On 11/5/84 at 1156 CST and 11/6/84 at 0450, with the plant in Mode 1 at 45% power and 16% power, respectively, air lines supplying the steam generator (S/G) feedwater regulating valves failed which caused Engineered Safety Feature (ES) actuations along with Reactor Trips.

The first event was due to a failure of the air line connection to the feedwater control valve, FCV-530, for S/G 'C.' Upon the loss of air supply, FCV-530 failed closed resulting in a lo-lo level in S/G 'C' which caused a Reactor Trip, Turbine Trip, Feedwater Isolation Signal (FWIS), Auxiliary Feedwater Actuation Signal (AFAS) and S/G Blowdown Isolation Signal (SGBIS).

The second event was due to a failure of the air line to the 'A' feedwater pump recirculation valve FV-2B causing it to fail open and closed then completely open. The resultant feedwater flow oscillations produced a high level in S/G 'C' causing a Turbine Trip, FWIS, AFAS and SGBIS. Due to the FWIS and AFAS, S/G levels began to decrease and at 0454 a lo-lo level on S/G 'D' caused a Reactor Trip.

The air line failures were due to improper material applications and resulting fatigue cracking caused by the vibrations imposed on the air lines during feedwater system operation. Temporary repairs using copper or stainless steel tubing were made and permanent design changes to install additional hangers are being made in accordance with administrative procedures.

This LER is submitted pursuant to 10 CFR 50.73(a)(2)(iv) in regard to two separate cases of service air line failures within the steam generator (S/G) feedwater system resulting in Engineered Safety Feature (ESF) actuations and Reactor Trips. In both instances all ESF actuations responded as designed. A description of these events is as follows:

1. On 11/5/84 at 1156 CST a Reactor Trip occurred when a 10-10 level signal was received on S/G 'C.' The plant was in Mode 1, 45% reactor power, at the time of the incident. The service air line manifold common to the S/G Feedwater Control Valves sheared at the connection which channels the service air supply for S/G 'C' Feedwater Control Valve FCV-530 causing it to fail closed. Approximately 50 seconds after FCV-530 closed a 10-10 level signal on S/G 'C' caused a Reactor Trip accompanied by a Turbine Trip, Feedwater Isolation Signal (FWIS), Auxiliary Feedwater Actuation Signal (AFAS) and Steam Generator Blowdown Isolation Signal (SGBIS).

The service air line was repaired and by 1343 the feedwater isolation valves were reopened, auxiliary feedwater secured and S/G blowdown reinstated. Mode 1 was re-entered at 0318 on 11/6/84.

2. On 11/6/84 at 0450 a high level signal on S/G 'C' resulted in a Turbine Trip, FWIS, AFAS and SGBIS. At 0454 a lo-lo level signal on S/G 'D' caused a Reactor Trip. The plant was in Mode 1, 16% reactor power at the time of the event.

Subsequent investigations revealed that the service air line to Feedwater Recirculation Valve FV-2B had ruptured causing FV-2B to fail in an intermittent fashion initially, which caused the recirculation valve to oscillate and finally to open. The loss of feedwater through FV-2B caused the feedwater control valves to open. Operators also compensated for the lost feedwater flow by increasing the flowrate through the main feedwater pump PAEOIA which was in manual control. The resultant feedwater flow oscillations caused the high level signal on S/G 'C' coducing a Turbine Trip, FWIS, AFAS and SGBIS. Due to the FWIS and AS, S/G levels began to shrink and at 0454 a lo-lo level on S/G 'D' caused a Reactor Trip.

Both air line failures were due to improper material application which resulted in fatigue cracking caused by the vibration imposed on the air lines during feedwater system operation. To prevent future failures the following changes are being incorporated as indicated below:

 The bypass tubing nipples previously installed on the air line manifold to the feedwater control valves have been replaced with copper tubing.

U.S. NUCLEAR REGULATORY COMMISSIO LICENSEE EVENT REPORT (LER) TEXT CONTINUATION APPROVED OMB NO 3150-0104 EXPIRES 8/31/86 DOCKET NUMBER (2) FACILITY NAME (1) LER NUMBER (6) PAGE 3 SEQUENTIAL Callaway Plant Unit 1 0 |5 |0 |0 |0 |4 | 8 | 3 |8 |4 - 01519 010 0 1 3 0 0 0 13

TEXT /// more space is required, use additional MRC Form JBSA's) (17)

- 2. Stainless steel tubing has been installed from the air line manifold to the feedwater control valve I/P converters.
- 3. A design change is being evaluated which would add a support to the air line upscream of the manifold for the feedwater control valves. This evaluation is expected to be complete by 2/15/85.
- 4. Temporary modifications have been installed for hangers and flexible air lines for the feedwater recirculation valves. A design change has been submitted to make these modifications permanent. An evaluation should be complete by 2/15/85.

No radiation was released and at no time was the health and safety of the public degraded as a result of these incidents.

Previous occurrences: none
