SUMMARY OF OPERATING EXPERIENCE

UNIT ONE

JULY, 1984

The status of Unit 1 remains shutdown with all fuel removed. The environment and equipment continues to be maintained as needed.

Last month it was reported that the activities for chemical cleaning have increased. The defective discharge outlet on the concentration recirculation pump has been repaired and is operational again.

During the last few days of the period a "Mock Run" was performed. This included pressurizing and heating of the Unit I reactor and piping. The purpose of the test was to determine the integrity of all involved systems and operator competence.

A small number of flange leaks were noted during the test which will necessitate a delay in the actual chemical cleaning. It is expected that by early August the long awaited chemical cleaning project will be in operation.

SUMMARY OF OPERATING EXPERIENCE

UNIT TWO

JULY, 1984

07-01 to 07-09

Unit 2 was in the process of being put on-line at the end of the last reporting period. At 0246 hours (7-1-84) Unit 2 was again on-line. Normal ramp rates and procedures were followed and by the 3rd of July the power output was over 800 MWe.

On the 9th during normal operation, while performing surveillance tests, an Instrument Mechanic improperly performed the steam line high radiation monitor test which caused the plant to scram. All safety systems performed as designed. A startup was then initiated to recover the Unit.

07-10 to 07-22

The unit operated continuously during this period (with normal power reductions on weekends for surveillances) until the 22nd of July. The Unit 3 RO requested that a recirculation valve on the EHC system be opened. The operator opened the valve on Unit 2 by mistake which resulted in a Unit 2 scram. All systems performed as designed.

07-23 to 07-31

A startup was initiated to again recover the unit, however, problems developed with the reactor feed pumps (RFP). The seal on one pump developed a leak while the other received damage due to a leaking discharge check valve (pump turning backwards). This left only one operational RFP and restricted the power level to about 350 MWe.

By the 29th a second RFP became available and unit power level was increased (at designed ramp rates) until at the close of this period the unit was once again above 800 MWe.

The unit achieved a capacity factor of 73.81% and an availability of 94.18%.

SUMMARY OF OPERATING EXPERIENCE

UNIT THREE

JULY, 1984

07-01 to 07-24

The final work on the main turbine was completed during this period. The long awaited startup was commenced with criticality being achieved by the 21st. However, on the 22nd the reactor scrammed due to MSIV closure with greater than 600 pounds reactor pressure. After the scram was reset, the unit was again prepared for startup and by the afternoon the unit was critical.

Unit heat-up continued along with turbine warm-up. After initial turbine rolls and instrument checks, the turbine was synchronized to the grid. A loud "hurrah" was then heard in the Control Room which meant the official end to a long outage that began September 30, 1983. The turbine performed as expected.

07-25 to 07-31

A 150 MWe level was established on the unit by adjusting control rods. This allowed for tests, i.e. scram testing to be performed which is required at the end of each refueling outage. By months end the unit was operating at 680 MWe but was limited due to condensate demineralizer differential pressure.

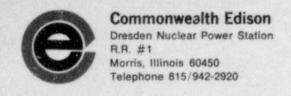

The unit achieved a capacity factor of 12.04% and an availability of 25.03%
