Examination Summary

Examination administered during the period June 26, 1984 through July 1, 1984. Written, oral, and simulator examinations were administered to one SRO candidate, six instructor certification candidates, and three RO candidates. Results: One SRO candidate, four instructor certification candidates and three RO candidates passed. Two instructor certification candidates failed.

#### REPORT DETAILS

#### 1. Candidates Examined

#### SRC Candidates

Thomas C. Anderson

\*Chief Examiner

#### 3. Examination Review Meeting

At the conclusion of the written examinations the examiners met with the following Consumers Power Company employees to review the written examinations and answer keys:

- A. S. Kanicki Training Shift Supervisor
- R. Massa Shift Engineer
- R. B. Heimsath General Nuclear Instructor
- W. W. Hunt Senior Nuclear Instructor
- W. E. Drummond Licensed Control Operator I
- E. A. Dziedzic Training Supervisor

The following comments were made concerning the RO written examination:

a. In the answer for question 1.01b, the facility representatives requested that the answer be expanded to accept "neutron competition" as an acceptable response. Since the value of reactivity coefficients is directly related to the relative affinity for neutron absorption demonstrated by the various constituents, the request was granted.

- b. Facility representatives requested that question 1.02 be deleted, contending that the plant does not perform primary and secondary heat balances, but a composite. The chief examiner checked GLC 12, the <u>Power Instrumentation Calibration Form</u>, which details specific steps for the performance of a secondary heat balance. The facility representatives' request was denied.
- c. In the answer for question 1.05a, the facility representatives requested that all references to control rod position be eliminated since the plant operates with all rods full out. Because the plant could not remain at a constant power level during a boron addition unless control rods were partially inserted and thus available to be withdrawn, the facility representatives' request was denied.
- d. In the answer for question 1.05b, the response "samarium" was awarded partial credit. Though samarium is not considered in the shutdown margin determination at Palisades, it does affect the shutdown margin.
- e. In the answer for question 1.11c, the facility representatives requested that both the answers "true" and "false" be granted full credit. Since the value of the latent heat of vaporization and the latent heat of condensation are identical, the request was denied.
- f. The facility representatives contended that question 1.12a was not worded in accordance with NUREG 1021, ES-202, E-17, which requires that the question be reviewed to ensure that it will elicit the intended answer. The question is worded in an unambiguous manner and full credit will be awarded if the examinees response is reasonable, so the facility representatives' contention was denied.
- g. The facility representatives contended that question 2.06 was a double jeopardy question, since part "b" required the student to correctly answer part "a". Since the auxiliary feedwater system is extremely important, and the combined point value of both parts is 3.5 points, only 14% of the section and thus well within the guidelines of the examiner standards, the contention was denied.
- h. In the answer for question 2.07 the facility requested that both "3.7 psig" and "5.0 psig" be accepted as correct responses because the Technical Specification value had been changed from "5.0 psig" to "3.7 psig" after copies had been sent to the examiner. Technical Specification Amendment 81 was checked to verify this fact, so the facility representatives' request was granted.
- i. In the answer for question 3.03c the facility representatives stated that the annunciator "SV and/or PORV open" is not an absolute indication that a PORV is open. However, it is an indication that a PORV may be open so the answer was not changed.
- j. In the answer for question 3.08a the facility representatives requested that full credit be accorded for the response T hot and T cold. They referenced Technical Specifications page 2-8, which was verified, so the facility representatives' request was granted.

- k. In the answer for question 3.08b, the facility representatives stated that the terminology was incorrect. The Palisades terminology is CRDM instead of CEA, and RWP instead of CWP. The answer was changed to reflect the Palisades terminology.
- In the answer for question 3.08c the facility representatives requested that "rod rundown" not be a required response. Since there are several design criteria used to minimize the possibility of an ATWOS, reasonable answers which mention these design criteria will be granted full credit.
- m. In the answer for question 3.09a the facility representatives requested that the backup heaters not be required for full credit since they are normally operated in manual and thus are always energized. This was confirmed by checking Palisades procedure SOP-1, Primary Coolant System, Revision 13, Section 7.3.2, Pressurizer Pressure Control, so the answer was changed.
- n. In the answer for question 4.01 the facility representatives requested that "pump seal controlled bleed off flow below alarm setpoint" be accepted as a correct response. The facility representatives' request was verified by checking SOP 1, step 7.2.9.b, so the answer was expanded to accept this response as one of the two required parameters.
- o. In the answer for question 4.02a, the response "HPSI pumps adding water to the PCS" was accepted as a correct response since HPSI pumps can be used to maintain PCS inventory during the reduced pressure of a cooldown.
- p. In the answer for question 4.04 the facility representatives stated that the bleeder trip valves do shut on a turbine trip, so there is no correct answer for this question. The reference - Phase III-5 SLN 19, drawing No. 3 - was checked to verify the facility's statement. The question was deleted.
- q. In the answer for question 4.05c the facility representatives requested that the answer "steam bypass to the condenser" be accepted as a correct response. Because steam pressure would be reduced in conjunction with PCS temperature if the aforementioned technique were used, greatly prolonging the steam generator tube rupture, the facility representatives' request was denied.
- r. In the answer for question 4.07b the facility representatives requested that full credit be given for the response "1250 mrem per quarter" since the question does not specify whether the individual's accumulated dose for previous calendar quarters had been determined. The reference, Admin. Procedure 7.04 Step 5.1, was verified, so the answer was expanded to grant full credit to the response "1250 mrem per quarter." Half credit was awarded if the examinee answered using the control level instead of the limit.

- s. In the answer for question 4.10, the response "pressurizer level erratic or rising abnormally rapidly" a accepted as a correct response, since voids in the core would displace water into the pressurizer. This response is referenced in EOP 8.1, "Loss of Primary Coolant" on page 8.
- t. In the answer for question 4.12a.1 the facility representatives requested that the answer be changed from "no" to "yes" since Startup Channels are required by Technical Specifications, Table 3.17.4. This reference was verified and the answer changed.
- u. In the answer for question 4.12.a.5 the facility representatives requested that both "yes" and "no" be accorded full credit since the word "datalogger" may be misleading, since the primary data logger is required while the feedwater purity datalogger is not required. The request was rejected since the datalogger of greatest concern to and most frequently used by the operators is the primary datalogger, so no ambiguity should exist.
- v. In the answer for question 4.12b, the response "CNBR 1.3 or greater" was accepted as a correct response since the basis for the Technical Specification curves is to maintain DNBR at or above 1.3.

The following comments were made concerning the SRO written examination:

- a. In the answer for question 6.2b the facility representatives stated that a steam generator level of 28.7% was equivalent to 447 inches above the support skirt. The Plant Modification and Level Setpoint document was referenced, so the answer was expanded to accept 28.7% as a correct response.
- b. In the answer for question 6.4a the facility representatives noted that "shutdown cooling relief" was entered twice. This was a typographical error, so the correct response "letdown line relief" was substituted for one of the redundant answers.
- c. In the answer for question 6.5a the phrase "from the loop associated with the reactor regulator system being used for control" was considered trivial by the examiner and will not be required for full credit.
- d. In the answer for question 6.5b the facility representatives requested that setpoints not be required for full credit. This was accepted since the question itself did not ask for setpoints. The facility representatives also requested that backup heaters not be required for full credit since they are operated in manual and always energized. The reference, SOP-1 Step 7.3.2 was verified and the request accepted. In addition, the responses "Stop #2 and #3 Chg Pumps," "Open #2 and #3 orifice stop valves," and "High level error alarm actuates" were considered trivial and/or redundant and will not be required for full credit.

- e. In the answer for question 6.7a the examiner considered the phrase "to provide for additional heat removal or to provide a backup capability for the fuel pool heat exchangers" to be trivial and will not be required for full credit.
- f. In the answer for question 6.8 the facility requested that the following system functions listed on page 1 of System Lesson Notes No. 42 be accepted as correct responses: monitor engineered safeguards systems; isolate failed static components and activate redundant static components; control shutdown systems and boric acid systems; monitor the primary system to perform hot shutdown and cold shutdown without access to the control room. Since the question asked for functions the facility representatives' request was granted.
- g. In the answer for question 7.9c the facility representatives requested that resetting the DBA sequencer no longer be required for full credit since a recent modification removed this requirement. During the examination each of the examinees brought this fact to the attention of the examiner and were told to explain the old procedure and mention the recent modifications on their papers. The request was therefore denied.
- h. The answer for question 8.14c was changed to accept "2" as correct, since a recent modification eliminated one high pressure safety injection pump, leaving only 2, one on each bus.

#### 4. Exit Meeting

At the conclusion of the visit to the Palisades Simulator and the Palisades Nuclear Plant the chief examiner, Mr. R. L. Higgins, met with the following facility personnel:

Mr. Montross, the Plant Manager Mr. Kozup, the Operations Supervisor Mr. Hunt, a Senior Nuclear Instructor Mr. Malone, a Licensing Engineer Mr. Heimsath, a General Nuclear Instructor

This meeting was held to discuss the known results of the examination as well as other observations noted by the examiners while they were at the plant and at the simulator.

- a. The facility representatives were informed that of the seven oral/simulator examinations administered five examinees definitely passed, one examinee was marginal, and one examinee did not show up to take his oral examination at the plant.
- b. While conducting the simulator examinations the following items were noted:

- The auxiliary feedwater system used at the simulator has not yet been updated to reflect recent plant modifications. The facility intends to modify the simulator in the near future to more closely model the plant's current auxiliary feedwater system.
- 2. Initial conditions modeled on the simulator did not correspond to steps in the Palisades procedures. Initial conditions should correspond to definite steps in the plant startup or shutdown procedures, with all applicable precautions, Technical Specifications, and preceding steps completed or observed.
- c. Many System Lesson Notes are outdated and no longer accurately describe plant components. The current revision of System Lesson Notes was produced in 1980, and since then many significant plant modifications have been made. The System Lesson Notes need to be revised to reflect the plant modifications. The facility is currently in the process of revising the System Lesson Notes and prior to the next exam will send the examiners copies of all updated versions which have been approved.
- d. Plant and simulator personnel were extremely cooperative during the examination. The control room operators were involved in conducting a plant heatup and forming a bubble in the pressurizer while the exams were being conducted, but they were nonetheless extremely accommodating. The simulator operators were also especially helpful.

The plant was complimented for being unusually clean, considering the extended outage from which the plant was recovering.

# QUESTION DELETED FROM THE RO WRITTEN EXAMINATION

## QUESTION 1.01 (2.40)

HOW does the moderator temperature coefficient change as the following conditions change in an undermoderated reactor core? EXPLAIN.

a. Noderator	temperature	increases.	(1.2)
--------------	-------------	------------	-------

b. Boron concentration in the moderator increases.

## QUESTION 1.02 (2.00)

Who is a secondary heat balance more accurate than a primary heat belance for determining the reactor heat output?

#### QUESTION 1.03 (3.00)

During a reactor startur, wil the actual critical position be HIGHER: LOWER or the SAME , the estimated critical position calculated before the following changes? EXFLAIN your choices. (Consider each change separately).

- a. The operator starts warming the main turbine prior to reaching criticality. (1.0)
- b. Actual boron concentration was 30 mm higher than the value used for figuring the ECP.
- c. Startup was deleved 4 hours beyond the ECP time? a shutdown time of 16 hours was used for the ECP.

#### QUESTION 1.04 (1.50)

The ratio of Pu-239 to U-235 atoms increases over core life. Will this ratio change cause:

- a. on INCREASE or DECREASE in the effective delayed neutron fraction (Beff)?
- b. a SLOWER or FASTER reactor response during reactivity transients?

## GUESTION 1.05 (2.50)

- a. Explain the effect on Shutdown Hardin of a 25 prm boron addition while operating at 50% power. (1.0)
  b. List three (3) factors, other than RCS boron concentration;
- which affect Shutdown Margin and are used in the SDM (1.5)

## QUESTION 1.06 (2.00)

Would power ranse indications tend to indicate an INCREASE, DECREASE, or NO CHANGE for the followind events? Assume actual power is constant at 75% before and after the event. Briefly explain your answer. (Consider each separately.)

a. Core adeins,b. Increase in boron concentration.

#### QUESTION 1.07 (2.00)

Indicate how the following changes in rlant conditions would individually affect DNBR (increase, decrease, or have no effect).

- a. Pressurizer pressure decreases
- h. To decreases
- c. Reactor power decreases
- d. RCS flow decreases

#### QUESTION 1.08 ( .60)

True or Faise?

At EOL, with decreased fuel temperatures, the Fuel Temperature Coefficient is more negative due to an increase in the quantity of Pu-240 in the fuel.

a.	In accordance with ONP-3 (Loss of Feedwater) there are FOUR automatic actions that can occur upon a loss of feedwater? Explain what causes each action to occur.	(2.8)
b.	What are your immediate actions if you lose one feedwater rump at approximately 70% rower? (3 required)	(1,5)

PAGE 14

(1.0)

#### QUESTION 4.10 (2.00)

EDP 8.1 (Loss of Coolent Accident) states that if 50 F subcooling cannot be maintained, assume there have been voids formed in the PCS. What are FOUR indications of substantial void formation? (& indications possible) (2.0)

#### OUESTION 4.11 (1.95)

The following concern the Primary Coolent System Plant requirements ( SOF-1 )

- a. What required actions must be performed if pressurizer error is operated when differential temperature between stray water and Frzr. water is 2200 F? (0.95)
- b. Is continued overation possible with a RCP main seal and low pressure (vapor) seal failed simultaneously. Explain your answer.

ANSWERS -- PALISADES

-81/06/26-STREIER, G.

MASIENCUPY

#### ANSWER 1.01 (2.40)

- a. MTC becomes MORE NEGATIVE as moderator temperature increases [0.6] because the density change per degree F temperature change of water is greater at higher temperature [0.6].
- b. HTC becomes LESS NEGATIVE (at the same moderator temperature) [0.6] because the number of boron atoms (reisons) in the core changes as the density of the water changes such that the negative reactivity effect from a heater of the moderator is somewhat decreased. [0.6](The moderator temperature coefficient can become resilive if the boron concentration is increased sufficiently). (Will also accept discussion on thermal utilization chansing Keff. or neutron commetition) (1.2)

#### REFERENCE

C-E Reactor Theory Pss. 166-168

#### ANSWER 1.02 (2.00)

Because errors in measurement have loss of an effect on the large delts enthelps as compared to the smaller delta temperature of the primary, E1.53 also the primary flow rate measuring device is relatively inaccurate E0.53.

Applicant's Signature -

5.1	a.	How are the terms "condenser vacuum" and "condenser backpressure" related?	(1.0)
	b.	What backpressure limit has been established?	(0.5)
	с.	Whose permission is required to exceed this limit?	(0.5)
5.2	Why, trip	if turbine flooding occurs, is the turbine not manually ped unless turbine vibration exceeds 14 mils?	(1.0)
5.3	limi	he specific accivity of the primary coolant exceeds certain ts the reactor must be shutdown and Tavg reduced below 500°F in 6 hours. Explain the basis for reducing Tavg below 500°F.	(2.0)
5.4	What diff	is the basis for establishing a maximum primary to secondary erential pressure limit?	(1.0)
5.5	a.	What is RT <sub>NDT</sub> ?	(1.0)
	b.	Why is the $RT_{NDT}$ shift greater at 1/4 thickness through the reactor vessel wall than it is at 3/4 thickness through the reactor vessel wall?	(2.0)
5.6	Why i 5 cc,	must the hydrogen concentration be reduced to less than /kg prior to opening the primary coolant system?	(1.0)
5.7	leve tive is i	ulate the length of time for power to rise from the power I at which the reactor is considered critical for administra- control until the lowest power level at which the reactor n the power operation condition. Assume that the maximum issible sustained startup rate is maintained the entire time.	(3.0)
5.8	a.	What is the minimum temperature for criticality for normal operation?	(0.5)
	b.	Explain the basis for establishing a minimum temperature for criticality.	(1.5)
5.9	What	is meant by the term "divergent azimuthal xenon oscillations?"	(2.0)
5.10	a.	What are the three reasons (bases) listed in Tech Specs for establishing control rod regulating group insertion limits?	(1.5)
	b.	When, if ever, is it permissible to violate the control rod regulating group insertion limits?	(1.0)
5.11	Why i	is samarium ignored in the shutdown margin equation?	(1.0)
5.12	a.	Define the term "Quadrant Power Tilt."	(1.0)
	b.	What is the maximum value for "Quadrant Power Tilt" for which no corrective action is required, and when is this limit applicable?	(1.0)

5.13 Tritium is addressed separately in Tech Specs.

a.	Give	two	reasons	for	the	extra	concern	shown	for tritium.	(1.0)
:ь.	Name	thre	e diffe	rent	ways	that	tritium	can be	e produced.	(1.5)

6.1	What signals will cause the automatic closure of the Component Cooling Water Containment Isolation Valves?			
6.2	, a.	What are the backup water supply sources for the Auxiliary Feedwater System?	(1.0)	
	b.	Explain how the FOGG system functions.	(2.0)	
6.3	allo rod the	actor trip will de-energize the electromagnetic clutch, wing the rod to drop due to its own weight. In case the does not drop, the motor can push the rod down. How can motor push the rod down if the electromagnetic clutch is nergized?	(1.0)	
6.4	a.	Other than the pressurizer safety valves and PORVs, what other relief valves relieve to the Quench Tank?	(1.5)	
	b.	What two interlocks are associated with CV-0155, the air- operated valve in the primary water supply line to the Quench Tank?	(1.0)	
6.5	a.	What signal is used to generate the pressurizer level setpoint?	(0.5)	
	b.	What automatic actions will occur as pressurizer level increases from its setpoint value up to a level of 90%?	(1.5)	
6.6	a.	Explain the difference between the primary and redundant Boric Acid Tank Heater and Pipe Heat Tracing circuits and how the two circuits function to maintain temperature.	(2.0)	
	b.	What action must be taken if temperature of the boric acid solution drops below the precipitation temperature?	(1.0)	
6.7	a.	Describe how the shutdown cooling system can be used for fuel pool cooling.	(1.5)	
	b.	What system provides a backup source of water for the fuel pool?	(0.5)	
6.8		three functions which can be controlled from the Remote down Control Panel.	(1.5)	
6.9	a.	How is SI precluded during normal shutdown?	(1.0)	
	b.	What maintains the SIRWT temperature above 40°F?	(1.0)	
6.10	Brie	fly describe how the incore neutron detectors detect neutrons.	(2.0)	
6.11		does the wide range logarithmic detection circuit employ belling at high power but not at low power?	(1.0)	

- 6.12 Briefly discuss the operation of the ground detection circuit used in the matrix relays. Include the normal and grounded conditions. (2.0)
- 6.13 What four abnormalities will cause a trip of an emergency diese generator? (2.0)

7.1	a.	What is the abnormal operating limit for the differential temperature between the spray water and the pressurizer water, and when, if ever, can this limit be exceeded?	(1.0)
	ь.	What action must be taken if the differential temperature between the spray water and pressurizer water exceeds 200°F?	(1.0)
7.2		action must be taken if Charging Pump Seal leakage exceeds ml/min, and what is the basis for this action?	(2.0)
7.3	What prio	is the reason for manually starting one diesel generator r to latching and rolling the main turbine?	(1.0)
7.4	serv pump wate	must the service water supply valves CV-0879 and CV-0880 and ice water return valve CV-0951 for the engineered safeguards s not be opened at the same time that the component cooling r supply valve CV-0913 and return valve CV-0950 for the neered safeguards pumps are open?	(1.0)
7.5	a.	What is meant by the term "minimum critical assembly?"	(1.0)
	b.	What is the minimum critical assembly value for Palisades?	(0.5)
7.6	a.	"By commitment to the NRC, no load greater than shall be handled over the spent fuel pool when it contains irradiated fuel which has less than 12 months' decay time unless it is moved per an approved procedure."	(0.5)
	b.	What action must be taken if the cable slack light comes on with "Lower Grapple Operate Zone" light off while inserting a fuel assembly into the core?	(1.0)
7.7	Expl mult	ain the actions which must be taken if a PCP experiences a iple seal failure.	(3.0)
7.8	List reac	the seven immediate actions which must be taken if a tor trip occurs accompanied by a safety injection.	(3.5)
7.9	cert	n SIS signal is received or primary pressure drops below a ain value after a Loss of AC power occurs, operators must certain action.	
	a.	What is that action?	(1.0)
	b.	What is the value of primary pressure at which this action must be taken?	(0.5)
	c.	Why is this action necessary?	(1.0)
7.10		the 3 situations specified in the Loss of Component	(1.5)

7.11 What five indications are used to confirm natural circ flow?	culation (2.5)
7.12 What is a Seiche?	. (1.0)
7.13 What is the limitation on amperage supplied to the Mot Auxiliary Feedwater Pumps?	or Driven (1.0)
7.14 What two immediate actions must be taken if a control evacuation is required when the reactor is at power?	room (1.0)

8.1	a.	What is the maximum recommended power escalation rate when power exceeds 90%?	(0.5)
	. b.	(1) What is the maximum load permitted when any two stages of feedwater heaters are bypassed?	(0.5)
		(2) Why is this load restriction imposed?	(1.0)
	c.	What action must be taken if the maximum ice limits for the Palisades switchyard lines are exceeded?	(1.5)
8.2	limi with	he specific activity of the primary coolant exceeds certain ts the reactor must be shutdown and Tavg reduced below 500°F in 6 hours. What are those specific activity limits? Define terms.	(3.0)
8.3	What Hot	Tech Spec safety limit is in effect when the plant is in Shutdown?	(1.0)
8.4	Expl	ain what is wrong with the following statements:	
	a.	If an individual discovers radioactive fluid leaking from a plant system, he should as quickly as possible shut system valves in an attempt to isolate the leak.	(1.0)
	b.	The standard RWP can be issued for a maximum of six months.	(1.0)
	c.	Only the Radiation Safety Supervisor may authorize entry without an RWP when immediate action is required.	(1.0)
8.5	What	does a circle R in a work procedure mean?	(1.0)
8.6	What	actions must you take if the following circumstances occur:	
	a.	You plan to undergo radictherapy in the near future.	(1.0)
	b.	You lose your dosimeter while in a radiation area.	(1.0)
8.7	Whos whol	e permission is required to exceed the 2500 mrem per quarter e body exposure control level?	(1.0)
8.8	reac Assu	e approval must the shift supervisor obtain to take the tor critical following a trip from 1% or greater power? me that the cause of the trip has been determined and ected.	(1.0)
8.9	Which	h individual on shift is directly responsible for the owing activities.	(2.0)
	a.	Preparing a Reactor trip report.	(0.5)
	b.	Ensuring the shift is properly manned.	(0.5)

	c.	Identifying specific operator weaknesses which could be corrected through new or improved training.	(0.5)
	d.	Declaring equipment operable or inoperable.	(0.5)
	e.	Mainbaining the Jumper, Link, and Bypass Log.	(0.5)
8.10	a.	How does an operator performing a System Checklist verify the position of a sealed valve which has an intact (unbroken) seal?	(1.0)
	b.	System Checklists for plant startup shall be invalid unless the system is placed in operation within after completion of the System Checklist.	(0.5)
8.11	a.	Each bypass authorized in the Jumper, Link, and Bypass Control Log shall be identified by placement of a	(0.5)
	b.	What is the purpose of CPIT stickers?	(0.5)
8.12	a.	When does the Temporary EOF assume the functions of the General Office Emergency Control Center?	(0.5)
	b.	Name two locations which can be used as an alternate TSC in the event the normal TSC becomes uninhabitable.	(1.0)
	c.	What organization provides offsite backup firefighting support for the Palisades Plant?	(0.5)
8.13	for r	e decisions which the Site Emergency Director is responsible making may not be delegated by him to another individual. those three decisions.	(1.5)
8.14	What must	is the minimum number of the following components which be operable in order to bring the reactor critical.	
	a.	Secondary system safety valves	(.25)
	b.	Safety Injection tanks	(.25)
	c.	High pressure safety injection pumps	(.25)
	d.	Boric acid tank level	(.25)

	b.	4.3 inches of mercury.	(0.5)
	c.	Specific written permission of the Plant Superintendent, Operations/Maintenance Superintendent, or Operations Supervisor.	(0.5)
	Ref:	Standing Order No. 16	(0.0)

5.2 Either of the following answers will be awarded full credit:

Considerable damage can occur as the turbine passes through the critical speeds (0.5) due to rubs which become progressively worse as the effect of the localized heating at the point of contact occurs. (0.5)

or

After the turbine has come to rest, the water from the heater will lay in the bottom of the turbine shell resulting in faster cooling of the bottom half than the top. (0.5) This results in a warped stator. (0.5)

Ref: Standing Order No. 18

5.3 Prevents the release of activity if a steam generator tube rupture occurs (1.0) since the saturation pressure of the primary coolant is below the lift pressure of the atmospheric steam relief valves. (1.0)

Ref: Tech Spec p. 3-18

5.4 Maintain the differential pressure below a value which would cause tube rupture.

(1.0)

Ref: Tech Spec p. 3-2

- 5.5 a. RT<sub>NDT</sub> is the reference transition nil ductility temperature (0.5), the temperature below which a material's failure mode will change from a ductile one to a brittle one. (0.5)
  - b. The RT<sub>NDT</sub> shifts due to neutron embrittlement (0.5), the embrittlement of the metal due to the deformation of the metal lattice by high energy neutrons. (0.5) The high energy neutron fluence is lower at 3/4 than it is at 1/4 due to the shielding of the reactor vessel walls (0.5), so the neutron embrittlement is greater at 1/4 than it is at 3/4. (0.5)

5.6 Hydrogen solubility is directly proportional to pressure. As pressure drops, hydrogen solubility will decrease markedly. (0.5) If hydrogen concentration is not reduced, hydrogen will escape from the primary coolant when the primary coolant system is opened creating a potential for an explosion. (0.5)
