony here on the pistons? I'm not

waga

1 going to allow his testimony to stand if we've got  
2 areas that were not questioned.

3 MR. ELLIS: : Then I would suggest we  
4 finish with Dr. Pischinger on pistons today.

5 JUDGE BRENNER: And what particular area  
6 would be Dr. Pischinger's area on pistons in your  
7 view?

8 MR. ELLIS: Other than the material that  
9 he's testified to, he has specific questions in the  
10 testimony and it's a relatively small number on  
11 which he is listed as a person, and I think this is --  
12 I mean --

13 JUDGE BRENNER: Let me stop you there. I  
14 don't have a cross reference. Maybe I should have  
15 developed that, but I did not. In other words I  
16 don't have a reference by name to which questions  
17 there are; presumably you have such a reference.

18 MR. ELLIS: : Yes, I do. Side thrust  
19 load and tin plating. Roman V and Roman VI of our  
20 testimony.

21 JUDGE BRENNER: He's supplied a lot of  
22 testimony already on the oral testimony on the other  
23 subject, that is, the FaAA report conclusion that  
24 cracks may occur but will not propagate.

25 MR. ELLIS: : Yes, sir. That's because

waga

1 he's been deeply involved and he agrees and he's an  
2 expert in pistons and diesels. In fact that's why  
3 we retained him because he's the best we could find  
4 in the world.

5 JUDGE BRENNER: You'd better find some  
6 inducement to keep him here then because -- I'm  
7 serious, because you told me that he would answer  
8 questions in the area you want to focus him on would  
9 be B and C, of the sub part of the text on piston, 4  
10 B and C and he's answered a lot of questions on 4 A,  
11 some of it voluntarily.

12 MR. ELLIS: : And some in response to  
13 cross-examination.

14 JUDGE BRENNER: Part of it's been -- the  
15 door has been opened by the voluntary answer and the  
16 cross was followed up.

17 MR. ELLIS: Well, I still --

18 JUDGE BRENNER: That doesn't matter. Be  
19 that as it may, we've got testimony on the record  
20 from him which has not been followed up. I infer  
21 you're willing to waive your redirect.

22 MR. ELLIS: That's correct.

23 JUDGE BRENNER: I have to think what our  
24 Board questions might be and I don't know about  
25 Staff questions.

waga

1 MR. ELLIS: I think --

2 MR. GODDARD: I can answer that, Judge  
3 Brenner, the Staff has no questions for Dr.  
4 Pischinger based on what he's testified to so far.  
5 We do have questions in the tin and possibly on the  
6 excess of side thrust area.

7 JUDGE BRENNER: I don't think we'd finish  
8 that this afternoon, anyway, in terms of all the  
9 parties asking questions on it.

10 MR. ELLIS: At the least, I would hope we  
11 could defer on our direct examination -- redirect  
12 examination.

13 JUDGE BRENNER: Then you get further up to  
14 the questions you may ask on redirect which  
15 overlapped into the area of a missing witness  
16 sometimes. I've seen this problem when we've tried  
17 to do it; in other words, I don't mean I don't mind  
18 trying to divide it up but if you try to divide it  
19 up too finely, that is, define that his sub area  
20 within an area is just A or B that's going to run  
21 into a problem.

22 For starters, Mr. Dynner, can you start  
23 on the area of B and C on part 4 of the contention  
24 and ask your questions on those, that is tin plating  
25 and side thrust load, and then we'll have the other

waga

1 parties ask their follow-up questions or their own  
2 questions on those subjects.

3 In the meantime, the Board on its own  
4 will be able to think of about -- these problems  
5 raised and what our own interests might be.

6 In that way, we can endeavor to see what  
7 happens and we'll try to let you know at the end of  
8 the day today, I guess, what the situation is.

9 I recognize you're in a difficult  
10 situation, Mr. Ellis, and I certainly don't mean to  
11 belittle the dilemma, but there are competing  
12 interests. We said that on the beginning of the  
13 conference call, that's why you cannot drop  
14 witnesses in and out of hearings. I understand it's  
15 not your desire to do that but you do that,  
16 circumstantial problems in that regard, and we have  
17 not yet gone into your justifying why it is he can't  
18 be available beyond those two weeks and I have to  
19 push that, but if we have to, that, too, may become  
20 pertinent.

21 MR. ELLIS: I agree, Judge.

22 MR. DYNNER: I'd like to -- this is the --  
23 the first I heard of it is when we got back and I  
24 spent part of the lunch hour trying to refine my  
25 cross plan and eliminate some stuff. I would like,

waga

.1 if we're going to jump to a totally different part,  
.2 then I am preparing to have some time to at least  
.3 review my cross plan and the questions I'm going to  
.4 ask on the side thrust, the tin plating questions.

.5 JUDGE BRENNER: How much more did you  
.6 have on the A? We'll let you continue on that.

.7 That's a valid point, Mr. Dynner.

.8 MR. DYNNER: You know the difficulty  
.9 we've had in predictions, I had sharpened down so  
10 that I was -- if you look at the cross plan for a  
11 second --

12 JUDGE BRENNER: Sometimes we spend more  
13 time talking about how much time it's going to take  
14 but --

15 MR. DYNNER: I'm just trying to give you  
16 the answer on the question. I've eliminated on part  
17 of page 4, all of page 5, almost all of page six,  
18 part of page 7 and was going to go into the area  
19 that begins in G quite quickly and explore that area  
20 which -- with some degree of who knows how deep I'm  
21 going to get into it. It depends on the answers  
22 that I get.

23 Old story. But then I was going into H  
24 on page 12

25 JUDGE BRENNER: G runs seven through 12.

wage

1 MR. DYNNER: Right.

2 JUDGE BRENNER: And then H.

3 MR. DYNNER: That's what I was planning  
4 to do.

5 If I'm going to switch around now and  
6 have to start on page 14, I would like to have 20  
7 minutes or so at least to try to review what I'm  
8 going to do.

9 MR. ELLIS: Judge, we appreciate that  
10 consideration and we understand the difficulties  
11 that Mr. Dynner has, but we appreciate the Board's  
12 consideration and we sympathize with Mr. Dynner. I  
13 wish that the constraints did not put us in the  
14 position of making this request.

15 JUDGE BRENNER: We can't run late today.  
16 I'll tell you that right now, in case anybody was  
17 considering that.

18 I'm trying to guess how long it would  
19 take Mr. Dynner if we took the time to let him  
20 prepare and then start with page 14, and I don't  
21 think he'd be able to do it fast enough so that the  
22 other parties would have an opportunity to complete  
23 all the follow-up rounds, including follow-up  
24 questions by the County, the Board questions and  
25 staff questions and redirect this afternoon either.

waga

1 so I don't think we'd finish that either. There's a  
2 chance, but hopefully optimistic.

3 I think it would take you about an hour  
4 and a half to go from I to the end, wouldn't it, Mr.  
5 Dynner? Well, I don't have an experience that --  
6 the excess experience that my colleague, Mr. Ellis,  
7 has and, therefore, I don't really know the answer  
8 to that question. I don't know how long it's going  
9 to take. I mean we've had -- sometimes we get an  
10 answer from one witness that's short, sometimes we  
11 get an answer from seven witnesses that's long, so --

12 JUDGE BRENNER: And when you get short.  
13 even if you get short answers it's going to take  
14 about an hour and a half, and that's optimistic in  
15 terms of being on the lower end of the time scale.  
16 In my opinion so that won't solve the problem either,  
17 I don't believe. It would help because then you  
18 could always start crankshafts this week if we  
19 solved your other problem of what to do with Dr.  
20 Pischinger's testimony on the record heretofore on  
21 the other subject. I'm reluctant to take 20 minutes  
22 of the hearing now and find out it was for naught.

23 MR. ELLIS: I think that's right, Judge.  
24 I think the best thing to do is just go ahead and  
25 let's get as much done as we possibly can and

waga 1 reassess things at the end of the day.

2 JUDGE BRENNER: I'd be willing to  
3 consider skipping subjects a little if you find that  
4 Dr. Pischinger can't be here the week after next.  
5 If you want to talk about coming back after to that  
6 subject in the near future week, not a particular  
7 week, but from a time frame forward for that.

8 MR. ELLIS: Yes, sir. Well, I will  
9 discuss that with Dr. Pischinger.

10 JUDGE BRENNER: I think you'd better,  
11 okay. All right, Mr. Dynner. You may proceed as  
12 you had planned to.

13 BY MR. DYNNER:

14 Q. Page 7.

15 Gentlemen, I'm going to ask you to please  
16 refer to page 43 of your testimony and Exhibit P-23  
17 of LILCO exhibits.

18 Gentlemen, as I understand, FAA has  
19 concluded that cracks might initiate in the AE  
20 skirts under certain conditions such as under  
21 isothermal conditions with a 11 mil gap in the  
22 piston of relative low yield strength.

23 Now, looking for a moment at Exhibit P-23,  
24 would you identify which of the blocks here, as I  
25 read it, at 11 in the right-hand part, where it says

waga

1 11, and then next to an open square isothermal and  
2 then next to the block square, it's blacked out,  
3 it's an 11 steady state, does that refer to the 11  
4 mil gap?

5 DR. HARRIS: Yes, Mr. Dynner, that's  
6 correct.

7 Q. And this crack initiation as shown by  
8 this document exists where you have the gap shown to  
9 the right of the solid diagonal on the left-hand  
10 side of the chart or to the left of that diagram?  
11 The diagonal I'm referring to says M I N sigma YS.

12 DR. HARRIS: In this particular exhibit,  
13 if the dot falls to the left of the diagonal line on  
14 the left hand portion of the figure, the cracks are  
15 predicted. Then cracks are predicted to initiate.

16 Q. So that would you explain why there are  
17 two open squares showing 11 mil gaps, one to the  
18 left of the sigma YS minimum line and one to the --  
19 inside that line

20 DR. HARRIS: As shown at the top of page  
21 4-3 of what I have been referring to as the thermal  
22 distortion report. And I'm not aware of whether  
23 this report has been entered as an exhibit. Let me  
24 give you the Failure Analysis Associates' report  
25 number, it's FaAA-84-5-18 dated June 1984, and I'm

waga

.1 sure that the County has been supplied with a copy  
.2 of this reference.

.3           At the top of page 4-3, it states in the  
.4 second sentence: "Two results are shown for each  
.5 set of conditions corresponding to the minimum and  
.6 the maximum values from table 4-1." I'd like to  
.7 amplify that to say the two results shown correspond  
.8 to the two results for each case that Mr. Dynner  
.9 identified in his question. The two results are  
10 shown corresponding to the two sets maximum and  
11 minimum conditions from table 4-1.

12           Turn to table 4-1 of the same report  
13 which is on page 4-6, the minimum and maximum  
14 results referred to different sets of skirt  
15 stiffnesses that were estimated from the  
16 experimental results.

17           If you look at table 4-1, there's two  
18 sets of results, one for an AE, one for an AE  
19 piston skirt. Concentrating on the results for the AE  
20 piston skirt, there are four columns. One for  
21 stiffness is based on the finite element  
22 calculations. And three others, based on nominal.  
23 minimum and maximum stiffnesses estimated from  
24 experimental observations derived from the strain  
25 gage measurements.

waga

1 I would like to point out that the two  
2 sets of -- two sets of results for each condition  
3 are very close to one another and serve to show the  
4 range of results that were obtained, both from the  
5 stiffnesses from the finite element results and the  
6 stiffnesses from the experimental observations.

7 In most instances the conclusions to be  
8 drawn from each of these sets are not altered by  
9 whichever set you use.

10 In the particular case that Mr. Dynner  
11 identified where we have the open squares, the  
12 conclusion regarding crack initiation could be  
13 changed if you were in a skirt with the minimum  
14 yield strength.

15 Dr. Swanger just pointed out to me in  
16 LILCO Exhibit P-17 much of the same type of  
17 information is presented, only for the AE.

18 In the particular instance of the two  
19 sets of results that you pointed out, you could come  
20 to a different conclusion regarding whether or not  
21 cracks would initiate; however, even the more  
22 favorable result is so close to the minimum yield  
23 strength line that any prudent engineer would check  
24 further to see whether or not cracks would propagate  
25 if they did happen to initiate, and they did go on

waga

1 to analyze the analysis of the possibility of  
2 propagation cracks in the AE skirt. And the  
3 conclusion from those results are that cracks will  
4 not propagate in the skirt even if they were to  
5 initiate.

6 Q. I'm just going to continue for a few  
7 questions just so I can try to understand this  
8 document at Exhibit 23.

9 As I understand your testimony, there  
10 were two factors. One is the size of the gap, and  
11 the other is the yield strength of the material  
12 which could influence whether or not the cracks  
13 might initiate; is that correct?

14 DR. HARRIS: A third factor is whether or  
15 not you are under isothermal conditions or steady  
16 state conditions.

17 Q. Fine. I'm going to get to that in minute.  
18 Now, looking at this document again,  
19 where would one be able to identify the yield  
20 strength of the material?

21 DR. HARRIS: The yield strength of --  
22 If you look down on the horizontal, if  
23 you look down on the horizontal axis in Exhibit P-23,  
24 the yield strength of the material is the intercept  
25 of the line with that horizontal axis.

waga

1                   From there you could identify the yield  
2 strength that was used in the drawing of this  
3 exhibit.

4           Q.     So this was a yield strength of what,  
5 approximately 30 to 32 or something like that?

6           DR. HARRIS:   Perhaps you misunderstood  
7 my statement.

8           Q.     All right.

9           DR. HARRIS:   Because I read more like 62  
10 to 65.

11          Q.     I'm sorry. I see what you mean. The  
12 base line in effect is the yield strength.

13          DR. HARRIS:   On the horizontal axis, the  
14 point at which the diagonal line intersects  
15 corresponds to the yield strength.

16                 Perhaps Exhibit P-21 would be a clearer  
17 representation of the procedures that you go through  
18 to draw this modified Goodman diagram.

19                 You can see on Exhibit P-21 that where  
20 you can see two sigma sub YS, that's the yield  
21 strength of the material.

22                 There's also on the vertical axis another  
23 sigma YS so the yield strength figures prominently  
24 in the drawing of this modified diagram.

25          Q.     Are these two squares which are hollow

waga

1 which represent the 11 mil gap isothermal and one is  
2 shown as, I think you said, predicted to initiate a  
3 crack and the other is not, which of those  
4 represents the skirt stiffness ascertained from the  
5 finite element analysis and which represents the  
6 skirt stiffness ascertained from the experimental  
7 data?

8 DR. HARRIS: Neither of those represent  
9 the results drawn from the finite element analysis.  
10 Both of them use the stiffnesses determined by use  
11 of the strain gage observations, and the minimum and  
12 maximum bracket, the results obtained from the  
13 finite element evaluation of the stiffnesses.

14 This could be seen by turning to Exhibit  
15 P-17 and looking at the cyclic stresses under  
16 isothermal and steady state conditions on this  
17 figure. There are some intermediate -- very  
18 elementary intermediate calculations in going from  
19 the results on Exhibit P-17 to those on Exhibit P-23,  
20 but if you -- as an example, and I'll give you one  
21 example, not give you all of them, in order to  
22 expedite matters here, if you look at the -- in  
23 Exhibit P-17, there's a -- over on the column to the  
24 left, coming down towards the middle there's a row  
25 that's labeled sigma isothermal.

waga

1                   And you go over two more columns and look  
2   at the row that has an 11 by it, that's the G sub  
3   zero which is at the head of that column, that's the  
4   gap of 11 mils. The minimum stress under isothermal  
5   conditions, and you can see that going to the two  
6   columns furthest to the right which is the minimum,  
7   the maximum that we are discussing, there is a number  
8   minus 63.8 for minimum and maximum of minus 68.1.

9                   Going over the fourth column in from the  
10   right, under the column labeled FE at the top, which  
11   is finite element, you can see sigma equals minus  
12   66.7 which falls between the minimum/maximum values  
13   that I discussed a moment ago.

14                  DR. SWANGER: Just as a point of  
15   clarification, Dr. Harris has been using the term  
16   sigma minimum for minimum stress. He's referring to  
17   the algebraic smaller stress. These are all  
18   negative stresses but in truth they are the stresses  
19   which have the maximum absolute value, so these are  
20   indeed the highest absolute value stresses, the ones  
21   that contribute to fatigue cracking.

22                  DR. HARRIS: A comparison of the finite  
23   element sigma and the corresponding values estimated  
24   by use of the stiffness from the experimental  
25   observations, you can see that the finite element

waga

1 result falls midway between the two extremes  
2 estimated from the experimental stiffnesses;  
3 therefore, if you were to plot the finite element  
4 result on Exhibit P-23, it would fall somewhere  
5 between the two open squares.

6 This serves to show that the mean and  
7 cyclic stresses that we estimate using these various  
8 sets of stiffnesses are very close to one another,  
9 and, therefore, the substance of the conclusions  
10 would not change if you were to use different sets  
11 of the stiffnesses. No matter which stiffness you  
12 use, you're going to conclude that cracks may  
13 initiate but will not propagate in the AE piston  
14 skirt under either steady state or isothermal  
15 conditions.

16 Q. If you had, reading this chart further,  
17 is it correct to say that generally that if the gap  
18 was in excess of .11 mils isothermal you could expect  
19 initiation of the crack and if -- in other words,  
20 the smaller the gap the less likely it is for a  
21 crack to initiate, the larger the gap, .11 mils and  
22 up, the more likely it is for cracks to initiate?

23 MR. ELLIS: Objection. The question is  
24 compound so when the answer comes we won't know  
25 whether he was answering specifically to the mils or

waga

1 whether it is not generally part of the question.

2 JUDGE BRENNER: Break it up a little bit,  
3 please.

4 Q. Yes. Is it correct that for a gap of  
5 greater than 11 mils in an isothermal condition that  
6 cracks would be more likely to initiate than for a  
7 smaller gap?

8 DR. HARRIS: I would first like to point  
9 out the gaps in the piston skirts at the Shoreham  
10 Unit have been measured and there are none that  
11 exceed 11 mils.

12 Q. Well, that's not -- you've answered my  
13 question. I'll get to that in a minute.

14 DR. HARRIS: If the gap, hypothetically  
15 if the gap was larger than 11 mils under isothermal  
16 conditions a crack would be more likely to initiate,  
17 however the engines are not operated under  
18 isothermal conditions.

19 I would also like to point out that we  
20 have also -- we have done the crack propagation  
21 analysis for a gap that never closes, so that would  
22 be a gap much bigger than 11 mils and you still come  
23 to the conclusion the cracks may initiate but will  
24 not propagate in an AE piston skirt, so the bottom  
25 line --

waga

1           Q.     We'll get to propagation. Right now I'm  
2 talking about initiation.

3                     Can you explain for me for a moment why  
4 it is that under steady state conditions, according  
5 to this chart, there is one situation in which a gap  
6 of 7 mils is shown to be more likely or at least  
7 it's closer to the left towards the line for the  
8 minimum stress than the steady state 11 mil gap? You  
9 see where you have the blacked out square in one  
10 case to the right of the blacked out triangle?

11                    DR. HARRIS: Yes, I see what you are  
12 pointing out, Mr. Dynner. And what is occurring in  
13 this case is that the placement of the dot on this  
14 graph, that is, the mean and cyclic stresses are  
15 more dependent on the estimates of the spring  
16 constants that you use when you're analyzing a  
17 piston under steady state conditions. This is shown  
18 by the fact that the two blackout squares which  
19 correspond to steady state conditions are further  
20 apart than the two open squares which correspond to  
21 the isothermal conditions.

22                    This tells me that the differences in the  
23 extreme values of the estimated mean and cyclic  
24 stresses are further apart under steady state  
25 conditions than they are under the isothermal

waga

1 conditions.

2                   And in this particular case, the  
3 estimates for the 11 and the -- the upper and lower  
4 bound estimates for an 11 mil gap at steady state  
5 conditions overlap the range of estimates for the 7  
6 mils gap under steady state conditions. Nonetheless,  
7 the conclusion remains the same no matter which of  
8 these sets you use for the spring constants,  
9 especially under steady state conditions where  
10 you're further down into the Goodman diagram and  
11 much further away from the points at at which cracks  
12 could initiate.

13           Q.     Dr. Harris, you made the point that  
14 measurements have been taken of the gaps; were those  
15 measurements taken for all of the pistons at  
16 Shoreham?

17           DR. HARRIS: I would prefer to let some  
18 of the LILCO personnel answer that, since they were  
19 involved directly in those measurements.

20           MR. SEAMAN: Mr. Dynner, to answer that  
21 question, we have records that show that the gaps  
22 were measured both when the pistons were initially  
23 assembled and also after the assembly, after the  
24 DRQR inspections when the pistons were disassembled  
25 all indicating the gaps were between 7 and 11 mils.

waga

1 DR. HARRIS: I am familiar enough with  
2 those measurements to know that they were taken at  
3 four different locations around the circumference of  
4 the piston skirt.

5 I can also state that the -- in the  
6 experimental work, the gaps were measured at at  
7 least four locations by myself personally, so the  
8 experimental work that we have is definitely with  
9 pistons that fall within the range of 7 to 11 mils  
10 other than the modified crown that I discussed this  
11 morning.

12 JUDGE BRENNER: Mr. Seaman, maybe I'm  
13 getting tired, but in your answer I didn't hear the  
14 fact one way or the other whether all the pistons  
15 were measured.

16 MR. SEAMAN: I'm sorry; I didn't say that.  
17 I meant to say all the pistons were measured at both  
18 times.

19 JUDGE BRENNER: You told me what all the  
20 measurements disclosed, but it's not necessarily the  
21 same but I've got to know. Thank you.

22 Q. Just to clarify your testimony, Mr.  
23 Seaman, at the bottom of Page 8 for a moment, this  
24 may assist some of my confusion and perhaps the  
25 Board's confusion, there were ten pistons that those

waga 1 gaps were measured as part of the DRQR program and  
2 they're the ones shown in Exhibit P-4; isn't that  
3 correct?

4 MR. SEAMAN: The ten pistons that were  
5 measured by the DRQR program correspond to the ten  
6 pistons that were disassembled as part of the DRQR  
7 inspection program.

8 Q. And that's the material data that's given  
9 in Exhibit P-4; correct? It's on page -- that is  
10 correct, right? Page 8 to 9 of your testimony.

11 MR. SEAMAN: Yes.

12 Q. And you testified that gap sizes were  
13 measured in AE piston skirts when they were  
14 installed in November of 1983. That's on page 80 of  
15 your testimony. And that data is not presented as  
16 exhibits to this testimony; is that true?

17 MR. SEAMAN: I believe that's correct,  
18 yes.

19 Q. And do you know whether any of the gaps  
20 measured in November of 1983 exceeded 11 mils?.

21 MR. SEAMAN: Yes.

22 As I've testified already, the gaps were  
23 measured in November, and none of them exceeded the  
24 seven to 11 mils criteria.

25 Q. Now, going back to page 43 for a moment,

waga

1 in your testimony you mentioned, Dr. Harris, that  
2 the smaller initial gap is beneficial and reduces  
3 the cyclic stress under isothermal conditions, but  
4 contributes to the possibility of momentary crown  
5 lift-off. And then you go on to say that the  
6 lift-off is not detrimental because it does not have  
7 an adverse influence on the operation of the AE  
8 piston skirt in Shoreham and does not increase the  
9 cyclic stress.

10 Now, that testimony conflicts with the  
11 statements on the pages 6-8 and 6-9 of the piston  
12 report which indicates that the momentary lift-off  
13 could increase stresses; isn't that true? Do you  
14 see at the bottom of page 6-8, Dr. Harris, where it  
15 talks about this may result in opening the gap at  
16 the inner ring under inertia loading at center of  
17 the exhaust stroke. Such lift-off would alter the  
18 load path of the stud loads which could increase  
19 sigma maximum substantially above the values used in  
20 this report which assume no lift-off.

21 Could you explain this apparent  
22 inconsistency?

23 MR. ELLIS: I object. I think the  
24 original question is is it inconsistent. He said  
25 its apparent inconsistency and he goes ahead to

waga

1 explain then the record suggests its apparent  
2 inconsistency.

3 JUDGE BRENNER: The cross-examiner is  
4 allowed some leeway to ask the questions his way,  
5 Mr. Ellis, and it's my belief that you can get the  
6 very same answer phrased the way Mr. Dynner phrased  
7 it or the way you phrased it. He's not asserting  
8 there's an inconsistency and then going on to a  
9 second question based on that my assumption which is  
10 my quarrel.

11 Rather, he's asking the witness to  
12 explain the apparent inconsistency so we should get  
13 his answer. If he had done the other thing I just  
14 described, then you have a valid complaint, but I  
15 think it's going to be the same answer either way.  
16 And now with your objection I'm sure it will be, but  
17 I want to -- just consider whether you need to  
18 object.

19 MR. ELLIS: I withdraw the objection.

20 JUDGE BRENNER: That doesn't matter.  
21 We're beyond that in discussing future purposes. I'm  
22 a little concerned about putting ideas and thoughts  
23 to the witness by being educated through objections  
24 from counsel. I'm not --

25 MR. ELLIS: I object to the first

waga

1 question.

2 JUDGE BRENNER: I'm not implying that was  
3 your motivation but nevertheless I'm concerned as to  
4 that effect and do think about the concern on my  
5 part before you phrase your objection.

6 DR. HARRIS: There is no inconsistency.  
7 Mr. Dynner, and let me explain why, but before I get  
8 to that, let me finish what's on the — the sentence  
9 that comes after the quote that you just provided.  
10 "Such effects," meaning lift-off, "Such effects are  
11 beyond the scope of the current report, which is the  
12 piston report, which considers only isothermal  
13 effects and are the topic of a future report." The  
14 future report being the thermal distortion report  
15 that I mentioned a short while ago, that is, report  
16 FaAA-84-5-18.

17 The cyclic stress is determined by two  
18 different numbers, the maximum stress and the  
19 minimum stress. So you're looking for the largest  
20 differences in stress during the stress cycle,  
21 during a combustion cycle of the engine. So there  
22 are two numbers that go into the determination of  
23 the cyclic stress. One of these is the maximum  
24 stress. One is the minimum stress.

25 The closing of the gap actually reduces

waga

1 the cyclic stress and, therefore, improves  
2 conditions as far as crack initiation is concerned.  
3 The statement in the piston report that  
4 Mr. Dynner just quoted says that lift-off could  
5 increase sigma max substantially above the values  
6 used in this report and, indeed, it does increase  
7 sigma max above the value, but simultaneously with  
8 this, the steady state operating conditions also  
9 have a big influence on sigma minimum. The cyclic  
10 stress is changed a lot. The maximum stresses  
11 change a bit, and the net result is that you -- when  
12 you reduce the cyclic stress you're improving  
13 conditions from a fatigue crack initiation  
14 standpoint. In spite of the fact that the maximum  
15 stress can be increased due to the lift-off under  
16 steady state operating conditions.

17 I can certainly see the source of your  
18 confusion in this, Mr. Dynner. Hopefully, this  
19 explanation will help to clarify matters.

20 JUDGE BRENNER: That last part wasn't  
21 necessary, Dr. Harris. You stated the facts. I am sure you  
22 said it to be courteous, but it wasn't necessary.

23 BY MR. DYNNER:

24 Q. Gentlemen, I'm going to proceed now on to  
25 page 44 of your testimony.

waga

1                   If the crack that your finite element  
2 analysis under certain conditions exists were to  
3 initiate, how large is the crack that initiates?

4                   DR. HARRIS: In order to draw the  
5 conclusion that we do from the fracture mechanics  
6 analysis it is not necessary precisely to define the  
7 size of the initiated crack because the fracture  
8 analysis shows that cracks -- hypothesized cracks up  
9 to one half inch in depth are not going to propagate;  
10 therefore, the initiated size is really not a  
11 necessary input to our analysis as long as it's less  
12 than half of an inch.

13                  Q.     That's after the fact, isn't it, Dr.  
14 Harris, that's after you've done the fracture  
15 mechanics analysis for propagation?

16                  I'm asking you, you've predicted from  
17 your finite element analysis that you may have a  
18 crack initiation. My question is how big would the  
19 crack be that initiates.

20                  DR. HARRIS: As I said, it's not  
21 necessary to precisely define that in order to  
22 perform the fracture mechanics analysis to see  
23 whether or not the crack will grow.

24                  A standard estimate of the size of  
25 initiated cracks is about ten mils, but I would like  
26 to emphasize that that's not a critical input not

waga

1 fracture mechanics nor the crack initiation analysis  
2 nor to any part of our analysis.

3 DR. MC CARTHY: And also it should be  
4 remembered that ten mils begins to correspond to the  
5 sort of size that people can find and, therefore,  
6 has acquired some currency as an initiated crack,  
7 but I would defer to Dr. Johnson on this, but my  
8 knowledge there is no stated definition at what size  
9 of crack it's initiated. As long as you find it's  
10 initiated below ten mils it gets more difficult to  
11 find even.

12 Q. In my problem in understanding this, when  
13 you state that a crack won't initiate and won't  
14 propagate, how do you know it didn't initiate at  
15 five mils and propagate to 15 mils and then you've  
16 discovered it?

17 DR. MC CARTHY: There are very few  
18 mechanisms that I'm aware of besides just plain  
19 rupture and overload which will bring a crack into  
20 existence at five mils. I mean most all fatigue  
21 theory depends at least some sort on the supposition  
22 and there's nothing -- there is not to my knowledge  
23 across the board agreement on exactly the -- the  
24 mechanisms of initiation but basically a crack will  
25 start growing and at some time it's below one mil

waga

1 and it grows to two mils and three mils and so on  
2 down the line. It always starts at something  
3 smaller than, you know, besides overload, something  
4 smaller than that. Fracture mechanics is the  
5 science that's concerned with a crack, by whatever  
6 reason it comes about is it going to go anywhere,  
7 and really what fracture mechanics is determined in  
8 bounding what kind of flaw, what kind of crack won't  
9 grow anywhere. Indeed on the AF pistons, those  
10 cracks did start, they grew and arrested, and that's  
11 the normal situation for a crack arrest. A crack  
12 will occur in driving mechanism such as a localized  
13 high stress, grow into a region of low stress and  
14 stop.

15 Q. What confuses me, Dr. McCarthy, is that  
16 I've heard a number of times, numerous times in the  
17 last two days in addition to your -- in your answers  
18 in addition to your testimony that a crack might  
19 initiate but won't propagate. Now it seems to me  
20 you're saying it will propagate. It might be from  
21 one mil to five mils but then it will arrest. Is it  
22 that what you meant by a crack will propagate?

23 DR. MC CARTHY: No. Not precisely.

24 Assume any size crack, okay, or flaw, or  
25 crack-like flaw which is what everybody really

IMAGE EVALUATION  
TEST TARGET (MT-3)

IMAGE EVALUATION  
TEST TARGET (MT-3)

waga

1 worries about. If it is below a half inch, it  
2 doesn't go anywhere. It does not grow.

3 Q. How does it get to a half inch?

4 DR. MC CARTHY: We don't -- like I told  
5 you yesterday my personal belief is you won't ever  
6 see cracks in these pistons.

7 Q. You predicted a crack might initiate; I'm  
8 just trying to take that as the assumption, and I  
9 know you testified many, many times that you really  
10 don't think that you're going to have any initiating  
11 in your own personal opinion although your report  
12 says that it might.

13 What I'm trying to get at is -- it's not  
14 to go somewhere to be seen, to be discovered. You  
15 yourself just said, it doesn't start suddenly at ten  
16 mil, 15 mil, you start at one and goes to two and  
17 goes to three.

18 I would like an explanation for how the  
19 crack gets from one to three mils without  
20 propagating.

21 DR. MC CARTHY: This is an interesting  
22 philosophical question for engineers and has been  
23 for quite some time. When does a crack come into  
24 existence. Basically what our conclusions are for  
25 the AE is that a crack or flaw-like imperfection

waga

i will not propagate if it is below a half inch.

2           Now, this flaw could be a simultaneous  
3 gas coalescence of a few angstroms long, it could be  
4 a dislocation coalescence that would be barely  
5 measurable. Assume for a moment, contrary to what  
6 we find, that there was a small surface imperfection  
7 of a kind below the size that we were able to detect  
8 that is below a 32nd of an inch. Regardless of what  
9 type of hypothetical flaw you put in a stud boss  
10 area of the AE piston, it will not propagate.

11           We are not postulating that a small crack  
12 originates, grows to some finite size and stops.  
13 That is what happened in the AF piston. That is not  
14 what would postulate for the AE piston. Choose your  
15 postulated flaw. If it's below a half inch in size  
16 in the AE piston, it goes nowhere. It grows not.

17           Now, what kind of a small crack-like  
18 feature one wants to call an initiated crack, you  
19 can come up with a number of postulations. Suffice  
20 it to say, whatever you postulate, and regardless of  
21 how it springs into existence, if it's below a half  
22 inch, it's going nowhere.

23           Q. Dr. McCarthy, I don't want to talk about  
24 flaws in casting now. I want to talk about the  
25 crack that you predict could initiate given a

waga

1 particular gap size and a particular material. On  
2 that chart that we just looked at at Exhibit 32 --  
3 or 23, I'm very sorry, P-23, in P-23 in your  
4 analysis of crack initiation doesn't presume the  
5 existence of any flaws, casting flaws or sand  
6 inclusions or anything like that; does it?

7 MR. ELLIS: I want to object to the first  
8 part of his characterization because I don't think  
9 it was correct. I don't have an objection to the  
10 final question. I just don't -- I do have an  
11 objection to the speech that he made on the first  
12 part.

13 JUDGE BRENNER: Sorry. I don't know  
14 which first part you're objecting to. The fact that  
15 he doesn't want to talk about flaws on the casting  
16 or the middle part after that?

17 MR. ELLIS: Yes. And the flaws that he  
18 characterized, what Dr. McCarthy predicted. I  
19 thought his previous answer was perfectly clear on  
20 the subject, but I'm not going to object to the  
21 final part of the question.

22 JUDGE BRENNER: All right. you're going  
23 to answer just the final part.

24 DR. MC CARTHY: What we mean by saying  
25 crack initiation, let's say that there is a field

waga

1 present that can drive a crack.

2 If there is, and it meets the criteria of  
3 the Goodman diagram, the crack will originate itself  
4 or has a possibility of initiating itself, if  
5 there's a field to drive it.

6 If you don't have a field to drive it, it  
7 may never grow. In fact it's postulated not to grow  
8 at all, so they will not be detected.

9 However, in the analysis of fatigue,  
10 there are two very different phases in a crack's  
11 life. There is initiation and propagation,  
12 initiation being usually the longer of the two but  
13 not always. The initiation criteria has to be  
14 viewed as something that will mean a crack will  
15 ultimately become detectable only if there's some  
16 cyclic stress field of enough intensity to drive the  
17 micro-initiated crack.

18 Q. By the field to drive the crack, are you  
19 suggesting the proper situation in which the crack  
20 can spring to life and grow to a size where it can  
21 be detected?

22 DR. HARRIS: Mr. Dynner, as Dr. McCarthy  
23 mentioned, the size of an initiated crack is an area under  
24 active discussion amongst engineers and borders in  
25 many ways upon philosophy. I think the important

waga

1 point which I've tried to make and I'll try again is  
2 that -- and this is also another example of the  
3 conservativism that we have built into our analysis.  
4 Let's say a crack initiates -- I'll be conservative  
5 and I'll say --

6 JUDGE BRENNER: Doctor, if I can  
7 interrupt, and forgive me if you're on this point,  
8 but if you are I'll say it, I think the question is  
9 what did Dr. McCarthy mean by the term field to  
10 drive crack, if we can get an answer to that, and if  
11 that's not what Mr. Dynner wants, we'll let him --

12 DR. HARRIS: I'm sorry, that was not the  
13 tack which I was upon.

14 JUDGE BRENNER: Let's try, and Mr. Dynner  
15 can correct me by asking the question.

16 DR. McCARTHY: There has to be the whole  
17 science of analyzing fracture and crack growth. As  
18 we know there are stress conditions which even  
19 though they're cyclic --

20 DR. MC CARTHY: We think from analysis  
21 of cracks and crack growth that there are  
22 variations in stress both in its mean level and  
23 cyclic variation that are sufficient to drive the fatigue  
24 cracks and other mean levels and cyclic variations  
25 which are insufficient to drive T cracks. You must

waga

1 have one of these variable drivers, if you will,  
2 sufficient mean stress and sufficient cyclic  
3 variations to drive an initiated crack, avoiding for  
4 a moment how small of a measure we want to use for  
5 initiation to some size where it would be visible or  
6 what we term measurable, I guess. You have to have  
7 that driving field for this to occur; and this field  
8 in this piston is not favorable for that driving.

9 Q. But you predicted it was favorable under  
10 certain conditions; right?

11 DR. MC CARTHY: No. No. Only that if  
12 you had a favorable driving field, the stresses are  
13 at a sufficient level to cause initiation or close  
14 to the borderline to cause initiation.

15 The whole reason that we have been saying  
16 again and again that the crack has to be at least a  
17 half inch in size is that unless it's that large the  
18 field is not favorable for crack growth.

19 DR. HARRIS: I think there might be some  
20 confusion as to the definition of favorable for  
21 crack growth. I believe Dr. McCarthy is saying  
22 that if it's favorable for crack growth, then the  
23 crack will grow. Such a field is certainly not  
24 favorable from the integrity standpoint of the  
25 piston, because it's not favorable to have a crack

waga

1 growing in your piston.

2 JUDGE BRENNER: That much I understood.

3 We've got it on the record anyway.

4 DR. MC CARTHY: No one is suggesting,  
5 myself included, that we want a field to grow a  
6 crack, but you have to have a certain, what I'll use  
7 instead of favorable strength, loading field in the  
8 mean stress levels are of insufficient strength in  
9 the stud boss level to drive any crack unless it's  
10 bigger than a half an inch.

11 Q. Dr. Harris and Dr. McCarthy, on page 44  
12 in the response to question 69, you refer to the use  
13 of engineering fracture mechanics in modern design  
14 and analysis in structures such as aircraft, space  
15 craft, pipelines and turbines, et cetera.

16 You mean to suggest that fracture  
17 mechanics are used in the design of these various  
18 structures in order to insure that, if there are  
19 defects or crack-like indications, that they won't  
20 propagate to dangerous levels.

21 DR. MC CARTHY: In a nutshell, yes. A  
22 lot of the work we do at Failure Analysis is just  
23 making those analyses for people of critical flaw  
24 size and what kind of a critical flaw can exist in  
25 your structure and I guess I should say to correct

waga

1 that, not just -- there are two things that you can  
2 do.

3 One is a critical flaw size to know your  
4 structure will not fail on overload.

5 And there's a second question. Does a  
6 critical flaw size determine how much you have to go  
7 back and look at your structure. Because not only do  
8 we deal with the analysis of when a crack will  
9 initiate, but indeed how fast it will propagate and  
10 at what size will it begin to affect the critical  
11 nature of your structure. And, in effect, the  
12 engine, the aircraft engine problem here referenced  
13 there, was that was not an a assumption of flaw size  
14 problem as much as a problem to analyze the rate at  
15 which cracks could grow in this field and how often  
16 such parts have to be inspected so that you can  
17 catch any growing crack at the appropriate time.  
18 You didn't have to postulate an initial flaw. These  
19 are expensive parts that are extensively inspected  
20 but come out with no real measurable flaws but, in  
21 fact, operate in the initiation range and, in fact,  
22 a crack would initiate and grow. And this was to  
23 establish their inspection interval.

24 DR. SWANGER: I might put this into the  
25 context of AE pistons at Shoreham and that is that

waga

1 our analysis says that no cracks are possible to  
2 propagate in these pistons; therefore, they do not  
3 need any reinspection. An initial inspection upon  
4 manufacture is sufficient to show that there are no  
5 cracks, and we have demonstrated through fracture  
6 mechanics that no further operational inspections  
7 are required.

8 Q. Was fracture mechanics used in the design  
9 of the AE piston skirt by DeLaval?

10 DR. MC CARTHY: It was used in our  
11 design analysis. We cannot speak for TDI's  
12 procedure.

13 Q. On the design analysis --

14 DR. MC CARTHY: It was used in our  
15 design analysis.

16 Q. My question is, was it used by DeLaval in  
17 designing the AE piston skirt?

18 MR. ELLIS objection. Asked and answered.

19 JUDGE BRENNER: The objection is  
20 sustained.

21 Q. Is your fracture mechanics analysis of  
22 the crack propagation in the AE piston one hundred  
23 percent accurate?

24 DR. HARRIS: Based on my 20 years of  
25 experience in the application of fracture mechanics

waga

1 engineering problems, I can confidently state that  
2 the fracture mechanics analysis that we have  
3 performed and the conclusions that we have drawn  
4 from it are as accurate as any engineering design  
5 tool that's being used.

6 Q. What I'm getting at, Dr. Harris, is there  
7 a margin for error that's assumed in these things?  
8 You say -- before, for example, you gave an answer  
9 that something was accurate plus or minus five  
10 percent.

11 Do you have some kind of sensitivity  
12 envelope where you say that this is 80 percent  
13 accurate or a hundred percent or 90 percent sure or  
14 there's a 10 percent margin for error?

15 Dr. Swanger, are you an expert in  
16 fracture mechanics also? The testimony is of Dr.  
17 Harris and Dr. McCarthy. I'd like to get their  
18 response to the question and then you can confer  
19 with them afterwards, if you don't mind.

20 DR. HARRIS: Could I please have the  
21 question repeated.

22 Q. I'll rephrase it.

23 In making your prediction in your  
24 fracture mechanics analysis, is there taken into  
25 consideration some margin for error? Do you assume

waga

1 that it's one hundred percent accurate or is it 90  
2 percent accurate? Have you taken any sensitivity  
3 into consideration as to the accuracy of your  
4 analysis?

5 DR. HARRIS: We have certainly allowed  
6 for a margin of error in our analysis. It's very  
7 difficult to put the percentage number on it.

8 Invariably, we have selected conservative  
9 values of important input variables to the problem.

10 In cases where we did not have precise  
11 measurements other than strain gage measurements in  
12 most instances, we made conservative estimates of  
13 the important input parameters and used these  
14 conservative estimates of the input parameters in  
15 our analysis of the possibility of crack propagation  
16 in the AE pistons skirt. And even taking any of these  
17 conservative values, putting them into the analysis  
18 we still invariably conclude that cracks will not  
19 grow in the AE piston skirt. However, to  
20 quantify the degree, percentage of confidence that  
21 we have in our results, it's very difficult to  
22 actually quantify that, but I would say -- I am at  
23 least 95 percent confident that cracks will not grow  
24 in the stud boss region of the AE skirts as they  
25 will be operated in the engines at Shoreham.

waga

1 DR. MC CARTHY: If I could just add to  
2 the last answer, as a result of the operating  
3 experience that I alluded to previously when this  
4 problem came up before and the successful running of  
5 the ten pistons for a hundred hours, statistically  
6 the confidence and degree of comfort we have with  
7 conclusions that there will not be any crack growth  
8 in the AE pistons is extremely high. Once again, I  
9 don't know how to put a number on it, but certainly  
10 in excess of 95, certainly in excess of 99 percent  
11 confident. It's just a matter of such a small  
12 probability, it really is tough to put a number on  
13 it but we are extremely confident of our predictions in  
14 this regard.

15 DR. HARRIS: The predictions are not  
16 border line, as is brought out by a number of exhibits  
17 in the testimony. Perhaps to point out to the most  
18 compelling one, the exhibit, I believe, 34, where we  
19 have --

20 MR. DYNNER: I haven't asked a question,  
21 Judge Brenner. I'm getting all kind of -- the  
22 answer to the question, there was a five minute gap,  
23 not 11 mil gap and I think getting some he  
24 elaboration here that I think may be in the direct  
25 testimony and it certainly is not responsive to my

waga

1 question which was answered.

2 JUDGE BRENNER: Let's get the answers in  
3 off at this point and if there's something you want  
4 to get in, check with your counsel. Let's go off  
5 the record.

6 I want to go off the record. We'll take  
7 a break until 3:05 to go off the record.

8 (Afternoon recess)

9 BY MR. DYNNER:

10 Q. We're on page nine of the cross plan,  
11 Judge Brenner.

12 Dr. Harris, was the fracture mechanics  
13 analysis, if it was done on the AE piston made  
14 according to the same methodology as the fracture  
15 mechanics analysis that you performed on the AF  
16 piston skirt?

17 DR. HARRIS: Yes, Mr. Dynner. The  
18 underlying procedures involved were very similar, if  
19 not identical between the AE and the AF piston skirt.

20 Q. Well, for instance, on page 6-8 of the piston  
21 report, it's true, isn't it, that you've given an  
22 explanation of the fatigue crack growth analysis that you  
23 performed on the AF piston skirt, and then you have  
24 a sentence in the first full paragraph of page 6-8  
25 that says corresponding fracture mechanics

waga

1 calculations for the AE piston skirt reveals that no  
2 crack depths provide Delta K and R values that  
3 exceed threshold conditions. By the use of the word  
4 corresponding calculations, does that indicate that  
5 whatever differences there were in the methodology  
6 were not significant?

7 DR. HARRIS: The methodologies employed  
8 on the two different types of skirts were the same.

9 Q. All right.

10 Now, do you have the same degree of  
11 confidence in the fracture mechanics analysis  
12 conclusions on the AF skirt that you just testified  
13 to with respect to your conclusions on the AE skirt,  
14 Dr. Harris?

15 DR. HARRIS: Yes, I do.

16 Q. All right. And it is true, isn't it, Dr.  
17 Harris, that when you look on Page 8-1 of the piston  
18 report, it concludes in the last, but under  
19 paragraph one that in no case are cracks predicted  
20 to propagate to a depth of more than 0.150 inch, and  
21 that's talking about the AF skirt; isn't it?

22 DR. HARRIS: That is, indeed, referring  
23 to the AF skirt, and it refers to the results of the  
24 analysis that was performed using the isothermal  
25 techniques that are reported in the report to which

waga

1 you just referred.

2 Q. Yes, but, in fact, notwithstanding that  
3 prediction, Dr. Harris, it's true, isn't it that,  
4 that the isothermal is -- you've testified before --  
5 you said before it was done according at the  
6 isothermal -- well, what did you just say about  
7 isothermal?

8 DR. HARRIS: What did I just say about  
9 isothermals.

10 (The last answer is read back)

11 Q. In the isothermal techniques are  
12 conservative in your view, is that correct?

13 DR. HARRIS: The isothermal stresses are  
14 conservative from a fracture -- from a crack  
15 initiation standpoint.

16 Q. But they're not -- are they not  
17 conservative from a crack growth standpoint?

18 DR. HARRIS: They are not necessarily  
19 conservative from a crack growth standpoint. The  
20 reason for this is -- can be seen by comparing the  
21 crack growth analysis in the AF skirt that was  
22 performed under isothermal conditions or using the  
23 stresses developed for isothermal conditions in the  
24 piston report, comparing that to the results of the  
25 fracture mechanics calculations on the AF skirt

waga

1 under steady state operating conditions that are  
2 reported in the thermal distortion report, the FaAA  
3 34-518.

4 The calculations on the AF skirt using  
5 the stresses determined under isothermal conditions  
6 predict that in no case will cracks deeper than .150  
7 inches propagate in the AF skirt, whereas turning to  
8 the thermal distortion report, on table 4-2, page  
9 4-7, there are additional calculations of crack  
10 propagation or the arrested depth of cracks that  
11 could propagate in the AF skirt, and it is seen that  
12 the arrested depth can be deeper than the .150  
13 inches determined using the stresses under  
14 isothermal conditions.

15 Q. How deep would those be?

16 DR. HARRIS: The largest number that I  
17 see on table 4-2, page 4-7 of the thermal distortion  
18 report is .494 inches.

19 So indeed under the steady state  
20 operating conditions the sigma max is increased  
21 if lift-off occurs and it's the sigma -- and the  
22 sigma max has a noticeable influence on the crack  
23 propagation and the arrest depths.

24 Q. Dr. Harris, could you explain on page 46  
25 of your testimony then where in answer 72 you

waga 1 testified that as temperature increases the fracture  
2 toughness increases. That's what that led me to  
3 believe, as I asked you in the question, that under  
4 higher temperatures if the fracture toughness  
5 increases then the likelihood of crack propagation  
6 would decrease.

7 Would you explain that for me?

8 Dr. Harris, maybe you could answer and  
9 then your colleagues would like to give their views.

10 DR. HARRIS: As stated on page 46,  
11 question 72 of our direct testimony, the fracture  
12 toughness is indeed a function of the temperature of  
13 the material. This is a characteristic of all  
14 ferrous alloys and really does not have any direct  
15 bearing on the difference in the arrested crack  
16 depths that I alluded to in the answer to the  
17 previous question.

18 Q. Well, is it your testimony that fracture  
19 toughness of the material does not have a bearing on  
20 the propagation of a crack in that same material or  
21 the crack growth rate?

22 DR. HARRIS: No, that is not my testimony,  
23 Mr. Dynner.

24 Q. Maybe you could explain it. I'm just not  
25 understanding you.

waga

1 DR. HARRIS: The fracture toughness which  
2 is usually denoted as  $K_{IC}$  is the value of the  
3 stress intensity factor which could be thought of as  
4 the crack driving force, is the value of driving  
5 force above which the crack can go unstable and  
6 result in a final failure.

7 At no time are any of the cracks in the  
8 AE skirt that are predicted to grow near instability.  
9 The  $K_{max}$ , the maximum driving force to which the  
10 crack is subjected never is anywhere near the  
11 critical value of the crack driving force.

12 Therefore, the value of  $K_{IC}$  of 40 ksi root inch  
13 really does not have direct influence on the depth  
14 of arrested cracks.

15 Q. Did you want to add something, Dr.  
16 Pischinger?

17 DR. PISCHINGER: In my understanding, it  
18 adds to the safety of this calculation.

19 DR. HARRIS: I believe what Dr.  
20 Pischinger is referring to is the fact that the  
21 maximum applied crack driving force is never  
22 anywhere near the critical value. It says that the  
23 crack never goes unstable and is just another  
24 example of the safety inherent in any possible crack  
25

waga

1 propagation in the AE skirt.

2 JUDGE BRENNER: We're waiting for the  
3 next question, Mr. Dynner.

4 BY MR. DYNNER:

5 Q. Dr. Harris, turn for a moment to Exhibit  
6 P-25, which is referenced in your answer 76 on Page  
7 49.

8 Dr. Harris, why did you assume in P-25 a  
9 seven mil gap rather than an 11 mil gap? You see in  
10 your testimony in question 76 you state that Exhibit  
11 P-25 shows the representative values of R and Delta  
12 K for various hypothesized crack depths for an  
13 AE piston skirt with a .007 inch gap operating  
14 under steady state temperature conditions.

15 DR. HARRIS: I would like to continue on  
16 with your quote. Next sentence reads: "This is the  
17 most severe condition from a crack propagation  
18 standpoint." By that I mean an 11 mil gap has a  
19 smaller maximum stress and is less severe. The  
20 cyclic stresses in an operating piston with an 11  
21 mil gap are less severe from a crack propagation  
22 standpoint than those for a seven mil gap. So for  
23 illustration purposes, we took the worst result and  
24 included them in Exhibit P-25.

25

waga

1 Q. Is the reverse true for crack initiation,  
2 that is, that an 11 mil gap is more likely to result  
3 in crack initiation than a 7 mil gap?

4 DR. HARRIS: yes, Mr. Dynner. That's  
5 correct. Once again, it's the difference between  
6 cyclic stresses and maximum stresses. All of these  
7 are important contributors to crack initiation and  
8 crack propagation.

9 Q. Is it correct that you conclude that the  
10 cyclic stress is the most important fact for crack  
11 propagation.

12 DR. HARRIS: No. It is not true that I  
13 conclude that. It's both -- it's the maximum stress--  
14 the maximum stress, I believe, has the most  
15 important influence. The minimum stress is also  
16 important from the crack propagation standpoint.

17 Q. Which are cyclic?

18 DR. HARRIS: The maximum minus the  
19 minimum is the cyclic. To clarify matters, in some  
20 cases one half the maximum minus the minimum is the  
21 cyclic stress amplitude.

22 Q. Why is this seven mil gap the most severe  
23 condition for crack -- well, let me rephrase that  
24 question.

25 Does the fact that this is the most

waga

1 severe condition for crack propagation have anything  
2 to do with the possibility of momentary lift off of  
3 the crown from the skirt?

4 DR. HARRIS: Yes, Mr. Dynner, it does.

5 Q. Is that the most important factor that  
6 makes the seven mil gap the most severe condition  
7 for crack propagation?

8 DR. HARRIS: Mr. Dynner, are we still  
9 talking about AF piston skirts or —

10 A. AE. We're talking about page 49, answer 76 of  
11 your testimony. That deals with the AE skirt;  
12 doesn't it?

13 DR. HARRIS: Yes, it does.

14 The P-25 also, of course, refers to the  
15 AE piston skirt.

16 JUDGE BRENNER: Why don't you repeat the  
17 question.

18 Q. Is the momentary lift-off of the crown in  
19 the operating AE piston with the seven mil gap the  
20 most important factor that makes this the  
21 most severe condition from a crack propagation  
22 standpoint?

23 DR. HARRIS: I would hesitate to say that  
24 it was the most important factor. I would say that  
25 it is an important factor.

waga

1 Q. Could you briefly state what the other  
2 important factors are.

3 DR. HARRIS: The other important factors  
4 that influence lift-off of the crown from the skirt  
5 or --

6 Q. No. That makes your exhibit P-25 using a  
7 seven mil gap the most severe condition from a crack  
8 propagation standpoint.

9 DR. HARRIS: Under steady state operating  
10 conditions, the seven mil gap provides a greater  
11 propensity for lift-off than 11 mil gap. Once you  
12 do get lift-off you get increases in maximum stress  
13 and the more lift-off you get, the greater the crack  
14 propagation you will calculate. Therefore, the gap  
15 size itself is the most important factor in whether  
16 or not lift-off occurs. Everything else being equal,  
17 such as the thermal distortion of the crown.

18 DR. HARRIS: If I may proceed.

19 Q. Please do.

20 DR. HARRIS: The seven mil gap is very  
21 important factor controlling or contributing to  
22 lift-off. And the other factor is the thermal  
23 distortion and the amount of thermal distortion  
24 depends on whether you are at steady state  
25 conditions or isothermal conditions, but under

waga

1 steady state conditions, the gap is one of the most  
2 important factors influencing lift-off. Others are  
3 skirt stiffnesses, stud stiffnesses, spring  
4 stiffnesses of the stud washer span and so forth.

5 Q. Gentlemen, if you could turn for a moment  
6 to page 16 of your testimony.

7 Now, referring to a moment to your answer  
8 20 -- I'm sorry, answer 19, and Exhibit P in Exhibit  
9 P-7, are the dimensions that were verified that you  
10 refer to in answer 19 the same as the sampling DROR  
11 dimensions which were made and referred to in  
12 Suffolk County's Exhibit 11.

13 MR. ELLIS: While they're looking may I  
14 have that question read back, please.

15 (The record is read)

16 MR. DYNNER: I'll refine the question a  
17 bit, make it perhaps more accurate or more easy to  
18 follow.

19 JUDGE BRENNER: Or shorter.

20 MR. DYNNER: Or shorter.

21 Q. It's true, isn't it, that the  
22 measurements which are shown in Exhibit P-7 for  
23 dimensions are, in fact, the measurements taken for  
24 the dimensional checks which are referred to on  
25 pages B-4 and B-5 of Suffolk County's Exhibit 11

waga 1 which is the DRQR report on the pistons?

2 MR. ELLIS: Judge Brenner, there's an  
3 awful lot of data in P-7 and it seems to me that  
4 this is the kind of question that if we -- maybe we  
5 ought to give the witnesses an opportunity over the  
6 evening, if it's that important, maybe they can  
7 answer it without that, but it seems to me this is  
8 the kind of thing --

9 JUDGE BRENNER: I've got your point. Why  
10 don't you more precisely ask him what particular  
11 data you're interested in. There is a lot in P-7  
12 indeed, especially since that's not going to be your  
13 ultimate point. You're just trying to make a  
14 foundation.

15 Q. The point is, were measurements taken of  
16 the dimensions of the AE piston skirts at Shoreham  
17 other than the dimensional checks on piston groove  
18 and ring height and the piston pin bore diameter in  
19 depths on the AE pistons reported in the DRQR report,  
20 pages B-4 and B-5 that I referenced you in the  
21 County's Exhibit II.

22 DR. SWANGER: In addition to the  
23 dimensional checks that are shown in LILCO Exhibit  
24 P-7 and referenced in the County's Exhibit II,  
25 additional dimensional verification checks were

waga

1 taken of the AE piston skirts which were installed  
2 in the Shoreham engines while they were still in the  
3 TDI plant in California.

4 These checks were taken by Stone and  
5 Webster under their procurement quality assurance  
6 program, and I believe Mr. Seaman can provide you  
7 with more details about the quality assurance  
8 aspects. Inspections of the key dimensions that  
9 Stone and Webster performed.

10 JUDGE BRENNER: Wait a minute. I'm  
11 confused. Wouldn't those be the AF pistons back  
12 then?

13 DR. SWANGER: No, these are the AE  
14 pistons.

15 JUDGE BRENNER: All right. You're  
16 talking about procurement involved in the AE piston.

17 DR. SWANGER: Yes, procurement of the AE  
18 pistons in October and November of 1983.

19 JUDGE BRENNER: I thought you said while  
20 the machines were still at DeLaval shop.

21 DR. SWANGER: If I might, while the AE  
22 pistons were still in DeLaval's shop.

23 JUDGE BRENNER: I misheard you. Go ahead.

24 MR. SEAMAN: As Dr. Swanger has  
25 mentioned, there were dimensional checks as well as

waga

1 liquid penetrant inspections of the stud boss area  
2 performed in the TDI shop. In addition to that  
3 there were normal inspections performed by LILCO,  
4 the startup organization in accordance with our  
5 repair/rework documents. For other dimensions that  
6 are important such as the piston crown gap, for  
7 example.

8 Q. Mr. Seaman, were measurements made of the  
9 dimensions of the boss area of the piston skirt  
10 to verify that they were in conformance with the  
11 drawings, if you know, Mr. Seaman, or anyone else  
12 that knows?

13 MR. YOUNGLING: Mr. Dynner, a whole  
14 series of measurements were taken of the piston  
15 skirts while they were still in Oakland, heights and  
16 diameters, as I remember. I don't remember whether  
17 that particular dimension was taken.

18 Q. Well, if it was taken, Mr. Youngling,  
19 would those measurements be documented in and  
20 maintained by LILCO?

21 MR. YOUNGLING: Yes. They would have  
22 been part of the documentation -- release  
23 documentation that Stone and Webster would have put  
24 in place prior to shipping the piston skirts.

25 Q. Do you know whether those measurements

waga 1 showed any deviations from the drawings?

2 JUDGE BRENNER: Wait a minute. He said  
3 he didn't know whether the measurements were taken.  
4 We're still talking about the measurements of the  
5 stud boss, correct?

6 MR. DYNNER: He said he didn't know  
7 whether those were taken. He said others were taken  
8 and I wanted to know whether the ones that were  
9 taken showed any deviation from the drawings. Sorry  
10 I didn't make that clear.

11 MR. YOUNGLING: Since the pistons were  
12 shipped, the conclusion is that all dimensions were  
13 satisfactory.

14 Q. You say since they were shipped, would  
15 you define --

16 MR. YOUNGLING: Without, because the  
17 dimensions were satisfactory, the pistons were  
18 released for shipment and accepted.

19 DR. HARRIS: While we're on that subject  
20 of measurements of the piston skirt, I would like to  
21 point out that there were numerous measurements made  
22 on actual piston skirts that were supplied to  
23 Failure Analysis Associates in order to make  
24 measurements for construction of the finite element  
25 models and the piston that was supplied to Failure

waga

1     Anaylsis Associates was from the same lot of pistons  
2     that was supplied by TDI to LILCO. Our finite  
3     element modelers including myself made extensive  
4     measurements off these pistons in order to have  
5     inputs for the computer finite element model. Such  
6     measurements, of course, are necessary in order to  
7     construct the models in an accurate fashion.

8           Q.     In your experience, any of you, are there  
9     variations in the dimensions of the various AE  
10    piston skirts? When I say variations, I'm talking  
11    about from the piston skirt to piston skirt rather  
12    than the same area from piston skirt to piston skirt.

13           DR. SWANGER: Yes. As with any  
14    manufactured part, there are tolerances which are  
15    determined through engineering calculations, and the  
16    machining there is on the AE pistons will exhibit  
17    these machining tolerances in the order of a few  
18    thousandths of an inch but within the tolerances as  
19    specified by TDI and these will be the dimensions  
20    that were checked by Stone and Webster.

21           As for the highly stressed stud boss area  
22    that's an as cast surface of the AE skirt and as  
23    such is a metal replica of the pattern equipment  
24    that is used to produce the pistons. Since all of  
25    the AE pistons were made from the same pattern

waga

1 equipment in the highly stressed area they are all a  
2 replica of one pattern and thus are very close to  
3 the same.

4 The degree of uniformity between them is  
5 immaterial to the analysis that we made and  
6 immaterial to our conclusions.

7 Q. I'm going to now refer you to page 17,  
8 question 21. What vapors are present in the crank  
9 case?

10 DR. SWANGER: I'll begin by telling you  
11 my understanding, perhaps Professor Pischinger will  
12 be able to confirm it, but the major vapors that are  
13 present in the crank case of an operating diesel  
14 engine are from the blow by from the combustion  
15 process and that would be comprised primarily of  
16 nitrogen along with carbon dioxide and carbon  
17 monoxide, water vapor, some unburned hydrocarbons  
18 and some oxygen as well.

19 In addition, there would be vapors from  
20 the lighter fractions of the lubricating oil which  
21 would be in an assortment of short chain hydrocarbons,  
22 and some oxygen as well. In addition, there would  
23 be vapors from the lighter fractions of the  
24 lubricating oil which would be in an assortment of  
25 the short chain hydrocarbons, perhaps C3 through C7

waga

1 or C8 hydrocarbons vapors present in the gas phase  
2 within the crank case, and perhaps Professor  
3 Pischinger will enlighten us more on this.

4 DR. PISCHINGER: I think the main  
5 components have been mentioned, but I should add  
6 that excess of these adhere to a metallic surface  
7 within the crank case is usually prevented by the  
8 oil which is sticking to the surface, also during  
9 the shutdown of the engine because of the adhesive  
10 properties of the oil particle, these surfaces stay  
:1 oily and the diesel oil has to be basic, not acid,  
12 but basic and will protect the surface or parts of  
13 the surface of the crank case against any attack of --  
14 if you think of this as opposed to asking in this  
15 direction, of any gases which, if they should be  
16 aggressive.

17 Q. Now, do any of those vapors that you  
18 refer to cause corrosion of nodular iron?

19 DR. SWANGER: The vapors did not cause  
20 corrosion of either AF or AE piston in the engines  
21 at Shoreham due to operation. Both the AFs and AEs  
22 have been inspected after operation with no signs of  
23 corrosion.

24 Q. That's not my question, Dr. Swanger.  
25 Please listen to my question. I said do any of the

waga

1 vapors that you mentioned cause corrosion of nodular  
2 iron.

3 MR. ELLIS: I object to the question  
4 because it's not relevant. The answer was right on  
5 point. We're not talking about any nodular iron.  
6 So it's immaterial to talk about it in the abstract.

7 JUDGE BRENNER: Give us an answer to the  
8 question and then we can have a follow-up or  
9 explanation on redirect. I'm not prepared to rule  
10 that it's immaterial just given the first question  
11 but usually given the answer to question 21 it may  
12 turn out to be the case but cross examiner is  
13 entitled to a little bit of leeway, but we certainly  
14 won't let something go for an hour or even ten  
15 minutes if it's not tied to something apparently  
16 relevant.

17 DR. SWANGER: It is possible that some of  
18 the gases, the water vapor, the oxygen and also one  
19 other that's present that I neglected to mention,  
20 sulfur dioxide could under certain conditions cause  
21 corrosion of nodular iron.

22 Q. Now, if the engine within a shutdown  
23 condition, Dr. Pischinger, would there be less oil  
24 in contact with the AE piston skirt than when the  
25 engine is running?

waga

1 DR. PISCHINGER: Of course, there would  
2 be less oil than when the engine is running, but by  
3 experience, this less oil never will be non oil.  
4 You would need a process of -- chemical process of  
5 oil removal to get a clean -- really metallic clean  
6 surface which can be attacked.

7 Q. Dr. Pischinger, in your experience, have  
8 you ever seen corrosion in a piston skirt in an  
9 engine?

10 DR. PISCHINGER: Yes. In the case, if  
11 the lubrication oil is not changed according to the  
12 rules, so that it gets acid at the time of the  
13 accident, you can get corrosion in case of this  
14 together with very long stand still and water break  
15 in, but my experience is that with the usual oil  
16 treatment that means that you also -- always have  
17 acid -- a base number of the oil which is prescribed,  
18 which would be -- you can get no corrosion.

19 Q. If there's a crack on the inside of the  
20 piston skirt, would there be, in your experience,  
21 sufficient amount of oil that would adhere to the  
22 cracked surfaces to prevent any corrosion from any  
23 of these vapors that we talked about?

24 DR. PISCHINGER: Especially in cracks,  
25 oil accumulates and never goes out.

waga

1 Q. And what did you mean when you said at  
2 very long stand still how long?

3 DR. PISCHINGER: I said this, I think, in  
4 connection with contaminated or -- what's the best  
5 word to indicate -- oil which has become acid --  
6 acid.

7 Q. You've mentioned that sulfur dioxide  
8 might be one of the elements in the crank case, I  
9 think.

10 Mr. Youngling or whoever knows, do you  
11 know what the sulfur content is that's allowable in  
12 the EEGs, the fuel oil I'm speaking of --

13 MR. YOUNGLING: In fuel oil?

14 Q. Yes.

15 MR. YOUNGLING: Mr. Dynner, I'm referring  
16 to the TDI instruction manual in Section 8,  
17 Appendices -- of Appendix No. VIII, Fuel Oil  
18 Specifications, sulfur percent, maximum, 1.05.

19 I don't know the exact number that we're  
20 bringing in but I believe we're down probably around  
21 a quarter a percent. We're much better than the  
22 maximum specified.

23 Q. Can you please turn to Page 20. With  
24 respect to question 28, what is the basis for the  
25 testimony that FaAA did not consider peak firing

waga

1 pressure at overload because the engine operates a  
2 relatively small amount of time under overload  
3 conditions and, therefore, would have little effect  
4 on the initiation and growth of cracks.

5 DR. HARRIS: At the time the piston  
6 report was originally written, we had not considered  
7 pressures under overload conditions. We concentrated on  
8 conservatively estimated firing pressure for one  
9 hundred percent load. This is because the engine  
10 will spend the vast majority of its life at loads of  
11 a hundred percent or less, and in doing our fatigue  
12 analysis, we were interested in infinite life and,  
13 therefore, we concentrated on the firing pressure  
14 that's going to be there, conservative estimate of  
15 the firing pressure that's going to be present for  
16 the vast majority of the numbers of the cycles.

17 We have subsequently performed analyses  
18 at higher pressures. We've discussed these at least  
19 once previously in these hearings, and have  
20 considered pressures up to and including 2,200 psi  
21 and the conclusion regarding the crack -- the  
22 absence of crack propagation in the AF skirt is the  
23 same regardless of the pressure that was used up to  
24 pressures of 2,200.

25 Pardon, if I said AF. I meant to say A2.

waga

1 All of my previous questions were in regard to AE  
2 skirts.

3 DR. SWANGER: Our consideration of peak  
4 firing pressures and its effect on the pistons also  
5 included the experience with the R5 test that you're  
6 running at 2,000 psi brake mean effective pressure  
7 for essentially ten to the seventh cycles and gives  
8 us additional confirmation that overloads, even  
9 though the magnitude which is unattainable at  
10 Shoreham of 2,000 psi brake mean effective — or  
11 2,000 psi peak firing pressure, if I said BMEP, I  
12 apologize, I mean to say peak firing pressure, have  
13 no effect on the initiation and propagation of  
14 cracks.

15 Q. When did you do the subsequent analysis  
16 that took you up to 2,200 psig that's referred to at  
17 the bottom of page 20 of your testimony?

18 DR. HARRIS: I believe those calculations  
19 were performed in early August.

20 In addition to those particular  
21 calculations we had over previous months dating back  
22 to almost the beginning of the piston analysis which  
23 was begun ten months ago, we had performed other  
24 fracture mechanics calculations using stresses —  
25 using high stresses and were aware of the influence

waga

1 of high calculated stresses on crack propagation in  
2 both the AE and the AF, so we had performed analysis  
3 using higher stresses than we ended up reporting in  
4 the piston report, but the actual calculations that  
5 we are alluding to at the bottom of page 20 were  
6 performed, as I recall, in early August of 1984.

7 We were already aware of what the results  
8 of such calculations would be. We merely performed  
9 additional calculations in response to the  
10 contentions regarding the influence of higher peak  
11 firing pressures than the 1,670 used in the piston  
12 analysis report.

13 Q. Well, the overload conditions that you're  
14 talking about in the quoted section of your answer  
15 to question 28, we were talking about the more than --  
16 3900 KW and higher.

17 DR. HARRIS: Mr. Youngling might want to  
18 amplify to my response to your question.

19 To my way of thinking, overload  
20 conditions would be something like 110 percent of  
21 the named plate rating of the engine.

22 In the TDI factory log supplied with  
23 their engine including the engine at Shoreham they  
24 do report peak firing pressures up to 110 percent of  
25 the rate load. That's what my definition of

waga

1       overload is.

2           Q.     So that's what you meant in your  
3       testimony, you meant 110 percent.

4           You and Dr. Swanger responded to this  
5       testimony.

6           DR. HARRIS:   Yes.  That's what I mean and  
7       I'd like to point out that at TDI factory load 110  
8       percent load as I recall provides pressures on the order of  
9       1800 psi which is well below the 2,200psig that was used for  
10      the peak firing pressure analysis of the influence of higher  
11      pressures so the 2,200 is way above the hundred and ten  
12      percent that I originally considered to be the overload.

13          Q.     I understand that.

14                 What did you mean by a small amount of time in  
15      your testimony?

16           MR. ELLIS:  I believe it says relatively small  
17      amount of time, Judge.  He ought to be given the benefit of  
18      the full --

19          Q.     You see where you said this in your testimony.  
20      It's right in front of you so you can see exactly what I'm  
21      referring to, Dr. Harris.

22           DR. SWANGER:  It was our understanding that on  
23      the 40 year functional life of the engines they would  
24      experience 3,000 hours of total testing

25

waga

1 and demonstration time. Of that approximately three  
2 thousand hours, about 60 hours over 40 years could  
3 be up to 110 percent of the -- or 11.4 percent.  
4 depends a little bit on exactly who you talk to,  
5 percent of the name plate load of the engines.

6 MR. YOUNGLING: I'd like to confirm Dr.  
7 Swanger's assessment that under the present  
8 technical specifications overload testing for the  
9 life of the engine would not exceed 60 hours.

10 MR. DYNNER: Judge Brenner, I'm going to  
11 move on to capital H of the cross plan now, and pick  
12 up one matter which is on page three of the cross  
13 plan, number four, so you can follow it.

14 JUDGE BRENNER: Thank you.

15 Q. Gentlemen, please turn to page 12 of your  
16 testimony.

17 What's the basis for your testimony that  
18 the AE inspection had not demonstrated design or  
19 operational problems?

20 DR. SWANGER: Which question number

21 Q. 13, bottom of the page.

22 DR. HARRIS: We at Failure Analysis  
23 Associates, I believe the people at LILCO, TDI  
24 owners group were not aware of any problems  
25 associated with AE piston skirts, either a design

waga

1 problem or an operational problem. This includes  
2 the -- I believe 622 hours on the R-5 engine that  
3 was tested by TDI in Oakland had a BMEP well in  
4 excess of the Shoreham rating and as well as the  
5 Kodiak experience and also the experience that's  
6 been related on the Shoreham engines.

7 Q. Did you conduct then a survey of all of  
8 the AE pistons that are in service?

9 MR. SEAMAN: The information that was  
10 provided to us from TDI regarding AE pistons that  
11 were -- that had seen service experience included  
12 the Kodiak engine and that is specifically why we  
13 contacted the people up in Kodiak Alaska to review  
14 those pistons that had been in service as well as  
15 the R5 pistons that had been run in the test engine,  
16 the R5 test engine at the Oakland facility.

17 Q. My question, Mr. Seaman, is did you  
18 conduct any survey in order to determine what AE  
19 pistons are in service?

20 MR. SEAMAN: Well, I guess Mr. Dynner, I  
21 don't really understand what you mean by a survey to  
22 determine where AE pistons are in service. We  
23 contacted the manufacturer of the engine,  
24 Transamerica DeLaval and asked them where these  
25 pistons were in service and contacted those

waga

1 facilities to find out what their experience had  
2 been.

3 Q. All right. So DeLaval told you what AE  
4 pistons were in service. Did they tell you how many  
5 were in service?

6 MR. SEAMAN: Yes. I believe they did  
7 tell us what the numbers were. They certainly told  
8 us that there were two in the R5 test engine. They  
9 also told us the number that was in Kodiak and I  
10 don't frankly recall what that number was except  
11 that we looked at two of them.

12 I believe it wasn't all 16 in that engine,  
13 but that's a recollection on my part.

14 Of course, the pistons that were supplied  
15 to Shoreham, the 24 that were run in the engine as  
16 well as two spares that we had were essentially the  
17 ones that were in service.

18 Q. Anybody else on the panel know whether  
19 there are any other AE pistons that are in service?

20 DR. SWANGER: There are AE pistons in  
21 service certainly at Shoreham as well as at the  
22 Grand Gulf Nuclear Station. I believe the AE piston  
23 skirts at Grand Gulf had accumulated between two and  
24 300 hours of successful operation.

25 Other nuclear facilities have obtained

waga

1 the AE piston skirts including the Catawba Power  
2 Plant at Duke Power, the Camanchee Peak --

3 JUDGE BRENNER: I think the question is,  
4 are any in service.

5 DR. SWANGER: I was going to say that I  
6 know that Catawba has reassembled their DGIA and I  
7 believe that it is operational now so it would be AE  
8 pistons in service at Duke Power Catawba Nuclear  
9 Station.

10 Q. Anybody on the panel aside from Mr.  
11 Seaman, he's already testified about Kodiak; he  
12 doesn't know how many for sure are in operation at  
13 Kodiak. Does anybody else know how many?

14 MR. YOUNGLING: Mr. Dynner, as I remember,  
15 there is one engine in Kodiak. It's a 16 cylinder  
16 engine and it has AE pistons in it.

17 Q. Are all 16.

18 MR. YOUNGLING: As I remember, yes.

19 Q. Who at DeLaval gave you this information  
20 about the AE pistons, Mr. Seaman?

21 MR. SEAMAN: I really don't recall, Mr.  
22 Dynner, where exactly that -- who exactly gave me  
23 that information.

24 JUDGE BRENNER: Is that going to be  
25 material, Mr. Dynner?

waga

1 MR. DYNNER: I guess it's not now since  
2 he doesn't recall

3 JUDGE BRENNER: Even if he had recalled,  
4 would that be material to anything you planned to go  
5 to?

6 MR. DYNNER: It might or might not. I  
7 can't say in the abstract.

8 JUDGE BRENNER: I can't say either unless  
9 you know something is going to be material or have a  
10 reasonable probability within the realms of  
11 certainty as there always is in litigation; don't  
12 ask questions that won't go anywhere. What if he  
13 said Joe Smith gave it to me. So what?

14 MR. DYNNER: That wouldn't matter

15 JUDGE BRENNER: Let's go on to something  
16 else.

17 Q. We could turn to page 12 of the cross  
18 plan.

19 JUDGE BRENNER: Mr. Dynner, do you want a  
20 few minutes to consider how you want to proceed? I  
21 realize you're going on to a new topic. We can give  
22 you ten minutes to think that through.

23 JUDGE BRENNER: Let's make it 4:35.

24 (Recess)

25 JUDGE BRENNER: We're back on the record.

waga

1 We haven't been able to solve the same problem in  
2 our own minds that we were not able to solve for you  
3 earlier, Mr. Ellis, in terms of where to go and what  
4 to do. So you'll have to consider any other  
5 specific proposals that you can come up with and  
6 tell us about it tomorrow morning. If you can. I  
7 don't know if there's anything we can do.

8 MR. ELLIS: Thank You, Judge. I  
9 appreciate that. We will consider that. I think  
10 one thing would help is the postponement of the  
11 redirect.

12 JUDGE BRENNER: I'll think about that  
13 tomorrow, but I alluded to some difficulties I  
14 perceived in that -- maybe I didn't state it clearly,  
15 but we'll hold off and I'll restate them again, if I  
16 remain with that view tomorrow morning.

17 In a nutshell, the difficulty is although  
18 you may plan to have your redirect focused only on  
19 witnesses other than Dr. Pischinger, the redirect  
20 may be on areas to which he testified during the  
21 original cross-examination, and then in terms of  
22 follow-up to your redirect, it may be the desire of  
23 the County or the Board to find out what Dr.  
24 Pischinger thinks about something you asked another  
25 witness on redirect given his initial testimony

waga

1       already.

2                   MR. ELLIS: Yes, I understand. I think I  
3       have a way around that but we can wait until  
4       tomorrow.

5                   JUDGE BRENNER: To call him back for one  
6       more question, we may be able to work something out.

7       Well, while we're on the subject let me say one  
8       other thing. I'm not going to let the convenience  
9       upset the proper compilation in terms of substance  
10      of a record on these important issues, and it's my  
11      paramount concern, I assume it's yours, also, but  
12      given that important concern, we'll do what we can,  
13      but we'll see how quickly that concern could be  
14      adversely affected.

15                   We're going to be here a while, beyond  
16      next week, beyond the week after next week, that  
17      much is clear, and it's hard to believe that an  
18      individual who is going to be unavailable for the  
19      rest of all those weeks, although I recognize the  
20      geography involved. It's not as simple as flying  
21      in from Washington or even California perhaps but  
22      you let us know if you have any concrete proposals  
23      tomorrow.

24                   I'm sure as sure as I can be which I'm  
25      perfectly sure but reasonably sure that we are going

waga

1 to finish pistons this week, even if we go through  
2 all the rounds, that is redirect and everything else,  
3 and we'd be ready to start crankshafts Monday  
4 morning. I recognize from your view that may not be  
5 enough time, but I think we'll be in a position to  
6 start on Monday morning.

7 -Mr. Dynner isn't nodding yes. I don't  
8 know if he's agreeing or not.

9 MR. DYNNER: I'm being as helpful as  
10 everyone else to move quickly.

11 JUDGE BRENNER: Are you going to finish  
12 your cross by lunch break tomorrow?

13 MR. DYNNER: I would think so.

14 JUDGE BRENNER: Try very, very hard to do  
15 that.

16 If you're going to miss it, don't miss it  
17 by much.

18 MR. DYNNER: With the usual cooperation  
19 for the witnesses giving brief answers and being to  
20 the point, I think it can be accomplished.

21 JUDGE BRENNER: Maybe I'm trying to help  
22 by answering your expert questions also.

23 We'll go back to the cross-examination,  
24 pick a convenient time to stop around 5 o'clock?

25 Q. We'll start, Judge Brenner, on page 13.

waga

.1 item six of the cross plan.

2 Gentlemen, I'll ask you for your  
3 convenience to turn to page 56 of your testimony.

4 Dr. Johnson, you in fact went to Kodiak,  
5 Alaska along with Mr. Judge of LILCO in order to  
6 look at the AE pistons there, didn't you?

7 MR. JOHNSON: I did not go to Kodiak,  
8 Alaska to look at the pistons. Donald Johnson did.

9 Q. I'm sorry, I got the Johnsons mixed up.

10 MR. JOHNSON: Did you hear my answer to  
11 that?

12 JUDGE BRENNER: Yes.

13 Q. Anyone, if there were 16 AE piston skirts  
14 at Kodiak, why did you choose to inspect only two of  
15 the 16?

16 MR. YOUNGLING: Mr. Dynner, that was done  
17 as a courtesy with the utility up there. They were  
18 very cooperative with us to take their engine out of  
19 service and make two pistons available, and we felt  
20 quite pleased that they were willing to cooperate  
21 with us.

22 Q. Well, did they have to take the engine  
23 out of service to let you have the two pistons to  
24 inspect?

25 MR. YOUNGLING: Yes, sir. There is no

waga

1 other way to remove the piston of the engine unless  
2 you take it out of service.

3 Q. Well, then why didn't you ask to see the  
4 other pistons?

5 MR. YOUNGLING: In order to take all 16  
6 pistons out of the engine, you would probably  
7 require an outage of -- well, let me put it this  
8 way. At Shoreham it takes us about a week to strip  
9 the engine out and about two weeks to put it back  
10 together. So if we were to multiply that by two,  
11 and then, of course, take a good factor for economy  
12 to scale, we would be talking about a four or five  
13 week outage.

14 Q. How long was the outage with the two  
15 pistons going?

16 MR. YOUNGLING: I really don't know, but  
17 I imagine they did it in a day or two.

18 Q. They replaced those two pistons with two  
19 others?

20 MR. YOUNGLING: We gave them two  
21 replacement pistons.

22 Q. I see.

23 Were the two AE piston skirts that you  
24 got from Kodiak to look exactly the same as the AE  
25 piston skirts that are installed at Shoreham?

waga

1 MR. YOUNGLING: I'll ask my colleagues on  
2 the panel if they can add, but I'll start by saying  
3 the pistons that are in the Kodiak engines are the  
4 same pistons that were delivered to Shoreham and put  
5 in service at Shoreham. That's certainly one of the  
6 reasons why we went up there to look at them.

7 In addition, one of the pistons out of  
8 the Kodiak engine was sent down to Failure Analysis,  
9 and they inspected the piston, perhaps someone else  
10 wants to comment.

11 Q. Does anybody else know whether they were  
12 exactly exactly the same, that's the question.

13 MR. JOHNSON: The Kodiak piston that was  
14 returned -- or, I mean, was delivered to Failure  
15 Analysis certainly appears to have the same  
16 appearance as the ones that were delivered to  
17 Shoreham.

18 MR. YOUNGLING: Mr. Dynner, we've looked  
19 at Exhibit No. 29 in our testimony at the  
20 photographs, and we are confident that the pistons  
21 from the Kodiak engine are the same as installed at  
22 Shoreham.

23 Q. Thank you.

24 JUDGE BRENNER: Let me clarify something  
25 in my own mind. Earlier, either Dr. Swanger or Dr.

waga

1 Harris talked about the piston that was analyzed by  
2 FaAA, and it was the testimony that that piston was  
3 from the same lot as the Shoreham AE pistons. Am I  
4 correct so far?

5 DR. HARRIS: Yes.

6 JUDGE BRENNER: Now, the Kodiak piston  
7 that was delivered to FaAA is in addition to that  
8 piston.

9 DR. SWANGER: Yes.

10 JUDGE BRENNER: Thank you.

11 Q. You've referenced EXhibit P-29 which is  
12 also for ease of reference.

13 Suffolk County Diesel Exhibit 15, which  
14 contains a copy of a trip report to Kodiak Electric  
15 on January 22 to January 27 and signed by Donald O.  
16 Johnson.

17 Is Donald Johnson an employee of FaAA?

18 MR. JOHNSON: Yes, he is.

19 Q. Now, perhaps you could answer my question,  
20 one of the pistons as reported in this report was  
21 sent to DeLaval to inspect.

22 Do you know what the results of that  
23 inspection was?

24 Let me withdraw that question. Do you know what  
25 the inspection that DeLaval carried out, the type

waga

1 inspection carried out on the piston skirt?

2 Do you know what type of inspection that  
3 DeLaval carried out on that piston skirt?

4 MR. YOUNGLING: I've checked with the  
5 other members of the panel. We do not know what  
6 inspections were carried out on that piston skirt?

7 MR. YOUNGLING: I've checked with the  
8 other members of the panel. We do not know what  
9 inspections were carried out by TDI.

10 Q. Did FaAA or LILCO or the Owners make any  
11 inquiry to DeLaval about the inspection at that  
12 piston skirt?

13 MR. YOUNGLING: We're not aware of any  
14 inquiries.

15 Q. So it's true, isn't it, that you have no  
16 knowledge as to whether that particular piston skirt,  
17 any cracks or other defects in it, did you?

18 MR. JOHNSON: Both pistons at Kodiak were  
19 inspected, not destructively examined, both with  
20 penetrant and eddy current, and no defects were  
21 reported in -- defect indications were observed in  
22 the piston skirt that was supplied to TDI.

23 Q. What's the basis for that statement, Dr.  
24 Johnson?

25 MR. JOHNSON: That we observed no --

waga

1 would you repeat the question?

2 Q. Yes. I would just like to know what the  
3 basis is for your testimony that both of these  
4 piston skirts were inspected with the dye penetrant  
5 and eddy current at Kodiak. That's what you said.  
6 I want to know what the basis for your statement is.

7 MR. JOHNSON: The trip report of Donald  
8 Johnson and my conversations with Donald.

9 Q. Where does he talk about both of them  
10 being die penetrant and eddy current tested in the  
11 trip report that I have which is Exhibit P-29, if  
12 that's the same one you're looking at?

13 MR. YOUNGLING: Mr. Dynner, perhaps I can  
14 help.

15 Q. Well, maybe Dr. Johnson first can answer  
16 as to what the basis is for his testimony. Then you  
17 can give me your view.

18 MR. JOHNSON: My conversations with  
19 Donald Johnson after he returned from this trip?

20 Q. Well, the trip report says on the first  
21 page that Mr. Johnson did an informational  
22 inspection on the replacement pistons and found no  
23 crack like indications, and then on the following  
24 page, he says that the AE piston that was designated  
25 for LILCO was penetrant tested and eddy current

waga

1 tested.

2 Did he tell you that -- what he meant by  
3 an informational inspection on the first page of  
4 that report that was meant to include both the dye  
5 penetrant and eddy current inspection?

6 JUDGE BRENNER: Let's ask the foundation  
7 question first because maybe I misunderstood what  
8 was meant by that sentence.

9 Dr. Johnson, the replacement piston for  
10 Kodiak engine, were those the pistons going in or  
11 pulled out from the Kodiak engine if you know. If  
12 you don't know, that's the answer.

13 MR. JOHNSON: I don't know for a fact the  
14 answer.

15 JUDGE BRENNER: Does anybody have  
16 knowledge of that one way or the other?

17 MR. YOUNGLING: Judge Brenner, the game  
18 plan going up there was to pull those two pistons  
19 out and to inspect them and to send one down to FaAA  
20 and one down to TDI.

21 I think if we look at the report, we see  
22 in the first paragraph that he says, which included  
23 inspection of AE pistons and gathering of operating  
24 information.

25 Then if we go to the third paragraph --

waga

1                   JUDGE BRENNER: Let me stop you. I can  
2 make some guess one way or the other of what the  
3 memorandum might mean and I'm telling you there's an  
4 ambiguity in that which I want to know if anybody on  
5 the panel knows rather than guessing what the memo  
6 says.

7                   MR. SEAMAN: Judge Brenner, I may be able  
8 to provide some clarification regarding the language  
9 used.

10                   The AE pistons in the Kodiak engine were  
11 replacement pistons.

12                   If I recall correctly, engines were  
13 originally supplied to Kodiak with AN type pistons  
14 and those were replaced with AE, and that may be the  
15 source of confusion.

16                   MR. YOUNGLING: Judge Brenner, I think in  
17 that third paragraph, where he says, I did an  
18 initial inspection on the replacement pistons, that  
19 was an inspection for the Kodiak people to insure  
20 them that we were giving them replacement AE pistons  
21 that had no defects.

22                   JUDGE BRENNER: That's what I thought,  
23 and what Mr. Seaman just said is apparently  
24 inconsistent with that thought, unless maybe he  
25 thinks all the ones coming out were replacement

waga

1       pistons.

2                   The only reason I got involved with this  
3 was Mr. Dynner was basing some of his questioning on  
4 that sentence, and I'm afraid Dr. Johnson based one  
5 of his answers on that sentence, too, and I don't  
6 want to sit around and guess.

7                   I want to know if anybody knows, and  
8 apparently nobody knows.

9                   DR. McCARTHY: Since it's five minutes  
10 before the end of the session, tomorrow morning we  
11 can have this whole thing resolved.

12                   JUDGE BRENNER: Fine. I'll leave that up  
13 to you and the cross-examiner and your own counsel  
14 also. But we interrupted Dr. Johnson earlier, I  
15 believe I did. He was going to tell us -- you  
16 started to say you had some other knowledge other  
17 than a memo. Am I wrong, Dr. Johnson?

18                   MR. JOHNSON: Yes. I also spoke directly  
19 with Dr. Johnson -- Donald Johnson concerning  
20 inspection immediately after the trip. He indicated  
21 to me that both penetrant and eddy current tests  
22 were conducted on both pistons at the site, and the  
23 piston which was eventually transmitted at TDI had  
24 no relevant indications either with penetrant or  
25 with eddy current.

waga

1 JUDGE BRENNER: Presumably, you'll obtain  
2 further details just in case anybody wants to pursue  
3 it tomorrow. Mr. Dynner's other question went to  
4 the results and let me not take it too far today.

5 Do you have something else you wanted to  
6 ask, Mr. Dynner?

7 MR. DYNNER: Well, I'm -- I was going to  
8 follow up with some questions about whether there's  
9 documentation of that inspection and whether we  
10 could get additional information on what facilities  
11 he had at Kodiak to conduct the eddy current  
12 examination and the die penetrant examination, and --  
13 unless you know that's information perhaps you could  
14 furnish tomorrow by talking to Donald Johnson?

15 MR. JOHNSON: With regard to the eddy  
16 current testing, he took our normal eddy current  
17 testing equipment with him specifically for the  
18 purpose of doing these eddy current testing. For  
19 the penetrant tests he also took penetrant supplies  
20 to do penetrant test.

21 Q. Can you tell us, Dr. Johnson, if you  
22 could, go to Page 2 of the trip report. It states  
23 in the last paragraph that one area -- I think it's  
24 referred to as the boss area was found to have a  
25 penetrant indication of three quarters inch long.

waga

1                   Upon inspection with eddy current, there  
2 were no crack-like indications noted.

3                   Could you explain the difference between  
4 the -- an indication and a crack-like indication?

5                   MR. JOHNSON: The penetrant indication  
6 and -- was three quarter inch long. And the  
7 crack-like eddy current indication, there was no  
8 such indication. The penetrant inspection is  
9 sensitive to -- is not -- the penetrant inspection  
10 from imperfections which have no significant depth.  
11 The eddy current test differs in that it is  
12 sensitive not only to the length of the indication  
13 but the depth of indication. Therefore, when we get  
14 no eddy current crack-like indication in this area,  
15 it's because the penetrant indication, the source of  
16 the penetrant indication was something of no  
17 significant depth.

18                   Furthermore, when we brought it back to  
19 Palo Alto, of course, we re-examined it very  
20 carefully, both with penetrant and with eddy  
21 current, and the penetrant indication was not  
22 reproduceable. We also looked at it optically using  
23 a 15 power scope in this area. There was nothing  
24 that we could detect there. The environment in  
25 which they were doing the inspection up at Kodiak, of

waga

1 course, was not ideal such as one we would find in a  
2 laboratory, so we believe that penetrant indication  
3 was not a reproduceable indication and did not  
4 correspond to a material imperfection of any  
5 significance.

6 Q. In the inspection of this single piston  
7 from Kodiak, were any other crack-like indications  
8 on other areas of the piston noted?

9 MR. JOHNSON: There were no other  
10 crack-like indications noted.

11 Q. Were other areas besides the boss area  
12 inspected by dye penetrant and eddy current  
13 examination?

14 MR. JOHNSON: There's the boss area and--  
15 the area down where the washers reside, which I  
16 guess is the washer landing area, which is part of  
17 the boss -- part of the boss configuration, but not  
18 the high stress area of the boss.

19 Q. But in addition to these examinations,  
20 was the AE piston skirt examined for any scuffing or  
21 fretting?

22 DR. SWANGER: When the piston was  
23 returned to FaAA in Palo Alto, we looked at the  
24 external surface of it to evaluate the patterns on  
25 it. We did not see anything out of the ordinary on

waga

1 that piston. We feel that it ran for approximately  
2 6,000 hours at load with no indications of anything  
3 unusual on the outside of the piston.

4 Q. When you say at load, do you know what  
5 the load was for that particular skirt?

6 DR. SWANGER: One of the things that Don  
7 specifically did while he was at Kodiak was to  
8 obtain information on the operating logs, and I  
9 believe some of that information is shown in Exhibit  
10 29. It's the page following Page 2 of the memo, and  
11 it shows two separate measurements of peak firing  
12 pressures on engine number four.

13 Q. My question is do you know which -- what  
14 the load was for that particular piston?

15 A. That particular piston was run for 6,000 hours  
16 at loads averaging about 5,600 kilowatts.

17 Q. Dr. Swanger, I didn't ask you an average.  
18 We got on the following page of that report, I can  
19 see it also, on the schedule that shows peak firing  
20 pressures on engine number four, and it shows  
21 different loads for different pistons.

22 And I'm asking you whether you know what  
23 the particular load was on the piston that you  
24 examined. You may not know.

25 DR. SWANGER: I may not know exactly what

waga

1 you mean by load, Mr. Dynner. What do you mean by  
2 load?

3 JUDGE BRENNER: I think he means the  
4 firing pressure; is that right, Mr. Dynner?

5 MR. DYNNER: Yes. Shows the peak firing  
6 pressures for various pistons which are related to  
7 the loads that they carry, right? Just looking at  
8 that chart, do you know which one of these pistons  
9 as shown on these charts was the one that you  
10 examined?

11 JUDGE BRENNER: That's a different  
12 question.

13 Q. I don't think so.

14 JUDGE BRENNER: I'll tell you what. I'm  
15 ready to break. You think about whether that's a  
16 different question or not.

17 He can know which piston that was but  
18 that doesn't necessarily tell him what the answer to  
19 your question, what the maximum firing pressure was  
20 seen by that piston.

21 MR. DYNNER: If he knows that's correct,  
22 one is related to the other and you're quite correct.  
23 Both questions then are pending. I'd like to know  
24 whether you know what load was run on the piston  
25 that was examined and also whether you can identify

waga

1       which of -- which one of these pistons listed on  
2       this schedule was the piston you examined.

3               JUDGE BRENNER: I have a feeling the  
4       second question is a lot easier than the first. All  
5       right. Let's break for the day. And you can come  
6       with that question in the morning and I'm sure that  
7       somebody will remind you what the question was.

8               DR. SWANGER: The question is pending.

9               JUDGE BRENNER: Yes. You'll keep us in  
10       suspense on that. We'll come back at 9 o'clock in  
11       the morning.

12               (Whereupon, at 5:00 p.m. the hearing was  
13       adjourned, to reconvene at 9:00 a.m., Wednesday,  
14       September 12, 1934.)

CERTIFICATE OF OFFICIAL REPORTER

This is to certify that the attached proceedings before the UNITED STATES NUCLEAR REGULATORY COMMISSION in the matter of:

NAME OF PROCEEDING:

SHOREHAM NUCLEAR POWER STATION

Long Island Lighting Company

DOCKET NO.: 50-322-0L

PLACE: Hauppauge, New York

DATE: September 11, 1984

were held as herein appears, and that this is the original transcript thereof for the file of the United States Nuclear Regulatory Commission.

STENOTYPE REPORTERS

October 30, 1984

TO: All Recipients of Transcripts of Proceedings of  
Docket No.: 50-322-1 (OL)  
Long Island Lighting Company  
(Shoreham Nuclear Power Station)

- I. Enclosed are corrected transcripts in the above matter for the following days:

September 10, 1984  
September 11, 1984  
September 12, 1984  
September 13, 1984  
September 17, 1984  
September 18, 1984

ORIGINAL + 3 COPIES  
RJM.

- II. A corrected transcript for September 19, 1984 is in the process of being prepared and should be distributed in the near future.
- III. Portions of the following pages have been questioned by the Commission. The items are being checked against the original notes by the subcontractor. New pages will be distributed when the items are resolved.
