PREFACE

This report presents the data obtained through the analysis of environmental samples collected in the Grand Gulf Nuclear Station (GGNS) Preoperational Radiological Environmental Surveillance Program from July 1978 - June 1982 and the Operational Radiological Environmental Surveillance Program for the period June 16, 1982, through December 31, 1982.

The analytical contractor for GGNS is Eberline Instrument Corporation, a division of Thermo Electric Corporation. Eberline has been the analytical contractor since the initiation of the GGNS Radiological Environmental Surveillance Program in 1978.

Section 1
INTRODUCTION & SUMMARY

1.1 Introduction

Grand Gulf Nuclear Station (GGNS) is located in Claiborne County, Mississippi. The site is on the east bank of the Mississippi River, approximately 25 Miles south of Vicksburg, Mississippi, and 37 miles north-northeast of Natchez, Mississippi. Grand Gulf Military Park borders a portion of the north side of the property and the community of Grand Gulf is approximately 1.5 miles to the north. The town of Port Gibson is approximately 6 miles southeast of the site. Two lakes, Hamilton Lake and Gin Lake, are located in the western portion of the site.

The Station consists of two boiling water reactors (BWRs) rated at 1250 MWe each. Unit I received a Low-Power Operating License on June 16, 1982. Fuel loading began on July 1, 1982, and was completed on August 6, 1982. Initial criticality was achieved on August 18, 1982. Nuclear heatup is scheduled for July, 1983, with commercial operation scheduled for late 1983. Unit II is in a construction phase and is presently 31.0% complete.

The Grand Gulf Nuclear Plant has been designed to keep radioactive releases to as low as is practicable levels. The quantities of radionuclides released to the environment are expected to be insignificant as a source of potential exposure.

The Radiological Environmental Surveillance Programs are designed to serve the following purposes:

- (1) The Preoperational Program was designed to:
 - a) measure background levels and their variations in environmental media in the area surrounding the plant;
 - b) yield average values of radiation levels and concentrations of radioactive material in various media of the environment;
 - c) evaluate environmental procedures, equipment, and techniques; and
 - d) provide environmental assessment experience to personnel.
- (2) The Operational Program is an extension of the Preoperational Program. It was designed to:
 - a) ensure that data from the two programs are compatible, and that smooth transition between the programs is achieved;
 - b) detect what effect, if any, operation of GGNS will have on the radiation levels and concentrations in the environment around GGNS.

Both the Preoperational and the Operational Program are designed in accordance with the following criteria:

1. To analyze the important pathways for anticipated types and quantities of radionuclides released from the Station into the surrounding environment;

2. To consider the possibility of a buildup of long-lived radionuclides in the environment and identify physical and biological sites of accumulation that may contribute to human exposures;
3. To consider the potential radiation exposure to important plant and animal life in the environment surrounding GGNS;
4. To correlate levels of radiation and radioactivity in the environment with radioactive releases from Station operation.

The Preoperational Radiological Environmental Surveillance Program was initiated in July, 1978. It was continued until GGNS received its Low-Power Operating License. At that time the Operational Environmental Surveillance Program began. This report summarizes the data for the period June 16, 1982 to December 31, 1982. The Preoperational data collected from July, 1978 to June, 1982 has also been included in Tables 8-12 as background material.

1.2 Summary

GGNS Unit 1 received a Low-Power Operating License on June 16, 1982. However, at no time during 1982 did the Station enter a power ascension mode. Therefore, the results of the Operational Environmental Surveillance Program from June 16, 1982 to December 31, 1982 are actually an extension of the preoperational program data. The data are presented in Tables 8-12.

The most significant environmental dose pathways from a nuclear power station are direct doses from the gaseous effluent and thyroid dose due to the ingestion of milk. The operation of GGNS is expected to have little, if any, impact from these pathways due to the absence of milking animals within 5 miles of GGNS. Also since the first use of Mississippi River water as drinking water is more than 200 miles downstream of GGNS, the dose from this pathway is expected to be minimal.

Table 1 and Figures 1-4 lists the sample collection sites for air samples, TLD badges, milk, cistern water, ground water, surface water, vegetation, fish and sediment samples relative to the distance and direction from GGNS Unit 1. Table 2 summarizes the sample frequencies and type of analyses performed, and Table 4 summarizes the range and average concentrations for measurements at indicator and control locations, as well as the location with the highest annual mean value. Complete background information for the years 1978 through 1982 is provided in Tables 8 through 12 in Section 5.

Section 2
RADIOLOGICAL ENVIRONMENTAL SURVEILLANCE PROGRAM

2.1 Air Particulate and Radioiodine

Eleven continuous air monitors are used in the GGNS Environmental Surveillance Program to provide for measurements of beta, gamma, and radioiodine activity in the airborne exposure pathway. The locations of these monitors range from 0 to 26 miles, as identified in Figures 1-3, and Table 1. Three samplers are located near the site (0-1 mile) in areas with the highest X/Q values. Two other samplers are located in a community (Port Gibson) having the highest X/Q value and in a control location (Vicksburg). These five air samplers are used to meet the requirements of GGNS Technical Specification 4.12.1. The remaining six samplers are located in areas which will provide additional data for the Environmental Surveillance Program.

The samplers are placed in weatherproof houses approximately one meter above the ground. A two-inch glass fiber filter is located in the intake line of the vacuum pump with a 2 X 1-inch charcoal cartridge located directly downstream. Flows are adjusted to approximately 1.25 cubic feet per minute. Filters and cartridges are changed weekly and analyzed for gross beta and radioiodine activity, respectively. In addition, the filters are composited quarterly and analyzed for gamma emitting radionuclides.

2.2 Thermoluminescent Dosimetry (TLD)

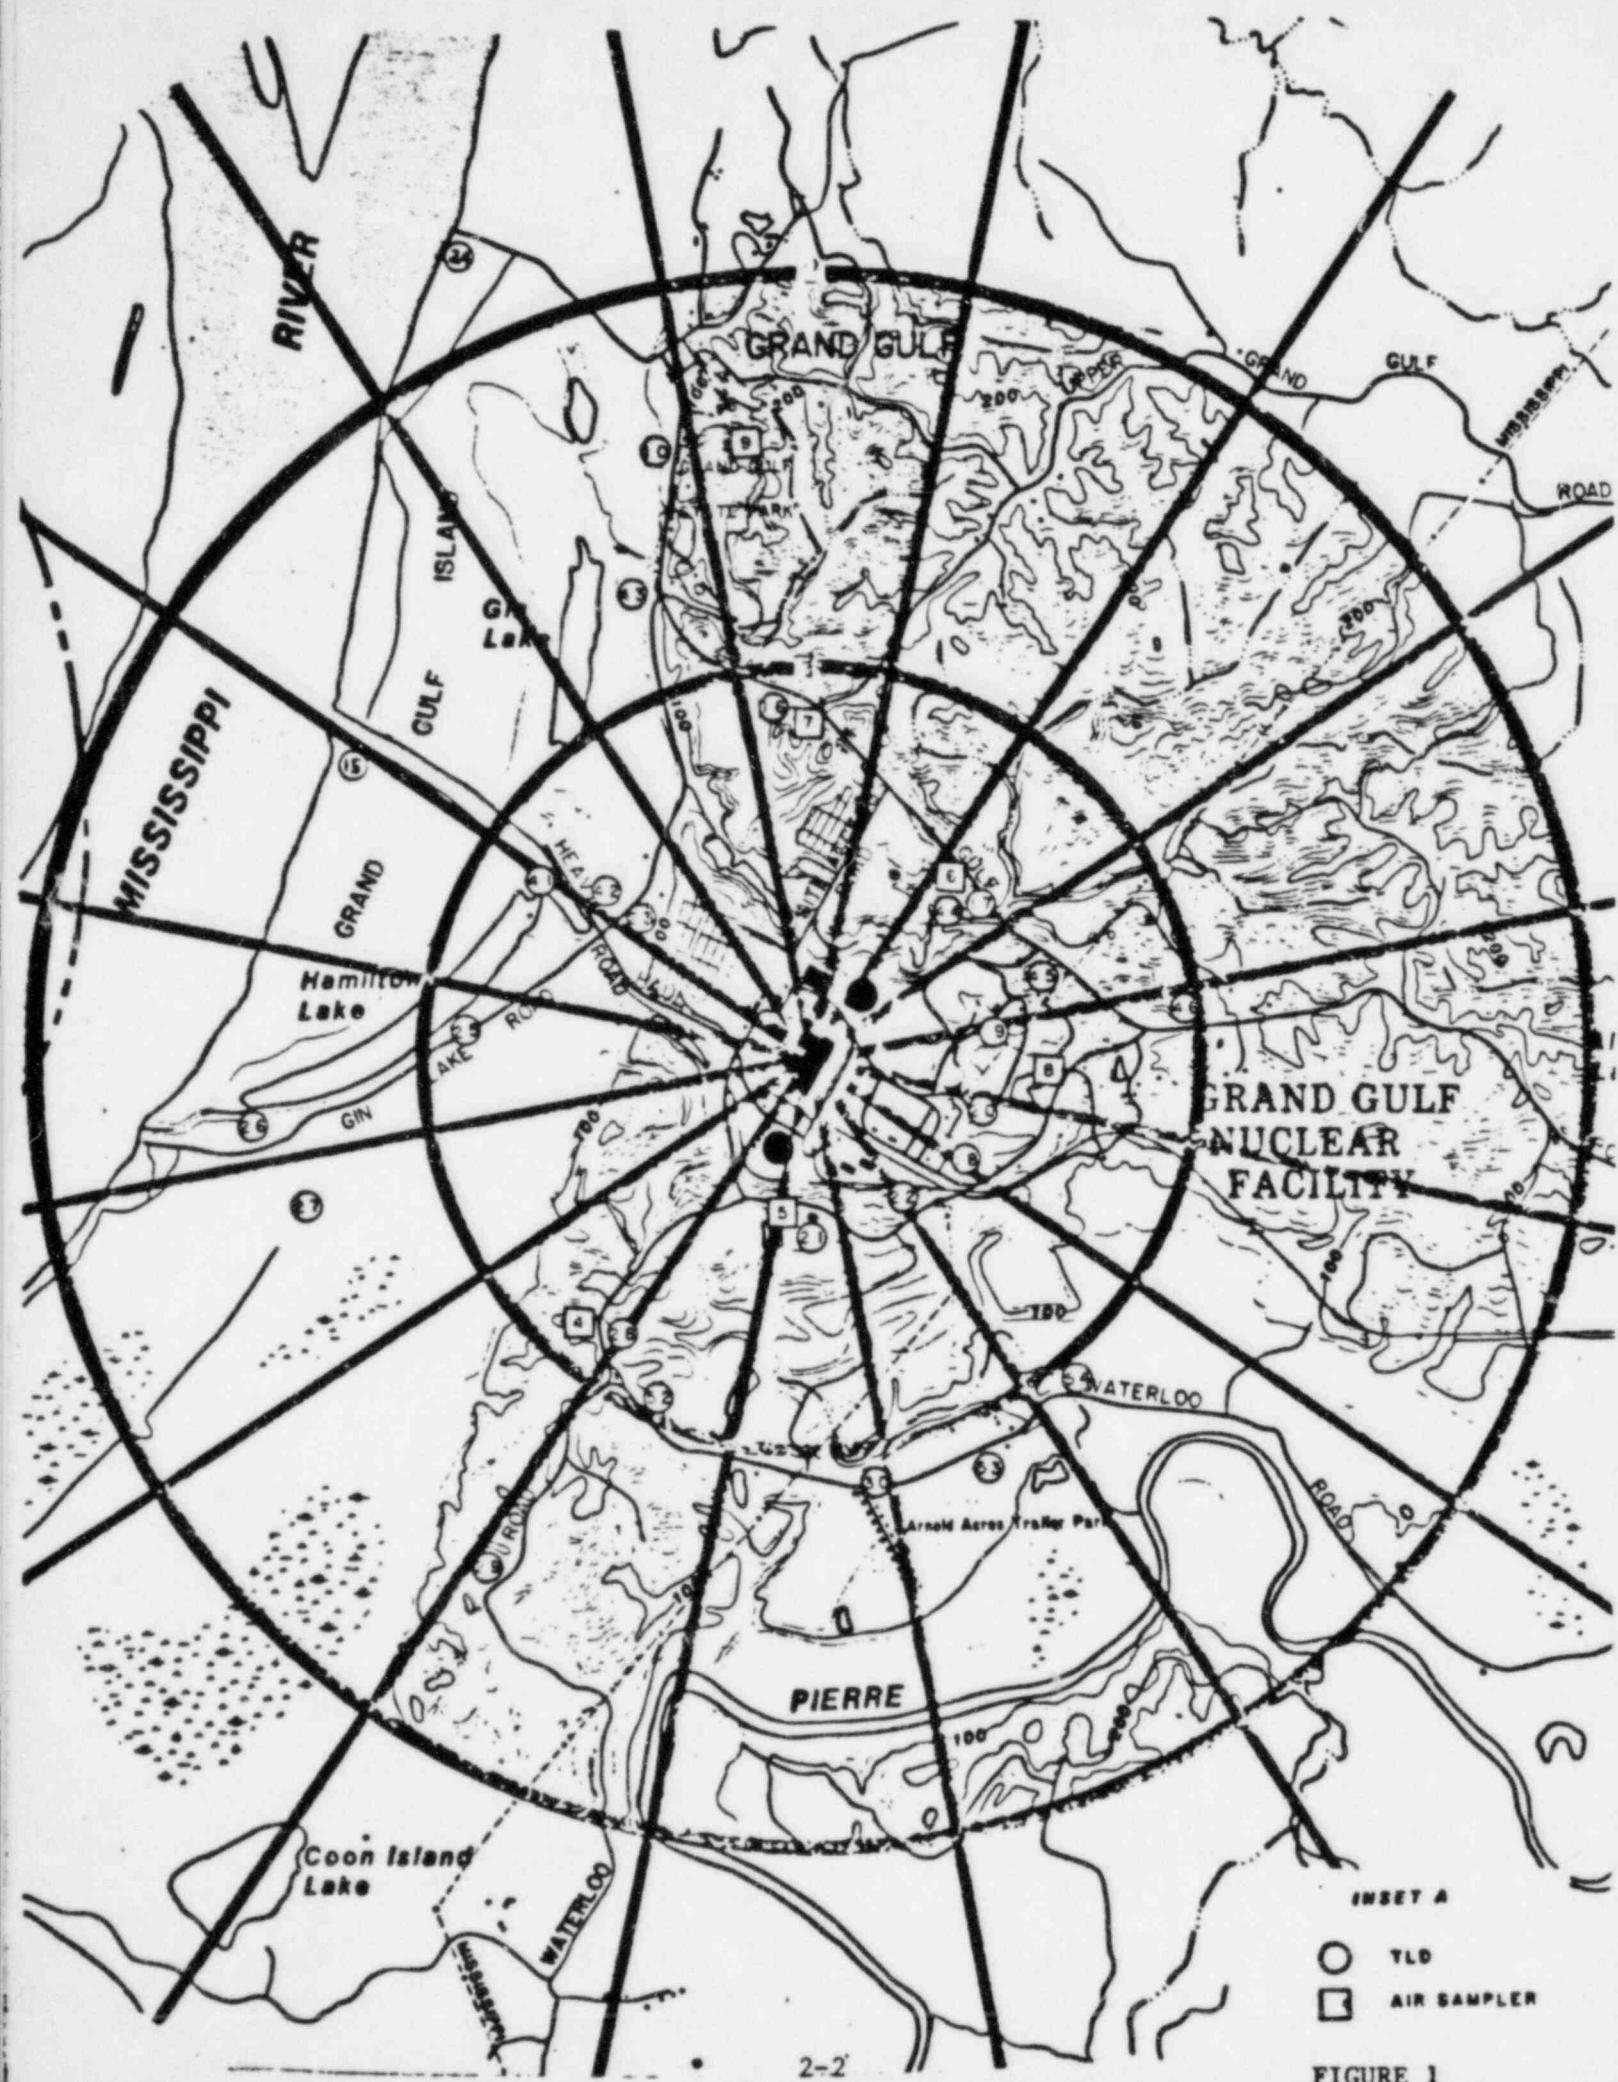

Eighty seven thermoluminescent dosimeters are used to measure direct radiation in the environment surrounding GGNS (Figures 1-3). Their locations are defined in Table 1. Forty of the TLDs are placed so as to meet the requirements of GGNS Technical Specification 4.12.1. This requires an inner ring of stations in the general area of the site boundary and an outer ring in the 4 to 5 mile range, with a station in each sector of each ring (16 stations X 2 rings = 32 stations). TLDs in the outer ring of sectors Q, R, and A are inaccessible; however, TLDs were placed in sectors Q and R at the first convenient locations, 8.0 miles and 7.5 miles respectively. The balance of the forty stations are located in special interest areas such as population centers, residences, and controls. Twenty-four of the 87 stations have recently been established on the protected area fence surrounding Unit 1. The remaining 23 stations are located in areas ranging from 0-15 miles away which will provide additional environmental data.

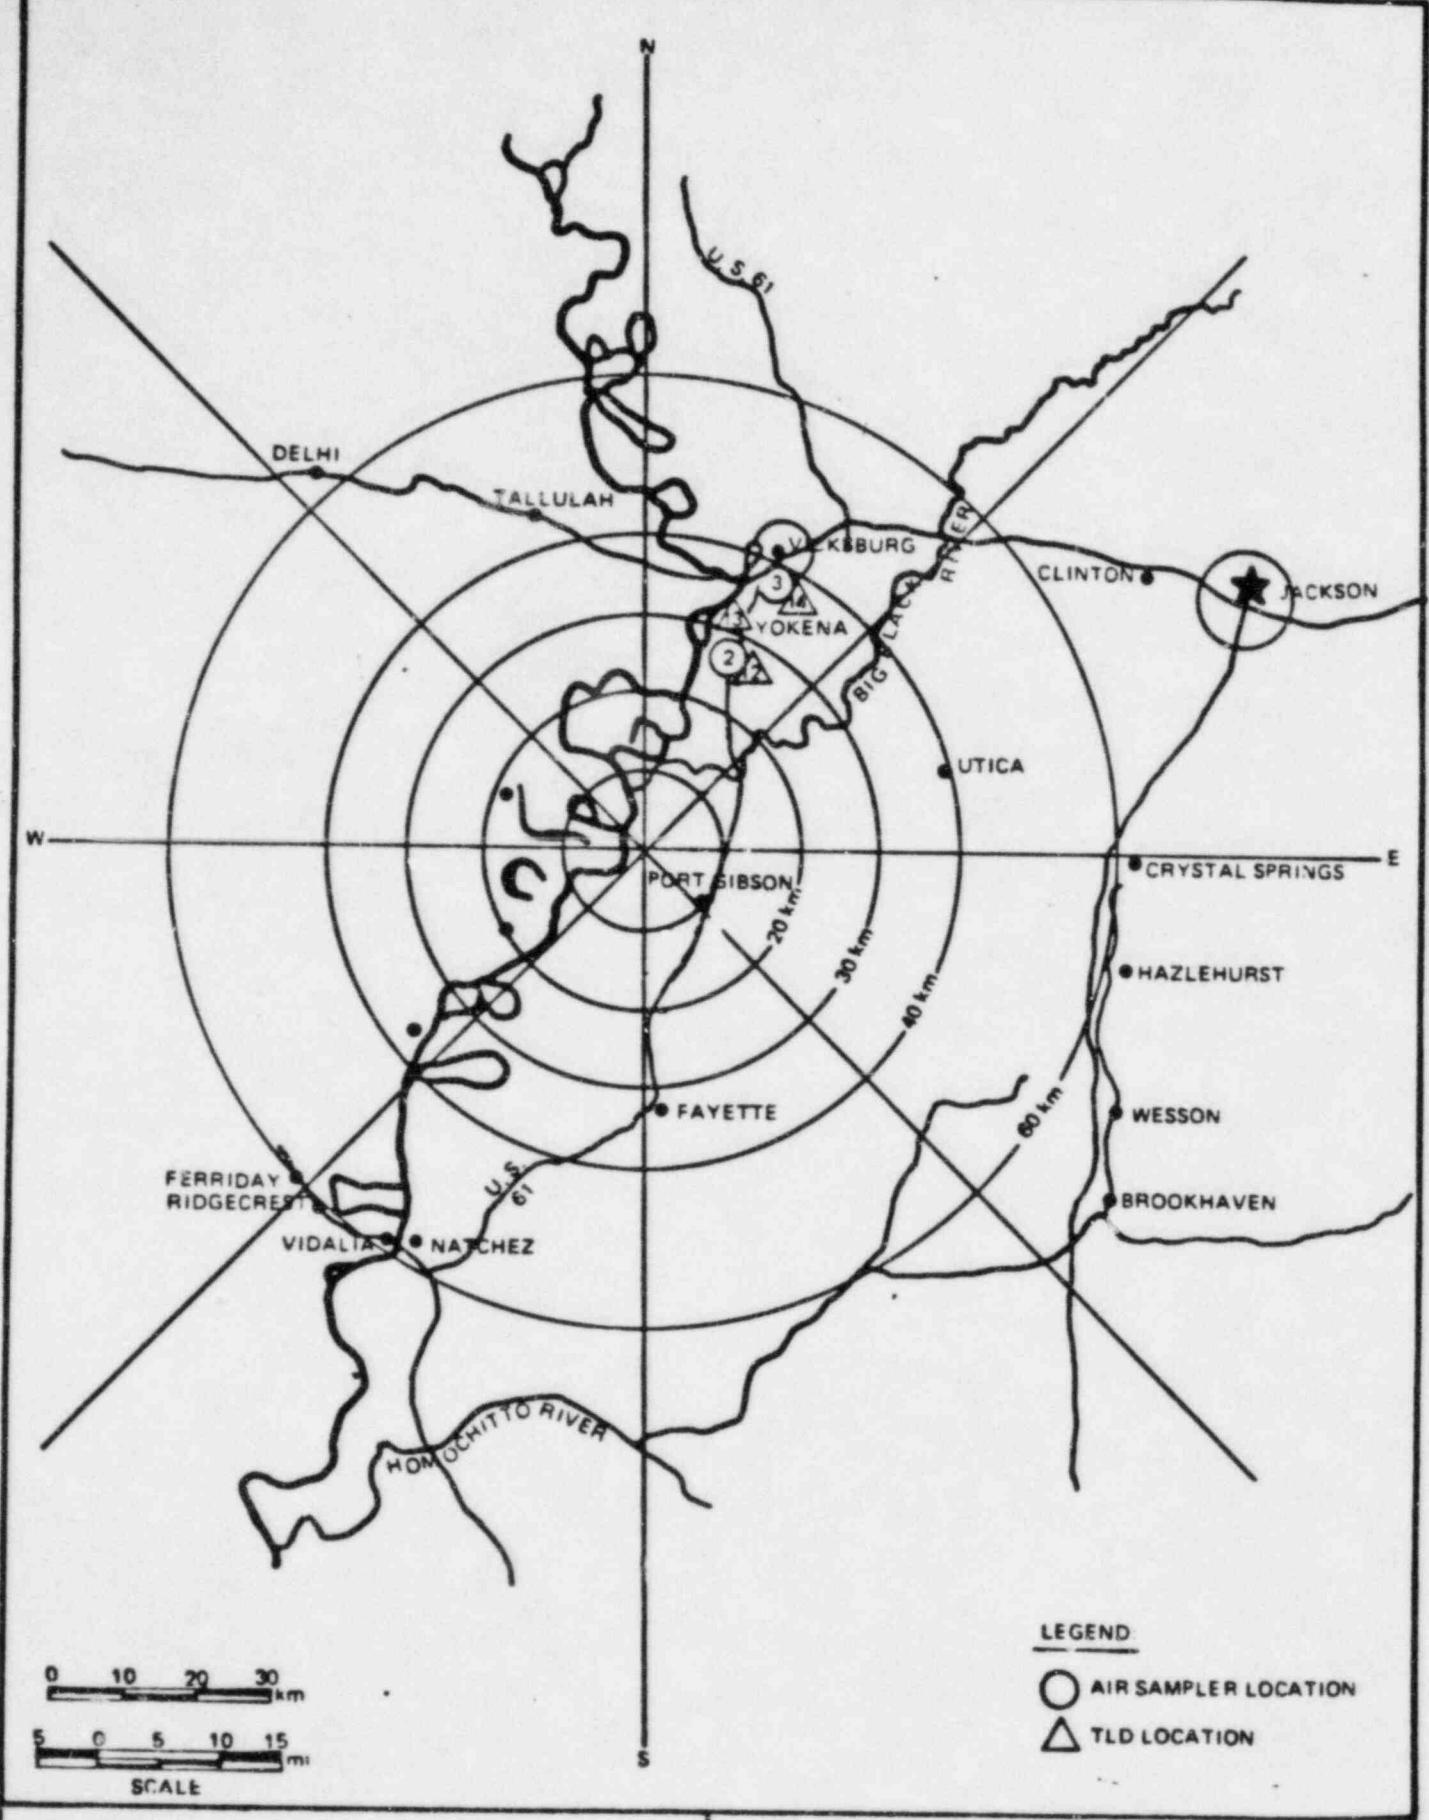

The dosimeters have five TLD chips sealed in plastic protective holders. These holders are suspended at each station approximately 1 meter above the ground. They are collected quarterly, with notations made concerning location, exposure period, and any abnormal conditions such as moisture and damage done by animals.

2.3 Milk Samples

Milk samples are collected in the vicinity of GGNS for the purpose of measuring radioactivity via the ingestion exposure pathway.

GGNS Technical Specifications require milk sampling at three locations within 5 km of the site and one control sample. No milking animals are

TABLE 1 (Cont'd)

SURFACE WATER

Upstream* 500-1000 meters upstream of the GGNS outfall to allow adequate mixing of the Mississippi and Big Black Rivers. (Sector Q)

Downstream* 1000 meters downstream of GGNS outfall, near the most northeastern radial well. (Sector P)

Discharge Basin* West of GGNS, 0.5 miles, Sector P

VEGETATION

Broad Leaf Vegetation* South of GGNS in the MP&L garden near the training center, or South Southwest in Glodjo garden, or areas adjacent to these gardens. (Sector J, 0.4 miles)

Lake C. J. Earle Willis garden
(Sector E, 3.0 miles)

Nelson Truck Farm (Sector E, 4.5 miles)

FISH SAMPLES

Catfish* Downstream of the discharge point in the Mississippi River.

Upstream of Discharge Point uninfluenced by Plant Operations.

SEDIMENT SAMPLES*

Collected semiannually during the low water periods of the Tidal Basin - samples taken downstream of the outfall in the vicinity of the boat landing near Hamilton Lake outlet and in the Barge Slip.
(Sector N and Q, 2 miles)

* Technical Specification requirements

available within the 5 km range. A control sample is taken from the Alcorn State University Dairy and samples are available on occasion from two area farmers (Figure 3, Table 1). Dairy samples are taken on a semi-monthly basis as required by GGNS technical specifications. The raw milk is then divided and the samples are analyzed for Iodine-131 and gamma emitting radionuclides.

2.4 Water Samples

Water samples are collected in the vicinity of GGNS for the measurement of radioactivity in the waterborne exposure pathway. Samples are collected in clean, labelled 2.5-gallon containers. The containers are rinsed with the sample media prior to collecting the sample.

Cistern water is sampled monthly at two locations, one near the site (Trimble Cistern) and the other at a control location (Willis Cistern) (Figure 4, Table 1). Cistern water is analyzed for gross beta, Iodine-131, and gamma emitting radionuclides. In addition, a quarterly composite is analyzed for tritium.

Ground water is sampled at four locations. The locations fulfilling the Technical Specifications are the source nearest the site (Trimble Well), and the control (Port Gibson City Well). The other two locations are controls which provide GGNS with additional data (Figure 3, Table 1). Ground water is collected and analyzed quarterly for gamma emitting radionuclides and tritium.

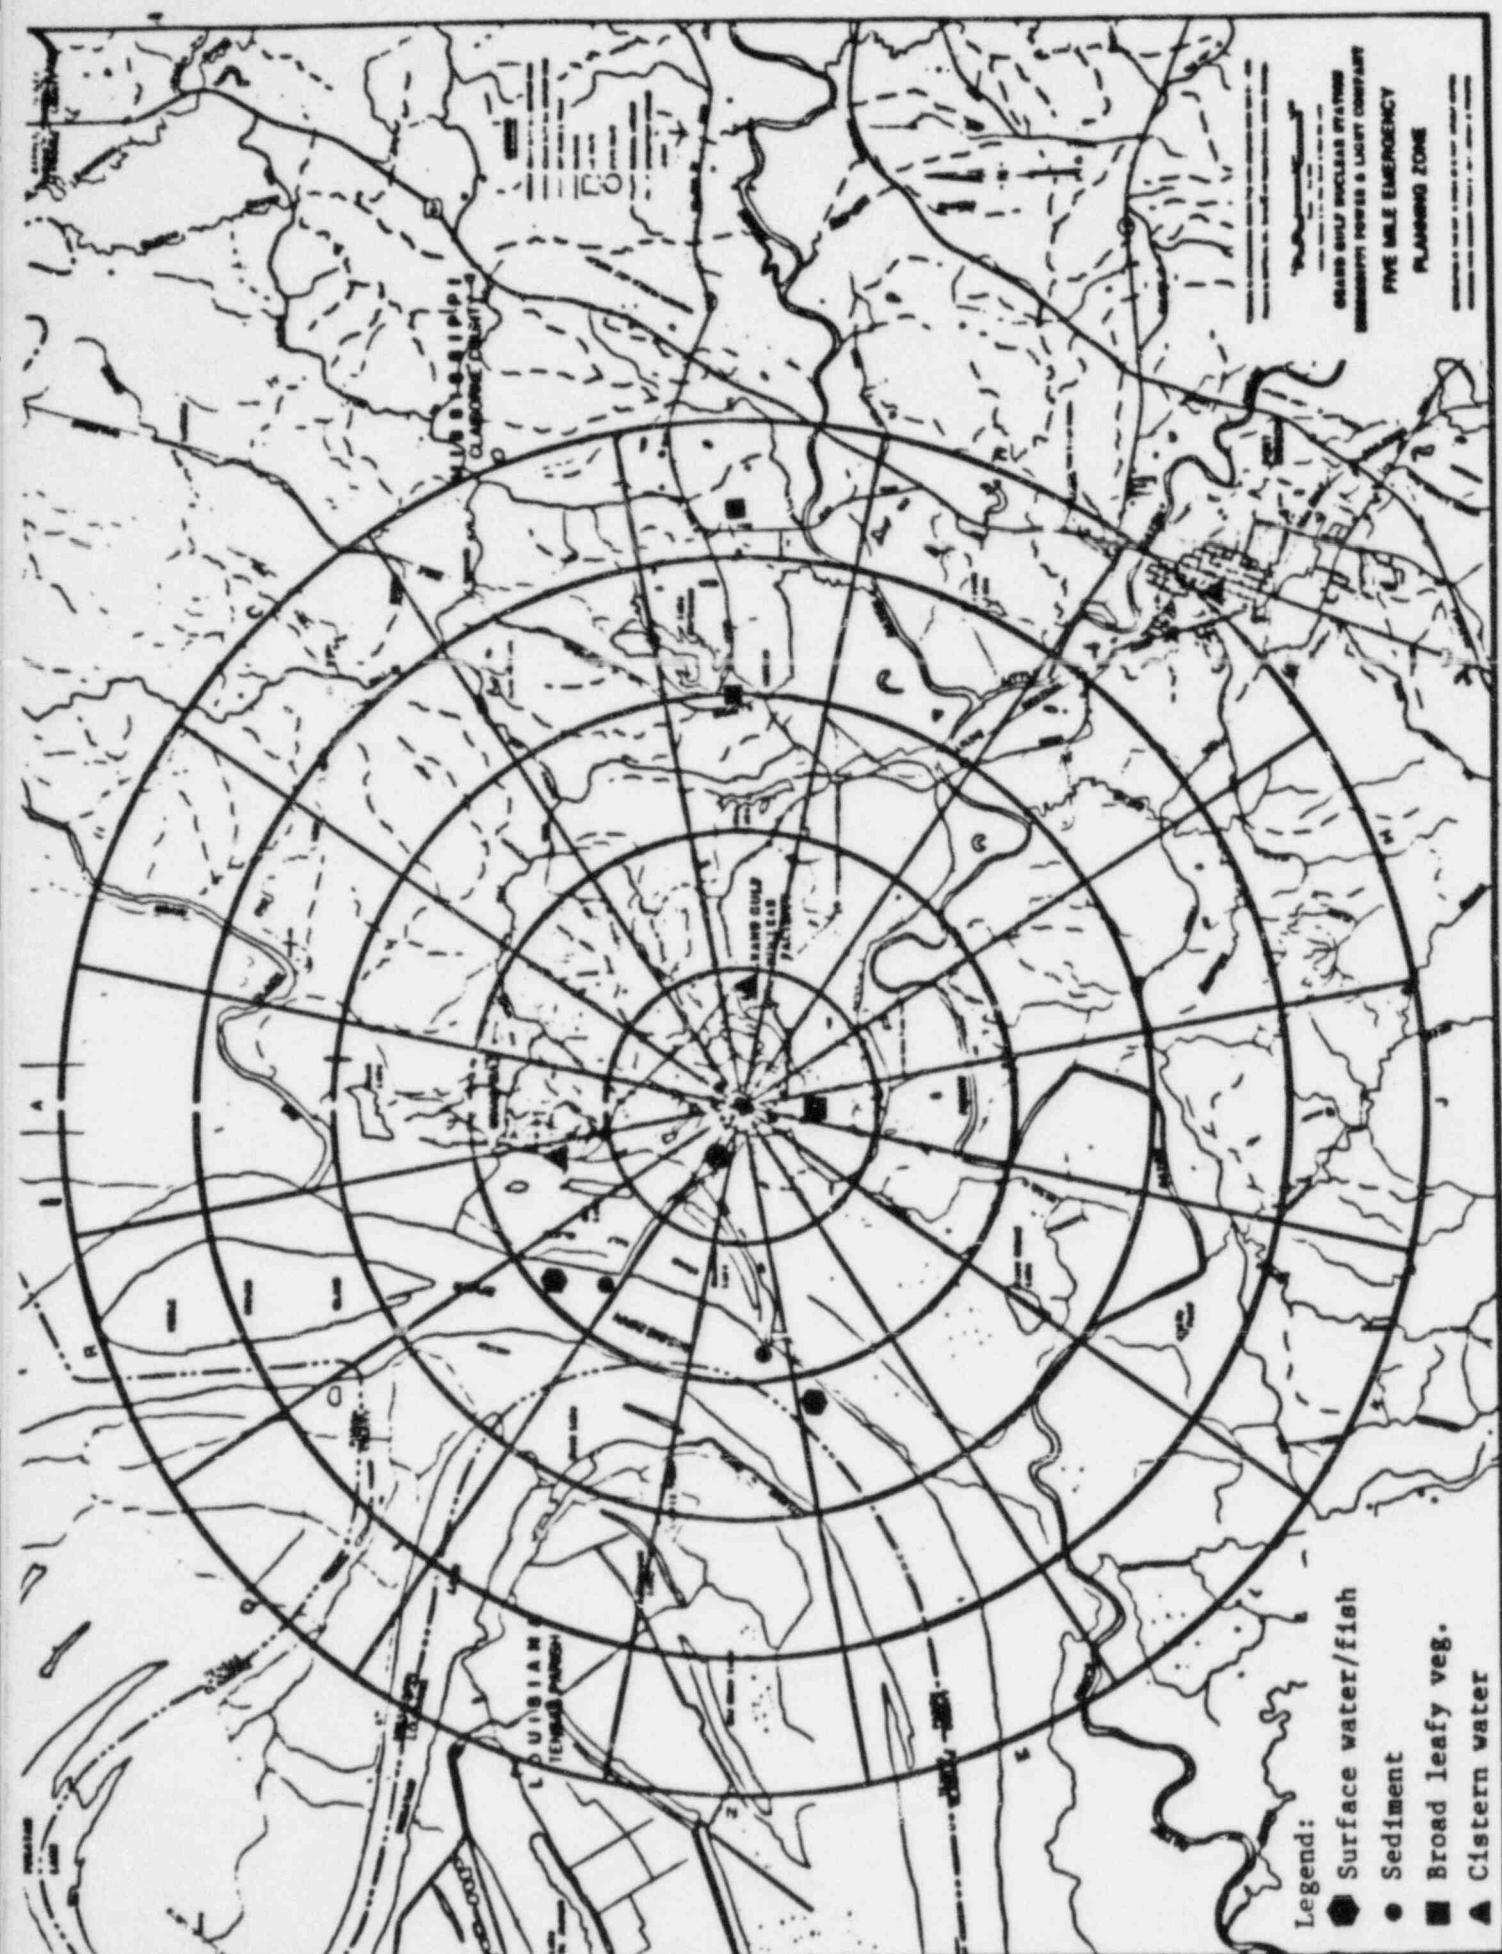

Surface water samples from the Mississippi River are collected monthly at a point above the plant discharge and downstream (Figure 4, Table 1). They are analyzed monthly for gamma emitting nuclides and a composite is analyzed quarterly for tritium.

Another surface water sample is taken from the plant discharge basin. Samples are composited monthly from samples taken at hourly intervals with an automatic sampler. This sample is analyzed for gamma emitting nuclides monthly, and a composite is analyzed quarterly for tritium.

2.5 Broad Leaf Vegetation

Broad leaf vegetation samples are collected in the vicinity of GGNS for the purpose of measuring radioactivity via the ingestion exposure pathway. Three samples of broad leaf vegetation grown near the site boundary (Figure 4, Table 1) with the highest anticipated annual average ground-level D/Q are required when milk samples are not available within 5 km distant of the site boundary. The preferred source of broad leaf vegetation is green leafy vegetables which would be suitable for human consumption. If such vegetables are not available, samples of any vegetation with relatively broad leaves on which airborne radioactive material might be deposited are sampled. The raw samples are then analyzed for gamma emitting radionuclides.

FIGURE 4

2.6 Sediment Samples

Sediment samples are collected semiannually at the river shoreline where the plant effluent is discharged and downstream of this discharge in the vicinity of Hamilton Lake's discharge (Figure 4, Table 1). Approximately 1000 grams of sediment are taken in the shallow water near the shoreline from the top one inch layer of sediment. Any living organisms or foreign objects are discarded and the samples are placed in a sample bag with location and date noted. The samples are then analyzed for gamma emitting radionuclides including Cesium-137.

2.7 Fish Samples

Twice a year, fish are collected from each of two locations. The control fish sample is collected in the Mississippi River about 1000 yards upstream from the GGNS barge slip. The indicator sample is collected approximately 6000 feet downstream from the barge slip. A minimum of 1000 grams (wet weight) of eviscerated fish is collected from each location (Figure 4, Table 1) and analyzed for gamma emitting radionuclides.

2.8 Special Samples

Special samples are occasionally taken of sampling media or locations which are not part of the routine Environmental Surveillance Program. These include such items as fruits and vegetables. In addition, special duplicate samples are periodically taken for water, milk and vegetable sample media. These serve as a quality control check of the GGNS analysis contractor.

Samples of deer meat are obtained on an annual basis from a deer harvested on the GGNS site by members of the GGNS Bow Hunting Club. The meat is then analyzed for gamma emitting radionuclides particularly for Iron-59 and Zinc-65.

2.9 Annual Land Use Census

As required by (GGNS) Technical Specification 3.12.2, Mississippi Power & Light Company (MP&L) conducted an Annual Land Use Census of the 10 mile Emergency Planning Zone surrounding GGNS for 1982, documenting the changes in the uses of land in the unrestricted areas surrounding GGNS which would require modifications to the Environmental Surveillance Program or the Offsite Dose Calculation Manual (ODCM). The criteria of most importance during the census was to determine the locations of the nearest residents, whether or not the residents had a garden equal to or greater than 500 square feet in area and if the residents milked a cow or goat for human consumption. In order to obtain the most accurate information, a door-to-door survey was utilized in the 0-2 mile zone.

The nearest resident remained the same, as in the original survey outlined in the GGNS Final Environment Report, at 982 meters from the Station in the East sector. The nearest garden remained the same as that identified in Section 2.2.2.b of the ODCM at 1432 meters from the Station in the southwest sector. None of the residents within the 0-2 mile zone milked a cow or goat for human consumption.

Land use information from 2-10 miles from GGNS was derived from interviews with the Claiborne County, Mississippi, County Agricultural Agent and the Tensas Parish, Louisiana, Parish Agricultural Agent. Four significant changes in land use were identified. These changes were:

- o Two persons milked a cow for human consumption in the 2-10 mile zone: one at 13,629 meters in the southeast sector, and the other at approximately 11,265 meters in the west sector (Figure 3). Originally, no milking animals were present.
- o Soybean production in Mississippi showed about a 146% increase over that estimated during the original survey.
- o Commercial production of green leafy vegetables increased considerably in the 2-10 mile zone over previous levels.
- o Cattle production for human consumption inside the affected counties were nonexistent except for personal use.

None of these four changes in land use necessitated change in the calculations or information outlined in the ODCM.

The results of the Land Use Survey indicate that the agricultural uses of land in the 0-10 mile zone surrounding GGNS have remained basically the same as those reported in the GGNS Final Environmental Report. Although some changes were identified in the type of crops grown, those areas which were utilized for agricultural production in the GGNS Final Environmental Statement have remained as such.

In conclusion, the results of the GGNS 1982 Land Use Survey reflect no uses of land in the 0-10 mile zone which will require a change in the GGNS ODCM or the Environmental Surveillance Program.

Section 3
ANALYTICAL PROCEDURES & COUNTING METHODS

3.1 Analytical Program and Methodology

Samples are analyzed for the various radioactive components by standard radiochemical methods. These methods are equal to and in most cases identical with those of the USDOE (HASL Procedures Manual, HASL-300, Health and Safety Laboratory, U. S. Atomic Energy Commission, 376 Hudson Street, New York, New York 10014), or those of the U. S. Environmental Protection Agency (EPA). The analytical program is summarized in Table 2.

3.2 Analytical Detection Limits and Count Rate Errors

In environmental radiological analyses the dominant known uncertainty is usually the sample count rate. Error terms given in this report are based on this factor since all other analytical uncertainties are calculated by standard methods and are reported at the 95 percent (2σ) confidence level. Analytical data for samples for which concentrations are less than the Lower Limit of Detection (LLD) are preceded by the symbol "<". The sample types, analyses performed, and units of the measurements along with the corresponding LLD, are presented in Table 3.

3.3 Air Particulates

Gross beta concentrations are measured with low background gas flow (proportional and/or Geiger) counting systems with anti-coincidence background suppression after the short-lived naturally occurring radon and thoron daughters have decayed. The filters are counted long enough to ensure that the required sensitivity (LLD) is met. The routine LLD is 0.01 pCi/m^3 for gross beta based on about $300 \text{ m}^3/\text{week}$ of air volume.

Gamma isotopic analyses of the quarterly composite samples are performed with a Ge(Li) detector with a routine detection level of 0.01 pCi/m^3 .

3.4 Radioiodine

The charcoal cartridges used are of the TEDA - impregnated type. The radioiodine is extracted from the charcoal, chemically separated, and counted as AgI using wide beta or low beta counters. The detection limit is 0.07 pCi/m^3 .

3.5 Cistern Water

Gross beta analysis of cistern water sample is performed by evaporation of a measured aliquot of the sample, digestion, planchetting of the processed sample, and radiometric assay by low-level beta counting. The LLD is 1 pCi/liter . Iodine- $i31$ analysis is based on anion exchange removal of the I-131 from a known sample volume. The iodine is eluted from the resin with NaOCl which also oxidizes it to the iodate. The iodate is reduced to iodine with hydroxylamine in 3N nitric acid solution. The iodine is extracted into carbon tetrachloride, reduced to iodide with sodium bisulfite, extracted into water and precipitated as AgI . The sample is filtered, dried, weighed and beta counted. The detection limit is 1 pCi/liter .

TABLE 2
Analytical Program

<u>SAMPLE PARAMETER</u>	<u>FREQUENCY</u>	<u>ANALYSIS</u>
Air Particulates	Weekly	Gross Beta ⁽¹⁾
	Quarterly	Gamma Isotope
Airborne Iodine	Weekly	Iodine-131
Thermoluminescent Dosimetry (TLD)	Quarterly	Radiation Dose
Milk	Monthly ⁽²⁾	Iodine-131 Gamma Isotopic
Broad Leaf Vegetation	Monthly ⁽³⁾	Gamma Isotopic
Sediment	Semiannually	Gamma Isotopic
Ground Water	Quarterly	Gamma Isotopic
	Quarterly	Tritium
Cistern Water	Monthly	I-131, Gamma Isotopic
	Quarterly Composite	Tritium
Surface Water	Monthly ⁽⁴⁾	Gamma Isotopic
	Quarterly Composite	Tritium
Fish	Semiannually	Gamma Isotopic
Meat	Annually	Gamma Isotopic

- (1) If gross beta activity of any filter is found to be greater than ten times the yearly mean of gross beta for the control (AS#3) then a gamma isotopic analysis is performed on the filter.
- (2) Twice a month when animals are on pasture.
- (3) Broad leaf vegetation sampling is performed monthly when available and when milk sampling is not performed within 5 km.
- (4) The composite water sample is utilized for the gamma isotopic analysis of the discharge basin.

TABLE 3
Lower Limits of Detection (LLD)

<u>SAMPLE TYPE</u>	<u>ANALYSIS</u>	<u>LLD</u>	<u>UNITS</u>
Air Particulate	Gross Beta Gamma Isotopic	0.01	pCi/m ³
Airborne Iodine	I-131	0.07	pCi/m ³
Cistern Water	Gross Beta I-131 Gamma Isotopic Tritium	1 1 15 330	pCi/l pCi/l pCi/l
Surface Water	Gamma Isotopic Tritium	15 330	pCi/l pCi/l
Well Water	Gamma Isotopic Tritium	15 330	pCi/l pCi/l
Milk	I-131 Gamma Isotopic	1 15	pCi/l pCi/l
Sediment	Gamma Isotopic	150	pCi/kg
Fruits & Vegetables	Gamma Isotopic	80	pCi/kg
Fish & Meat	Gamma Isotopic	130	pCi/kg
TLD	Total Dose	1	mR/Qtr

Gamma isotopic analysis is performed by taking a measured aliquot of the preconcentrated sample and counting it in a standard geometry in a high resolution (GeLi) gamma spectrometer long enough to meet the sensitivity (LLD) of 15 pCi/liter.

Tritium analysis is performed on the quarterly composite of the samples collected monthly. The sample is isotopically enriched in tritium concentration prior to liquid scintillation counting. The isotopic enrichment is done by the classical method of Ostlund which involves alkaline electrolysis of a purified aliquot sample under controlled conditions of temperature and electrode current density.

3.6 Surface Water

The samples collected monthly are analyzed by gamma spectrometry as described in section 3.5 under cistern water. The quarterly composite sample of the monthly collections is analyzed for tritium by the electrolytic enrichment technique described in section 3.5 under cistern water.

3.7 Well Water

The samples collected quarterly are analyzed for gamma emitting radionuclides and tritium as described in section 3.5 under cistern water.

3.8 Milk Samples

I-131 analysis is performed on the milk samples collected monthly. The method used is same as given in section 3.5 under cistern water.

Gamma isotopic analysis is done as follows: A measured aliquot of the sample is evaporated and oven dried. The dried sample is pulverized and counted in a calibrated geometry in a high resolution Ge(Li) gamma spectrometer for a long enough period to achieve the required Lower Limit of Detection (LLD) of 15 pCi/liter.

3.9 Sediment Samples

The sediment sample is oven dried and then sieved (if required) to remove stones and/or other large pieces of material. An appropriate sized and weighed aliquot is then transferred into a standard geometry container and counted in a high resolution Ge(Li) gamma spectrometer for a long enough period to achieve the required Lower Limit of Detection (LLD) of 150 pCi/^{Ag}(dry).

3.10 Fruit & Vegetable Samples

Measured amounts of the oven-dried sample is transferred into a standard geometry container and counted in a high resolution Ge(Li) gamma spectrometer for a long enough period to meet required Lower Limits of Detection (LLD) of 80 pCi/kg (wet).

3.11 Fish and Meat

A measured amount of the oven-dried samples is transferred into a standard geometry container and counted in a high resolution Ge(Li) gamma spectrometer for a long enough time to meet the required Lower Limits of Detection (LLD) of 130 pCi/kg (wet).

3.12 Thermoluminescent Dosimeters (TLDs)

Environmental radiation doses are measured using badges comprised of five chips sealed in plastic protective holders having a density of about 50 mg/cm². The TLD chips are 1/8" X 1/8" X 1/32" LiF (Thallium activated) known commercially as Harshaw TLD-100. The chips are all selected to provide uniform responses. Prior to installation, the chips are annealed by a standard cycle of 60 minutes at 400°C and immediate cooling to ambient temperature by placing the tray containing the annealed chips on an aluminum block.

After exposure the chips are read on an Eberline Instrument Corporation Model TLR-6 reader. The system employs a preheat cycle which removes low temperature peaks and integrates and digitizes only the light output in a selected temperature range.

The dose is calculated from the average light output for the five readings. Control badges are used to detect any unusual exposure to the badge which might occur during shipment. The Lower Limit of Detection (LLD) for environmental TLDs is 1 mrem/quarter.

Section 4
RESULTS AND DISCUSSION

Results and Discussions

4.1 Air Particulates and Radioiodine

Air particulate, and radioiodine levels for the 1982 reporting period averaged 0.015 pCi/m³ for gross beta and less than the detectable level for radioiodine. These values are consistent with the baseline data collected during the GGNS Preoperational Radiological Environmental Surveillance Program from July, 1978, to June 15, 1982 (Tables 4-8). The only time period when gross beta values have indicated increased levels of measurable radiation was during the spring of 1981. These elevated values were attributable to the 25th Chinese nuclear test explosion of October, 1980.

The analysis of quarterly composited filters for gamma isotopes for the reporting period were nondetectable. Once again this is consistent with the preoperational data, with the exception of those samples collected following the Chinese nuclear test explosion.

4.2 Thermoluminescent Dosimetry (TLDs)

TLD badges collected during the 1982 reporting period averaged 18.6 mr/quarter. These values were consistent with the baseline results obtained from the GGNS Preoperational Radiological Environmental Surveillance Program (Table 4-8).

4.3 Milk Samples

The results of the Iodine-131 and gamma isotopic analysis, of control and data milk samples, were less than the Lower Limits of Detection (LLD) during the 1982 reporting period. The only exception to this was the August 1982 control sample at Alcorn State University in which Cesium-137 was detected at a level of 850 pCi/l. It is MP&L's opinion that this was attributable to some type of cross contamination by the analysis contractor and was not a result of GGNS effluents. Our rationale for arriving at this conclusion is described below:

- o Alcorn State University (ASU) is a control location 10.5 miles from GGNS, opposite from the predominant wind direction.
- o The ASU milk samples for July, September, and October, 1982, showed nondetectable amounts of Cesium-137 both by MP&L's analysis contractor and the Mississippi Department of Radiological Health.
- o Activities at GGNS during this period were such that this level of radioactivity at Alcorn could not be attributable to GGNS.

Since the determination was made that the measured level of radioactivity was not the result of plant effluents, a special report as outlined in the GGNS Technical Specifications was not submitted.

4.4 Water Samples

Gamma isotopic and tritium concentrations for surface, well, and cistern water samples were nondetectable during the 1982 reporting period. Iodine-131 analysis of cistern water samples were nondetectable and gross beta analysis

averaged 5.0 pCi/l. One gross beta result from the Trimble cistern was statistically higher than the average (December 7, 1982, 16 ± 2 pCi/l). However, this appears to be the result of laboratory error since gross beta analysis of a duplicate sample collected at the same location and on the same day was 4 ± 1 pCi/l.

4.5 Broad Leaf Vegetation

Broad leaf vegetation samples for the 1982 reporting period were nondetectable for gamma emitting radionuclides.. These results are consistent with the data obtained during the Preoperational Environmental Surveillance Program.

4.6 Sediment Samples

Gamma analysis of sediment samples during the 1982 reporting period were nondetectable except for Cesium-137 which was detected in concentrations of 0.25 pCi/g and 0.33 pCi/g at the Hamilton Lake outfall and GGNS barge slip, respectively. These results are consistent with preoperational data in which detectable levels of Cesium-137 were found in sediment samples in June 1979, June, 1980, and December 1981.

4.7 Fish Samples

The results of the analysis of fish obtained during the 1982 reporting period were less than the Lower Limits of Detection (LLD).

4.8 Special Samples

The results of all the analysis conducted on special samples during the 1982 reporting period were nondetectable.

The results of the analysis of meat obtained during the reporting period were nondetectable for gamma emitting radionuclides, Iron-59 and Zinc-65.

4.9 Exceptions to the Environmental Surveillance Program

4.9.1 A control cistern water sampling point (Ark Cistern) located in the SSE sector at 8.5 miles, (Figure 3), was discontinued in November, 1982. The resident utilizing the cistern rerouted the discharge from his swimming pool to the cistern which rendered the water no longer potable. An alternate control location (Willis Cistern) was identified in the ENE sector, sector D, at approximately 6 miles (Figure 3).

4.9.2 GGNS Technical Specifications require that a monthly composite sample utilizing one-hour sampling intervals be taken from the plant discharge basin (Figure 4). The equipment necessary for hourly composite sampling was not available on June 16, 1982; therefore, grab samples were taken at eight-hour intervals. A Design Change Package was implemented and an automatic composite sampling system capable of taking hourly samples was installed on February 7, 1983.

4.9.3 GGNS Technical Specifications require that a downstream sediment sample be taken semiannually. Sediment samples were taken in May, 1982. However, the semiannual sample for November, 1982, was not taken due to an

unusual winter rise in the level of the Mississippi River. The river remained out of its banks until February, 1983. In order to avoid this problem in the future, sediment sampling during the fall will be scheduled earlier in the fall.

4.9.4. The Plant Service Water System was shut down for the majority of December, 1982, to allow maintenance to be performed; therefore, there was no composite sample collected for the month of December, 1982.

4.9.5 GGNS technical specifications require the monthly Discharge Basin samples to be composited quarterly and analyzed for Tritium. Due to an oversight these quarterly composites were not compiled during the reporting period. The July and September samples have been discarded; therefore, the Tritium analyses for the third quarter will be conducted on the August sample alone. The fourth quarter samples have not been discarded. They will also be composited and analyzed for Tritium. The results of these analyses will be submitted in a follow-up letter.

Section 5
RADIOLOGICAL ENVIRONMENTAL SURVEILLANCE PROGRAM SUMMARY

5.1 Program Results for 1982

The results of the Radiological Environmental Surveillance Program for 1982 are summarized in Table 4.

TABLE 4 RADIOLOGICAL SURVEILLANCE PROGRAM SUMMARY (1982)

Medium or Pathway Sampled (Unit of Measurement)	Type and Total Number of Analyses Performed	Lower Limit of Detection ^a (LLD)	All Indicator Locations Mean(f) ^b Range	Location with Highest Annual Mean			Number of Control Locations Mean(f) ^b Range	Nonroutine Reported Measurements ^c
				Name	Distance and Direction	Mean(f) ^b Range		
Meat (pCi/g wet)	Gamma Isotopic (1)	0.13	LLD				0	

^a Nominal Lower Limit of Detection (LLD) as defined in HASL-300 (Rev. 8/73), pp. D-08-01, 02, 03, and Tech Spec.

Table 4.12.1-1

^b Mean and range based upon detectable measurements only. Fraction of detectable measurements at specified locations is indicated in parentheses.(f)^c Nonroutine reported measurements are defined in Section 4.

Section 6
QUALITY DATA CONTROL

6.1 Quality Control Analyses Summary

The analyses conducted for quality control purposes on GGNS environmental samples are summarized in Table 5.

TABLE 5
1982 Quality Control Analyses Summary

The table below summarizes results of samples run for process quality control purposes during the subject year. These listings are in addition to such measurements as detector backgrounds, check source values, radiometric-gravimetric comparisons, system calibrations etc. Detailed listings of each measurement are maintained at the laboratory and are available for inspection if required.

Blank Samples

<u>Nuclide Analyzed</u>	<u>Number of Determinations</u>	<u>Number of Analyses Exceeding the LLD for that Analysis</u>
Gross Alpha	47	0
Gross Beta	37	0
Tritium	75	0
Sr-89-90	26	0
I-131	*	
Am-241	12	0
Pb-210	27	0
Po-210	2	0
Pu-239	37	0
Ra-226	44	0
Fe-55	3	0
Isotopic Uranium	38	0
Isotopic Thorium	17	0

* Blank I-131 analyses are performed with each batch of samples processed.
 All blank data were below the detection limit.

6.2 U. S. Environmental Protection Agency - Eberline Intercomparison Program

To gauge the accuracy of environmental analyses, Eberline Instrument Corporation participated in the Intercomparison Program in 1982, as in former years, the results of which are displayed in Table 6.

TABLE 6

Section 7
SAMPLING AND ANALYSIS RESULTS FOR 1978-1982

7.1 Notes on Data Tables

Wet Weight	A reporting unit used with organic tissue samples such as vegetation and animal samples in which the sample weight is taken to be the weight as received from the field with no moisture removed.
Dry Weight	A reporting unit used with soil and sediment samples in which the sample weight is taken to be the weight of the sample after removal of moisture by drying in an oven at about 110°C for about 15 hours.
pCi/m ³	A reporting unit used with air particulate and radioiodine data which refers to the radioactivity content present (expressed in picocuries) the volume of air(expressed in cubic meters) passed through the filter and/or the charcoal trap. The volumes are not corrected to standard conditions.
Gamma Emitters or Gamma Isotopic	Samples were analyzed by high resolution (GeLi) gamma spectrometry. The resulting spectrum is analyzed by a computer program which scans from about 50 to 200 KeV and lists the energy peaks of any radionuclides present in concentrations exceeding the sensitivity limits set for that particular analysis.
Error Terms	Figures following "t" are error terms based on counting uncertainties at the 2 (95 percent confidence) level. Values preceded by the " " symbol were below the stated concentration at the 4.666 (99.99 percent confidence) level.
Sensitivity	In general, all analyses meet the sensitivity requirements of the program as given in Table 3. For the few samples that do not (because of inadequate sample quantities, analytical interference, or similar problems, the sensitivity actually obtained in the analysis is listed. When all analyses of a particular type during the period resulted in concentrations below the sensitivity limits, a statement is made on the appropriate table rather than presenting a whole page of " " data. If all but one or two data points are below the sensitivity limits, the convention described above is followed.

7.2 Data for 1978 - 1982

The analytical results for the years 1978 through 1982 are presented in Tables 8 through 12, respectively.

*The spectrum is computer scanned from -20 to +2000 KeV. Specifically included are Cs-144, Ba-La-140, Cs-134, Cs-137, Zr-Nb-95, Co-58, Co-60, Mn-54, Zn-65. Naturally occurring gamma emitters such as K-40 and Ra daughters are frequently detected but not listed here. Data listed as "<" are at the 3 σ level, others are 2 σ . Unless otherwise noted, listed concentration is for Cs-137 and may be slightly more or less sensitive for other nuclides.

TABLE 9
1979 Sampling and Analysis Results

1.0 Introduction

This report summarizes data obtained on samples received through December, 1979 in the environmental radiological monitoring program for Grand Gulf Nuclear Station.

Where blank spaces appear following dates, work was not completed on these samples in time for inclusion in this report.

Data from analyses completed during the month were within the expected ranges and do not indicate the presence of radioactivity from the operation of nuclear power stations.

The spectrum is computer scanned from "20 to -2000 KeV. Specifically included are Ce-144, Ba-La-140, Cs-134, Cs-137, Zr-Nb-95, Co-58, Co-60, Mn-54, Zn-65. Naturally occurring gamma emitters such as K-40 and Ra daughters are frequently detected but not listed here. Data listed as "<" are at the 3σ level, others are 2σ . Unless otherwise noted, listed concentration is for Cs-137 and may be slightly more or less sensitive for other nuclides.

A summary of Quality Control data obtained during the month is presented in Section 3.0. Included in this section are data from all analytical programs, not only those associated with this program.

QUALITY CONTROL ANALYSES SUMMARY

DECEMBER 1979

The tables below summarize results of samples run for process quality control purposes during the subject month. These listings are in addition to such measurements as detector backgrounds, check source values, radiometric-gravimetric comparisons, system calibrations, etc. Detailed listings of each measurement are maintained at the laboratory and are available for inspection if required.

TABLE 10
1980 Sampling and Analysis Results

Introduction

This report summarizes data obtained on samples received through the month reflected on the cover in the environmental radiological monitoring program for the Grand Gulf Nuclear Station of the Mississippi Power and Light Company.

Where blank spaces appear following dates, work was not completed on these samples in time for inclusion in this report.

Data from analyses completed during the month were within the expected ranges and do not indicate the presence of radioactivity from the operation of the nuclear power station.

The spectrum is computer scanned from ~20 to ~2000 KeV. Specifically included are Ce-144, Ba-La-140, Cs-134, Cs-137, Zr-Nb-95, Co-58, Co-60, Mn-54, and Zn-65. Naturally occurring gamma emitters such as K-40 and Ra daughters are frequently detected but not listed here. Data listed as "<" are at the 3σ level, others are 2σ . Unless otherwise noted, listed concentration is for Cs-137 and may be slightly more or less sensitive for other nuclides.

A summary of Quality Control data obtained during the month is presented at the end of this report. Included in this section are data from all analytical programs, not only those associated with this program.

QUALITY CONTROL ANALYSES SUMMARY

1980

The tables below summarize results of samples run for process quality control purposes during the subject month. These listings are in addition to such measurements as detector backgrounds, check source values, radiometric-gravimetric comparisons, system calibrations, etc. Detailed listings of each measurement are maintained at the laboratory and are available for inspection if required.

TABLE 11
1981 Sampling and Analysis Results

Introduction

This report summarizes data obtained on samples received during 1981 in the environmental radiological monitoring program for the Grand Gulf Nuclear Station of the Mississippi Power and Light Company.

Data from analyses completed during 1981 were within the expected ranges and do not indicate the presence of radioactivity from the operation of the nuclear power station.

The spectrum is computer scanned from ~20 to ~2000 KeV. Specifically included are Ce-144, Ba-La-140, Cs-134, Cs-137, Zr-Nb-95, Co-58, Co-60, Mn-54, and Zn-65. Naturally occurring gamma emitters such as K-40 and Ra daughters are frequently detected but not listed here. Data listed as "<" are at the 3 σ level, others are 2 σ . Unless otherwise noted, listed concentration is for Cs-137 and may be slightly more or less sensitive for other nuclides.

A summary of Quality Control data obtained during the year is presented at the end of this report. Included in this section are data from all analytical programs, not only those associated with this program.

LISTING OF MISSED SAMPLES

<u>Sample Type</u>	<u>Location</u>	<u>Expected Collection Date</u>	<u>Reason</u>
Surface water	MRUP MRDOWN	January	Unattainable due to low water level
Air particulate	A/S 1	05/04, 11	Unit out of order
sediment	-	June	High river stages
Air particulate	A/S 3	07/06	Filter missing
Fruit	-	July	Not available
Vegetables	-	July	MF&L garden flooded
AP/CC	A/S 3	08/10-09/08	Unit out of order
Fruit	-	August	Not available
Vegetables	-	August-September	Not available
AP/CC	A/S 6	09/08	Unit down during power failure fuse blew at restart.
AP/CC	AS 2, AS 3	09/21	Filters & cartridges jarred from unit, time unknown.
CC	AS 8	09/21	Cartridge burst on removal from unit
AP/CC	AS 2	09/28-10/12	Unit out of order
AP/CC	AS 6	10/12	Fuse blown
Fruit/Vegetables	-	October-December	Not available
Surface Water	MRUP MRDOWN	October	Non-availability of boat
AP/CC	AS 3	12/07, 14, 21	Unit out of order
AP/CC	AS 2	12/14, 21, 28	Unit out of order

ENVIRONMENTAL QUALITY CONTROL ANALYSES SUMMARY

1981

The tables below summarize results of samples run for process quality control purposes during the subject month. These listings are in addition to much measurements on detector backgrounds, check source values, radiometric-gravimetric comparisons, system calibrations, etc. Detailed listings of each measurement are maintained at the laboratory and are available for inspection if required.

*When analyses of a particular type result in concentrations below the detection limits, the term "LT" is used to indicate "Less Than" values for that measurement based on 3_α (99.5%) confidence level.

TABLE 12
1982 Sampling and Analysis Results

INTRODUCTION

This report summarizes data obtained on samples received during the year 1982 for the radiological monitoring program for the Grand Gulf Nuclear Station of the Mississippi Power and Light Company.

Data from analyses completed during the month were within the expected ranges and do not indicate the presence of radioactivity from the operation of the nuclear power station.

The spectrum is computer scanned from ~20 to ~2000 KeV. Specifically included are Ce-144, Ba-La-140, Cs-134, Cs-137, Zr-Nb-95, Co-58, Co-60, Mn-54 and Zn-65. Naturally occurring gamma emitters such as K-40 and Ra daughters are frequently detected but not listed here. Data listed as "<" are at the 3σ level, others are 2σ . Unless otherwise noted, listed concentration is for Cs-137 and may be slightly more or less sensitive for other nuclides.

A summary of Quality Control data obtained during the month is presented at the end of this report. Included in this section are data from all analytical programs, not only those associated with this program.

1982 Quality Control Analyses Summary

The tables below summarize results of samples run for process quality control purposes during the subject year. These listings are in addition to such measurements as detector backgrounds, check source values, radiometric-gravimetric comparisons, system calibrations etc. Detailed listings of each measurement are maintained at the laboratory and are available for inspection if required.

Blank Samples

<u>Nuclide Analyzed</u>	<u>Number of Determinations</u>	<u>Number of Analyses Exceeding the LLD for that Analysis</u>
Gross Alpha	47	0
Gross Beta	37	0
Tritium	75	0
Sr-89-90	26	0
I-131	*	0
Am-241	12	0
Pb-210	27	0
Po-210	2	0
Pu-239	37	0
Ra-226	44	0
Fe-55	3	0
Isotopic Uranium	38	0
Isotopic Thorium	17	0

* Blank I-131 analyses are performed with each batch of samples processed.
All blank data were below the detection limit.

Spiked Samples

<u>Nuclide Analyzed</u>	<u>Number of Det'ns</u>	<u>Within 2σ of known</u>	<u>Within 3σ of known</u>	<u>Differing from known by > 3σ</u>
Gross Alpha	47	47	-	-
Gross Beta	37	37	-	-
Tritium	75	75	-	-
Sr-89-90	26	26	-	-
Am-261	12	12	-	-
Pb-210	27	27	-	-
Po-210	2	2	-	-
Pu-239	37	37	-	-
Ra-226	44	44	-	-
Fe-55	3	3	-	-
Isotopic Uranium	38	38	-	-
Isotopic Thorium	17	17	-	-

Split Samples

<u>Nuclide Analyzed</u>	<u>Number of Det'ns</u>	<u>No. Agreeing Within 2σ</u>	<u>No. Agreeing Within 3σ</u>	<u>No. Differing by > 3σ</u>
Gross Alpha	17	17	-	-
Gross Beta	20	20	-	-
Tritium	20	20	-	-
Sr-89-90	7	7	-	-
I-131	2	2	-	-
Gamma Emitters	14	14	-	-
Pb-210	4	4	-	-
Po-210	2	2	-	-
Pu-239	3	3	-	-
Am-241	2	2	-	-
Isotopic Thorium	3	3	-	-
Isotopic Uranium	16	16	-	-
Ra-226	13	13	-	-

JAMES P. McGAUGHEY, JR.
VICE PRESIDENT

Office of Inspection and Enforcement
U. S. Nuclear Regulatory Commission
Region II
101 Marietta Street, N.W., Suite 2900
Atlanta, Georgia 30303

Attention: Mr. J. P. O'Reilly, Regional Administrator

Dear Mr. O'Reilly:

SUBJECT: Grand Gulf Nuclear Station
Unit 1
Docket No. 50-416
License No. NPF-13
File: 0292/15322
Annual Radiological Environmental
Operating Report for 1982
AECM-83/0241

In accordance with Grand Gulf Nuclear Station's (GGNS) Unit 1 Technical Specifications, we are enclosing one copy of the Annual Radiological Environmental Operating Report for the period June 16, 1982, through December 31, 1982. This reporting period began the day we received the Low-Power Operating License for GGNS Unit 1, June 16, 1982.

Questions concerning the technical content of this report should be referred to Dr. L. R. McKay at (601) 969-2432.

Yours truly,

J.P. McGaughy
for J. P. McGaughy
