ABSTRACT

This report presents the results of the NRC Direct Radiation Monitoring Network for the fourth quarter of 1991. It provides the ambient radiation levels measured in the vicinity of 75 sites throughout the United States. In addition, it describes the equipment used, monitoring station selection criteria, characterization of the dosimeter response, calibration procedures, statistical methods, intercomparison, and quality assurance program.

SUMMARY

The U.S. Nuclear Regulatory Commission (NRC) Direct Radiation Monitoring Network is operated by the NRC in cooperation with participating states to provide continuous measurement of the ambient radiation levels around licensed NRC facilities, primarily power reactors. Ambient radiation levels result from naturally occurring radionuclides present in the soil, cosmic radiation constantly bombarding the earth from outer space, and the contribution, if any, from the monitored facilities and other man-made sources. The Network is intended to measure radiation levels during routine facility operations and to establish background radiation levels used to assess the radiological impact of an unusual condition, such as an accident.

This report describes the program objectives, scope, and methodology of the monitoring program and presents the radiation levels measured during the fourth quarter of 1991. (Radiation level measurements are made at NRC licensed nuclear facilities under construction, as well as those in operation.) In addition, it describes the equipment used, monitoring station selection criteria, and the quality assurance program.

All radiation measurements are made using small, passive detectors called thermoluminescent dosimeters (TLDs), which provide a quantitative measurement of the radiation levels in the area in which they are placed. The National Bureau of Standards (NBS)* has performed an independent study of the following characteristics of the NRC dosimetry system: energy response, angular dependence, temperature and humidity sensitivity, fading, light dependence, self-irradiation, and reproducibility. NBS has also tested the response of the NRC's dosimetry system against the requirements of ANSI N545-1975 and NRC Regulatory Guide 4.13. Details of this testing can be found in NUREG/CR-3775. Each site is monitored by arranging approximately 30 to 50 TLD stations in two concentric rings extending to about five miles from the facility. All TLD stations are outside the site boundary of the facility.

Section 10 presents the radiation levels measured around the 75 facilities monitored during the Network for the fourth quarter of 1991. There are 72 different sets of dosimeters because, in some instances, two power reactor facilities are monitored by the same set of dosimeters (e.g., Keweenaw and Point Beach). The radiation levels are presented as gross and net exposures. The gross exposure includes naturally occurring background radiation, radiation levels resulting from a facility's operation, and the exposure received during transport and storage of the TLD. Net exposures are obtained by subtracting an estimate of the exposure received by the dosimeter during transit from the gross exposures. All exposures are normalized to a 90-day quarter (standard quarter) and reported in units of milliroentgens (mR). Station numbers for which no data are reported include stations which have been deleted, stations for which the TLD was lost during the quarter, or stations for which the TLD was damaged.

* Now the National Institute of Standards and Technology (NIST)

Four sets of information are presented for each site. The first set includes the TLD station number, its direction and distance from the site, the integrated gross exposure for the period, the net exposure normalized to a 90-day quarter (standard quarter), and the historical average net exposure and standard deviation. All measurements are listed with their respective random and total uncertainties.

The uncertainties are listed in the following format:

$$X \pm S_x; U_x$$

where: X = value of the result
 S_x = random uncertainty expressed as one standard deviation
 U_x = combined total uncertainty

The second set of data summarizes the average net exposure measured in each of the 16 standard windrose sectors (see Table 1) around the facility, normalized to a standard quarter. Also this set of data summarizes the average net exposure measured at three ranges of distances from the facility, normalized to a standard quarter. When average net exposures cannot be reported because of the unavailability of the site's control dosimeters, the average gross exposures, normalized to a standard quarter, are reported in these sets of data.

The third set of information describes geographic locations of the TLDs around the nuclear power plants. A detailed list of the TLD station locations for each site in the NRC program as of December 31, 1991 is included. Each location is designated by a station number and is completely identified by windrose sector, azimuth and radial distance from the site, and physical description. Specific details of the physical location have been omitted to maintain the security of the stations.

The fourth set of data illustrates the fourth quarter measured dose around a site. Due to the constraints of digitizing the entire monitoring area onto the limited space on the map, some TLD data are not included.

Beginning with Volume 10, Number 4 of this report, an additional column of data was added alongside the individual TLD gross and net exposure data for each monitored site. The new information consists of the historical average and standard deviation for each TLD station. Sufficient data have been collected during the more than ten years that this program has been in existence to allow meaningful statistics to be calculated.

This report is one of a continuing series of technical reports covering the results and experiences of the operation of the NRC TLD Direct Radiation Monitoring Network. Suggestions on methods to improve the presentation or analysis of the data contained in this NUREG are appreciated and should be submitted to NRC Region I, 475 Allendale Road, King of Prussia, Pennsylvania 19406, ATTN: Radiation Dosimetry Specialist.

Table 1
Standard Windrose Sectors
Used in Selecting TLD Station Locations

Sector Name	Azimuth**
N*	348.75° - 11.25°
NNE	11.25° - 33.75°
NE	33.75° - 56.25°
ENE	56.25° - 78.75°
E	78.75° - 101.25°
ESE	101.25° - 123.75°
SE	123.75° - 146.25°
SSE	146.25° - 168.75°
S	168.75° - 191.25°
SSW	191.25° - 213.75°
SW	213.75° - 236.25°
WSW	236.25° - 258.75°
W	258.75° - 281.25°
WNW	281.25° - 303.75°
NW	303.75° - 326.25°
NNW	326.25° - 348.75°

* North (0° and 360°) is defined as True North.

** The principal airborne radioactivity release point (vent or stack) at each site is considered to be the center of a circle. The area of each circle is divided into 16 standard windrose sectors, each of 22.5° arc. These sectors are standardly used in the nuclear power industry to describe direction from a site.

1. INTRODUCTION

The NRC TLD Direct Radiation Monitoring Network was established in August 1979 by the NRC Office of Inspection and Enforcement (IE) to measure ambient radiation levels around NRC licensed facilities and to provide the NRC staff with prompt, independent data in emergency response and assessments. The need for such a Network was identified during the experiences at Three Mile Island (TMI) and subsequent reviews. The Network is a cooperative effort between NRR headquarters, NRC Regional Offices, and participating states. The operation of the program (consisting, in part, of processing badges, shipping and packaging, data processing, and reporting) is the responsibility of the Facilities Radiological Safety and Safeguards Branch, NRC Region I, in King of Prussia, Pennsylvania.

At most sites the TLD badges are exchanged and placed in the field locations by state agencies participating under a cooperative agreement with the NRC. For sites located in nonparticipating states, the field work is performed by individuals under contract to the NRC. The dosimeters are scheduled to be exchanged, shipped, and processed in Region I on a quarterly schedule. The program is further described in the TMI Action Plan, Item III.D.2.4(2), NUREG-0660, "Nuclear Action Plan Developed as a Result of the TMI-2 Accident."

After the Three Mile Island accident, the NRC determined that relying solely on licensee estimates of population exposure during an accident situation was unacceptable. The NRC decided to develop its own program to provide the data needed to independently assess the radiological impact of an accident. The principal objectives of this program are to:

- (1) Assure uniform treatment of dosimeters with respect to handling, shipping, calibrating, reading, and data processing for all monitored facilities in the United States;
- (2) Establish preoperational, baseline radiation dose levels, whenever possible, for each nuclear power reactor facility;
- (3) Provide ongoing environmental radiation dosimetry data during routine operations;
- (4) Provide post-accident estimates of population exposures;
- (5) Allow for independent verification of the adequacy of NRC licensees' environmental radiation monitoring program; and
- (6) Provide uniform, consistent environmental radiation monitoring data for use by the Congress, Federal and state agencies, the monitored facilities, and the public.

2. DOSIMETER SITE SELECTION CRITERIA

Since the variation in site characteristics is great, the staff endeavored to establish criteria that were as general as possible. The criteria have been used with great flexibility in the actual establishment of dosimetry stations in the field. In each case site data were obtained from information supplied by licensees in their Preliminary and Final Safety Analysis Reports (PSARs and FSARs), U.S. Geological Survey (USGS) topographical maps, Aerial Monitoring System (AMS) data, and state and local maps. Figure 1 illustrates the placement of dosimeters around a typical site.

2.1 TLD Network Stations Within Five Miles of the Plant Site

Around each site, TLD network stations are distributed in two concentric rings outside the licensee owner-controlled property. In each ring, one TLD station is located in each appropriate standard windrose sector. These sectors are defined in Table 1 and are those standardly used in the nuclear power industry. Dosimeter stations are not placed in sectors that consist entirely of open water or in sectors that are unoccupied or inaccessible. The inner ring is located between the licensee owner-controlled boundary and an imaginary circle of two miles radius centered on the site airborne radioactivity release point. The remaining stations are five miles or more from the plant site, as discussed below. One station is located at the nearest residence to the site.

2.2 TLD Network Stations Beyond Five Miles of the Plant Site

Beyond five miles from the boundary of the owner-controlled area, TLD stations are also established at major population centers and at places of high public interest not already covered by the stations described above. Three stations are also established in a predominantly upwind direction to serve as indication of the ambient radiation levels that are not expected to be influenced by plant operations.

2.3 Collocated TLD Stations

At each monitored facility, several (normally five) stations are placed side by side with those of the licensee to allow for independent verification of the licensee's environmental radiation monitoring program. These stations are generally within the five mile radius.

2.4 Emergency TLD Placement

In addition to the locations monitored during normal reactor operations, additional dosimeters would be placed around the site in the event of an incident during which continued releases of radioactive material were expected. The number and locations of such dosimeters would be determined by the anticipated duration and severity of the releases as well as the meteorological conditions prevailing during the incident.

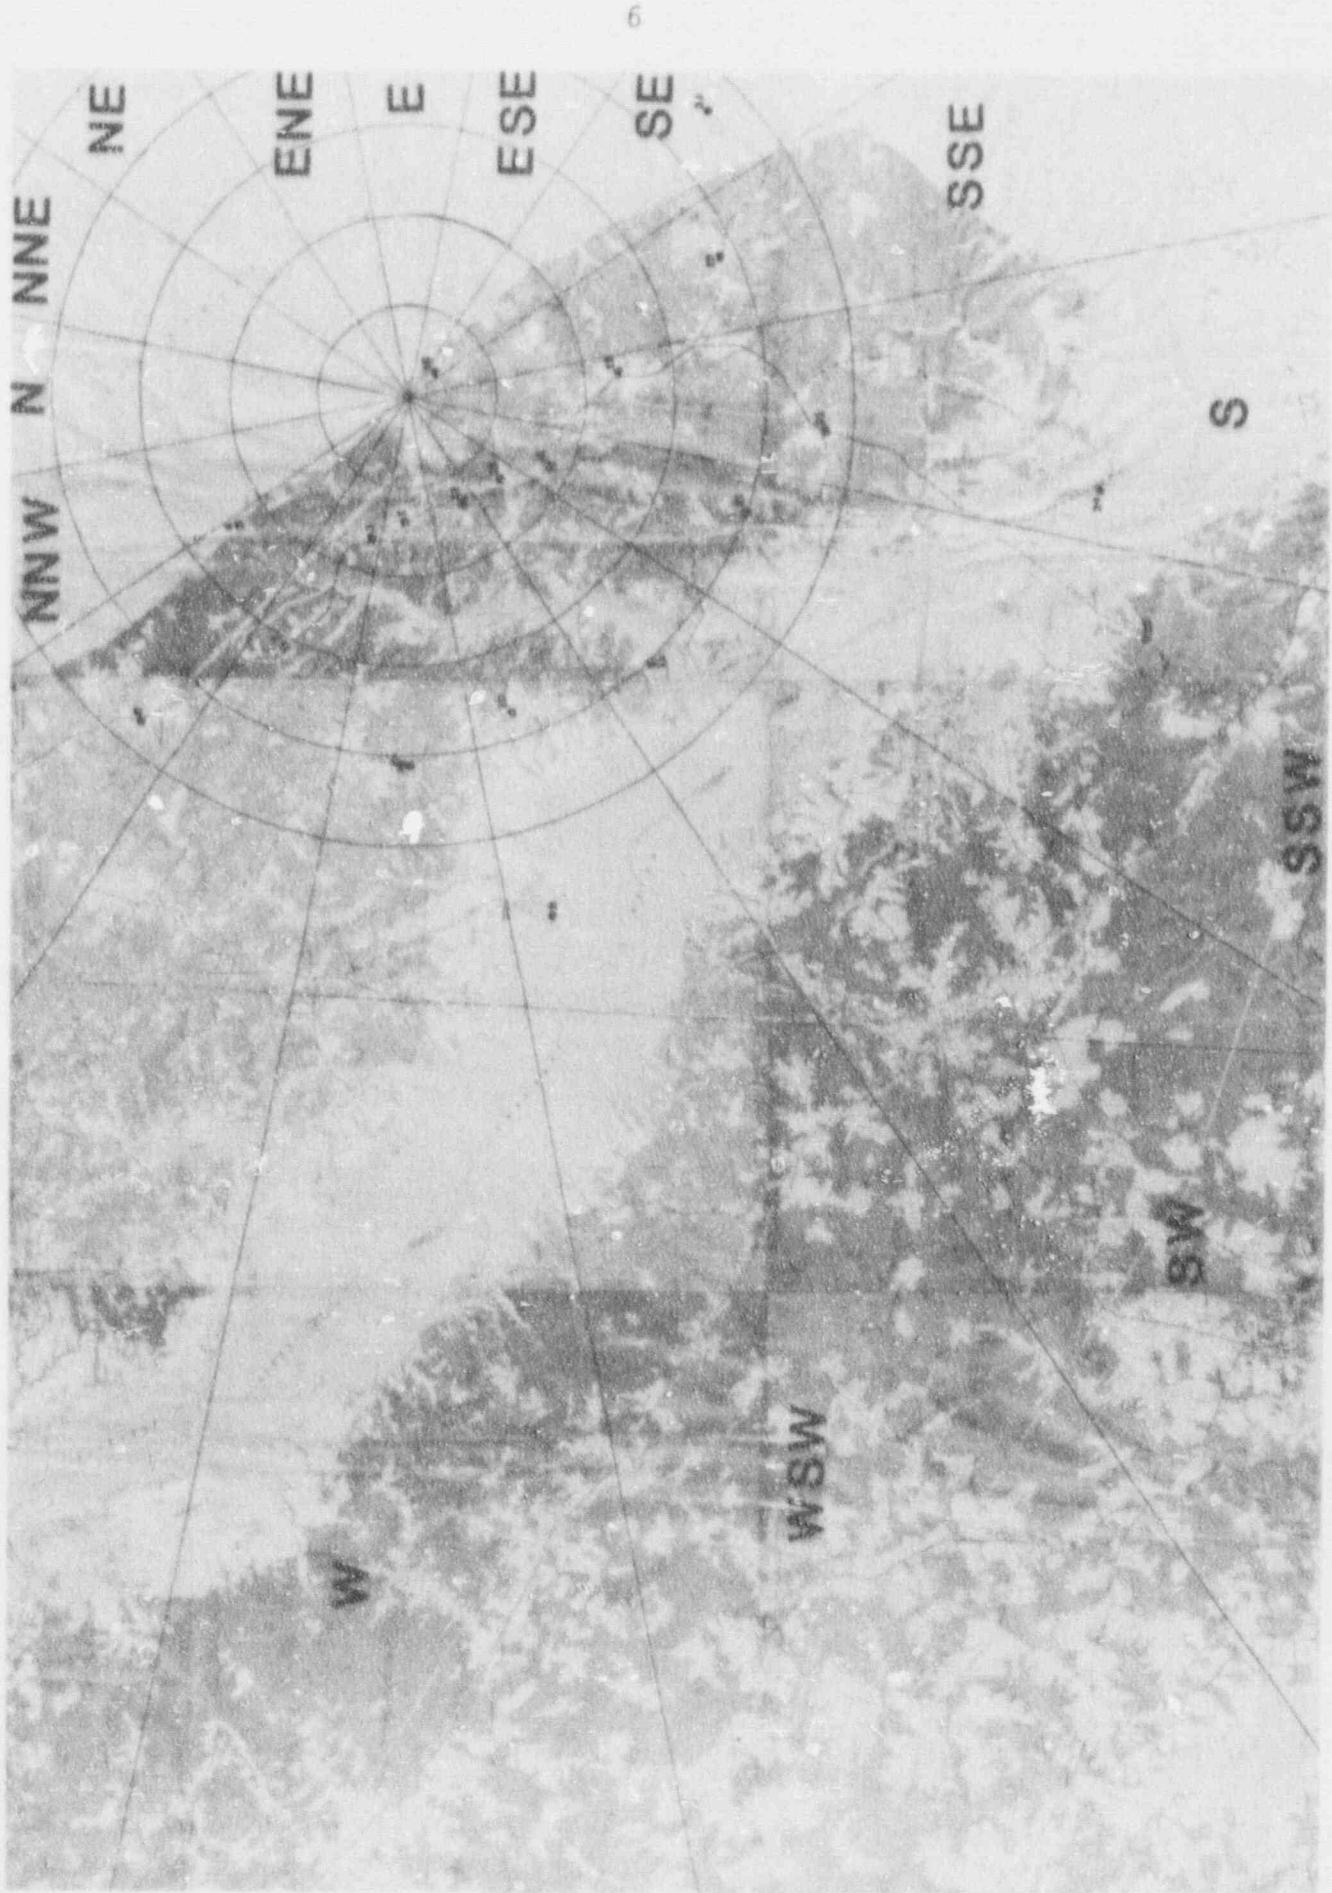

Figure 1 Illustration of Dosimeter Placement

3. EQUIPMENT AND GENERAL PROCEDURES

3.1 Dosimetry System

The NRC TLD program routinely employs the Panasonic* Model UD-801 thermoluminescent dosimeter and Model UD-710A automatic dosimeter reader. A Panasonic Model UD-702E manual dosimeter reader is also available and may be taken to a site in the event of an incident which required the processing of dosimeters near the site. The dosimeter has four thermoluminescent elements to measure radiation exposure. It consists of two elements of natural lithium borate activated with copper ($\text{Li}_2\text{B}_4\text{O}_7:\text{Cu}$), and two elements of calcium sulfate activated with thulium ($\text{CaSO}_4:\text{Tm}$). One lithium borate element uses an "open" window of 3 mg/cm^2 to minimize attenuation of beta radiation; the other incorporates a 160 mg/cm^2 plastic filter. These values are in addition to the filtration imposed by the polyamide backing (11 mg/cm^2) and the teflon window (28 mg/cm^2) covering each element.

Each of the two calcium sulfate elements is covered by an 850 mg/cm^2 lead filter (plus 160 mg/cm^2 of plastic) to attenuate low-energy photon radiation in a manner that is intended to compensate for the over-response of calcium sulfate in this portion of energy spectrum. The average response of the two calcium sulfate elements is used to determine exposure during routine operations. (See Figure 2.) The energy dependence of the calcium sulfate elements as determined by the National Bureau of Standards (NBS)** is shown in Table 3. For further details of the NBS testing, see NUREG/CR-2560, NUREG/CR-3120, and NUREG/CR-3775.

The automatic dosimeter reader consists of a badge transport and insertion mechanism, a heat source, a carbon-14 (C-14) activated reference light source, a light measurement system, and a microprocessor controller. Up to 500 TLD badges may be loaded into 10 magazines of the automatic sample changer that is attached to the reader, or single 50-badge magazines may be loaded manually. The magazine is automatically advanced to admit badges into the reading mechanism. In the mechanism, the dosimeter portion (card) of the badge is withdrawn from the holder. Each phosphor is then heated and its light output measured. When all four phosphors have been read, the card is inserted into the holder, the holder is lowered into the magazine, and the process is repeated for the next badge. (See Figure 3.) The manual dosimeter reader is similar in the reading process but dosimeters are manually inserted into the reader one at a time.

* Mention of a specific product in this report does not constitute an endorsement by the U.S. Nuclear Regulatory Commission.

** Now the National Institute of Standards and Technology (NIST)

3.2 Field Container

The dosimeter for each station is placed in a moisture-resistant polyester pouch inside a polypropylene mesh cylindrical cartridge approximately 15 cm long and 5 cm in diameter. The thickness of the pouch is approximately 5.5 mg/cm². The cartridge is attached by wire or polyester straps to a relatively permanent structure, usually a utility pole. This container provides physical security with minimum attenuation of photon radiation. It is placed approximately three meters above the ground to minimize vandalism. Figure 4 shows a TLD field container.

3.3 Exchange Procedures

Prior to shipment, all dosimeters are calibrated by the NRC (Section 4). All dosimeters are then annealed at the Region I office and packaged for shipment. The packages are then mailed to the contractors, usually representatives of the radiological health department of the state in which the reactor is situated. In some instances, the NRC has contracted with private individuals to exchange the dosimeters.

The contractors receive the packages, travel to the sites, and exchange the dosimeters with those of the previous quarter. The contractors have been provided with lead casks in which they store the control dosimeters during the field period. At the end of the quarter, these control dosimeters are removed from the storage cask and returned by mail with the field dosimeters. The use of control dosimeters to estimate transit exposure is discussed in Section 5.

When returned to the NRC Region I office, the dosimeters are processed, using the automatic TLD reader. They are then recalibrated to establish the current response of the dosimeter and to check for dosimeter response variability.

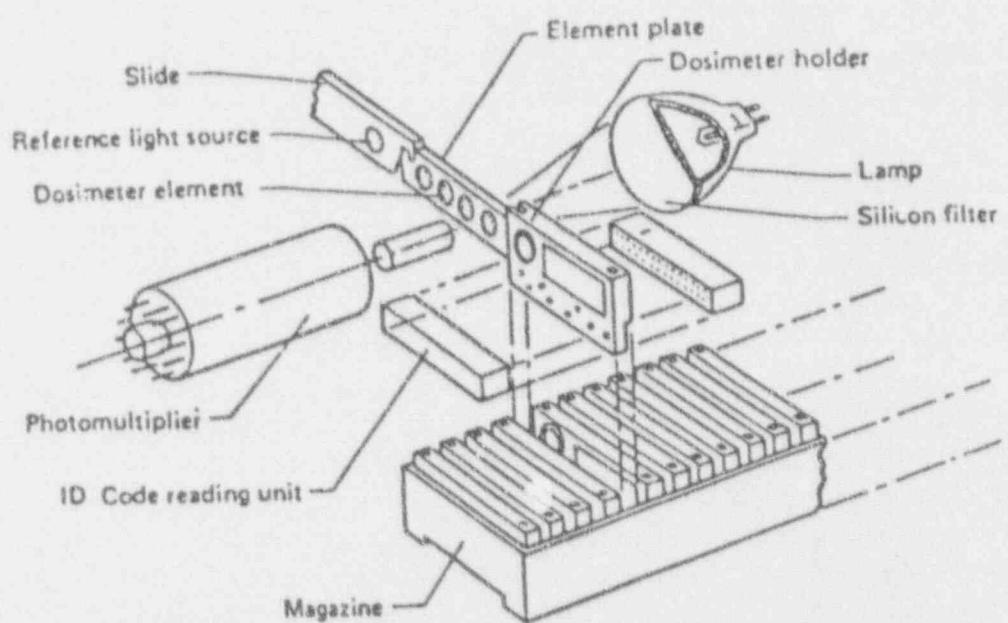

Figure 3 TLD Reader - Reading Method and Construction

4. CALIBRATION

4.1 Facilities

Two calibration facilities are available for use in the program. One facility contains a panoramic irradiator with a 120-cm diameter rotating table. The irradiator has a nominal 120-millicurie cesium-137 gamma radiation source that currently delivers an exposure rate of approximately 2 mR/minute at 50 cm from the source. The exposures received by the badges are monitored, using a 33cm³ air ionization chamber and a Viciorren model #550 high-precision electrometer calibrated by and traceable to the National Institute of Standards and Technology. The ionization chamber is placed directly over the TLD badges; the radiation field around the table is uniform within $\pm 3\%$. The exposure period is controlled by the use of a timer accurate to within ± 0.1 seconds. The exposure rate on the table has been confirmed by exposing dosimeters provided and read by the National Institute of Standards and Technology. The dosimeters exposed at this facility are selected from a set with precisely determined element calibration factors (ECFs). They are used for calibration of the TLD reader.

The NRC TLD program employed the Williston Elin TLD Irradiator (Model WE-2001)* in June 1986. The major components of the WE-2001 are the electronic console including the irradiation timer and the display module, a lead castle which contains the irradiation source (Cs-137), and the magazine rack. Up to 500 TLD badges may be loaded into 10 magazines of the automatic sample changer that is integral to the irradiator. The magazine is automatically advanced to admit TLDs into the irradiation chamber. Immediately following the calibration of the TLD reader, dosimeters with precisely-known ECFs are exposed in the WE-2001, then read in order to determine its exposure rate. This permits the WE-2001 irradiator to be used in the determination of the ECFs of the field TLDs.

4.2 Procedures for Calibrating Field Dosimeters

Element calibration factors (ECFs) are determined quarterly for field dosimeters. During each calibration, each TLD badge is exposed to approximately 40 mR. The irradiated badges are stored for about 24 hours before reading to allow for the rapid fading of the low-temperature glow peak of the lithium borate elements. After the badges have been read, the ratio of recorded exposure to delivered exposure is calculated and recorded for each of the four elements of each dosimeter. These ECFs are subsequently used to modify the raw element readings to determine exposure.

* Mention of a specific product in this report does not constitute an endorsement by the U.S. Nuclear Regulatory Commission.

5. ESTIMATION OF TRANSIT EXPOSURE

Field dosimeters receive exposure both while in transit to and from the placement contractor and while in storage at the contractor's facility, as well as while they are at their monitoring locations. To determine the field exposure, it is necessary to estimate this additional exposure, which is designated transit exposure.

Two control dosimeters are sent to each contractor to estimate the transit exposure. Control #1 remains unshielded, except when stored in the IRC-provided lead cask at the contractor's facility. This cask provides 2.75 inches of lead shielding. Control #2 is no longer used. Control #3 is used to indicate whether a significant exposure was received by the dosimeters while in transit from the NRC office in King of Prussia, Pennsylvania, to the contractors. It is shipped unshielded with the new batch of dosimeters to the contractor and returned unshielded with the previous quarter's dosimeters. If an unacceptably high transit exposure is detected by this dosimeter as a result of its shipment to the site, a new set of field dosimeters will be sent to the contractor for an early exchange.

The exposure to Control #1 is the sum of the transit exposure and the exposure received while in storage during the quarter. The exposure rate during storage is estimated to be 0.09 ± 0.03 mR per day and is based on previous measurements. For information on how the exposure rate in the cask was previously estimated, refer to Appendix A of NUREG-0837, Volume 2, Number 4. The transit exposure to the field dosimeters is estimated by taking the difference between the exposure measured by Control #1 and the exposure calculated to have been received by Control #1 while in storage in the contractor's lead cask. The storage exposure rate is essentially due only to the cosmic ray component of the local natural background radiation.

Likely sources of transit exposure include shipments of medical and other radioisotopes in the mail, as well as natural terrestrial and cosmic radiation.

A summary of the control dosimeter placement and usage is included in Table 3 of this report.

Table 3
Control Dosimeter Summary

	Control #1	Control #3
Purpose of Control:	Determination of round trip transit exposure	Determination of one-way transit exposure from NRC to field
During shipment to Contractor:	Unshielded, with field dosimeters	Unshielded, with field dosimeters
Storage Prior to Field Placement:	Unshielded, with field dosimeters	Unshielded, with field dosimeters
Storage During Quarter:	In lead shield	Not stored, returned with field dosimeters from previous quarter
Storage After Field Exchange (prior to return):	Unshielded, with field dosimeters	Unshielded, with field dosimeters*
During shipment to NRC:	Unshielded, with field dosimeter	Unshielded, with field dosimeters*

*Applies to the control #3 dosimeter for the next quarter

6. STATISTICAL METHODS

The total uncertainty of the reported exposures is a combination of the random and systematic components of uncertainty. The random component is primarily the statistical uncertainty in the reading of the TLD elements themselves. Based on repeated known exposures, this uncertainty for the calcium sulfate elements used to determine exposure is estimated to be approximately three percent ($\pm 3\%$ for one standard deviation). There are several systematic components of uncertainty, and include:

<u>Source of Uncertainty</u>	<u>Value of Parameter</u>	<u>Uncertainty of Parameter</u>
Energy-Directional Response	1.0	0.14*
Fading	1.0	0.05**
Calibration	Element Calibration Factor	0.03 x Element Calibration Factor
Estimate of Storage Shield Exposure Rate	0.0865 $\mu\text{R}/\text{day}$	0.0265 $\text{mR}/\text{Day}^{***}$

* Estimate based on NBS testing of dosimeters.

** Estimate based on NRC measurements of calcium sulfate element fading.

*** Estimate reflects observed variation of past measurement of storage exposure rate.

These uncertainties are propagated according to established statistical methods for propagation of uncertainty. Since one component of the systematic uncertainty is greater than one-third the sum of all the components, the overall uncertainty was calculated by taking the square root of the sum of the variances of all the components. This is in accordance with U.S. Environmental Protection Agency (EPA) recommendations contained in "Upgrading Environmental Radiation Data" - Health Physics Society Committee Report HPSR-1, 1980. The uncertainty of the adjusted exposure is determined by combining the uncertainties of the gross and transit exposures.

The uncertainties are listed in the following format:

$X \pm S_x; U_x$

where: X = value of the result
 S_x = random uncertainty expressed as one standard deviation
 U_x = combined total uncertainty

Example of Uncertainty Estimation

Assumptions: Gross Field Exposure = 25 mR
 Control 1 Exposure = 10 mR
 Time in Field = 90 days

A. Gross Field Exposure Uncertainty

$$\text{Random Uncertainty} = (25 \text{ mR})(0.03) = 0.75 \text{ mR}$$

Systematic Uncertainty:

$$\begin{aligned}\text{Calibration} &= (25 \text{ mR})(0.03) = 0.75 \text{ mR} \\ \text{Fading} &= (25 \text{ mR})(0.05) = 1.25 \text{ mR} \\ \text{Energy-Directional Dependence} &= (25 \text{ mR})(0.14) = 3.50 \text{ mR}\end{aligned}$$

$$\text{Total Uncertainty} = [(0.75)^2 + (1.25)^2 + (3.50)^2]^{1/2} = 3.86 \text{ mR}$$

$$\text{Gross Field Exposure} = 25 \pm 0.8 ; 3.9 \text{ mR}$$

B. Control 1 Exposure Uncertainty

$$\text{Random Uncertainty} = (10 \text{ mR})(0.03) = 0.30 \text{ mR}$$

Systematic Uncertainty:

$$\begin{aligned}\text{Calibration} &= (10 \text{ mR})(0.03) = 0.30 \text{ mR} \\ \text{Fading} &= (10 \text{ mR})(0.05) = 0.50 \text{ mR} \\ \text{Energy-Directional Dependence} &= (10 \text{ mR})(0.14) = 1.40 \text{ mR} \\ \text{Total Uncertainty} &= 1.55 \text{ mR}\end{aligned}$$

$$\text{Control 1 Exposure} = 10 \pm 0.3 ; 1.6 \text{ mR}$$

C. Transit Exposure Uncertainty

The uncertainty of the transit exposure is determined by combining the uncertainty of the Control 1 measurement with the uncertainty of the storage exposure.

$$\begin{aligned}\text{Storage Exposure} &= (90 \text{ days})(0.0865 \text{ mR/day}) = 7.78 \text{ mR} \\ \text{Storage Exposure Uncertainty} &= (90 \text{ days})(0.0265 \text{ mR/day}) = 2.38 \text{ mR}\end{aligned}$$

This uncertainty is treated as a systematic uncertainty. The transit exposure is estimated as the difference between the Control 1 measured exposure and the estimated storage exposure. The uncertainty is determined by combining their associated uncertainties.

$$\begin{aligned}\text{Transit Exposure} &= (10 \text{ mR}) - (7.8 \text{ mR}) = 2.2 \text{ mR} \\ \text{Systematic Uncertainty} \\ \text{of Transit Exposure} &= [(1.55)^2 + (2.38)^2]^{1/2} = 2.84 \text{ mR} \\ \text{Transit Exposure} &= 2.2 \pm 0.3 ; 2.8 \text{ mR}\end{aligned}$$

D. Net Field Exposure Uncertainty

The net field exposure is the difference between the gross field exposure and the transit exposure. The uncertainty is determined by combining the associated uncertainties.

$$\begin{aligned}\text{Net Field Exposure} &= (25 \text{ mR}) - (2.2 \text{ mR}) = 22.8 \text{ mR} \\ \text{Random Uncertainty} &= [(0.8)^2 + (0.3)^2]^{1/2} = 0.9 \text{ mR} \\ \text{Systematic Uncertainty} &= [(3.86)^2 + (2.84)^2]^{1/2} = 4.8 \text{ mR} \\ \text{Net Field Exposure} &= 22.8 \pm 0.9 ; 4.8 \text{ mR}\end{aligned}$$

If the time had not been 90 days, the net field exposure and its associated uncertainties would be adjusted and reported as exposure per 90 days.

E. Historical Average Exposure Uncertainty

The uncertainty of the historical average exposure is expressed as the unbiased standard deviation of the population normalized net field exposures reported from 1982 (or earliest available period after 1982) to the present quarter. Quarters for which net exposures could not be calculated are not included in the historical average.

7. QUALITY ASSURANCE PROGRAM

The NRC TLD Quality Assurance (QA) program consists of the planned and systematic actions necessary to provide adequate confidence in the accuracy and precision of the measurements obtained through the NRC TLD Direct Radiation Monitoring Network. These measurements utilize instrumentation located in the Region I Dosimetry Laboratory. The QA program for these measurements has been established in order to:

- (1) Provide a means of relating the results of the measurements to the U.S. National Institute of Standards and Technology (NIST), whenever possible;
- (2) Obtain a measure of confidence in the accuracy and precision of the data; and
- (3) Identify any deficiencies in monitoring and analyses so that corrective actions can be taken.

The following sections describe the procedures for ensuring the quality of proper measurements.

7.1 Dosimeter Quality Control

Before dosimeters are placed into service, they must pass the following tests:

7.1.1 Visual Inspection

Badges are visually inspected to ensure that the elements are of the correct type and have the right filtration.

7.1.2 Identification Number and Dosimeter Type

Dosimeters are read by the TLD reader and the badge identification numbers reported on the TLD reader output are compared with the corresponding numbers on the badge labels. Any deviations are corrected prior to dosimeter calibration or use.

7.1.3 Element Calibration Factors

Element calibration factors (see section 4 of this report) are determined for all dosimeters upon being placed into service. Dosimeters for which any element calibration factor falls below 0.5 are withdrawn from service.

7.2 Reader Quality Control

The calibration of the TLD reader is verified after any significant servicing or maintenance. In addition, a Quality Control (QC) check is routinely performed on the reader to determine

system trends, to apply corrections as necessary, and to ensure that the system is operational. The WE-2001 irradiator described in Section 4.1 is used to irradiate each dosimeter element. These dosimeters previously have been calibrated with a cesium-137 source to establish their element correction factors. A depleted uranium slab is also available for irradiation of dosimeters. This source serves primarily as a check on the reproducibility of readings between reader calibrations. In addition, the following system parameters are measured and printed by the reader.

7.2.1 Sensitivity Correction Factor

Prior to reading a rack of up to 50 dosimeters, the TLD reader determines the sensitivity correction factor. This factor is the ratio of the mean of 10 reference carbon-14 light source measurements to a constant reference reading. This factor is automatically applied by the reader to all badge readings to correct for changes in light transmission through the reader's optics. The reader will not operate if this factor is greater than 1.1 or less than 0.9.

7.2.2 Dark Counts

The dark count (from electronic noise, light leaks, thermionic emissions) is measured by the reader before it reads each badge. The dark count is usually less than five counts. The reader will not operate if the measured dark count is greater than 20 counts.

7.2.3 Reference Element Counts

A pin hole on the slide mechanism (that moves the dosimeters horizontally into the heating path) is briefly aligned between the heating lamp and the photomultiplier tube, allowing a small amount of light to pass from the lamp to the PMT. This reference element (RE) reading serves as a check of the integrity of the filters in the light path. The RE is usually less than 20 counts. The reader will not operate if the measured RE is greater than 600 counts.

7.3 Quality Assurance Audits

The NRC TLD Direct Radiation Monitoring Network is monitored on a regular basis by the NRC Region I Radiation Dosimetry Specialist. In addition to this continuing evaluation, the program will be audited by a member of management designated by the Region I Administrator. This audit ensures that all operations, maintenance, calibration, and quality control activities are being performed in accordance with approved procedures. The results of these audits will be documented and reported to the Region I Regional Administrator. Deficiencies identified will be resolved as soon as practicable and the Region I Regional Administrator is informed of their resolution.

8. INTERCOMPARISON

8.1 Description

The NRC TLD laboratory participated in the 1991 TLD Intercomparison conducted by the Environmental Radiation Quality Assurance Task Force of the Pacific Northwest during the fourth quarter of 1991. It included exposures of TLDs to ambient and elevated environmental conditions, as well as laboratory exposures to two levels of Cs-137 and two levels of Ra-226. Upon return of the TLDs to the NRC laboratory, they were processed using routine methods (as described in Section 4), and the results were reported to the Quality Assurance Task Force.

8.2 Results

The results given below are from a preliminary report covering only the comparison of the NRC results with the delivered exposures as stated by the Quality Assurance Task Force; no comparison to other participants' results was provided at this time.

Exposure type	Delivered Exposure (mR)	Measured Exposure (mR)	Ratio*
Field Site 1	†	‡	..
Field Site 2	†	19.4	--
Cs-137 (low)	30.2	28.9	0.96
Cs-137 (high)	105.5	106	1.00
Ra-226 (low)	18.7	19.6	1.05
Ra-226 (high)	95.5	96.3	1.01

*Ratio is defined as: Measured Exposure / Delivered Exposure

†Results not yet released by Quality Assurance Task Force

‡NRC TLD was damaged

8.3 Discussion

The NRC's results are in excellent agreement with the the laboratory exposures reported by the Environmental Radiation Quality Assurance Task Force. Results for field site 2 will be provided in a future report.

8.4 Previous Intercomparisons

A set of TLDs were irradiated by the Radiological Environmental Sciences Laboratory (RESL) at the Idaho National Engineering Laboratory in January 1989. RESL used a Cs-137 source to irradiate these TLDs to five different exposure levels in the range of exposures normally encountered for field TLDs and for calibration of the reader. The NRC's results were in excellent agreement with the exposures reported by RESL. More information about this intercomparison may be found in NUREG-0837, Vol. 10, No. 4.

The 8th International Intercomparison of Environmental Dosimeters was performed by the Environmental Measurements Laboratory (EML) of the Department of Energy in 1986. Information about the NRC's participation in this intercomparison may be found in NUREG-0837, Vol. 8, No. 4.

9. SUMMARY OF OPERATING EXPERIENCES

Since the inception of this program, many problems common to environmental monitoring programs have been experienced. Many of the problems were associated with the field sampling. Environmental monitoring devices are vulnerable to vandalism and mischief. The manner in which NRC TLDs are packaged and installed was designed to protect the dosimeter from the elements and curious individuals. NRC TLD dosimeters have been vandalized, shot, melted in a forest fire, and stolen. The recovery rate (that is, the percentage of return) has averaged approximately 95% which has been acceptable, considering the nature and scope of the program.

Table 4 lists all licensed facilities included in the Network as of December 31, 1991.

The equipment and procedures used by the NRC TLD Direct Radiation Monitoring Network generally satisfied the requirements of the program for 1991. The NRC environmental radiation data base for the monitored sites became larger and more accurate. In the future, the NRC is planning to make use of the upwind control dosimeters and the expanding data base to evaluate possible plant contribution to the local radiation levels or to estimate the upper limit of such contributions, if no statistically significant contributions are measured.

9.1 Explanation of Results for North Anna and Surry

The TLDs for two sites, North Anna and Surry, appear to have received some exposure during transit to the contractor. The elevated exposures are seen primarily in the gross results and in the transit control TLDs. The magnitude of exposure varies, indicating that some of the TLDs probably were closer than others to the source (e.g., a shipment of radioisotopes for medical use, x-ray exposure, etc.). The net results in most cases do not vary appreciably from the historical means for each of the field TLDs. This is because the

additional exposure is taken into account by means of the transit control TLDs; the exposure recorded by the transit controls is subtracted from the gross results for the individual field TLDs. The possibility that these TLDs received elevated levels of exposure in the field was considered and rejected for the following reasons: (1) Both sets of TLDs received the elevated exposure. It is very unlikely that both sites would have releases that would go unreported and/or undetected by other means. (2) The State of Virginia, which also monitors the site with its own TLD program, did not report any elevated exposures at either site. (3) The exposure levels of the individual field TLDs showed no correlation with distance or direction from the plant sites, as would be expected in the case of an actual release. (4) The likelihood that the exposure occurred during transit is very high, as evidenced by the following considerations: The two sets of TLDs for these sites are shipped together. The transit control TLDs of both sets were exposed. These TLDs were never taken into the field; two of them remained in the contractor's office, most of the time in a lead shield. Two others were returned immediately to the NRC at the beginning of the quarter. Both of these sets of controls showed elevated exposure levels.

The possibility that the TLDs were exposed while in the possession of the contractor was also rejected, because there were no radioactive sources at the contractor's facilities.

The historical range shown on the first data page for each field TLD at each site is comprised of the mean and standard deviation of the normalized net exposure rates (mR / Std. Qtr.) for all quarters up to but not including the present one. The historical range does not include those quarters for which no net data could be calculated, e.g. if a TLD was missing or damaged, or if the result was considered anomalous. The results for North Anna and Surry for the present quarter are considered anomalous, and therefore will not be included in the calculation of the historical range for these sites.

10. ENVIRONMENTAL DIRECT RADIATION MONITORING DATA FOR NRC LICENSED NUCLEAR POWER REACTORS

1. REPORT NUMBER
(Assigned by NRC. Add Vol., Supp., Rev.,
and Addendum Numbers, if any.)

NUREG-0837
Vol. 11, No. 4

2. TITLE AND SUBTITLE

NRC TLD Direct Radiation Monitoring Network

Progress Report
October-December 1991

3. DATE REPORT PUBLISHED

MONTH YEAR

April 1992

4. FIN OR GRANT NUMBER

5. AUTHOR(S)

R. Struckmeyer, N. McNamara

6. TYPE OF REPORT

Quarterly

7. PERIOD COVERED (Inclusive Dates)

October-December 1991

8. PERFORMING ORGANIZATION - NAME AND ADDRESS (If NRC, provide Division, Office or Region, U.S. Nuclear Regulatory Commission, and mailing address. If contractor, provide name and mailing address.)

Region I
U.S. Nuclear Regulatory Commission
King of Prussia, PA 19406

9. SPONSORING ORGANIZATION - NAME AND ADDRESS (If NRC, type "Same as above". If contractor, provide NRC Division, Office or Region, U.S. Nuclear Regulatory Commission, and mailing address.)

Same as 8. above

10. SUPPLEMENTARY NOTES

11. ABSTRACT (200 words or less)

This report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents the radiation levels measured in the vicinity of NRC licensed facilities throughout the country for the fourth quarter of 1991.

12. KEY WORDS/DESCRIPTIONS (List words or phrases that will assist researchers in locating the report.)

Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network

ambient radiation levels
