

FEB 3 1975

Memo to File
Thru: D. L. Capton
Senior Reactor Inspector
Reactor Operations

OYSTER CREEK
(DN 50-219)
IE 75-01 SHUTDOWN AND POTENTIAL FISH KILL

Oyster Creek informed me on February 3, that plans are continuing to shutdown the plant Wednesday night, February 5, 1975.

The temperature in Barnegat Bay is now 36⁰F (the lethal threshold for Menhaden) and a coldwave is solidly entrenched according to plant personnel. This would indicate the potential for a fish kill similar to the January 1974 occurrence.

I have also been informed that the State of New Jersey has been in communication with the State Attorney General regarding the shutdown. I was queried as to the signature on IE Bulletin 75-01 by the plant, in that the State was requesting a response from JCP&L.

E. G. Greenman
