Design/Stress Report Title: ADDENDUM TO CLASS 1 PIPING STRESS REPORT,  
MAIN STEAM SUBSYSTEM 2MS-31B, LASALLE  
COUNTY STATION - UNIT 2  
Identification No: EMD-042129 Date: 06-08-93 Revision No. 02,  
Addendum C  
Owner's Review

I, the undersigned, a duly authorized representative of the Commonwealth Edison Company and experienced in nuclear power plant system requirements, have reviewed the attached Design/Stress Report in accordance with ASME, Section III, Division 1.

Concurred by:  
Design Superintendent:

B. [Signature]      4-13-94  
Signature                      Date

Chairman  
Nuclear Engineering Committee:

ISSUE SUMMARY

<u>ADDENDUM</u>	<u>DATE</u>	<u>DESCRIPTION</u>
A	04-12-84	An errata to document errors and corresponding corrections
B	05-01-87	Documentation of evaluation of rotation of motor operator on valve 2B21-F020
C	06-08-93	Evaluate replacement of Valve 2B21-F019

---

CERTIFICATION OF:

Addendum: C

Dated: 06-08-93

I, the undersigned Registered Professional Engineer, competent in the field of piping analysis using the design rules specified by the American Society of Mechanical Engineers Boiler and Pressure Vessel Code Section III Subarticles NB-3640 and NB-3650, certify that to the best of my knowledge, this addendum is technically adequate, complete and complies with the requirements of the referenced design specification.

L. Kaushansky

## 1.0 PURPOSE AND SCOPE

### 1.1 Purpose

The purpose of this addendum is to evaluate the replacement of Motor Operated Valve 2B21-F019. This addendum contains only material affected by this change, as explained in Section 1.2. All other material remains unchanged and can be found in the design basis stress report (Reference 7.1).

### 1.2 Scope

Per Reference 7.2, Valve 2B21-F019 is to be replaced by a heavier valve. This addendum evaluates the effect of this change by reanalyzing Subsystem 2MS-31B in its entirety.

## 2.0 DESIGN INPUT

Design input for this evaluation is obtained from References 7.1, 7.2, 7.9 and 7.10

## 3.0 ASSUMPTIONS/GENERAL NOTES

3.1 Design information for this analysis is based on DIT LS-PMED-0178 (Ref. 7.2) which is preliminary. A verified DIT from PMED will be required.

3.2 Per Ref. 7.2, Valve 2B21-F019 was analyzed for a weight of 450 lbs in computer analysis (Run ID SMS31B), dated 08-19-92. The center of gravity was conservatively assumed to be at 1'-8-3/4" from the centerline of the pipe.

## 4.0 APPROACH

### 4.1 Methodology

The computer model for this calculation obtained from References 7.9 and 7.10 is updated to include the replacement valve weight and center of gravity (see Sections 3.1 and 3.2). This new model was reanalyzed for all loading cases as shown in Section 5.0.

Two Stress-B analyses will be performed in order to consider the results of SRV Asymmetric analysis and SRV Symmetric analysis in Equation 10 stress combinations.

The resulting combined loads, stresses, accelerations, etc. are then compared to the corresponding allowables.

4.2 Acceptance Criteria

The resulting combined loads, stresses, accelerations, etc. should meet all requirements specified in Reference 7.1.

4.3 Identification of Computer Programs

4.3.1 Sargent & Lundy Computer Program PIPSYS/PC, Program PIP 03.7.026-1.40; Run ID SMS31B, microfiche, dated 04-06-93 and analysis dated 08-19-92.

SMS31B	04-06-93	08-19-92	Stress B - Class 1 (Two Analyses) (See Note 4.1)

## 6.0 RESULTS

### 6.1 Summary

#### 6.1.1 Support/Containment Penetration Loads:

Per Support Load Summary Sheets (Pages 28 to 32), supports with load increases were transmitted to SED and MDD through Ref. 7.3 and were found acceptable per Ref. 7.4. Reactions at penetration M-22 also increased and were transmitted to CMED and SED through Ref. 7.3 and were found acceptable per Ref. 7.5. Welded attachments need not be evaluated, since there is no increase in loads and stresses at these locations.

#### 6.1.2 Valve Accelerations:

The new accelerations for valve 2B21-F019 are low (less than 1g in each direction) and were sent to CMED (per their request) via Ref. 7.11. Accelerations on all other valves in subsystem 2MS-31B remain below their corresponding allowables (see Ref. 7.9).

#### 6.1.3 Pipe Stresses and Usage Factors:

All piping stresses and usage factors found in Run ID SMS31B are within the Code (Ref. 7.7) allowables.

#### 6.1.4 The basic data for the analysis documented in this report has been copied into file G:\LASALLE\PIPEDAT\U2\CBC42129.

### 6.2 Conclusion

6.2.1 The piping subsystem is re-evaluated and it is concluded that the replacement of Valve 2B21-F019 does not cause any overstress in subsystem 2MS-31B. The support and penetration loads are also found to be acceptable.

6.2.2 A final verified DIT is required from PMED in order to confirm all preliminary valve information in DIT LS-PMED-0178 (Ref. 7.2).

6.2.3 This addendum to the stress calculation for subsystem 2MS-31B is issued pending as-built verification. This open item will be closed upon receipt and evaluation of the DCR from Commonwealth Edison incorporating the changes described in this addendum.

**STATUS OF INFORMATION** (This information is approved for use. Design information, approved for use, that contains assumptions or is preliminary or requires further verification (review) shall be so identified)

This information is approved for use, however it requires further verification regarding the weight of the valve 2B21-F019.

**IDENTIFICATION OF THE SPECIFIC DESIGN INFORMATION TRANSMITTED AND PURPOSE OF ISSUED**  
(List any supporting documents attached to DIT by its title, revision and/or issue date, and total number of pages for each supporting document.)

EMD has completed the reanalysis of Main Steam Piping Subsystem 2MS-31B due to the increased weight of the valve 2B21-F019. Attached for your evaluation are the revised reactions and thermal movements for the supports/anchors which have load increase.

Attachment No. 1 - Detailed Combined Reactions, Total 12 Pages

CMED - Responsible for the qualification of Penetration M-22 only

Upon completion of your evaluation, please respond as to the adequacy of the supports/anchors.

Unit ~~1~~ 2

Subject Evaluation of Load Increases For DIT Number LS-EMD-0684

MOV replacement (WIN # 1920)

To: Kiran Patel - 22

cc: A. N. Gandhi - 21  
M. A. Pressburger - 22  
D. Robinson - 21

The Structural Engineering Division (SED) has completed reviewing the load increases per DIT Number LS-EMD-0684. All affected auxiliary steel and main structure are acceptable for these load increases. Calculations for this evaluation are filed in SED Calculation Book 8896-30EP, Revision Q.

Please call if you have any questions regarding this matter.

**\* VERIFICATION REQUIRED.**

SED ASSESSMENT CALC'S ARE PRELIMINARY.

Also, support in DIT should be as follows:

MS14-2862 G should be MS14-2403 G

MS14-2823 G & should be MS14-2823 X.

Acc. No. EMD-042129

Addendum: C

- References:
1. DIT LS-EMD-0684, dated 08/26/92,  
with revised loads
  2. DIT LS-EMD-0701, dated 11/04/92,  
with revised loads
  3. CQD File CQD-038710, Rev. 01, dated 01/11/90

CMED has analyzed the subject penetration for the primary containment and found that the revised loads provided in References 1 & 2 are acceptable.

By copy of this memorandum, the formal report is submitted to the CMED Library under CMED-038710, Rev. 02.

Please call if you have any questions.

1.0 Purpose

The purpose of this Addendum to the Stress Report for subsystem ZMS-31B, Rev. 2 is:

- I  - Validation of current Stress Report for record Document Package information.
- IIa  - documentation of revised restraint - support information;
- b  - documentation of a review to reconcile minor analytical drawing, design document, or construction modifications;
- c  - documentation of manual reconciliation calculations which were required by a design change;
- d  - documentation of manual reconciliation calculations for restraint-support and piping design change reconciliations.
- III  - Other (provide a detailed description of purpose).  
To document a list of errors and corresponding corrections and resolutions. These errors were found during an internal audit.

This Addendum addresses material identified by the specific design changes as well as those items identified in all prior addenda. All other material will remain unchanged and can be obtained in the specified Stress Report.

2.0 Changed Input Design Documents

2.1 Sargent & Lundy Drawings:

### 3.0 Conclusions & Recommendations

The piping subsystem was re-evaluated and the following was concluded:

- Changes do not warrant reanalysis based on engineering judgement; Identified in Article 4.1 and/or 4.2.
- Changes do not warrant reanalysis, but the subsystem must be modified as instructed by EMD ACC. Nos. \_\_\_\_\_. Identified in Article 4.3.
- All Analytical Evaluations satisfy the Criteria set forth in the Documentation of the Current Stress Report and Applicable Addenda. File# \_\_\_\_\_.
- Other (describe in detail on an attachment).

The errors which have been found and documented in this addendum along with the corresponding corrections have no impact on the design information contained in this report. No further action is required.

## 1.0 PURPOSE AND SCOPE

### 1.1 Purpose of Addendum

The purpose of this addendum to the Stress Report for subsystem 2MS-31B is to document the evaluation of the following modification to the subsystem:

Rotation of the motor operator of valve No. 2B21-F020.

This addendum addresses material identified by the specific design changes as well as those items identified in all prior addenda. All other material will remain unchanged and can be obtained in the specified Stress Report.

## 2.0 GENERAL NOTES

- 2.1 Commonwealth Edison Company Technical Staff has requested Sargent & Lundy to determine if rotating motor operator on valve 2B21-F020 will affect the seismic analysis of 2MS-31B. Valve operator needs to be rotated to eliminate clearances near motor.
- 2.2 Component Qualification Division has determined the center of gravity for valve 2B21-F020 with the motor operator rotated 90° from the current position. See Reference 4.4 for new location of center of gravity.
- 2.3 Engineering Mechanics Division has reviewed the difference in the coordinates of the center of gravity - current and after the proposed change. See calculation on pages 9 to 11 for EMD review which shows that the differences are minor and will not affect the seismic or weight analysis.
- 2.4 Project Management Engineering Division has been informed per Reference 4.5 that the proposed change is acceptable.

## 3.0 CONCLUSIONS & RECOMMENDATIONS

The piping subsystem was reevaluated and the following was concluded:

Changes do not warrant reanalysis based on engineering judgment; Identified in Hand Calculations in Section 6.0.

Rotation of the motor operator will not affect the weight and/or seismic analyses of subsystem 2MS-31B. This proposed change is thus considered acceptable. There would be no change to pipe stresses and/or support loads.

#### 4.0 DOCUMENTATION REFERENCES

#### 5.0 RECONCILIATION OF DESIGN DOCUMENT MODIFICATIONS

##### 5.1 Introduction

Paragraph NA-3355 of Reference 4.6 requires that all modifications of the design documents on which the calculations in this report are based be reconciled with the calculations. All modifications reported to Sargent & Lundy after the completion of Reference 1 and prior to this addenda, have been reconciled with their associated calculations and the activities involved in reconciling the changes are documented in this section of the addendum.

##### 5.2 Record of Reconciled Changes

Table 5.1 contains a record of all modifications to the base design documents that have been reconciled. Listed with each modification is a reference to the document containing the reconciliation calculation.

Client Commonwealth Edison Company	Prepared by M.W. Gonzalez	Date 5-1-87
Project LaSalle County	Reviewed by	Date
Proj. No. Equip. No.	Approved by	Date

**PURPOSE:** The purpose of this calculation is to compare the design position of the valve 2B21-F020 center of gravity to the proposed position with the motor operator rotated 90°. This calculation will show that the differences are minor and that there is no need for seismic or weight reanalysis.

**ASSUMPTIONS:** The weight of the valve + Motor operator remains the same, only the position of the valve-motor operator center of gravity changes.

**REFERENCES:**

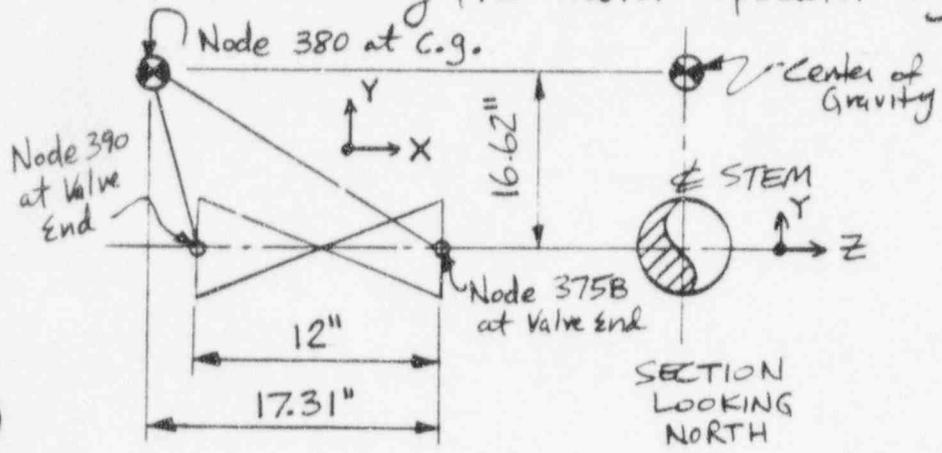

- 1) EMD-027046, STRESS REPORT FOR ZMS-31B, REV. 00, dated 3-4-82 (RUNID= SJ2S, 3-27-81)
- 2) CQD-035939, Interoffice Memorandum from L. Sorkin to F. Gonzalez, Subject: "Center of Gravity for Crane G. 3" - 900# Globe Valve with SMB-00 Actuator, Tag No. 2B21-F020," dated 4-16-87
- 3) LaSalle County Station Engineering Work Request, dated 3-31-87 prepared by Commonwealth Edison Company Tech Staff.

**CONCLUSION:** The changes in the coordinates of the valve-motor C.G. are minor (max  $\Delta = 3.93"$ ) and will not significantly affect the weight and/or seismic analyses. The proposed 90° rotation of the valve 2B21-F020 motor operator is acceptable.

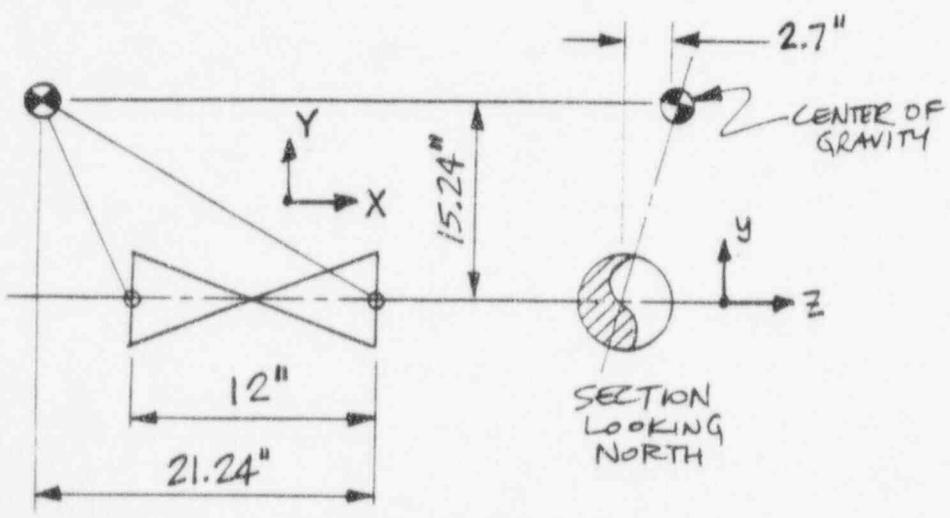

Client _____		Prepared by _____	Date _____
Project _____		Reviewed by _____	Date _____
Proj. No. _____	Equip. No. _____	Approved by _____	Date _____

**CALCULATIONS:**

The following shows the valve c.g. orientation before and after rotating the motor operator by 90°:

VALVE ORIENTATION BEFORE ROTATION OF MOTOR OPERATOR  
SEE REFERENCE 1

VALVE ORIENTATION AFTER ROTATING VALVE OPERATOR BY 90°  
SEE REFERENCE 2

$$\Delta X = 21.24 - 17.31 = 3.93''$$

$$\Delta Y = 15.24 - 16.62 = -1.38''$$

$$\Delta Z = 2.7 - 0 = 2.70''$$

∴ MAX Δ = 3.93'', NO SIGNIFICANT CHANGE IN SEISMIC RESPONSE AND/OR WEIGHT LOADING.

## 1.0 Introduction

### 1.1 Introduction

The purpose of this revision is to document the changes made to the original stress report for piping subsystem 2MS-31B. The revision contains only material affected by the design changes made to the piping configuration. All other material will remain unchanged and can be found in the original stress report (Reference 1.4.1).

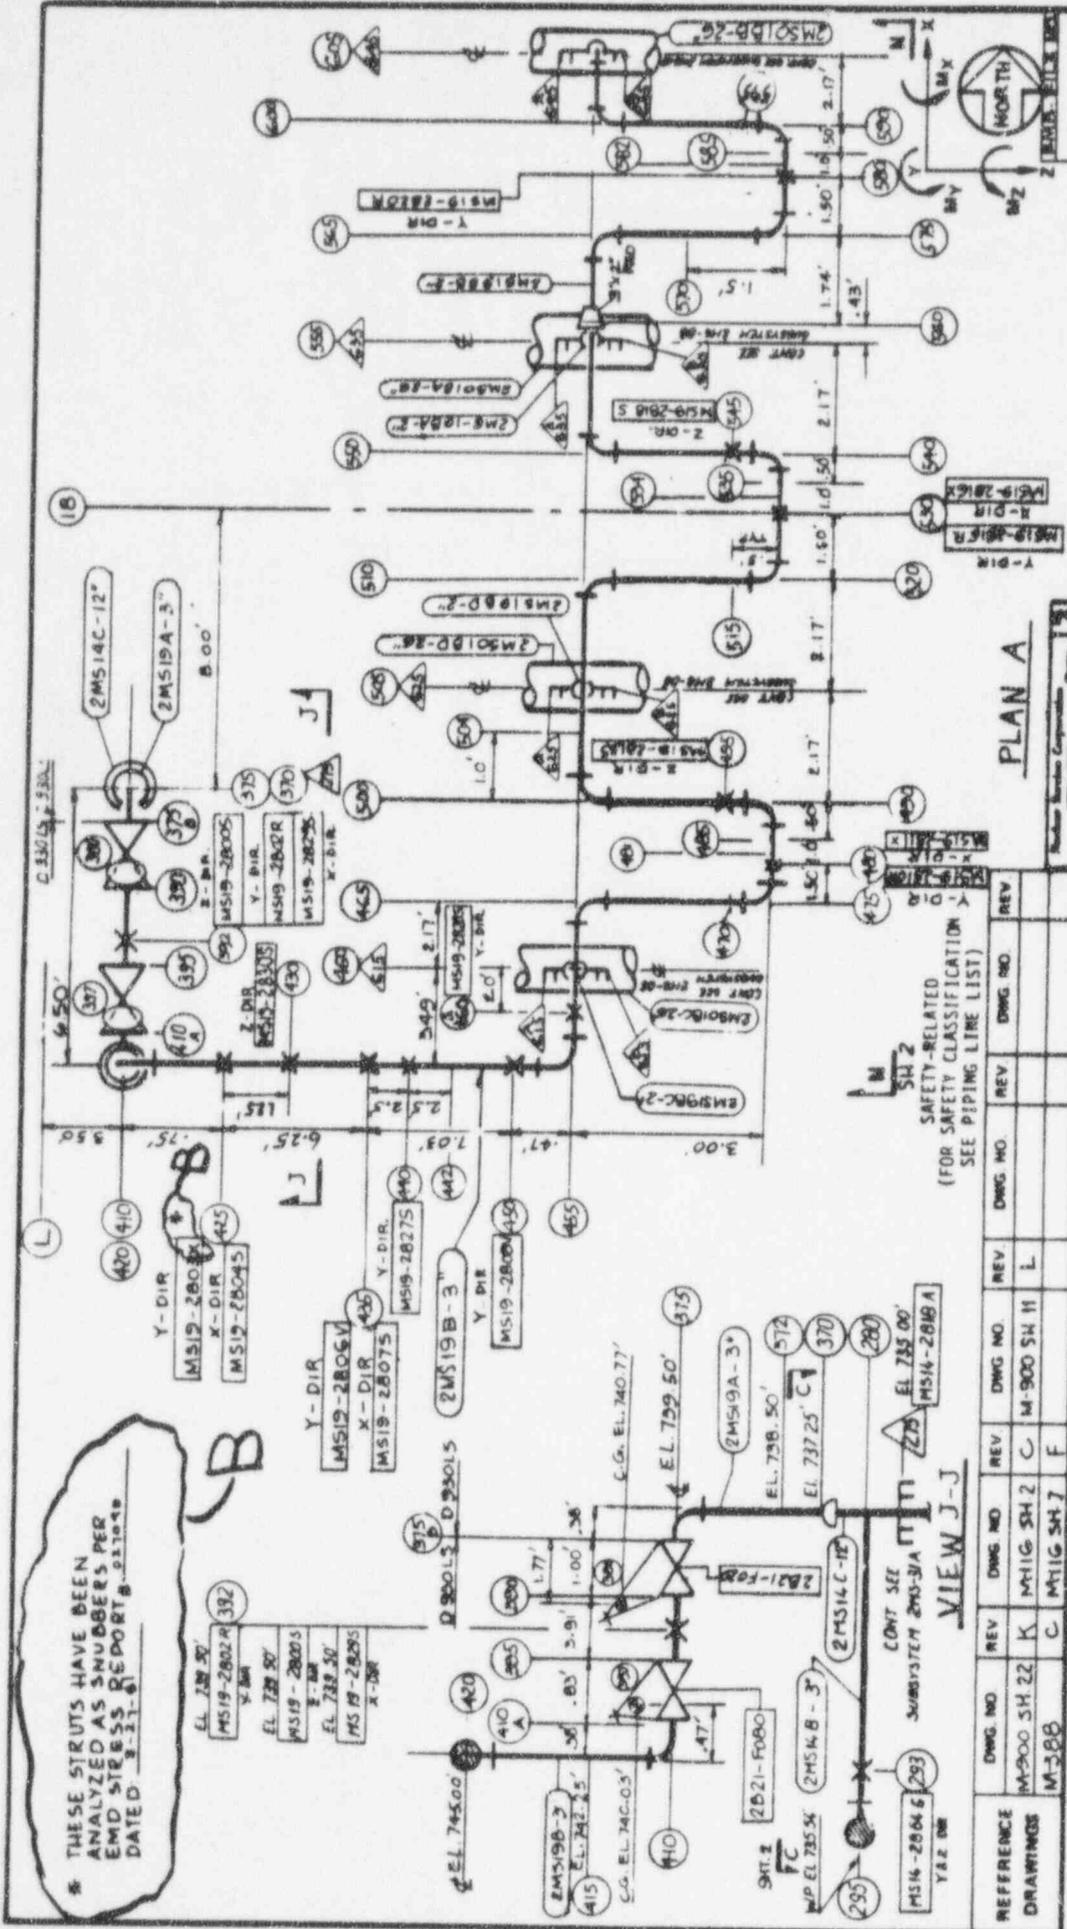

All calculations required for reconciliation of design document modifications are documented, as required by NA-3355, in Section 9 of this report.

### 1.2 Scope of Report

The purpose of this revision is:

- Documentation of verification that the current stress report configuration is identical to the as-built configuration.
- Documentation of revised restraint-support information;
- Documentation of a review to reconcile minor design drawing, design document, or construction modifications;
- Documentation of manual reconciliation calculations for restraint-support and piping design changes.
- Other (provide a detailed description of purpose)

To confirm agreement between the information on the final line walk letter and the analysis input data.

1.2.1 Conclusions & Recommendations

The piping subsystem was re-evaluated and the following was concluded:

- Changes do not warrant reanalysis based on engineering judgment;
- Changes do not warrant reanalysis, but the subsystem must be modified as described by EMD memorandum, see Reference 11.0;
- All hand calculations satisfy Code criteria;
- All restraint-support and equipment loads increase less than 5% or decrease less than 15%;
- For piping less than 2 inches NPS, restraint-support loads increase less than 10 lb or decrease less than 25 lb;
- Other (describe in detail on an attachment).

The Final Linewalk letter agrees with the piping analysis input data. Unit 2 is a mirror image of Unit 1.

The linewalk letter applies only to the seismic part of this subsystem..

## 9.0 Reconciliation of Design Document Modifications

### 9.1 Introduction

Paragraph NA-3355 of Reference 1 requires that all modifications of the design documents on which the calculations in this report are based be reconciled with the calculations. All modifications that were reported to Sargent & Lundy prior to the date of the current amendment of this report have been reconciled with their associated calculations. The activities involved in reconciling the changes are documented in this section of the report.

### 9.2 Record of Reconciled Changes

Table 9.1 contains a record of all modifications to the base design documents that have been reconciled to date. Listed with each modification is a reference to the document containing the reconciliation calculations. Table 9.2 lists all the support and restraint design drawings used for this subsystem.

10.0 Hand Calculations

All hand calculations required to prepare the original issue of this report are documented in this section.
