ARKANSAS POWER & LIGHT COMPANY
ARKANSAS NUCLEAR ONE
HIGHWAY 333
P. O. BOX 608
RUSSELLVILLE, ARKANSAS 72801

The content of ISI Technical Manual for Arkansas Nuclear One, Unit One, Volume 1 and Volume 2 are controlled and uncontrolled manuals. Controlled copies are stamped on the front cover sheet of Volume 1. Uncontrolled manuals are also stamped on the front cover sheet of Volume 1. Holders of controlled manuals will be provided with up to date revisions as they may be made and after required AP&L approval. Holders of uncontrolled manuals will not be provided with the latest revisions. Holders of controlled manuals will be required to return Engineering Form ENG-014 upon receipt of all revisions. If Engineering Form ENG-014 is not returned to the ISI Coordinator within six (6) months, the controlled manual will automatically become an uncontrolled manual and revisions will no longer be provided. Control of revisions are in accordance with AP&L Procedure 1032.07, "ISI Program Requirements," latest revision.

ARKANSAS POWER & LIGHT COMPANY
Arkansas Nuclear One

TITLE: ~~ISI PROGRAM APPROVAL~~ | FORM NO. ~~1032.07~~

REV. # 2 PC #

TITLE: I.S.I. Technical Manual For Arkansas Nuclear One - Unit 1

REVISION NO. 10

DESCRIPTION OF REVISION (ATTACH ADDITIONAL PAGES AS REQUIRED):

Changed NDE Boundry Iso's to Zone's Iso's.
Developed Zones for Service Water System - Class 3.
Developed Zones for Building Spray System - Class 2.
Changed Augmented examinations of Decay Heat Removal System to required (PT) examination - Class 2.
Selected different 25% of Class 1 welds for second interval examination.
Selected different 50% of Class 2 welds for second interval examination.
Changed NDE requirements to comply with Section XI, 1980 Edition (W80).
Added IWF requirements to program plan.

REASON FOR REVISION (ATTACH ADDITIONAL PAGES AS REQUIRED):

These revisions were made to comply with 10CFR-50.55(a)(g) and A.S.M.E. Section XI Inservice Inspection of Nuclear Power Plant Components, which requires the ISI Program to be upgraded to meet the requirements of that edition of the Code that is in effect one year earlier than the latest approved edition, which is the 1981 edition (W81 addenda).

TABLE OF CONTENTS

INTRODUCTION

The technical content of this manual describes the methods by which Arkansas Power & Light Company - Arkansas Nuclear One - fulfills the requirements of 10CFR50.55a for inservice inspection. In accordance with 10CFR50.55a(g) and based upon the Unit One commercial operating license date of 12/19/74, the applicable code for inservice inspection is the ASME B&PV Code, Division 1, Section XI, 1980 Edition including addenda through Winter 1980.

This manual does not address the inspection requirements of IWP, IWV or steam generator tubes, which is the responsibility of the IST Department. Nor are the inspection and testing requirements of hydraulic and mechanical snubbers addressed, since this is the responsibility of the Mechanical Maintenance Department.

Arkansas Power & Light Company will provide an uncontrolled copy of this manual, along with other requirements, to interested and qualified NDE Contractors. The NDE Contractors shall submit a proposal, which will address the availability of personnel, number of personnel which can be provided, approximate length of time to complete the required examinations and cost of the NDE services.

Arkansas Power & Light Company will notify the successful NDE Contractor, at which time a contract for the services will be completed.

The NDE Contractor shall furnish current NDE procedures covering the five (5) disciplines, to the ANO-ISI Coordinator for review and acceptance. These NDE procedures shall be maintained under a separate cover known as ISI Technical Manual, Volume 3

Upon arrival on site the NDE Contractor shall provide the ISI Coordinator with Certifications of Calibration for equipment, Certifications for materials such as couplant, penetrant, cleaner/ remover and developer. Certification of NDE

Personnel including up-to-date and current eye examinations. The NDE Contractor shall be subject to audits by A.P.&L.-QA and AIA.

The NDE Contractor shall provide the ISI Coordinator with the original NDE examination data report, along with ANO's examination work list, which shall indicate specific information required by this program.

The various manual sections detail examination requirements for a ten (10) year interval, special examination requirements, inventory and drawings of calibration standards, and relief requests.

The ISI Coordinator shall write the final examination report and complete the NIS-1 form.

The information contained herein is the property of Arkansas Power & Light Company and is provided to the NDE Contractor solely for their use in conjunction with the work scope performed under the required contract.

SPECIAL EXAMINATION REQUIREMENTS

The listing of Examinations as shown in Section 2 of this manual specify the examination method (s) to be used for each exam number.

Included in this section are drawings which depict the volume or area to which these examination methods are applied in order to satisfy the applicable Code and plant specification requirements.

INVENTORY LIST AND DRAWINGS FOR CALIBRATION STANDARDS

Included in this section is an inventory list and drawings of the calibration standards applicable to the examinations required during this second ten (10) year inspection interval.

The calibration standards are the property of Arkansas Power & Light Company. The standards shall be placed in controlled storage and their removal from and return to storage will be controlled.

The calibration standards shall be protected as necessary against mechanical or chemical damage, rust or corrosion.

CALIBRATION STANDARDS DRAWINGS AND INVENTORY LIST

Included in this section is a list of calibration standards and drawings of the calibrations standards applicable to the examination required during this refueling outage 1R7.

The calibration standards are the property of Arkansas Power and Light Company. These standards should be placed in bonded storage, and their removal from and return to storage should be controlled.

The calibration standards shall be protected as necessary against mechanical damage, rust and corrosion.

A.P.&L. CURRENT RELIEF REQUESTS

Included in this section are letters directed to the NRC, requesting relief from certain ASME Section XI examination requirements, which for some reason cannot be examined due to structural interference, in-accessable or radiation limitations.

When a request for relief states an alternate NDE method to be used in lieu of the one required by Section XI, this alternate method shall be incorporated into the ISI Program Plan and Schedule.

ARKANSAS POWER & LIGHT COMPANY
POST OFFICE BOX 551 LITTLE ROCK, ARKANSAS 72203 (501) 371-4000

November 12, 1982

1CAN118203

Director of Nuclear Reactor Regulation
ATTN: Mr. J. F. Stolz, Chief
Operating Reactors Branch #4
Division of Licensing
U. S. Nuclear Regulatory Commission
Washington, D. C. 20555

SUBJECT: Arkansas Nuclear One - Unit 1
Docket No. 50-313
License No. DPR-51
Inservice Inspection (ISI)
Relief Requests

Gentlemen:

This letter consolidates our responses to your letters dated February 23, 1982, (1CNA028205) and March 2, 1982, (1CNA038202). The stated purpose of your February 23, 1982, letter was to ensure that the ISI relief request information that the NRC is supplying its contractors for review is current and reflects the latest requirements for Arkansas Nuclear One - Unit 1 (ANO-1). The stated purpose of your March 2, 1982, letter was to solicit additional information related to the ISI program for ANO-1. It was felt that a consolidated response would be a more effective way to present the information requested and keep the overall ISI program in perspective.

THE FOLLOWING RESPONSES ARE SPECIFIC TO YOUR FEBRUARY 23, 1982, LETTER:

Item 1. Previous ISI Submittals

You listed five (5) previous submittals on our ISI program and stated that any earlier submittals would be considered obsolete. Accordingly, AP&L was asked to determine if there were any additional previous submittals that NRC should be reviewing. We concur that there are no earlier submittals that the NRC should be reviewing in order to bring current our ISI relief requests. The five (5) letters referenced in your February 23, 1982, letter and this present document (1CAN118203) will update all our requests for ISI relief to this point in time.

Item 2. Inspection Interval for ANO-1

You indicated that, although the proposed inspection interval for ANO-1 is April 19, 1978 to August 19, 1981, the ISI regulations would allow for an inspection interval of April 19, 1978 to December 19, 1984. In keeping with the provisions of the regulations governing ISI, we concur with the ANO-1 inspection interval being April 19, 1978 to December 19, 1984. Accordingly, we also concur with the ISI review being conducted against the 1974 edition of the ASME Boiler & Pressure Vessel Code, Section XI, up to and including the Summer 1975 Addenda.

Item 3. Additional Requests for ISI Relief

AP&L was also asked to submit any additional requests for ISI relief that the NRC should be considering. Our additional requests and related information are as follows:

Control Rod Drive Mechanism (CRDM) Welds

Discussion - Some of the welds on the CRDM's are not accessible as a result of the shroud covering. This means that AP&L would have to either remove the shroud to perform the required examinations or request relief. Deferral of the examinations to the end of the inspection interval is permitted by the Code; therefore, we believe it will be feasible to perform the CRDM examinations as required by the Code. However, it was felt appropriate at this time to state our intent to defer these examinations for documentation purposes.

Additional Relief Requests on Class I Components

(1) AP&L requests relief from the requirement to examine the clad patch areas of the reactor vessel, pressurizer, and steam generators as required by the 1974 Edition of Section XI (Items B1.13, B1.14, B2.9 and B3.8, Examination Categories B-I-1 and B-I-2).

Basis - Four reactor vessel closure head patches have been examined visually and with liquid penetrant. In addition, one steam generator clad patch has been visually examined. No evidence of clad degradation has been found. The accessible areas of the reactor vessel interior will be visually examined. This will cover a significant amount of cladding in critical areas of the primary pressure boundary to provide assurance that the general condition of the cladding has not deteriorated.

Proposed Alternate Examination - Visually inspect the accessible areas of the internal pressure boundary surfaces of the reactor vessel. This is consistent with the Summer 1978 Addenda to Section XI, 1977 Edition.

(2) AP&L requests relief from the requirement to do a volumetric examination of the reactor vessel support skirt weld as required by the 1974 Edition of Section XI (Item B1.12, Examination Category B-H).

Basis - The reactor vessel support skirt-to-vessel weld is impractical to examine volumetrically considering access for examination equipment, the necessity of insulation removal, personnel exposure to a 150-200 mR general area radiation field in the range of 1R on contact with insulation, and the amount of time required to obtain acceptable results. With insulation removed, close proximity radiation readings are expected to be considerably higher. This weld is not considered part of the Section XI, Class 1 (IWB) boundary under the rules of the 1980 Edition and therefore would be exempt from any examination requirements (See Figures 1 & 2).

Proposed Alternate Examination - None.

(3) AP&L requests to use Article 4 of Section V as referred to by Section XI of the 1977 Edition through Summer 1978 Addenda for ultrasonic examination of the reactor vessel, pressurizer, and steam generators in lieu of Appendix I of the 1974 Edition of Section XI.

Basis - An improved reactor vessel inspection program is being prepared for ANO-1 which is based on USNRC Regulatory Guide 1.150. This Guide refers to Article 4 of Section V, 1977 Edition through Summer 1978 Addenda for ultrasonic examination methods. Article 4 of Section V is equivalent to Appendix I and would provide an inspection program for the major components that is compatible and consistent with future Code-required ultrasonic examinations.

Proposed Alternate Examination - Article 4 of Section V, 1977 Edition, including Addenda through Summer 1978 will be used to establish the ultrasonic examination methods for the referenced components.

(4) AP&L requests relief from the surface examination requirements of the reactor vessel core flood nozzle-to-safe end and safe end-to-pipe welds as required by the 1974 Edition of Section XI (Items B1.6 and B4.1, Examination Category B-F).

Basis - The preparation includes removal of the refueling canal seal plate, shielding bricks and supports in the nozzle area, and insulation. Scaffolding would also have to be erected. Due to the elevation and proximity to the reactor vessel cavity, temporary shielding is not considered practical. The subject welds will be examined ultrasonically (full-volume) from the ID surface. The 1977 Edition of Section XI, IWB-3514.3 states, "Where indications on the outer surface of piping as detected by the surface examination method during an inservice examination exceed the allowable standards, the indication may be examined by the volumetric method. The acceptance of these indications shall be governed by the allowable indication standards for the volumetric examination method...".

Proposed Alternate Examination - Welds will be ultrasonically examined from the inside surface.

(5) AP&L requests to use the requirements of the 1977 Edition through Summer 1978 Addenda for examination of branch connection welds (Items B4.6 and B4.7, Examination Category B-J).

Basis - Because of weld and nozzle configurations for branch connections, complete volumetric examination required by the 1974 Edition of Section XI cannot be accomplished. This impracticality was recognized and revisions to the examination requirements were incorporated in the 1977 Edition, Summer 1978 Addenda. The examination requirements of the Summer 1978 Addenda provide adequate assurance that pipe branch connection welds and base metal remain structurally sound.

Proposed Alternate Examination - The examination methods and examination areas for all Class 1 piping branch connection welds will be chosen from Table IWB-2500-1 of the 1977 Edition of ASME Section XI with Addenda through the Summer 1978.

Proposed Alternate Examination - None.

Class 2 Components

(6) AP&L requests relief from volumetric examination of Class 2 piping welds in pipes with nominal wall thickness 0.5 inch and less (Items C2.1, C2.2, and C2.3, Examination Categories C-F and C-G).

Basis - Reliability for detection and characterization of flaws in thin-wall piping using the procedures of the 1975 Summer Addenda is poor. This is mainly due to resolution problems inherent with the ultrasonic technique, weld joint configurations, and material properties in the case of austenitic welds. In some cases, the Code required calibration reflector is over 50% of the pipe wall.

The 1977 and later Editions of Section XI (including Addenda) require a surface examination of Class 1 piping weldments with less than 4 inches nominal pipe diameter and of Class 2 piping weldments 0.5 inch and less in thickness. Non-volumetric examination is required for these welds.

A surface examination (magnetic particle or liquid penetrant) provides better sensitivity for detecting and sizing surface initiating flaws in this thickness range.

Proposed Alternate Examination - A surface examination will be performed on those welds with thicknesses 0.5 inch and less.

(7) AP&L requests to perform a surface examination in lieu of a volumetric examination where welds are inaccessible due to location of reinforcing collars (Item C2.3, Examination Category C-G).

Basis - The attachment of the reinforcement collar to nozzle penetrations makes the full penetration nozzle weld inaccessible for volumetric inspection.

~~Proposed Alternate Examination - A surface examination will be performed on the reinforcement collar welds. Only the reactor vessel will be hydro-tested.~~

Item 4. Continuing Review of ISI Relief Requests

Although this submittal, along with the five letters listed in your February 23, 1982, letter, represents the best information we have compiled at this point in time, we are continuing to review our ISI program. Based upon the results of our review, we may supplement this letter with additional data at a later date so that the NRC can provide any review contractors the most current information available for our facility.

THE FOLLOWING IS SPECIFIC TO YOUR MARCH 2, 1982, LETTER

Your verbatim requests for additional information are followed by our responses (Ref. 2 refers to AP&L's letter (1CAN127803) dated December 15, 1978):

1. General

"Under the change in regulation 10CFR50.55a effective November 1, 1979, your ISI program when finally approved, will cover the last 80 months of your current 10-year inspection interval, i.e., from April 19, 1978 to December 19, 1984. Does this result in any changes you wish to make in your relief requests? Do you require other ISI relief?"

AP&L Response

AP&L wishes to make no changes to our previous relief requests other than those contained in this letter. Additional ISI relief requests are included herein under Item 3 in this letter.

2. Extent of Volumetric Examinations (Question 1, Ref. 2)

"In this question you were asked whether full volumetric examinations can be performed in accordance with code reqirements for all Class 1 and 2 systems. Your response suggested that the plant has some partially inaccessible welds for which relief requests have not been prepared. For example, the use of Article I-5121 to record limited examination is discussed and the suggestion is made that "a supplemental... surface examination could be performed". Formal relief requests should be submitted on welds for which complete compliance with code requirements is not possible. The fraction of the weld which is inaccessible should be estimated as well as the total fraction of inaccessible welds or weld length in a given code item. As appropriate, a definite commitment should be made to perform any supplemental, alternative examinations."

AP&L Response

Included in our above response to your February 23, 1982, letter are all relief requests AP&L wishes to make at this time on inaccessible welds. In all cases, the total weld should be considered as "inaccessible" for the reasons noted. Our commitments to perform any necessary supplemental, alternative examinations were included under the headings, "Proposed Alternate Examination."

3. Exemption due to Paragraph IWC-1220 of Section XI (Question 6, Ref. 2)

"In your response you identified Class 2E systems on your P&ID's as being exempted from examination because of paragraph IWC-1220. The NRC does not accept the "chemistry control" provision of the S-75 addenda as a basis for exempting systems for inspection. You should develop an ISI program for the ECC, RHR, and CHR (containment heat removal) systems that complies with the intent of the S-79 addenda, in which the "chemistry control" provision has been deleted. A commitment to such a program with any necessary relief requests for reasons other than chemistry control, should be provided in response to this inquiry."

AP&L Response

The ISI program for ANO-1, which is presently committed to the 1974 edition of the ASME Boiler and Pressure Vessel Code, Section XI, up to and including the Summer 1975 Addenda, was established and put into effect prior to the acceptance of the Summer 1979 Addenda. Therefore, it is AP&L's position that the exemption from examination based on IWC-1220 is valid, that this exemption is allowable, and that it does not require NRC approval. This situation is analogous to the less than 4 inch Class 2 piping exemption.

AP&L will, however, pursue the development of an ISI program for the Emergency Core Cooling, Decay Heat Removal, and Containment Cooling Systems during the next ISI program upgrade as required by 10CFR50.55a.

4. Item B5.6, Volumetric Examination of Pump Casing Welds, and Others (Ref. 2)

"Your response to Question 2 indicates "that relief request on this item is to follow at a later date". Possible relief requests are also pending on: (a) Quesiton 6 - pressure testing of Class 2E systems, (b) Question 7 - pressure testing of service water system, and (c) Question 9 - supplementary information (resulting from March 1, 1979 outage) re. HPI and core flood line welds. Please provide as much of the missing information as possible."

AP&L Response

Except for those requests explicitly made or referenced in this letter, we are withdrawing our previous relief requests where the development of additional information was pending. Should the need arise for ISI relief at a future date, we will advise NRC with a specific request for relief at that time.

Sincerely,

John R. Marshall

John R. Marshall
Manager, Licensing

"Guidelines"

The following information, along with the attached sheet (Form ENG-011) is a guide to how Section 2 of the ISI Technical Manual for Arkansas Nuclear One - Unit-1 is set up.

A - Designates the unit number this program covers.

B - Designates whether it is a "vessel pressure boundary", or piping pressure boundary".

C - Designates the zone number the examinations are to be performed in.

D - Designates the component being examined, such as "Reactor Vessel".

E - Designates the number of pages, which cover the examinations for the particular zone.

F - Designates the ASME class to which the examinations are performed to, such as class 1-IWB, class 2-IWC, etc.

G - Designates the unique number which is assigned to each examination, such as 01-001. This unique number is also shown on the isometric drawings after each zone.

H - Describes what is to be examined, such as "Shell to Flange" "Circumferential Seam" (or weld).

I - Designates the item number as specified on table 2500-1 of Section XI of the ASME Code, such as B1.30.1.

J - Designates the catagory of the weld to be examined per table 2500-1 of Section XI of the ASME code, such as BA.

K - Designates a one year interval, of which there are ten (10).

L - Designates a forty (40) month period, of which there are three (3). Each 40 month period covers three (3), one (1) year periods. An "x" placed in line with the exam number, parts examined, etc. and in the first year column designates which refueling outage the examination is to be performed. In this case the examination is to be performed during the 1R7 refueling outage.

M - Designates any examinations to be performed which for some reason was not done at its regularly scheduled time during the 120 month period.

N - Designates the percent of the weld to be examined.

O - Describes the method of NDE to be performed on the weld, such as MT-Magnet Particle, PT-Liquid Penetrant, UT-Ultrasonics, etc.

P - Designates the serial number of the UT calibration standard, which is to be used to calibrate the UT equipment prior to and after performing the examination.

Q - Designates, whether scaffolding is required to safely perform the examination.

R - Designates, whether insulation needs to be removed to allow examination of the weld or part.

S - Designates, whether weld preparation, such as buffing or grinding is required to perform the examination.

T - The remarks section is self explanatory and may provide pertinent information.

TEN (10) YEAR INSPECTION PLAN

Included in this section is the complete ten (10) year interval inspection program plan and schedule print-out of the required examinations for Arkansas Nuclear One, Unit One. This ten (10) year inspection plan is divided into five (5) refueling outages, with allowances for a sixth (6) refueling outage if necessary.

The examinations are divided into Class 1("B" item numbers with corresponding catagory numbers), Class 2 ("C" item numbers with corresponding catagory numbers), Class 3 ("D" item numbers with corresponding catagory numbers). For IWF Component Supports Class 1 ("B" item numbers with corresponding catagory numbers, when the support is intergally welded), and ("F" item and catagory numbers when the support is not intergally welded). Class 2 ("C" item numbers and corresponding catagory numbers, when the support is intergally welded) and ("F" items and catagory numbers when the support is not intergally welded). Class 3 ("F" item and catagory numbers).

Augmented inspections are those inspections which are not ASME Code required, but are being performed to satisfy Regulatory Guides, Technical Specifications, A.P.&L. commitments or for information only. Augmented inspections are designated by (X000000) examination numbers.
