SURVEILLANCE REQUIREMENTS

4.0.1 Surveillance Requirements shall be met during the OPERATIONAL MODES or other conditions specified for individual Limiting Conditions for Operation unless otherwise stated in an individual Surveillance Requirement.

4.0.2 Each Surveillance Requirement shall be performed within the specified , time interval with:

- a. A maximum allowable extension not to exceed 25% of the surveillance interval, but
- b. The combined time interval for any 3 consecutive surveillance intervals shall not exceed 3.25 times the specified surveillance interval.

4.0.3 Failure to perform a Surveillance Requirement within the allowed surveillance interval, defined by Specification 4.0.2, shall constitute noncompliance with the OPERABILITY requirements for a Limiting Condition for Operation. The time limits of the ACTION requirements are applicable at the time it is identified that a Surveillance Requirement has not been performed. The ACTION requirements may be delayed for up to 24 hours to permit the completion of the surveillance when the allowable outage time limits of the ACTION requirements are less than 24 hours. Surveillance Requirements do not have to be performed on inoperable equipment.

4.0.4 Entry into an OPERA/IONAL MODE or other specified condition shall not be made unless the Surveillance Requirement(s) associated with the Limiting Condition for Operation have been performed within the specified surveillance interval or as otherwise specified. This provision shall not prevent passage through or to OPERATIONAL MODES as required to comply with ACTION requirements.

4.0.5 Surveillance Requirements for inservice inspection and testing of ASME Code Class 1, 2 and 3 components shall be applicable as follows:

a. Inservice inspection of ASME Code Class 1, 2 and 3 components and inservice testing of ASME Code Class 1, 2 and 3 pumps and valves shall be performed in accordance with Section XI of the ASME Boile. and Pressure Vessel Code and applicable Addenda as required by 10 CFR 50, Section 50 55a(g), except where specific written relief has been granted by the Commission pursuant to 10 CFR 50, Section 50.55a(g)(6)(i). 4.0.2 Each Surveillance Requirement shall be performed within the specified surveillance interval with a maximum allowable extension not to exceed 25 percent of the specified surveillance interval.

APPLICABILITY

BASES

BLACHER

in tead, provided the other specified conditions are satisfied. In this case, this would mean that for one division the emergency power source must be OPERABLE (as must be the components supplied by the emergency power source) and all redundant systems, subsystems, trains, components and devices in both divisions must also be OPERABLE. If these conditions are not satisfied, action is required in accordance with this specification.

In MODES 5 or 6, Specification 3.0.5 is not applicable, and thus the individual ACTION statements for each applicable Limiting Condition for Operation in these MODES must be adhered to.

4.0.1 This specification provides that surveillance activities necessary to insure the Limiting Conditions for Operation are met and will be performed during the OPERATIONAL MODES or other conditions for which the Limiting Conditions for Operation are applicable. Provisions for additional surveillance activities to be performed without regard to the applicable OPERATIONAL MODES or other conditions are provided in the individual Surveillance Requirements. Surveillance Requirements for Special Test Exceptions need only be performed when the Special Test Exception is being utilized as an exception to an individual Specification.

4.0.2 The provisions of this specification provide allowable tolerances for performing surveillance activities beyond those specified in the nominal surveillance interval. These tolerances are necessary to provide operational flexibility because of scheduling and performance considerations. The phrase "at least" associated with a surveillance frequency does not negate this allowable tolerance value and permits the performance of more frequent surveillance activities.

The tolerance values, taken either individually or consecutively over 3 test intervals, are sufficiently restrictive to ensure that the reliability associated with the surveillance activity is not significantly degraded beyond that obtained from the nominal specified interval.

4.0.3 This specification establishes the failure to perform a Surveillance Requirement within the allowed surveillance interval, defined by the provisions of Specification 4.0.2, as a condition that constitutes a failure to meet the OPEPABILITY requirements for a Limiting Condition for Operation. Under the provisions of this specification, systems and components are assumed to be OPERABLE when Surveillance Requirements have been satisfactorily performed within the specified time interval. However, nothing in this provision is to be construed as implying that systems or components are OPERABLE when they are found or known to be inoperable although still meeting the Surveillance Requirements. This specification also clarifies that the ACTION requirements are applicable when Surveillance Requirements have not been completed within the allowed surveillance interval and that the time limits of the ACTION requirements apply from the point in time it is

INSERT B

4.0.2 Specification 4.0.2 establishes the limit for which the specified time interval for Survoillance Requirements may be extended. It permits an allowable extension of the normal surveillance interval to facilitate surveillance scheduling and consideration of plant operating conditions that may not the suitable for conducting the surveillance; e.g., transient conditions . other ongoing surveillance or maintenance activities. It also provides flexibility to accommodate the length of a fuel cycle for surveillances that are performed at each refueling outage and are specified with an 18-month surveillance interval. It is not intended that this provision be used repeatedly as a convenience to extend surveillance intervals beyond that specified for surveillances that are not performed during refueling outages. The limitation of Specification 4.0.2 is based on engineering judgement and the recognition that the most probable result of any particular surveillance being performed is the verification of conformance with the Surveillance Requirements. This provision is sufficient to ensure that the reliability ensured through surveillance activities is not significantly degraded beyond that obtained from the specified surveillance interval.

ENCLOSURE 2

PROPOSED TECHNICAL SPECIFICATION (TS) CHANGE

SEQUOYAH NUCLEAR PLANT UNITS 1 AND 2

DOCKET NOS. 50-327 AND 50-328

(TVA-SQN-TS-92-03)

DESCRIPTION AND "STIFICATION FOR DELETION OF 3.25 LIMIT ON EXTENDING SURVEILLANCE INTERVALS

Description of Change

TVA proposes to modify the Sequoyah Nuclear Plant (SQN) Units 1 and 2 Technical Specifications (TSs) to revise Surveillance Requirement (SR) 4.0.2 and the associated bares to delete the 3.25 limit for the allowable extension of three consecutive surveillance intervals.

Reason for Change

The nuclear industry has experienced occasions where the 3.25 limit has required the performance of surveillances with plant conditions that are not conducive to plant safety or has required the request of one-time exceptions to the 3.25 limit from NRC. SQN has the potential for requiring one of the above actions because of the surveillance interval impact of past extended outages and the possibility of extending future fuel cycles. Deletion of the 3.25 limit w 1 provide the relaxation to eliminate the need to consider these actions. In addition to the positive effect on safety, this deletion will reduce the administrative burden associated with its use as well as incorporate the inne-item improvement recommended by NKC in Generic Letter (GL) 89-14.

Justification for Change

NRC issued GL 89-14 on August 21, 1989, that supports and recommends the deletion of the 3.25 limit on extending surveillance intervals. The basis for this position is that the benefit for not performing surveillances when plant conditions are not conducive to safe conduct outweighs the importance to maintain the 3.25 limit. This propo. 1 is consistent with the guidance provided in GL 89-14 for the SR and bases changes. The deletion of the 3.25 limit will provide greater flexibility in the use of the provisio: for extending surveillance intervals, reduce the administrative burden associated with its use, and have a positive effect on safety.

Environmental Impact Evaluation

The proposed c'ange request does not involve an unreviewed environmental question because operation of SQN Units 1 and 2 in accordance with this change would not:

- Result in a significant increase in any adverse environmental impact previously evaluated in the Final Environmental Statement (FES) as modified by the staff's testimony to the Atomic Safety and Licensing Board, supplements to the FES, environmental impact appraisals, or decisions of the Atomic Safety and Licensing Board.
- 2. Result in a significant change in eff'uents or power levels.
- Result in matters not previously reviewed in the licensing basis for SQN that may have a significant environmental impact.

Enclosure 3

PROPOSED TECHNICAL SPECIFICATION (TS) CHANGE SEQUOYAH NUCLEAR PLANT UNITS 1 AND 2 DOCKET NOS, 50-327 AND 50-328 (TVA-SQN-TS-92-03)

DETERMINATION OF NO SIGNIFICANT HAZARDS CONSIDERATION

18

TVA has evaluated the proposed technical specification change and has determined that it does not represent a significant hazards consideration based on criteria established in 10 CFR 50.92(c). Operation of Sequoyah Nuclear Plant (SQN) in accordance with the proposed amendment will not:

 Involve a significant increase in the probability or consequences of an accident previously evaluated.

The deletion of the 3.25 limit on extending surveillance intervals will not alter the effectiveness of surveillances that ensure the operability of equipment based on the 1.25 limit that remains in effect. Since operability will be maintained and the 3.25 limit deletion only removes a provision to prevent routine use of the 1.25 limit, the consequences of an accident is not increased. This deletion of the 3.25 limit for extending surveillances is administrative only and does not have the potential for affecting an accident or increasing the probability of an accident. However, this deletion may eliminate unnecessary challenges to safety functions created by surveillance performances during undesired plant conditions or because of required unit shutdown.

 Create the possibility of a new or different kind of accident from any previously analyzed.

As discussed above, this is an administrative change to surveillance interval extensions only and does not have the potential for creating a new or differe. kind of accident. The surveillances remain the same and only the extension restrictions have been reduced but not eliminated.

3. Invol a a significant reduction in a margin of safety.

The surveillances will remain unchanged to verify adequate margins of safety and only the allowable extensions fo surveillance performance have been revised. Therefore, no reduction in a margin of safety is involved with the deletion of the 3.25 limit on extending surveillance intervals.
