SECONDARY CONTAINMENT LEAK RATE TEST BROWNS FERRY NUCLEAR PLANT UNIT 2 CONDUCTED MARCH 20, 1978

SUBMITTED TO
THE UNITED STATES NUCLEAR REGULATORY COMMISSION
PURSUANT TO
FACILITY OPERATING LICENSE NUMBER DPR-52

1.0 - Browns Ferry Nuclear Plant Unit 2 Secondary Containment Leak Rate
Test Report

2.0 Purpose

This report describes the results and analysis of the test data taken during leak rate testing of the Browns Ferry Nuclear Plant Unit 2 secondary containment pursuant to Technical Specification 4.7.C.l.c prior to the first refueling outage.

3.0 Procedure

The attached surveillance instruction, SI 4.7.C-1, outlines the procedures followed during secondary containment leak rate testing.

4.0 Data

The attached surveillance instruction data sheets lists the following test data:

- (1) Standby gas treatment system flow rate: 8700 scfm
- (2) Reactor building differential pressure:

Unit 2 reactor zone: -0.53" H₂0

Refueling zone average: -0.48" H20

- (3) Wind Speed: 17.1 mph
- (4) Wind direction: southwest

5.0 Analysis and Interpretation

Technical Specification 4.7.C.l.c requires that secondary containment capability to maintain 1/4 inch water vacuum under calm (<5 mph) wind conditions with a total system inleakage rate of not more than 12000 scfm shall be demonstrated at each refueling outage prior to refueling. Following shutdown of Unit 2 on March 18, 1978, the secondary containment for the common refuel zone and the Unit 2 reactor zone were leak rate tested.

Browns Ferry Nuclear Plant Unit Secondary Containment Leak Rate Test Report (Continued)

5.0 Analysis and Interpretation (Continued)

These two zones were isolated from the Unit 1 and Unit 3 reactor zones. Appendix A to SI 4.7.C gives the allowable inleakage per secondary containment zone documented during preoperational testing. Assuming a total allowable inleakage of 12000 scfm, it is shown in Appendix A that the allowable inleakage for testing the refuel zone and Unit 2 reactor zone in combination under calm wind conditions is 8988 scfm. From the data taken during this test it is shown that assuming a total combined inleakage of 8700 scfm in the Unit 2 reactor zone and the refuel zone that the secondary containment system is capable of maintaining greater that 0.25 inches of water vacuum. These results fulfill the requirements of Technical Specification 4.7.C.1.c.

SI 4.7.C - Secondary Containment

Description

This surveillance is used to comply with the requirements of portions of technical specification 4.7.C. The following table lists the requirements satisfied by this instruction

	Tech. Spec.		
Frequency	Reference	Surveillance	Requirements

At each refueling out- 4.7.C.l.c age prior to refueling

Demonstrate the capability of secondary containment to maintain -1/4" water pressure with a system inleakage of not more than 12,000 cfm under calm wind conditions < 5 mph. SI 4.7.C-1 will be used to satisfy this requirement.

Any time the integrity 4.7.C.2 of one zone has been violated

Isolate the affected zone from the other zones and demonstrate secondary containment capability to maintain -1/4" water pressure under calm wind conditions using the SGTS.

SI 4.7.C-1 will be used to satisfy the requirements for the zones.

The reactor building is broken up into four zones, each of which can be isolated independently. These zones are the unit 1 reactor zone (U1RZ), the unit 2 Reactor zone (U2RZ), the unit 3 reactor zone (U3RZ), and the refueling zone (RFZ) which is common to all three units.

This surveillance instruction is written to use the SGTS fans A and C, B and C, or A and B, or a single fan to demonstrate that at a flow of \leq 12,000 cfm the secondary containment zones can be maintained at a static pressure of -1/4" water under calm wind conditions. Manual isolation of the zones will be used since it is fast and the steam line tunnel temperature increases, which may cause a unit trip.

SI 4.7.C - Secondary Containment

Description (Continued)

SI 4.7.C-1 will be used to demonstrate secondary containment capability. This is to be accomplished by isolating the secondary containment for the reactor building or the required zones, starting the standby gas treatment trains, adjusting the flow to less than the allowable flow and verifying the static pressure of the tested zone(s) is -1/4" $\rm H_2O$ or less. This procedure will normally be used to test the secondary containment capability of the reactor building prior to refueling.

SI 4.7.C-1 Testing should be limited to 30 minutes if at all possible since the main steam line tunnel temperatures may trip an operating unit.

1. PURPOSE

This procedure is used to isolate the zones to be leak tested and to verify secondary containment capability to maintain -1/4" H_2O with a system in-leakage of $\leq 12,000$ cfm without actually measuring the in-leakage.

2. REFERENCES

- 2.1 Technical specifications for units 1, 2, and 3, Section 4.7.C.
- 2.2 The following drawings:

Number	Revision	Number	Revision
45N614-5	5	47W610-64	15
45N614-6	5	47W610-65	15

3. PREREQUISITES

- 3.1 Notify each unit operator and assistant shift engineer such that they may communicate and be aware of the ventilation and SGTS status during this test.
- 3.2 Verify that the reactor building ventilation system is in a normal operational status per OI 30.
- 3.3 Verify that the SGTS is in standby readiness per OI 65.
- 3.4 Verify that each unit's main steam line tunnel temperature is not above 150° F.
- 3.5 Verify switch 16A-S34 is not in DRYWELL BYPASS or TORUS BYPASS on each unit or the unit that is to be tested.

3. PREREQUISITES (Continued)

- 3.6 Station a man at the Reactor Building 480V Vent Board in case any breakers need to be reset during this test, and in the SGTS building to adjust manual dampers.
- 3.7 Set up communication between panel 9-25-1 and 9-25-2 and the following

panels: 25-219-1 25-215-2 25-215-3 25-213-1 25-213-2 25-213-3

3.8 Verify the following process instruments to be within a current

calibration period. FI-65-50 1-PdIC-64-2 FI-65-71 2-PdIC-64-2 1-PdIC-64-1 3-PdIC-64-2 2-PdIC-64-1 3-PdIC-64-1

- 3.9 Verify the inboard equipment access lock doors closed with seals inflated.
- 3.10 Verify that a drywell or suppression chamber purge is not in process or planned during this test.
- 3.11 Verify on Data Sheet SI 4.7.C-1 that each of the doors are closed for the respective zones to be tested or the doors indicated by number (See Table 3.11 of Data Sheet SI 4.7.C-1) for all four zones.

4. PRECAUTIONS

- 4.1 Do not allow the main steam line tunnel temperature on any unit in operation to exceed 160° F. If this temperature is approached to within 10° F, stop the test and reestablish normal ventilation per OI 30 or provide another means for ventilating the main steam line tunnel to prevent a unit trip (trip point is 186° F).
- 4.2 Attempt to restrict testing time to 30 minutes.

5. LIMITATIONS AND ACTIONS

5.1 None

6. PROCEDURE

- 6.1 Initial and perform the indicated sections on the configuration to be tested on Data Sheet SI 4.7.C-1 and perform steps indicated below.
 - 6.1.1 UlRZ Perform section 6.2 and section 6.4.
 - 6.1.2 U2Rz Perform section 6.2 and section 6.4.
 - 6.1.3 U3RZ Perform section 6.2 and section 6.4.
 - 6.1.4 RFZ Perform section 6.3 and section 6.4.
 - 6.1.5 UlRZ and RFZ Perform sections 6.2, 6.3 and section 6.4.
 - 6.1.6 U2RZ and RFZ Perform sections 6.2, 6.3 and section 6.4.
 - 6.1.7 U3RZ and RFZ Perform sections 6.2, 6.3 and section 6.4.
 - 6.1.8 Reactor Building Perform section 6.2 for each RZ, and section 6.3 for the RFZ and section 6.4.
- 6.2 Manual Isolation of a Reactor Zone
 NOTE: HS-64-117, HS-64-120, HS-64-119, & HS-64-122 are spring return to normal.
 - 6.2.1 Place HS-64-117 (Panel 9-25) in the TEST position for the reactor zone to be isolated. (Inboard and common valves)
 - 6.2.2 Place HS-64-120 (Panel 9-25) in the TEST position for the reactor zone to be isolated. (Outboard valves)
 - 6.2.3 Start SGTS trains A and B in accordance with OI 65 and verify actions and/or take data as indicated on Data Sheet SI 4.7.C-1 for the reactor zone that is being isolated.
 - NOTE: If a reactor zone is the only zone to be isolated, go to Section 6.4 and if the refuel zone is to be isolated complete Section 6.3 before going to Section 6.4.
- 6.3 Manual Isolation of the Plant Refueling Zone
 - 6.3.1 Place HS-64-119 (Panel 9-25-1) in the TEST position. (Inboard and common valves)

- 6. PROCEDURE (Continued)
 - 6.3 Manual Isolation of the Plant Refueling Zone (Continued)
 - 6.3.2 Place HS-64-122 (Panel 9-25-1) in the TEST position. (Outboard valves)
 - 6.3.3 Start SGTS trains A and B, if not already running, in accordance with OI 65 and verify actions and/or take data as indicated on Data Sheet SI 4.7.C-1 for the refueling zone.
 - 6.4 Secondary Containment Capability
 - NOTE: This section is to verify that the secondary containment is capable of maintaining a -1/4" h) with a system inleakage of < 12,000 cfm for the entire reactor building or allowable in-leakage for one or more zones.
 - 6.4.1 Adjust the total flow indicated on FI-65-50 and FI-65-71

 (Panel 9-25-2) to 11,500 cfm for entire reactor building or less than allowable flow for one or more zones as shown in Appendix A by closing a SGTS fan discharge damper or if two fans are running it may be necessary to shut one fan off.

 NOTE: Let the flow stabilize for 5 minutes before the next step.
 - 6.4.2 Record flows indicated on FI-65-50 and FI-65-71 (Panel 9-25-2) and total on Data Sheet SI 4.7.C-1.
 - 6.4.3 Record the following static pressures and the air temperatures at the differential pressure indicator locations.

Zone	Instrument	Panel
Ulrz	1-PdIC-64-2	1-25-213
U2RZ	2-PdIC-64-2	2-25-213
U3RZ	3-PdIC-64-2	3-25-213
Ulrfz	1-PdIC-64-1	1-25-219
U2RFZ	2-PdIC-64-1	2-25-215
U3RFZ	3-PdIC-64-1	3-25-215

6.4.4 Verify all four zones static pressures are $\leq -1/4$ " H_2 0.

- 6. PROCEDURE (Continued)
 - 6.4 Secondary Containment Capability (Continued)
 - 6.4.5 Record the wind direction and velocity from the 33 ft. level windspeed.
 - 6.4.5.1 Record air temp. outside reactor building at ground level indicator.

NOTE: If all four zones static pressures are < -1/4" H₂O this will satisfy 4.7.C.l.b and c. If one or more zones do not meet the -1/4" H₂O static pressure requirements the following steps must be completed.

NOTE: Check to assure reactor building is isolated.

6.4.0 Adjust the total flow indicated on FI-65-50 and FI-65-71

(Panel 9-25-2) to 12,000 cfm or allowable flow from Appendix A for one or more zones by opening the fan discharge damper or it may be necessary to start another fan and adjust its discharge damper.

NOTE: Let the flow stabilize for 5 minutes before the next stop. Record flows indicated on FI-65-50 and FI-65-71 (Panel 9-25-2) and total on Data Sheet SI 4.7.C-1.

6.4.7 Record the following static pressures.

Zone	Instrument	Panel
Ulrz	1-PdIC-64-2	1-25-213
U2RZ	2-PdIC-64-2	2-25-213
U3RZ	3-PdIC-64-2	3-25-213
Ulrfz	1-PdIC-64-1	1-25-219
U2RFZ	2-PdIC-64-1	2-25-215
U3RFZ	3-PdIC-64-1	3-25-215

6.4.8 Verify all four zones static pressures are ≤ -1/4" H₂0.

NOTE: If all four zones static pressures are $\leq -1/4$ " H₂O this will satisfy 4.7.C.l.b and c. If one or more zones do not meet the -1/4" H₂O static pressure requirement the following steps must be completed.

- 6.4.9 Isolate the zone(s) that have a static pressure of > -1/4"

 H₂O from the remaining zones and indicate zones isolated on

 Data Sheet SI 4.7.C-1.
- 6.4.10 Adjust the total flow indicated on FI-65-50 and FI-65-71 (Panel 9-25-2) to the Allowable Flow of the remaining zones. See Appendix A for the Allowable Flows.

- 6. PROCEDURE (Continued)
 - 6.4 Secondary Containment Capability (Continued)
 - 6.4.10 (Continued)

NOTE: Let the flow stabilize for 15 minutes before the next step.

- 6.4.11 Record flows indicated on FI-65-50 and FI-65-71 (Panel 9-25-2) and total on Data Sheet SI 4.7.C-1.
- 6.4.12 Record the following static pressures.

Zone	Instrument	Panel
Ulrz	1-PdIC-64-2	1-25-213
U2RZ	2-PdIC-64-2	2-25-213
U3RZ	3-PdIC-64-2	3-25-213
Ulrfz	1-PdIC-64-1	1-25-219
U2RFZ	2-PdIC-64-1	2-25-215
U3RFZ	3-PdIC-64-1	3-25-215

6.4.13 Verify the remaining zones static pressures are $\leq -1/4$ " E_2^0 .

NOTE: If these zones static pressures are < -1/4" H₂O this will satisfy 4.7.C-2. Maintenance must be performed on the isolated zone and should be indicated on Data Sheet SI 4.7.C-1 cover sheet under Remarks.

- 6.4.14 Check those switches that were put in the TEST position under sections 6.2 and/or 6.3 in their NORMAL position and verify on Data Sheet SI 4.7.C-1.
- 6.4.15 Verify on Data Sheet SI 4.7.C-1 those actions listed under RETURN TO NORMAL for the zones tested.

Appendix A

Secondary Containment Leak Rate Test Criteria

During preoperational testing for unit 3 the following in-leakage rates at -1/4" H₂O static pressure were documented.

Common refuel floor (units 1, 2, & 3)	Documented Inleakage 6250	Percentage 64%
Unit 1 reactor zone	1239	12.7%
Unit 2 reactor zone	1064	10.9%
Unit 3 reactor zone	1211	12.4%
lotal secondary containment	9764 CFM	100%

Leak rate testing will normally be done with all zones simultaneously lined up for testing; however, plant operating conditions and the technical specification do not always permit this. When less than four zones (3-unit plant) are being tested, the total allowable inleakage will be based on preoperational testing and will be based on the sum of the allowable inleakages for the zones being tested. After a secondary containment violation, the total inleakage must not be greater than the total of the allowable inleakage for each individual zone as indicated below.

The technical specifications require the total secondary containment inleakage to be less than 12,000 cfm at -1/4" differential pressure. The following are therefore established for surveillance testing various combinations of zones when secondary containment has been violated.

Zone	Allowable Inleakage
Common refuel floor	7680
Unit 1 reactor zone	1524
Unit 2 reactor zone	1308
Unit 3 reactor zone	1488

⁽¹⁾ Corrective action must be filled our explicitly, addition shows or trouble reports, that contain explicit information so that common-mode failures can be evaluated and quality assurance established.

HHachment to SI 4.7. C.1 (Umit 2/3-20-78) Colculate dynamic pressure, q: (See FSAR \$ 12-2-2-9.1) 9= .002558 V2 9 = .002557 (17.1) 2 psf (.01602 f+ H20) (12 in H20) g = 0/4 in H20) Note: Containent DP res 5 Limits .25 Margin = .25int. Hnalysis Unit 2 Refuel Zone Total Limit (In House) 1307 + 7680 = 8988 Measured 3500 + 5200 = 8700 Margin to Limit 2 [288 scfm]

On 3-20-77, a margin to the leak rate limit of 228 scfm was measured for unit 2. This margin would be reduced at calm wind conditions. However, since the dynamic pressure of the winds to (14 lin H20) was less than the excess of Ap (~25 in H20) occurring during the test, there was stiff a sufficient conservatism to satisfy Tech spec requirem
