1.0 EXCEPTIONS TO VERIFIED DATA

All information used in this calculation was obtained from HVACD, EPED, AED, and approved S&L drawings. These data are therefore considered to be verified except for the following:

No exceptions.

## 2.0 COMPUTER PROGRAMS

The transient calculations reported herein were done using S&L computer Program COMPARE/MODT (03.7.322-1.0), which is described in Reference 1. Validation documentation for COMPARE/MODT is maintained in the S&L Computer Software Library.

### 3.0 PURPOSE

The purpose of this analysis is to calculate the transient air temperatures in the Auxiliary Electric Equipment Rooms (AEERs) following a postulated station blackout (SBO) event. The 4 AEERs are at floor elevation 731' -0" between column rows (13) and (17), and between column rows (J) and (N).

The purpose of Revision 1 is to:

1. Adjust heat loads in the 4 AEER'S.
2. Modify initial temperatures of all nodes.
3. Modify final temperatures for nodes 5-14.

#### 4.0 ANALYTICAL MODEL

The model used consists of 15 nodes, 4 paths, 32 walls, 1 blower characteristic curve, and 4 blowdown functions. The paths and blower curves model one-way venting of the AEERs as their atmospheres heat up. The blowdown functions model the heat loads in the AEERs. Nodes 1 through 4 represent the 4 AEERs, as follows (items in parentheses are column designations):

- Node 1: south AEER of Unit 1, which is located between (13) and (13).7 and between (J) and (N);
- Node 2: north AEER of Unit 1, which is located between (13).7 and (15) and between (J) and (N);
- Node 3: south-east AEER of Unit 2, of "L" shape, and located between (J) and (N) from (15) to (16), and between (J) and (M) from (16) to (17); and
- Node 4: north-west AEER of Unit 2, between (16) and (17) and between (M) and (N).

All of Nodes 5 through 12 represent rooms adjacent to the four AEERs with floor elevation 731' -0". Nodes 13 and 14 represent the cable spreading area just above the AEERs of Units 1 and 2, respectively. Node 15 represents the offices and laboratories beneath the AEERs.

Figure 1 is a schematic diagram of the nodes and walls. In it are shown the left hand face (LHF) and the right hand face (RHF) connections of the walls to the nodes. Walls 1 through 11 are 12-inch (nominal) masonry firewall sidewalls, which surround the set of AEERs. Wall 12 is an 8-inch (nominal) masonry firewall sidewall which separates nodes 1 and 2. Wall 13 is a 12-inch (nominal) masonry firewall sidewall between nodes 2 and 3. Wall 14 is an 8-inch (nominal) masonry firewall sidewall

between nodes 3 and 4. The actual thicknesses of the masonry firewalls are 3/8 inch less than their nominal thicknesses. Walls 15, 16, 17 and 18 are the ceiling walls of nodes 1, 2, 3 and 4, respectively. These ceiling walls are 12-inch thick reinforced concrete. Walls 19, 20, 21 and 22 are the floor walls of nodes 1, 2, 3 and 4, respectively. Walls 19, 20 and 22 are 9-inch thick reinforced concrete. Wall 21 has thicknesses of 9, 12 and 24 inches. A preliminary computer run indicates the 24-inch thickness provides the conservative answer, so it is used in the model. Walls 23 through 26 model doors in the perimeter of the AEERs. Walls 27 through 32 model doors in the walls between the AEERs. Walls 28 and 31 are rolling doors.

Heat generation rates in the active nodes (1 through 4) are modeled as "blowdowns" (1 through 4, respectively). Each of these blowdowns is characterized by a fixed energy input rate, but zero mass flow.

Heat transfer to and from the walls of the model is assumed to be by natural convection and by radiation. Vapor-to-surface radiation is accounted for.

The first 4 paths allow flow to leave (but not enter) each AEER as its pressure increases above atmospheric.

5.0 ASSUMPTIONS AND INFORMATION

1. The air volume in each AEER is assigned as 90 percent of the gross volume, to conservatively account for the volume of equipment in the room. The gross volumes are calculated in Appendix A based on Ref. 7.
2. The rate of heat generation in the AEERs is given via Ref. 4 as follows:

<u>Btu/sec</u>	<u>Room</u>
3.593	South AEER of Unit 1
11.64	North AEER of Unit 1
13.58	South-east AEER of Unit 2
2.133	North-west AEER of Unit 2

The required conversion of units is noted in Appendix A.

3. According to Reference A, the following temperatures were used:

Node	Description	Initial Relative Humidity	Initial Temp	Temperature of			
				2.0 HR	3.0 HR	4.0 HR	
1	AEFR 1	20%	90		Calculated		
2	AEER 2	20%	90		Calculated		
3	AEER 3	20%	90		Calculated		
4	AEER 4	20%	90		Calculated		
5	Cable Spreading RM 201	47%	102	108.9	115.8	122.6	129.5
6	Stair A3	34%	106	107.2	108.5	109.7	110.9
7	Cable Spreading RM 212	47%	102	103.9	105.8	107.8	109.7
8	Battery Electric RM 118	36%	104	104	104	104	104
9	Riser Aisle 203	36%	104	120.7	137.4	154.1	170.8
10	Riser Aisle 205	36%	104	104	104	104	104
11	Switchgear RM 202	36%	104	118.6	133.3	147.9	162.5
12	Battery RM 202	36%	104	118.6	133.3	147.9	162.5
13	Cable Spreading Area Above 1&2	36%	104	104.5	105.0	105.4	105.9
14	Cable Spreading Area Above 3&4	36%	104	105.2	106.4	107.6	108.8
15	Offices and Labs Below	20%	75	75.2	76.2	76.7	77.3

4. Relative humidities at 1.0, 2.0, 3.0 and 4.0 hours were calculated assuming constant absolute humidity. The absolute humidity was determined from the initial data in Reference 5. These calculations can be found in Appendix B.
  5. Natural convection and vapor-to-surface radiation are assumed as heat transfer mechanisms between the atmosphere in the AEERs and adjacent wall surfaces.
  6. No credit is taken for augmentation of wall surface areas due to the presence of columns and beams in a room. Calculation of the wall areas is presented in Appendix A, based on Ref. 7.
  7. The properties of reinforced concrete are taken from Ref. 3 as follows:
    - Thermal conductivity =  $0.92 \text{ Btu}/(\text{hr}\cdot\text{ft}\cdot^{\circ}\text{F})$
    - Density =  $145 \text{ lbm}/(\text{cu. ft})$ , and
    - Heat capacity =  $0.156 \text{ Btu}/(\text{lbm}\cdot^{\circ}\text{F})$ .
  8. The properties of firewall material were determined in Appendix A from information provided in Ref. 6. The properties thus obtained were found to depend on the wall thickness considered, as follows:
    - For a 12-inch (nominal thickness) wall:
      - Thermal conductivity =  $0.300 \text{ Btu}/(\text{hr}\cdot\text{ft}\cdot^{\circ}\text{F})$
      - Density =  $53.7 \text{ lbm}/(\text{cu. ft})$  and
      - Heat capacity =  $0.156 \text{ Btu}/(\text{lbm}\cdot^{\circ}\text{F})$  (assumed).
    - For the 8-inch (nominal thickness) wall:
      - Thermal conductivity =  $0.203 \text{ Btu}/(\text{hr}\cdot\text{ft}\cdot^{\circ}\text{F})$
      - Density =  $53.5 \text{ lbm}/(\text{cu. ft})$ , and
      - Heat capacity =  $0.156 \text{ Btu}/(\text{lbm}\cdot^{\circ}\text{F})$  (assumed).
- For both firewall thicknesses, the actual thickness is  $3/8$  inch less than the nominal thickness.

9. The properties of the doors were determined in Appendix A from information provided in Ref. 8. Each rolling door is modeled, conservatively, as a single sheet of steel 0.050-inch thick. All other doors are modeled, conservatively, as of 18-gauge honeycomb construction.
  
10. All doors remain closed throughout the duration of the SBO.

6.0 RESULTS

The transient temperatures as calculated in the AEERs during the SBO are presented in Figure 2. At 4 hours after the start of the SBO, the temperatures are:

<u>Temperature, °F</u>	<u>Room Description</u>
At 4 hours	
110.0	South AEER of Unit 1 (node 1)
119.7	North AEER of Unit 1 (node 2)
119.7	South-east AEER of Unit 2 (node 3)
108.6	North-west AEER of Unit 2 (node 4)

After 4 hours, the temperatures of all 4 AEERs are still increasing. These results are based on a model designed to cause the temperature of the hottest AEER to be conservatively high throughout the SBO transient. However, the model is not specifically intended to cause the cooler AEERs to have a conservatively high temperature. For this reason it is recommended that the envelope of the curves of Figure 2 be considered to apply to all 4 AEERs. An additional reason favoring use of the envelope is that doors between hotter and colder AEERs may be opened during the SBO.

## 7.6 DISCUSSION OF RESULTS

The temperature of the hottest AEER during the SBO transient is considered to be conservatively high for the following reasons:

1. Equipment-to-wall-surface radiation within the AEERs is not included in the model. It would enhance heat transfer away from the AEERs throughout the transient.
2. Use of the lightest door constructions and firewall materials from Refs. 8 and 6 yield correspondingly low wall conductance values and wall capacitance values. Both of these effects tend to maximize the temperatures in the hottest AEERs.
3. Since the model assumes that all doors remain closed during the SBO, doors used for operator access to the AEERS should involve the lowest possible temperature differential and be open only as long as necessary. Door 265 should be used as a starting point to enter any of the AEERS. The other AEERS can then be accessed by employing doors 612 or 611, 261, and 854, which are internal to the AEER area, as necessary.

AEER TRANSIENT TEMPERATURES FOLLOWING A STATION BLACKOUT

REVIEW METHOD SHEET

Calc. No. 3C7-0289-001  
 Revision: 1  
 Page: 18 / 4  
 Project No. 8406-27

This calculation has been reviewed by me according to the method(s) checked below.

1. Computer Aided Calculations

a	Review to determine that the computer program(s) has been validated and documented, is suitable to the problem being analyzed, and that the calculation contains all necessary information for reconstruction at a later date.
b	Review to determine that the input data as specified for program execution is consistent with the design input, correctly defines the problem for the computer algorithm and is sufficiently accurate to produce results within any numerical limitations of the program.
c ✓	Review to verify that the results obtained from the program are correct and within stated assumptions and limitations of the program and are consistent with the input.
d	Review validation documentation for temporary changes to listed, or developmental, or unique single application programs, to assure that methods used adequately validate the program for the intended application.
e ✓	Review of code input only, since the computer program has sufficient history of use at Serpent & Lund, in similar calculations.
f ✓	Review arithmetic necessary to prepare code input data.
g	Other:

2. Hand Prepared Design Calculations

a	Detailed review of the original calculations.
b	Review by an alternate, simplified, or approximate method of calculation.
c	Review of a representative sample of repetitive calculations.
d	Review of the calculation against a similar calculation previously performed.

3. Revisions

a ✓	Editorial changes only.
b	Elimination of unapproved input data without altering calculated results.
c	Other:

4. Other

Part 2: Node Volumes of Active Nodes (1-4)

H = Height of nodes 1-4, ft (Dwgs. of Ref. 7)

$$= (749'0" - (6'6" - 731'0")) \approx 17.0 \text{ ft}$$

$V_{N1,g}$  = Vol. of node 1, gross,  $\text{ft}^3 = A_{N1,plan} \times H$  (A-186)

$$A_{N1,plan} = (8.33)^2 [1.85 \times 2.80 + 2.03 \times 2.15] = 662.3 \text{ ft}^2$$

$$V_{N1,g} = 662.3 \times 17.0 \approx 11259.1 \text{ ft}^3 \quad [8.33 \text{ ft} \text{ node height}]$$

#  $V_{N2,g}$  =  $A_{N2,plan} \times H$  = Vol. of node 2, gross,  $\text{ft}^3$  (A-186)

$$A_{N2,plan} = (8.33)^2 [3.90 \times 2.75 + 3.73 \times 2.20] = 1313.6 \text{ ft}^2$$

$$V_{N2,g} = 1313.6 \times 17.0 \approx 22331.2 \text{ ft}^3$$

#  $V_{N3,g}$  = Vol. of node 3, gross,  $\text{ft}^3 = A_{N3,plan} \times H$  (A-187)

$$A_{N3,plan} = (8.33)^2 [5.24 \times 5.00 - 3.18 \times 2.18 + .8 \times .16] = 1554.0 \text{ ft}^2$$

$$V_{N3,g} = 1554.0 \times 17.0 = 26418.0 \text{ ft}^3$$

#  $V_{N4,g}$  = Vol. of node 4, gross,  $\text{ft}^3 = A_{N4,plan} \times H$  (A-187)

$$A_{N4,plan} = (8.33)^2 [3.07 \times 2.08 - .90 \times .17] = 432.5 \text{ ft}^2$$

$$V_{N4,g} = 432.5 \times 17.0 \approx 7352.0 \text{ ft}^3$$

# Net node volumes are taken as 90% of gross volumes to account for equipment in the rooms:

$$V_{N1,net} = 10133.2 \text{ ft}^3, V_{N2,net} = 20098.1 \text{ ft}^3, V_{N3,net} = 23776.2 \text{ ft}^3, V_{N4,net} = 6617.0 \text{ ft}^3$$

Part 4 (contd.)

- $A_{W9, gross} = 8.33 \times 1.15' \times 17.0' = 162.9 \text{ ft}^2$ ;  $t_{W9} = 11.625''$
- $A_{W10, gross} = 8.33 (0.60' + 3.20') \times 17.0' = 538.1 \text{ ft}^2$ ;  $t_{W10} = 11.625''$
- $A_{W11, gross} = 8.33 \times 1.50' \times 17.0' = 212.4 \text{ ft}^2$ ;  $t_{W11} = 11.625''$
- $A_{W12, gross} = 8.33 (2.75' + 10' + 2.12') \times 17.0' = 703.8 \text{ ft}^2$ ;  $t_{W12} = 7.625''$
- $A_{W13, gross} = 8.33 \times 4.83' \times 17.0' = 684.0 \text{ ft}^2$ ;  $t_{W13} = 11.625''$
- $A_{W15, gross} = 8.33 (1.9' + 2.15' + 0.6' + 8.0') \times 17.0' = 695.3 \text{ ft}^2$ ;  $t_{W15} = 7.625''$

Floor (F) wall & ceiling (C) wall areas are taken equal to the corresponding "plan" areas of p. A3 =

- $A_{W15} = A_{W19} = A_{N1, plan} = 662.3 \text{ ft}^2$
- $A_{W16} = A_{W20} = A_{N2, plan} = 1313.6 \text{ ft}^2$
- $A_{W17} = A_{W21} = A_{N3, plan} = 1554.0 \text{ ft}^2$
- $A_{W18} = A_{W22} = A_{N4, plan} = 432.5 \text{ ft}^2$

All C walls have same thickness:  $t_{W15} = t_{W16} = t_{W17} = t_{W18} = 12''$   
(see S-575 & S-1073)

For F walls:  $t_{W19} = t_{W20} = t_{W22} = 9''$ , but W21 has 3 thicknesses: 9", 12" & 24". For conservatism,  $t_{W21} = 24''$  is used.  
(See S-573 & S-1071.)

Part 5: Properties of wall materials

For ceiling walls (W15-W18), reinforced concrete (RC) properties as found in Table 2 of Ref. 3 are assigned:

$$\rho_{rc} = 145 \frac{\text{lbm}}{\text{ft}^3};$$

$$c_{p,rc} = .156 \frac{\text{Btu}}{\text{lbm-F}}; k_{rc} = .92 \frac{\text{Btu}}{\text{hr-ft-F}}$$

For all firewalls (FWs) of the AEFRA (W1-W14) properties are based on Ref. 6:

A. For 12" (nominal) thick 2-core unit ( $t_w = 11.625"$ )

$$M_{12"fw} = \text{ave. mass per ft}^2 \text{ wall surf.} = 52 \frac{\text{lbm}}{\text{ft}^2}$$

$$\rho_{12"fw} = \frac{M_{12"fw}}{(11.625/12)} = \frac{52 \times 12}{11.625} = 53.7 \frac{\text{lbm}}{\text{ft}^3}$$

$$\text{Assume } c_{p,12"fw} = c_{p,rc} = .156 \frac{\text{Btu}}{\text{lbm-F}}$$

$$U_{12"fw} = \text{Thermal conductance} = .31 \frac{\text{Btu}}{\text{hr-ft}^2\text{-F}}$$

$$k_{12"fw} = \text{Thermal conductivity, Btu/hr-ft-F}$$

$$= U_{12"fw} \times t_{w,12"fw} = .31 \times \left(\frac{11.625}{12}\right) = .30 \frac{\text{Btu}}{\text{hr-ft-F}}$$

B. For 8" (nominal) thick 2-core unit ( $t_w = 7.625"$ ):

$$M_{8"fw} = 34 \frac{\text{lbm}}{\text{ft}^2}; \rho_{8"fw} = \frac{34 \times 12}{7.625} = 53.5 \frac{\text{lbm}}{\text{ft}^3};$$

$$U_{8"fw} = .32 \frac{\text{Btu}}{\text{hr-ft}^2\text{-F}}; k_{8"fw} = .32 \left(\frac{7.625}{12}\right) = .203 \frac{\text{Btu}}{\text{hr-ft-F}}$$

$$c_{p,8"fw} = .156 \frac{\text{Btu}}{\text{lbm-F}} \text{ assumed.}$$

Part 6: Properties of door "walls" (non-rolling type)

Based on thinnest gauge A rated honeycomb door in Ref. 8 (ie 18 gauge, .05" sheet steel)

U-factor (winter)  $\equiv U_w = .42 \text{ Btu/hr-ft}^2\text{-F}$

$R_w = 1./U_w = 1./.42 \equiv 2.381 \text{ hr-ft}^2\text{-F/Btu}$

Via Ref. 9:  $R_{\text{interior film}} = .685$  "

&  $R_{\text{exterior film, winter}} = .167$  "

Thus:  $R_{\text{door only}} = 2.381 - .685 - .167 = 1.529$  "

ie  $U_{\text{door only}} = 1./1.529 = .654 \text{ Btu/hr-ft}^2\text{-F}$

U-factor (summer)  $\equiv U_s = .41 \text{ Btu/hr-ft}^2\text{-F}$

$R_s = 1./U_s = 1./.41 \equiv 2.439 \text{ hr-ft}^2\text{-F/Btu}$

Via Ref. 9:  $R_{\text{interior film}} = .685$  "

&  $R_{\text{exterior film, summer}} = .250$  "

Thus:  $R_{\text{door only}} = 2.439 - .685 - .250 = 1.504$  "

ie  $U_{\text{door only}} = 1./1.504 = .665 \text{ Btu/hr-ft}^2\text{-F}$

For conservatism, use lower value of

$U_{\text{door only}}$  of .654 Btu/hr-ft}^2\text{-F}

Client <u>CECB</u>	Prepared by <u>R. Curry</u>	Date <u>8-27-89</u>
Project <u>LAS 1 &amp; 2</u>	Reviewed by	Date
Proj. No. <u>8406-27</u> Equip. No.	Approved by	Date

Part 6 (cont.)

$t_d$  thickness =  $\frac{1.75''}{2} = .1458$  ft (per A-447, A-456, A-462.)

$R_d$  thermal conductivity =  $U_{door\ only} \times t_d$   
 $= .654 \frac{Btu}{hr \cdot ft^2 \cdot F} \times .1458$  ft =  $.095 \frac{Btu}{hr \cdot ft \cdot F}$

Via Ref 8: max. gauge no. for A rating of honeycomb door is 18, ie min. thickness of steel face is .050" (see col "(4)" of Table 1-11 of Ref. 10). Neglecting the

honeycomb mass, density of door is

$$\rho_d = \frac{\text{mass}/\text{ft}^2 \text{ face area}}{\text{vol}/\text{ft}^2 \text{ face area}} = \frac{\rho_{\text{steel}} \times 2 \times (.05)}{t_d}$$

$$= \frac{490 \times 2 \times .05}{.1458 \times 12} = 28. \text{ lbm/ft}^3$$

Specific heat capacity is assumed to be that of steel =  $c_{pd} = .12 \frac{Btu}{lbm \cdot F}$ .  
 (Steel properties are taken from Ref. 3.)

Client <u>CECO</u>	Prepared by <u>R. Curry</u>	Date <u>8-27-87</u>
Project <u>LAS 1 &amp; 2</u>	Reviewed by	Date
Proj. No. <u>8406-27</u> Equip. No.	Approved by	Date

Part 7: Properties of rolling door "walls"

Based on Ref. 8, rolling doors are assumed to be a single thickness of steel of 16 U.S. Std. gauge (0.062" thick).

Thus,  $\rho_{rd}$  = density of rolling door material  
 $= \rho_{steel} = 490 \text{ lbm/ft}^3$

$c_{p,rd}$  = specific heat capacity of rolling door material  
 $= c_{p,steel} = 0.12 \text{ Btu/lbm-F.}$

(Properties of steel as via Ref. 3.)

The actual conductivity of the rolling door material is  $k_{steel} = 27 \frac{\text{Btu}}{\text{hr-ft-F}}$

To avoid numeric difficulty,  $k_{rd}$  is set as  $0.27 \frac{\text{Btu}}{\text{hr-ft-F}}$  (is .01 of actual value).

This choice is conservative.

$$t_{rd} = \text{rolling door thickness} \\ = \frac{.062}{12} = .00517 \text{ ft}$$

Part 2: Mean beam length calcs.

Via eqn. (4-53) of Ref. 11 =  $L^0 = 4V/A$

Node 1:  $V = \text{Gross vol.} = 11259.1 \text{ ft}^3$  (see pp. A2, A3 & A5);

$$A = \text{Wall area sum} = W1 + W9 + W10 + W11 + W12 + W15 + W19$$

$$= 288.2 + 162.9 + 538.1 + 212.4 + 703.8 + 662.3 \times 2$$

$$\equiv 3225.7 \text{ ft}^2; L^0 = \underline{13.96 \text{ ft}}$$

Node 2:  $V = 22331. \text{ ft}^3$ ;  $A = W2 + W8 + W12 +$

$$+ W13 + W16 + W20 = 518.3 + 552.3 + 705.8 +$$

$$+ 684.0 + 1313.6 \times 2 \equiv 5085.6 \text{ ft}^2; L^0 = \underline{17.56 \text{ ft}}$$

Node 3:  $V = 26418. \text{ ft}^3$ ;  $A = W3 + W4 + W7 + W13 +$

$$+ W14 + W17 + W21 = 339.9 + 28.3 + 1249.0 + 684.0 +$$

$$+ 695.3 + 1554.0 \times 2 \equiv 6104.5 \text{ ft}^2; L^0 = \underline{17.31 \text{ ft}}$$

Node 4:  $V = 7352.0 \text{ ft}^3$ ;  $A = W5 + W6 + W14 +$

$$+ W18 + W22 = 410.7 + 254.9 + 695.3 +$$

$$+ 432.5 \times 2. \equiv 2225.9 \text{ ft}^2; L^0 = \underline{13.2 \text{ ft}}$$

Inside AEFER 4:  $\text{max } P_w L \approx .43 \times .4298 \times 17.56 / 14.7 = .221 \text{ ft-alk}$

so, from plot of Table 4-3 of Ref. 11 =  $L/L^0 \approx .91$  (from AEFER 4)

$$L_{\text{node 1}} = 13.96 \times .91 = 12.7 \text{ ft}; L_{\text{node 2}} = 16.0; L_{\text{node 3}} = 15.7; L_{\text{node 4}} = 12.0 \text{ ft}$$
