Attention: Document Control Desk

Enclosed is the Quad Cities Station Annual Radiological Environmental Operating Report, Docket Numbers 50-254 and 50-265. This report contains the results of the Radiological Environmental and Meteorological Monitoring Programs for the 1995 calendar year. The Radioactive Effluent Release Report(s) were submitted under separate cover.

Two copies of the report are provided for your use. Two copies will be forwarded to Region III and one copy to the Resident Inspector.

Respectfully,

ComEd  
Quad-Cities Nuclear Power Station

L. W. Pearce

## INTRODUCTION

Units 1 and 2 of the Quad Cities Station located near Cordova, Illinois next to the Mississippi River, are 2511 MW<sub>th</sub> boiling water reactors, similar in design to Dresden Units 2 and 3. The station has been designed to keep releases to the environment at levels below those specified in the regulations.

Liquid effluents from Quad Cities are released to the Mississippi River in controlled batches after radioassay of each batch. Gaseous effluents are released to the atmosphere after delay to permit decay of short-lived (noble) gases. Releases to the atmosphere are calculated on the basis of analyses of grab samples of noble gases as well as continuously collected composite samples of iodine and particulate activity sampled during the course of the year. The results of effluent analyses are summarized on a monthly basis and reported to the Nuclear Regulatory Commission as required per Technical Specifications. Airborne concentrations of noble gases, I-131, and particulate radioactivity in offsite areas are calculated using isotopic composition of effluent and meteorological data.

Environmental monitoring is conducted by sampling at indicator and control (background) locations in the vicinity of the Quad Cities station to measure changes in radiation or radioactivity levels that may be attributable to station operations. If significant changes attributable to Quad Cities are measured, these changes are correlated with effluent releases. External gamma radiation exposure from noble gases and internal dose from I-131 in milk are the most critical pathways at this site; however, an environmental monitoring program is conducted which includes these and other pathways.

ComEd is in the process of implementing a Uniform Radiological Environmental Monitoring Program, referred to as UREMP, among the ComEd nuclear stations. This program includes generic requirements pertaining to environmental sampling and analysis, an annual land use census, an interlaboratory comparison program and environmental reports.

## SUMMARY

Gaseous and liquid effluents for the period contributed to only a small fraction of the Quad Cities Technical Specification limits. Calculations of environmental concentrations based on effluent, and meteorological data for the period indicate that consumption by the public of radionuclides attributable to Quad Cities Station does not exceed the regulatory limits. Radiation exposure from radionuclides released to the atmosphere represented the critical pathway for the period with a maximum individual dose estimated to be 8.56E-04 mrem for the year, when a shielding and occupancy factor of 0.7 is assumed. The assessment of radiation doses are performed in accordance with the ComEd Offsite Dose Calculation Manual (ODCM). The results of these analyses confirm that the station is operating in compliance with 10CFR50 Appendix I, 10CFR20 and 40CFR190.

## **1.0 EFFLUENTS**

### **1.1 Gaseous Effluents to the Atmosphere**

Measured concentrations and isotopic composition of noble gases, radioiodine, and particulate radioactivity released to the atmosphere during the year, are listed in Table 1.1-1. A total of 5.54E+01 curies of fission and activation gases was released with a maximum quarterly average release rate of 2.06  $\mu\text{Ci/sec}$ .

A total of 1.88E-03 curies of I-131 was released during the year, with a maximum quarterly average release rate of 8.14E-04  $\mu\text{Ci/sec}$ .

A total of 2.07E-02 curies of beta-gamma emitters was released as airborne particulate matter with a maximum quarterly average release rate of 1.42E-03  $\mu\text{Ci/sec}$ . A total of 1.46E-05 curies of alpha emitters was released during the year. Gross alpha values for second and fourth quarters are estimates based on values from the previous six months.

A total of 3.12E+01 curies of tritium was released, with a maximum quarterly average release rate of 1.35  $\mu\text{Ci/sec}$ .

### **1.2 Liquids Released to the Mississippi River**

A total of 7.36E+06 liters of radioactive liquid waste (prior to dilution) containing 6.26E-02 curies (excluding tritium, noble gases, and alpha) was discharged from the station. These wastes were released at a maximum quarterly average concentration of 7.03E-09  $\mu\text{Ci/ml}$ . No alpha radioactivity was detected in the liquid waste. A total of 2.25E+01 curies of tritium was released at a quarterly average concentration of 7.37E-07  $\mu\text{Ci/ml}$ . Quarterly release estimates and principal radionuclides in liquid effluents are given in Table 1.2-1.

## **2.0 SOLID RADIOACTIVE WASTE**

Solid radioactive wastes were shipped to Barnwell, South Carolina (CNSI); Oak Ridge, Tennessee (AERC, American Ecology, SEG); and Wampum, Pennsylvania (Alaron). The record of waste shipments is summarized in Table 2.0-1.

## **3.0 DOSE TO MAN**

### **3.1 Gaseous Effluent Pathways**

Table 3.1-1 summarizes the doses resulting from releases of airborne radioactivity via the different exposure pathways.

#### **3.1.1 Noble Gases**

##### **3.1.1.1 Gamma Dose Rates**

Offsite gamma air and total body doses are shown in Table 3.1-1 and were calculated based on measured release rates, isotopic composition of the noble gases, and average meteorological data for the period. Isodose contours based on concurrent meteorological data for gamma

dose are shown in Figure 3.1-1. Based on measured effluents and average meteorological data, the maximum total dose to an individual would be 8.56E-04 mrem for the year, with an occupancy or shielding factor of 0.7 included and based on measured effluents and concurrent meteorological data would be 6.76E-03 mrem. The maximum gamma air dose was 1.14E-03 mrad and 9.66E-04 mrad based on concurrent meteorological data.

### 3.1.1.2 Beta Air and Skin Dose Rates

The range of beta particles in air is relatively small (on the order of a few meters or less); consequently, plumes of gaseous effluents may be considered "infinite" for purpose of calculating the dose from beta radiation incident on the skin. However, the actual dose to sensitive skin tissues is difficult to calculate due to the effect of the beta particle energies, thickness of inert skin and clothing covering sensitive tissues. For purposes of this report the skin is taken to have a thickness of 7.0 mg/cm<sup>2</sup> and an occupancy factor of 1.0 is used. The skin dose from beta and gamma radiation for the year was 9.40E-04 mrem.

The air concentrations of radioactive noble gases at the offsite receptor locations are given in Figure 3.1-2. The maximum offsite beta air dose for the year was 9.60E-05 mrad.

## 3.1.2 Radioactive Iodine

The human thyroid exhibits a significant capacity to concentrate ingested or inhaled iodine. The radioiodine, I-131, released during routine operation of the station, may be made available to a person resulting in a dose to the thyroid. The principal pathway of interest for this radionuclide is ingestion of radioiodine in milk by an infant.

### 3.1.2.1 Iodine Concentrations in Air

The calculated concentration contours for iodine in air are shown in Figure 3.1-3. These calculations include an iodine cloud depletion factor which accounts for the phenomenon of elemental iodine deposition on the ground. The maximum offsite concentration is estimated to be 2.40E-04 pCi/m<sup>3</sup> for the year.

### 3.1.2.2 Dose to Infant's Thyroid

The hypothetical thyroid dose to an infant living near the station via ingestion of milk was calculated. The radionuclide considered was I-131 and the source of milk was taken to be the nearest dairy farm with the cows pastured from May through October. The maximum infant's thyroid dose was 3.51E-02 mrem during the year (Table 3.1-1).

## 3.1.3 Concentrations of Particulates in Air

Concentration contours of radioactive airborne particulates are shown in Figure 3.1-4. The maximum offsite average level is estimated to be 3.13E-04 pCi/m<sup>3</sup>.

### 3.2 Liquid Effluent Pathways

The three principal pathways through the aquatic environment for potential doses to man from liquid waste are ingestion of potable water, eating aquatic foods, and exposure while walking on the shoreline. Not all of these pathways are significant or applicable at a given time or station but a reasonable approximation of the dose can be made by adjusting the dose formula for season of the year or type and degree of use of the aquatic environment. NRC developed equations\* were used to calculate the doses to the whole body, lower GI tracts, thyroid, bone, skin; specific parameters for use in the equations are given in the ComEd Offsite Dose Calculation Manual. The maximum whole body dose for the year was 4.74E-04 mrem and no organ dose exceeded 9.64E-04 mrem (Table 3.2-1).

### 3.3 Assessment of Dose to Member of Public

During the period January to December, 1995, Quad Cities Station did not exceed the following limits as shown in Table 3.1-1 and Table 3.2-1 (based on yearly average meteorological data), as shown in Figure 3.1-1 (based on concurrent meteorological data), and as shown in Table 3.3-1:

- The RETS limits on dose or dose commitment to an individual due to radioactive materials in liquid effluents from each reactor unit (3 mrem to the whole body or 10 mrem to any organ during any calendar quarter; 6 mrem to the whole body or 20 mrem to any organ during any calendar year).
- The RETS limits on air dose in noble gases released in gaseous effluents to a member of the public from each reactor unit (5 mrad for gamma radiation or 10 mrad for beta radiation during any calendar quarter; 10 mrads for gamma radiation or 20 mrad for beta radiation during any calendar year).
- The RETS limits on dose to any individual due to iodine-131, iodine-133, tritium, and radionuclides in particulate form with half-lives greater than eight days in gaseous effluents released from each reactor unit (7.5 mrem to any organ during any calendar quarter; 15 mrem to any organ during any calendar year).
- The RETS 40CFR190 limits for total body dose or any organ (except thyroid) is less than 25 mrem annually for radioactive liquid and gaseous effluents. The thyroid is limited to 75 mrem over 12 consecutive months.
- The 10CFR20 limit on Total Effective Dose Equivalent to individual members of the public (100 mrem).

---

\* Nuclear Regulatory Commission, Regulatory Guide 1.109 (Rev. 1).

#### 4.0 SITE METEOROLOGY

A summary of the site meteorological measurements taken during each quarter of the year is given in Appendix II. The data are presented as cumulative joint frequency distributions of the wind direction for the 296' level and wind speed class by atmospheric stability class determined from the temperature difference between the 296' and 33' levels. Average data recovery for all measurements on the tower was about 99.1% for 1995.

#### 5.0 ENVIRONMENTAL MONITORING

Table 5.0-1 provides an outline of the Radiological Environmental Monitoring Program (REMP) as required in current Technical Specifications. Table 5.0-2 identifies the sampling locations, sample collections and analyses for each location. This program went into effect in November 1977 and differs from previous programs in the number and types of analyses performed. Tables 5.0-3 to 5.0-6 summarize data for the year. Tabulated results of these analyses are not included in the annual report. All data tables are available for inspection at the Station or in Corporate Office.

##### 5.1 Gamma Radiation

External radiation dose from onsite sources and noble gases released to the atmosphere was measured using CaSO<sub>4</sub>:Tm thermoluminescent dosimeters (TLDs). A comparison of the TLD results for control stations with onsite and offsite indicator stations is included in Table 5.1-1. The quarterly average external radiation dose for the year was 14.5 mR at the indicator locations and 14.5 at the control locations. TLD results are listed in Table 5.1-1 and locations are shown in Figures 5.0-1 and 5.0-2.

Quarterly average of external radiation dose (including background) at sixteen air sampling locations averaged  $15.0 \pm 1.4$  mR and was similar to levels measured in 1986 (13.5 mR), 1987 (14.1 mR), 1988 (13.4 mR), 1989 (14.5 mR), 1990 (14.6 mR), 1991 (15.8 mR), 1992 (14.7 mR) and 1993 (14.1 mR) and 1994 (14.1 mR). The differences are not statistically significant.

##### 5.2 Airborne I-131 and Particulate Radioactivity

Locations of the air samplers are shown in Figure 5.0-2. Airborne I-131 remained below the LLD of 0.10 pCi/m<sup>3</sup> throughout the year.

Gross beta concentrations ranged from 0.010 to 0.044 pCi/m<sup>3</sup> and averaged 0.022 pCi/m<sup>3</sup> and was similar to overall average levels in 1985 (0.024 pCi/m<sup>3</sup>), 1986 (0.025 pCi/m<sup>3</sup>), except for the period from May 17 through June 7 when it was influenced by the nuclear reactor accident at Chernobyl), 1987 (0.023 pCi/m<sup>3</sup>), 1988 (0.030 pCi/m<sup>3</sup>), 1989 (0.028 pCi/m<sup>3</sup>), 1990 (0.020 pCi/m<sup>3</sup>), 1991 (0.022 pCi/m<sup>3</sup>), 1992 (0.021 pCi/m<sup>3</sup>), 1993 (0.021 pCi/m<sup>3</sup>) and 1994 (0.022 pCi/m<sup>3</sup>).

No radioactivity attributable to station operation was detected in any sample.

##### 5.3 Aquatic Radioactivity

Water samples were collected daily and composited for analysis weekly from the Station's Intake and Discharge Canal. These cooling water samples were analyzed

weekly for gross beta concentrations. Annual mean gross beta concentration in the intake and discharge canal water samples averaged 4.0 and 5.7 pCi/L, respectively. The results were similar to those obtained in 1986 (4.7 and 5.1 pCi/L), 1987 (3.5 and 3.5 pCi/L), 1988 (3.6 and 3.4 pCi/L), 1989 (3.9 and 3.7 pCi/L), 1990 (4.1 and 3.8 pCi/L), 1991 (4.0 and 4.3 pCi/L), 1992 (3.9 and 3.4 pCi/L), 1993 (3.9 and 3.5 pCi/L) and 1994 (3.9 and 5.5 pCi/L).

Composite samples collected weekly from Discharge Canal during the months of March and April showed an increase in gross beta analysis results. A maximum gross beta result of 27.5 pCi/L was seen from the April 6, 1995, sample. The increase in gross beta analyses results was due to an increase in the activity of normal station releases.

Samples were collected weekly from the East Moline Water Works and Davenport Water Works. These samples were composited monthly for each location and analyzed for gamma emitters. All samples analyzed were below the limits of detection for the program indicating no measurable amount of radioactivity was found due to station operation.

Levels of gamma radioactivity in fish were measured and found in all cases to be below the lower limit of detection for the program. One upstream and one downstream sediment sample were analyzed by gamma spectrometry. All gamma-emitters were below the limits of detection indicating that no radioactivity was found due to station operation.

Water, sediment, and fish sample locations are shown in Figure 5.0-3.

#### 5.4 Milk

Milk samples were collected monthly from November through April and weekly from May through October and analyzed for I-131. Sampled locations were the Musal Dairy, located 6.0 miles west southwest of the station, Bill Stanley Farm located 3.0 miles east northeast of the station, and Dean Havill Farm located 9.7 miles southwest of the station.

I-131 remained below the detection limits of 5.0 pCi/L during the non-grazing period (November through April) and 0.5 pCi/L during the grazing period (May through October).

Milk sample locations are shown in Figure 5.0-3.

#### 5.5 Sample Collections

All samples were collected as scheduled except those listed in the Listing of Missed Samples, Appendix III. Sample collection anomalies are also included in the Listing of Missed Samples.

#### 5.6 Listing of Missed Samples

All samples were collected as scheduled except for those listed in Listing of Missed Samples, Appendix III.

## 5.7 Program Modifications

Added Dean Havill Farm (Q-32) for milk sampling during September. The farm went out of business in October. No replacement dairy was found.

## 6.0 ANALYTICAL PROCEDURES

Analytical procedures used for analyzing and reporting radioactivity in environmental samples have remained essentially unchanged. A summary of the procedures is given in Appendix VI of the 1993 Annual Radiological Environmental Operating Report.

## 7.0 MILCH ANIMALS AND NEAREST LIVESTOCK CENSUS

A census of milch animals and nearest livestock was conducted around the station by G. Kreuder. The surveys were conducted on August 28 and 29, 1995.

Milch animal and nearest cattle census results are presented in Appendix IV.

## 8.0 NEAREST RESIDENT CENSUS

A census of the nearest residences within a five (5) mile radius was conducted on August 28 and 29, 1995 by G. Kreuder.

The nearest residence census results are presented in Appendix IV.

## 9.0 INTERLABORATORY COMPARISON PROGRAM RESULTS

Teledyne's Interlaboratory Comparison Program Results are presented in Appendix V.

ComEd's Thermoluminescent Dosimeter (TLD) Program is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) which requires biennial review and evaluation. In addition to the biennial ANSI tested requirement, ComEd also tests to the ANSI standard during the non-NVLAP visitation year. ComEd additionally has an internal irradiation program that tests each of the six nuclear station TLD processors once per quarter. The results of all TLD performance tests are retained by ComEd's Corporate Health Physics Support Department.

## 10.0 ERRATA DATA

In January, 1996, while turnover was being conducted between two computer programmers on the ODCM computer program, 5 of the 6 pathways used in the calculation of organ dose to verify compliance with 10CFR50 dose limits were found to be turned "off". It was determined that these pathways were "off" since January 1, 1994, when the computer program was updated to comply with the revision to 10CFR20. The pathway switches were immediately turned on and the organ doses for 1994 and 1995 were recalculated. Appendix VI contains the corrected organ dose data for 1994.

## EFFLUENT &amp; WASTE DISPOSABLE SEMI-ANNUAL REPORT

LIQUID EFFLUENTS - SUMMATION OF ALL RELEASES

A. FISSION & ACTIVATION GASES	UNIT	THIRD QUARTER	FOURTH QUARTER	Est. Total Error %
1. Total Release (not including tritium, gases & alpha)	Ci	2.53E-03	3.91E-03	5.5
2. Average diluted concentration during batch discharges for the period	$\mu\text{Ci/mL}$	2.50E-10	4.61E-10	
3. Percent of applicable limit*	%	1.25E-03	1.43E-03	
		5.22E-04	7.84E-04	
4. Maximum diluted concentration during batch discharges	$\mu\text{Ci/mL}$	4.47E-10	8.65E-10	
<hr/>				
B. TRITIUM				
1. Total Release	Ci	5.56E00	5.16E00	4.0
2. Average diluted concentration during batch discharges for the period	$\mu\text{Ci/mL}$	5.50E-07	6.08E-07	
3. Percent of applicable limit	%	1.83E-02	2.03E-02	
<hr/>				
C. DISSOLVED & ENTRAINED GASES				
1. Total Release	Ci	3.23E-05	4.49E-04	5.5
2. Average diluted concentration during batch discharges for the period	$\mu\text{Ci/mL}$	3.20E-12	5.29E-11	
3. Percent of applicable limit	%	1.60E-06	2.64E-05	
<hr/>				
D. GROSS ALPHA ACTIVITY				
1. Total Release	Ci	<LLD	<LLD	14.5
2. Average diluted concentration during batch discharges for the period	$\mu\text{Ci/mL}$	<LLD	<LLD	
<hr/>				
E. VOLUME OF WASTE RELEASED (prior to dilution)	Liters	1.31E+06	1.42E+06	
F. VOLUME OF DILUTION WATER USED DURING BATCH DISCHARGES	Liters	1.01E+10	8.49E+09	
G. TOTAL VOLUME OF DILUTION WATER USED DURING PERIOD (quarter)	Liters	3.78E+11	3.60E+11	

\* Whole Body/Organ (ODCM)

of Noble Gases from the Quad Cities Station  
for the period January-December 1995

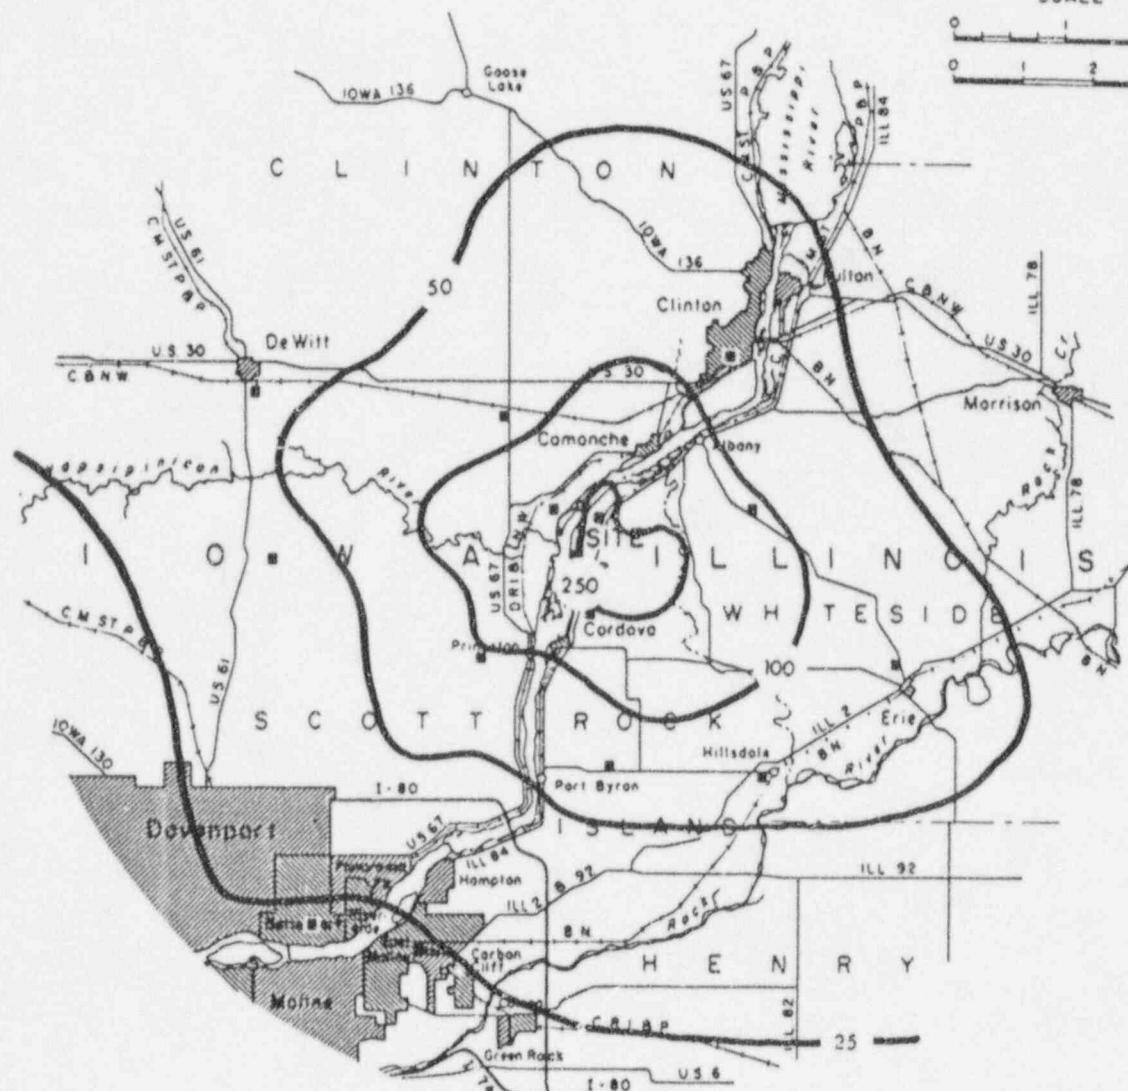

### Isopleth Labels

**Small figure - multiply by  $10^{-3}$**   
**Large figure - multiply by  $10^{-3}$**

**SCALE**

A scale bar with two horizontal lines. The top line has tick marks at 0, 1, and 2, labeled "MILES" to its right. The bottom line has tick marks at 0, 1, 2, and 3, labeled "KM" to its right.

QUAD CITIES STATION

RADIOLOGICAL ENVIRONMENTAL MONITORING PROGRAM, SAMPLE COLLECTION AND ANALYSES

Sample Media	Location		Collection Frequency	Type of Analysis	Frequency of Analysis	Remarks
	Code <sup>a</sup>	Site				
1. Airborne Particulates	Onsite and Near Field		Continuous operation for one week	Gross Beta	Weekly	On all onsite and near field samples.
	Q-01	Onsite No. 1		Gamma isot.		If gross beta in a sample exceeds 5X the average concentration of the preceding calendar quarter for the sample location.
	Q-02	Onsite No. 2				
	Q-03	Onsite No. 3		Gamma isot.	Quarterly	
	Q-04	Nitrin				
	Q-05	Saddle Club Dairy Farm		Filter Exchange	Weekly	On Quarterly composite from each location.
	Q-06	Fairbanks				
	Far Field			Gross Beta	Weekly	
	Q-07 (C)	Clinton	Continuous operation for one week	Gamma isot.		
	Q-08 (C)	Sikkema Farm				See footnote "b."
	Q-09 (C)	Erie				
	Q-10 (C)	Hillsdale		Filter Exchange	Weekly	
	Q-11 (C)	Port Byron				
	Q-12 (C)	Bettendorf				
	Q-13	Princeton				
	Q-14 (C)	Utica Ridge Road				
	Q-15 (C)	DeWitt				
	Q-16	Low Moor				
2. Airborne Iodine	Same as 1.		Continuous operation for two weeks	I-131	Biweekly	On all samples from onsite and near field; for far field samples, see footnote "b."
3. Air Sampling Train	Same as 1.		--	Test and Maintenance	Weekly	On all samplers.

<sup>a</sup> Control (background) locations are denoted by a "C" in this column. All other locations are indicators.

<sup>b</sup> Far-field samples are analyzed when near-field results are inconsistent with previous measurements and radioactivity is confirmed as having its origin in airborne effluents released from the station or at the discretion of the Emergency Preparedness Director.

APPENDIX III  
LISTING OF MISSED SAMPLES

## QUAD CITIES

LISTING OF MISSED SAMPLES

Sample Type <sup>a</sup>	Location	Expected Collection Date	Reason
TLD	Q-202-1	04-01-95	Missing from location.
TLD	Q-301-1	06-03-95	Missing from location.
TLD	Q-06-1	07-29-95	Missing from location.
TLD	Q-204-1	08-05-95	Missing from location.
A	Q-02	09-01-95	No electricity.
A/I	Q-02	09-08-95	No electricity.
A	Q-02	09-15-95	No electricity.
TLD	Q-102-1	10-07-95	Missing from location; replaced telephone pole.
TLD	Q-204-1	10-07-95	Missing from location.
TLD	Q-213-2	10-07-95	Missing from location.
M	Q-32	10-13-95	Went out of business in October, 1995.
TLD	Q-108-2	12-02-95	Missing from location; installed a replacement TLD.

Sampling Variances<sup>b</sup>

A	Q-02	02-17-95	Volume estimated;installed new timer.
A	Q-03	02-17-95	Filter light due to leak in sampling train.
A	Q-04	03-31-95	Volume estimated; installed new timer.
A/I	Q-04	04-07-95	Filter light; no discernible reason for anomaly.
A/I	Q-04	04-21-95	Volume low due to pump malfunction; installed spare pump.
A/I	Q-06	07-14-95	Pump malfunction; deposit on air filter extremely light.
A/I	Q-02	08-25-95	Volume low; no electricity.
A/I	Q-02	09-22-95	Volume low; no electricity.
TLD	Q-203-2	12-02-95	TLD bottle found on ground; reattached bottle to pole.

<sup>a</sup> A/I= Air Particulate (Filter)/Iodine (Cartidge)

<sup>b</sup> Sampling Variances are samples which have not been missed but indicate unusual sample results or factors which contribute to sample anomalies.

APPENDIX IV  
MILCH ANIMALS, NEAREST LIVESTOCK, AND  
NEAREST RESIDENCES CENSUS

## QUAD CITIES

### MILCH ANIMALS CENSUS, 1995

A. There are four dairy farms within a 6.5 mile radius of Quad Cities Station.

B. Sampling Locations

Q-18 Musal Dairy Farm  
6.0 miles @ 240°

Number of cows - 90

Diet consists of: 40% pasture  
60% hay, silage and supplement

Q-32 Dean Havill Farm<sup>a</sup>  
9.7 miles @ 214°

Number of cows - 60

Diet consists of: 10% pasture  
90% hay, silage and supplement

Q-26 Bill Stanley Dairy  
3.5 miles @ 120°

Number of cows - 24

Diet consists of: hay, grain, and supplement

Julie DePauw<sup>a</sup>  
6.3 miles @ 135°

Number of cows - 100

Diet consists of: 10% pasture  
90% chop and feed

Carl Otte<sup>b</sup>  
6.0 miles @ 275°

Number of cows - No Data Available

Diet consists of: No Data Available

<sup>a</sup> Dean Havill Farm was added to the program in September 1995 and went out of business in October 1995.

<sup>b</sup> Non-participating.  
Census conducted by G. Kreuder on August 28 and 29, 1995.

## QUAD CITIES

### NEAREST LIVESTOCK CENSUS, 1995

Nearest livestock of the Quad Cities Station within a 6.5 mile radius.

<u>Sector</u>	<u>Direction</u>	<u>Distance</u>
A	N	2.5 miles
B	NNE	None
C	NE	None
D	ENE	3.0 miles
E	E	3.0 miles
F	ESE	3.1 miles
G	SE	None
H	SSE	3.5 miles
J	S	1.5 miles
K	SSW	None
L	SW	3.5 miles
M	WSW	4.5 miles
N	W	4.5 miles
P	WNW	3.5 miles
Q	NW	4.5 miles
R	NNW	2.3 miles

---

Census conducted by G. Kreuder on August 28 and 29, 1995.

## QUAD CITIES

### NEAREST RESIDENCE CENSUS, 1995

Nearest resident of the Quad Cities Station within a 6.5 mile radius.

<u>Sector</u>	<u>Direction</u>	<u>Distance</u>
A	N	0.5 miles
B	NNE	0.8 miles
C	NE	2.8 miles
D	ENE	1.3 miles
E	E	2.3 miles
F	ESE	3.0 miles
G	SE	2.5 miles
H	SSE	1.0 miles
J	S	0.8 miles
K	SSW	3.0 miles
L	SW	3.0 miles
M	WSW	2.0 miles
N	W	2.3 miles
P	WNW	2.3 miles
Q	NW	2.3 miles
R	NNW	1.8 miles

---

Census conducted by G. Kreuder on August 28 and 29, 1995.

APPENDIX V

INTERLABORATORY COMPARISON PROGRAM RESULTS

Appendix V  
Interlaboratory Comparison Program Results

Teledyne Brown Engineering Environmental Services, Midwest Laboratory (formerly Teledyne Isotopes and Hazelton Environmental Services) has participated in interlaboratory comparison (crosscheck) programs since the formulation of its quality control program in December 1971. These programs are operated by agencies which supply environmental type samples (e.g., milk or water) containing concentrations of radionuclides known to the issuing agency but not to participant laboratories. The purpose of such a program is to provide an independent check on the laboratory's analytical procedures and to alert it to any possible problems.

Participant laboratories measure the concentration of specified radionuclides and report them to the issuing agency. Several months later, the agency reports the known values to the participant laboratories and specifies control limits. Results consistently higher or lower than the known values or outside the control limits indicate a need to check the instruments or procedures used.

The results in Table A-1 were obtained through participation in the environmental sample crosscheck program for milk, water, air filters, and food samples during the current year. This program is conducted by the U.S. Environmental Protection Agency Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, Las Vegas, Nevada.

Table A-2 lists results of the analyses on in-house "spiked" samples.

Table A-3 lists results of the in-house "blank" samples.

Table A-4 lists results of the in-house "duplicate" program.

Out-of-limit results are explained directly below the result.

Table A-1. U.S. Environmental Protection Agency's crosscheck program, comparison of EPA and Teledyne Brown Engineering Environmental Services, Midwest Laboratory results for various sample media<sup>a</sup>.

Table A-1. U.S. Environmental Protection Agency's crosscheck program, comparison of EPA and Teledyne Brown Engineering Environmental Services, Midwest Laboratory results for various sample media<sup>a</sup>.

Lab Code	Sample Type	Date Collected	Analysis	Concentration in pCi/L <sup>b</sup>		
				EPA Result <sup>c</sup> 1s, N=1	Control Limits	TBEESML Results ± 2 Sigma <sup>d</sup>

<sup>a</sup> Results obtained by Teledyne Brown Engineering Environmental Services Midwest Laboratory as a participant in the environmental sample crosscheck program operated by the Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, U.S. Environmental Protection Agency (EPA), Las Vegas, Nevada.

<sup>b</sup> All results are in pCi/L, except for elemental potassium (K) data in milk, which are in mg/L; air filter samples, which are in pCi/Filter; and food products, which are in mg/Kg.

<sup>c</sup> USEPA results are presented as the known values and expected laboratory precision (1s, 1 determination) and control limits as defined by the EPA.

<sup>d</sup> Unless otherwise indicated, the TBEESML results are given as the mean ± 2 standard deviations for three determinations. The numbers after the semi-colon are the Total Propagated Uncertainty of the result.

<sup>a</sup> All results are in pCi/L, except for elemental potassium (K) data in milk, which are in mg/L; air filter samples, which are in pCi/Filter; and food products, which are in mg/Kg.

<sup>b</sup> Control limits are based on the known value ± 10%+TPU (Where all parametric uncertainties, other than counting statistics, are less than 5%).

<sup>c</sup> All samples are the results of single determinations. The result is reported in the following format:  
Activity ± Counting Error ; Total Propagated Uncertainty.

NOTE: For fish, Jello is used for the spike matrix. For vegetation, Sawdust is used for the spike matrix.

Table A-3. In-house "blank" samples.

Lab Code	Sample Type	Sample Date	Analysis	Concentration pCi/L <sup>a</sup>		
				Teledyne Results (4.66 Sigma)		Acceptance Criteria (4.66 Sigma)

<sup>a</sup> All concentrations are reported in pCi/L, except solid samples, which are reported in pCi/g wet. Results are reported as Activity±Counting Error;Total Propagated Uncertainty (TPU).

<sup>b</sup> Lab codes are comprised of the sample media and the sample numbers. Client codes have been eliminated to protect client anonymity.

<sup>c</sup> Acceptance is based on the difference of the two results divided by the pooled standard deviation being less than two, where, the pooled standard deviation is the square root of the sum of the squares of the TPU's.
