

FEB 22 1985

Docket Nos: 50-416
and 50-417

LICENSEE: Mississippi Power and Light Company

FACILITY: Grand Gulf Nuclear Station (GGNS)

SUBJECT: JANUARY 28, 1985 SITE VISIT

The DL Project Manager for Grand Gulf and the Chief of Licensing Branch No. 4 visited the site to tour the facility and discuss licensing actions with the licensee. The NRC senior resident inspector participated in the discussion of licensing actions. Enclosure 1 is a list of attendees. Enclosure 2 is a copy of slides and handouts used in the meeting.

The tour and the briefing prior to the tour included the emergency operations facility (located adjacent to the site), the GGNS simulator, the Unit 1 control room, Unit 1 remote shutdown panel, key features of the Unit 2 Mark III containment, and the ultimate heat sink.

Unit 1 is undergoing startup testing in the range of 50-75 percent power. On January 27, 1985, testing at 70 per cent power was started. Unit 2 is about 35 per cent completed.

The Emergency Operations Facility (EOF) is located within the MP&L Energy Services Center about one-half mile from the reactor containments. A Corporate Emergency Center, located in MP&L offices in Jackson, Mississippi provides space for staging and briefing of corporate officers and has communication links to the EOF. An Emergency News Center is located in Port Gibson, Mississippi. An office for use during a general emergency by Louisiana State officials, with communication links to the EOF, is located in Tensas Parish, Louisiana.

The GGNS simulator is located in the Energy Services Center. The control panels duplicate as much as possible, the control room of Unit 1, including the layout of the panels. Remote shutdown panels are simulated. When the safety parameter display system (SPDS) is installed in the plant, it will also be simulated in the GGNS Simulator. There are five instructors who conduct two simulator classes per year with 6 to 14 students in each class. Requalification courses are conducted once every five weeks.

P PDR

The control room was viewed from the observation deck. The reactor was in operation at the time of the visit. A temporary wall in the control room separates the Unit 1 control area from the Unit 2 control area which is still under construction.

The ultimate heat sink for Units 1 and 2 consists of two below-grade concrete basins which together contain enough water to cool a shutdown reactor for 30 days without makeup water. Mechanical draft cooling towers on top of the basins transfer heat from the service water to the atmosphere. An underground siphon line connects the two basins so that water in both basins is available for Unit 1.

The BWR Mark III containment has a larger drywell than earlier BWR models making access for surveillance and maintenance easier. On Unit 2, the containment dome is not yet installed. Most of the large piping is installed, including the main steam lines and main feedwater lines and the 20 main steam safety relief valves and associated discharge piping.

The tour included a walk in the drywell and in the part of the containment which will be the suppression pool. Very little work is being done on Unit 2 at this time.

Licensee described current licensing activities. A major task is preparation for the fire protection audit to be conducted by Region II. An updated Fire Hazards Analysis will be submitted in April 1985. Another fire protection task is the development and implementation of compensatory measures and procedures to shutdown the reactor in the event of a fire in the control room. Other recent activities and licensing activities are listed on sheets 36, 37 and 38 of Enclosure 2.

The NRC staff requested that licensee consider the preparation of an integrated schedule that will provide dates for licensing actions through the first refueling. This will permit NRC to plan and schedule resources more effectively. Staff provided a list of licensing actions - primarily resolution of license conditions - and requested dates when submittals would be made. Licensee said it is interested in the preparation of an integrated schedule and has been working on the scheduling of its effort for surveillance tests and modifications required to be completed prior to startup following the first refueling outage. MP&L currently estimates the start of the first refueling will occur in the 3rd calendar quarter of 1986.

In the review of specific licensing actions, licensee provided estimated dates for submittals which will be included in the staff's scheduling of licensing actions. A question arose regarding License Conditions 2C(9), concerning reactor internals tests, and 2C(25)(b), concerning MP&L response to TDI Owners Group recommendations on standby diesel generators. These license conditions require submittals for review and approval prior to certain dates. The question was whether the staff's review and approval should be completed prior to the stated date. Based on discussions with the appropriate technical review branches subsequent to this site trip, the staff finds that the report on reactor internals test results is intended to be submitted no later than 6 months after completion of the startup test program and that staff review and approval can be made after that date.

With respect to License Condition 2C(25)(b), staff intended that MP&L's actions in response to the TDI Owners Group recommendations for the standby diesel generators should be submitted in sufficient time to allow staff review and approval to be completed prior to startup following the first refueling outage. Another question arose regarding the date for staff's evaluation of MP&L's responses to License Conditions 2C(6) Soil Structure Interaction, and 2C(8) Masonry Walls, since the license conditions require modifications to be made if required by staff's review. Based on discussions with the Structural and Geotechnical Engineering Branch subsequent to the meeting, the staff has determined that the staff's evaluations are scheduled to be completed April 30, 1985 and a letter to licensee transmitting the evaluations is scheduled for May 15, 1985.

Licensee and staff agreed that monthly meetings to review licensing actions would be beneficial. Some meetings will be held in licensee's offices or the site and others in the NRC staff offices in Bethesda or Atlanta.

CLOSING REMARKS

FIRE PROTECTION MAJOR TASKS

- SAFE SHUTDOWN EQUIPMENT LIST
 - SAFE SHUTDOWN LOGIC DIAGRAMS
 - SAFE SHUTDOWN P&ID'S
 - MICROCOMPUTER DATABASE OF CABLES AND DEVICES
- SAFE SHUTDOWN RACEWAY DRAWINGS
- FIRE BARRIER QUALIFICATION
- SEPARATION ANALYSIS
- ALTERNATIVE SHUTDOWN ANALYSIS
- EMERGENCY LIGHTING REVIEW
- UPDATE FSAR/FHA

SCHEDULE

- *ALL REVIEW/DOCUMENTATION ACTIVITIES TO BE COMPLETED PRIOR TO NRC AUDIT, CURRENTLY SCHEDULED FOR APRIL 15-19.
- *FULL COMPLIANCE WITH APPENDIX R, BASED ON CURRENT GUIDELINES, TO BE ACHIEVED BY END OF FIRST FUELING OUTAGE.
- *UPDATED FIRE HAZARD ANALYSIS TO BE SUBMITTED BY APRIL 15.

CONTROL ROOM INTERIM ANALYSIS

- *PURPOSE - TO DEMONSTRATE THAT SAFE SHUTDOWN CAN BE ACHIEVED GIVEN A LIMITED FIRE IN THE CONTROL ROOM AND PROVIDE COMPENSATORY MEASURES, AS NECESSARY, FOR THE INTERIM PERIOD PRIOR TO FIRST REFUELING.
- *STATUS - ALL SAFE SHUTDOWN CIRCUITS/DEVICES IN THE CONTROL ROOM HAVE BEEN IDENTIFIED AND A FAILURE MODES ANALYSIS PERFORMED. AN EVALUATION OF THE EFFECTS OF A LIMITED FIRE ON REDUNDANT CIRCUIT CIRCUITS IS IN PROGRESS. A SHUTDOWN PROCEDURE IS IN DEVELOPMENT.

COMPENSATORY MEASURES UNDER REVIEW:

- ADMINISTRATIVE LIMIT ON FLAMMABLE LIQUIDS
- END-OF-SHIFT CHECK FOR COMBUSTIBLES
- PROVIDE METAL FURNITURE AND ENCLOSED PRINT RACKS
- PROVIDE SELF-EXTINGUISHING TRASH CANS AND ASH TRAYS
- IMPLEMENT "NO SMOKING" IN BACK PANEL AREAS
- FIRE WATCH WHEN PANELS ARE OPEN FOR HOT WORK

- *SCHEDULE- THE LIMITED CONTROL ROOM FIRE ANALYSIS AND SAFE SHUTDOWN PROCEDURE WILL BE COMPLETE BY 2/2. OPERATOR TRAINING WILL BE SCHEDULED THEREAFTER.
