Director of Nuclear Reactor Regulation Attention: Mr. G. W. Knighton, Chief Licensing Branch No. 3 Division of Licensing U.S. Nuclear Regulatory Commission Washington, D.C. 20555

Dear Mr. Knighton:

Subject: Waterford 3 SES Docket No. 50-382 License No. NPF-38 INITIAL TEST PROGRAM

Reference: Waterford 3 FSAR, Chapter 14

This submittal is made in accordance with 10 CFR 50,59(b) and the license condition in Section 2.C.10 of the subject license. Reported herewith is a change made to the Waterford 3 Initial Test Program, as described in reference 1, as amended through Amendment No. 36.

The attached marked-up pages 14.2-129 (Amendment 34) and 3.9-109 (Table 3.9-19 Amendment 14) of the Waterford 3 FSAR reflects the change made for test subsection 14.2.12.3.17, Piping Thermal Growth, Vibration, and Shock. A satisfactory evaluation of piping stresses in main steam piping after the revised test will be acceptable instead of an actual instrumented level 4, transient monitoring of the main steam system during turbine trip from 100% power.

The vibration testing consists of a visual inspection of the supports/ restraints on the main steam piping after turbine trip from 85% power and a conservative evaluation of the piping stresses using the results of the visual inspection. The evaluation of the results of the visual inspection will also determine if admitional transient vibration monitoring of the main steam line is required. An additional transient vibration monitoring of the steam line will be performed if required.

This change to the initial test program does not involve a change in the license technical specifications or an unreviewed safety question. LP&L has conducted and documented the required 10 CFR 50,59 safety evaluation.

8507310102 850729 PDR ADOCK 05000382

Mr. G. W. Knighton W3P85-1441 Page 2

LP&L will provide the FSAR change in accordance with 10 CFR 50.71(e) requirements. The original plus 39 copies of this report transmittal are provided in accordance with 10 CFR 50.59(b).

Very truly yours,

Zw Cook

K.W. Cook Nuclear Support & Licensing Manager

14	12.3.17 PIPINC THERMAL GROWTH, VIERATION, AND SHOCK	34
14	12.3.17.1 Objectives	1
To ba vil	monstrate that the essential Nuclear Stear Supply System (NSSS) and ce of plant components meet acceptable limits for thermal expansion, tion, and dynamic response in accordance with design parameters during y-state and transient conditions.*	15 8
14	12.3.17.2 Prerequisites	34
Α.	Construction activities on the systems to be tested are complete.	18
B.	Temporary instrumentation is installed where required.	15
c.	Easeline positions and alignment are recorded.	
D.	Preservice inspection of the snubbers identified in the Technical Specifications (Chapter 16, Section 3/4.7.9) has been completed within 6 months of the start of the individual system preoperational tests.	18
14	12.3.17.3 Test Method	34
Α.	Expansion will be monitored during plant heatups, cooldowns, and operation at various power levels.	8
В.	Piping vibration will be monitored during steady-state and transient operation.	
C. D.	Demonstrate that the dynamic response during transient operation meets design parameters. For Main steam giping it will be demonstrated as per Table 3.9-19. On original system heatup and cooldown, verify snubber operability by comparing actual and expected thermal movement at specified temperature intervals. Also verify by observation and/or measure-	15
E.	For systems that do not attain design operating temperature, verify by observation and/or calculation that the snubbers will accommodate the predicted thermal movement. LP&L W-3 RECORDS	
L	NCONTROLLED COPY	
*	additional restraints are installed as a result of the preoperational ing test, the NRC will be advised of the change. In addition, any ess analysis required to verify the change will be maintained on a for NRC review.	34 8
