3	NRC/TUGCO MEETING
4	* * * * * * * * * * * * * * * * * * * *
5	APPEARANCES:
6	NRC: TUGCO:
7	Larry Chandler John W. Beck Robert Bosnak John Marshal Larry Shao Fred Madden
9	Jose Calvo Angelos Marinos CASE:
10	Jim Milhoan Jerry Lee Ellis Charlie Trammell Dr. David H. Boltz
11	TENERA CORPORATION.
12	John Guilbert Jim Mollonson
13	STONE AND WEBSTER:
14	John Hansel Ed Siskin
15	Cris Mortgat Martin Jones
16	*************************
17	MEETING HELD before Jayne Ames, a CSR, and Notary Public, in
18	Tarrant County for the State of Texas, on the 14th day of June,
19	1985, beginning at 8:00 a.m., at the Sheraton Hotel, 1500 Stadium
21	Drive East, Arlington, Texas.
22	
23	
24	
25	

	3
1	SECOND DAY
2	
3	June 14, 1985
4	
5	PROCEEDINGS
6	MR. NOONAN: We would like to go ahead and start
7	this meeting this morning. This is the second day of
8	the utilities presentation to the NRC on the program.
9	And I don't have any comments, other than people please
10	speak up when they identify themselves, so the recorder
11	can write down their names and so forth. With that,
12	I'll turn it over to you, John.
13	MR. BECK: Thank you, Vince. If I could have the
14	first slide, give you an outline of what we're going to
15	be covering today in the presentation on the design
16	adequacy program. We will have an intro that will give
17	a good solid background and outline the program
18	structure and the organization.
19	We're going to spend a considerable amount of time
20	on methodology so that it's clear the approach that's
21	being taken in all the areas. I guarantee that we will
22	get to the bottom line of understanding and dealing with
23	root cause and generic implications, whether they may
24	lie or whether they may lead us.
25	And we're going to spend probably haif the

presentation in that neighborhood talking about the specific discipline reviews that will give a demonstration clearly of how the methodologies apply.

1

2

3

25

4

Howard Levin is going to be the chief spokesman.
He will be assisted by others who will be introduced
later. Howard, as you recall from our discussions
yesterday, has been a review team leader to date on the
issues, specific TRT questions, several structural and
mechanical.

When in February we adopted the policy of covering all outstanding issues under the CPRT umbrella for the Comanche Peak project, the SRT, at Mr. Spence's direction, with regard to undertaking those tasks, shows Howard Levin the head of the design adequacy effort. That effort has been under development and evolving since that time.

17 For those who aren't familiar with Howard 18 background. Howard has an MS in structural engineering 19 and a BS in civil from Massachusetts Institute of 20 Technology. He's got over 13 years of total engineering 21 experience, 11 of which are in nuclear power. Architect 22 engineer with the NRC staff, and 4 years in the 23 consulting business, focusing primarily on construction 24 and design verification.

Howard's a vice president with the Tenera Division

	5
1	of Tenera Corporation Nuclear Subsidiary. And without
2	further ado, Howard, the mike is yours, and it's going
3	to be a nice long day, I'm sure.
4	MR. SHAO: I have one question here.
5	MR. BECK: I'm glad to hear, Larry, there's only
6	going to be one today. But now is a good time to start.
7	MR. SHAO: Yeah. On the discipline that's
8	involved, you have mechanical assistant, electrical,
9	RNC , piping and supports, civil, structural. But I
10	don't see any of the mechanical components like pumps
11	and valves. Is that an oversight here or
12	MR. BECK: It's not an oversight. It's included.
13	And Howard will get to it later this afternoon. And
14	there are going to be lots of pumps and valves involved.
15	MR. SHAO: But it's included?
16	MR. BECK: Yes, sir.
17	MR. LEVIN: It's in the
18	MR. SHAO: Including systems and components?
19	MR. LEVIN: That's correct.
20	MR. SHAO: Okay.
21	MR. LEVIN: Okay. As John has indicated, our
22	presentation today is segmented to three sections. The
23	first being introduction, and I will be running through
24	that.
25	In this portion of the presentation, I'd like to
	GODEREY & AMES COUPT REPORTING

Metro 469-6100, (817) 460-2048

present some background on the evolution of events that
 brought us here and has led to the creation of the
 design adequacy program.

6

4 The charge that John referred to by Texas Utilities Management in terms of our goals and objectives, and 5 given these responsibilities, how we are prepared to 6 execute. In the process I plan to briefly identify the 7 issues and their sources, the functional elements of our 8 program that will direct -- that will be responsive to 9 these issues, our organization personnel and the roles 10 11 of our people and the project.

12 Okay. As many of you are aware, issues have been raised by various external sources that are design 13 related. The source of these issues include the 14 15 independent assessment program; the NRC ASOB licensing proceedings; the NRC's staff's licensing review itself, 16 17 including the TRT work; SIT; and SSER 's, as well as the NRC inspection program, which includes Region 4 18 19 activities and CAT.

As mentioned, in view of these outstanding issues,
TUGCO has charged the CPRT with responsibility for
development and implementation of a program that will
address and resolve all identified issues.
However, for enhanced confidence, TUGCO has
expanded that charge to include responsibility for

7 1 insuring that there are no undetected safety issues. 2 MR. CHANDLER: Howard, let me may at this point ask 3 you. This is Larry Chandler. You used the word 4 "resolved", while ago, identified issues. Could you 5 define how you're using the term "resolve"? 6 MR. LEVIN: By resolved -- I really have to address 7 that in two segments. We have responsibility for 8 capturing the issues, reviewing them, assessing their 9 significance. And where issues are identified, that in 10 particular, that may have safety significance, or where 11 there may be deviations from commitments. We have a 12 responsibility to bring those to the attention of TUGCO. 13 And oftentimes, particularly if there are 14 deficiencies, some corrective action may be required. 15 So the resolution, is a processing that oftentimes 16 includes our identification of an issue and definition 17 of an issue. But when it comes to corrective action. 18 the total course of resolution will undoubtedly, through 19 effort on the part of TUGCO, and in many cases, as you 20 will be evident through our presentation, you will see 21 how we will be involved in the verification of that 22 resolution where they have responsibilities. 23 MR. CHANDLER: If a corrective action is taken on 24 the basis of one of your recommendations, do you then 25 follow-up on the same issue, or is that still left with

1	the project?
2	MR. BECK: Larry, if I can say my piece on that
3	issue. It's a responsibility of CPRT, as Howard said,
4	to identify, and in cases of where necessary, recommend
5	resolution of an issue.
6	The responsibility for execution of the
7	resolution, if you will, is clearly that of the owner,
8	TUGCO. It's the further responsibility of CPRT to
9	agree that that resolution will in fact resolve the
10	question. So it's a matter of identification, passage
11	of that recommendation through the SRT and TUGCO
12	management, to see that it happens.
13	MR. CHANDLER: Does the CPRT though, then go back,
14	after corrective action has been taken, to, in a sense,
15	verify that that action recommended has been properly
16	implemented?
17	MR. BECK: The program, as it's set up right now,
18	does not include a an audit of implementation by
19	CPRT per se, but it will be very clear what their
20	resolution path is. It will also be very clear that
21	TUGCO has that responsibility. It's a process that
22	takes place exactly as I have described it.
23	Obviously, CPRT is not in the implementation of the
24	corrective direction.
25	MR. CHANDLER: That helps.

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

9 MR. LEVIN: The goal of the design adequacy program 1 is to provide reasonable assurance that safety 2 3 significant design deficiencies have been detected and 4 resolved. 5 And with this goal, I think we all may ask the question, you know, just what about the unknown? I 6 7 personally consider this to be the most important 8 challenge before us in terms of meeting that goal. 9 And we have developed, and you will have some 10 understanding of our program that will in fact address. not only those issues that are on the table, but those 11

12 issues that we may not know about today.

I guess it's conceptually easier to deal with issues on the table. I think in all cases, that I'm aware of, engineering solutions are available.

MR. BOSNAK: Howard. This is Bob Bosnak, NRC.
Yesterday we spent, I don't know if you heard, we spent
quite a bit of time discussing licensing commitments and
their rcle, visavis safety significance. And I would
hope that this would include the licensing commitments.

If they to have to be revised, that would be part of their goal, to include those and seek resolution with the staff.

24 HR. LEVIN: I'll be getting into that in a moment.
25 We have some objectives that might serve support -- that

1	support this goal, and we'll be getting directly into
2	that. I agree, Bob. Your point is well taken.
3	MR. CHANDLER: Howard, I'm sorry. Before you move
4	on, I asked both John Beck and John Hansen, yesterday,
5	for their definition of the term safety significance.
6	Could you tell me how you have defined the term for your
7	purposes?
8	MR. LEVIN: Okay. I'll give you yeah, an
9	engineer's definition of that. And fundamentally what
10	we're talking about is the ability of a system or
11	component or structure to meet its intended safety
12	function.
13	MR. CHANDLER: All right.
14	MR. LEVIN: Just for Bob's question, I address
15	issues that are on the table, and in fact that, there is
16	a road map for addressing those. And engineering
17	solutions are available, and you will hear some of the
18	initiatives that are associated with that.
19	But getting back to the question of unknown for a
20	moment, the initiatives that are required to address
21	that question, require a combination of both
22	exploratory, and sometimes investigative type of work.
23	And as part of this presentation, you will be nearing
24	about a particular functional element of our program
25	that will help address that question.

MR. CALVO: Excuse me. I thought yesterday was our perception that the goal for the construction adequacy review and the <u>senate</u> adequacy review was, when you finished with it, you had reasonable assurance that you had quality in the design and quality in the construction.

11

7 And you may be trying to say that in here, but it 8 doesn't quite come through with your goal. You could 9 have found safety significance deficiencies. But 10 suppose you had not found anything, and everything is .11 all right, you still have got to reach that conclusion, 12 that you have the same quality in Comanche Peak as in 13 the electrical station; is that correct? Is this what 14 you have in mind?

MR. LEVIN: Absolutely.

15

MR. CALVO: It doesn't come through, then, in that. MR. MILHOAN: Jim Milhoan. Your definition of safety significance about a system being unable to perform its safety function is a rather high threshold. Are you considering failure of components to perform their safety function?

22 MR. LEVIN: Absolutely, Jim. If it didn't come 23 across, I really prefer to the ability of systems, 24 components, or structures. So it's not such a broad 25 definition.

1 For example, it's not one that includes 2 consideration of -- for example, let's say there is a 3 deficiency in one train that may make that train 4 unavailable. We're not going to rely on the other train 5 or a diverse system, okay, as part of that definition. 6 Okay. So it gets down to a much more local level, to 7 the component level, in some cases, where that's 8 important.

12

9 MR. MILHOAN: While you're concentrating on 10 hardware, and I agree with your statements there, 11 there's also programmatic deficiencies, such as failure 12 to implement FSAR commitments, or figure to update --13 maintain and update an FSAR. Will that be included in 14 the safety significant category, or how are you 15 resolving the programmatic issues as related to safety 16 significance?

17 MR. LEVIN: Basically, we'll be getting into this 18 in a moment, but there are three segments to our 19 program. One of which is our programmatic and generic 20 implications evaluation. And it's a one of three 21 principal elements in the program, and I will ce 22 addressing that in some detail. Okay. 23 Our goal has led to the development of a list of 24 objectives. As I alluded to earlier, when we were in

25 the development phase of our program, there were clearly

	13
1	two aspects that we had to address. One, our program
2	had to address all external source identified issues.
3	And, two, it had to be developed in such a way that we
4	had reasonable assurance of detecting significant issues
5	that are presently unidentified.
6	Importantly, our program required the investigation
7	of root cause of safety significant deficiencies, as
8	well as generic implications that Jim Milhoan just
9	alluded to.
10	Bob, the point you brought up, the program also
11	includes an assessment, the compliance to licensing
12	commitments.
13	Getting back to safety significance again, we
14	indicate here, we will assess it. That is, its the
15	ability of systems, components, and structures to meet
16	their performance requirements.
17	And we will be looking from the standpoint of
18	deviation from commitments and deviations that may be
19	identified with respect to existing issues. And others
20	that may be identified during the course of the program.
21	It goes without saying that any significant
22	deficiencies will be corrected. That's an objective.
23	However, we will also trend deviations from
24	licensings commitments. And we will be describing how
25	we're going to do that. A deviation means something

1 less significant than a deficiency.

2	And this really gets back to how we plan to do our
3	business. But it will be evident that we plan to
4	address many of these issues in an integrated manner and
5	try to understand the meaning of the issues as a whole.
6	I mentioned that there are three functional
7	elements to the program. The first being the external
8	source issues, evaluation and resolution. Those are the
9	issues that are derived from the sources that I
10	mentioned earlier.
11	Secondly, self-initiated evaluation, which is very
12	analgous to John Hansel's discussion in the construction
13	program, where the emphasis of that program is
14	addressing some of these potentially unknown issues, as
15	well as providing additional confidence.
16	And lastly, the root cause and generic implications
17	programs. Now we have structured our program along
18	discipline lines, because we're going to be drawing
19	conclusions on that basis. And with any of these
20	disciplines, there are these three functional elements.
21	MR. NOONAN: Howard, I have got to ask you a
22	question first. One thing, we were talking about the
23	external sources, and I didn't near a word said about
24	the CYGNA language, what all CYGNA has done.
25	MR. LEVIN: I referred to the independent

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2046

	12
1	assessment program. Yeah. But it certainly includes
2	that work.
3	MR. NOONAN: I guess my question is, this CYGNA has
4	done four phases, what's known as the four phases. When
5	do you expect to receive the fourth phase and put this
6	in the program?
7	MR. LEVIN: Okay. I will have to defer the timing
8	aspect of your question to John. But I will state
9	categorically that a significant amount of information
10	has been folded into this program, okay, in the way of
11	generic issues that they have identified, and through
12	letters, as well as their open issues lists.
13	And also information that's been communicated to
14	us. For example, our meeting in San Francisco sometime
15	back. So that information has been captured and has led
16	to the development of certain technical aspects of the
17	program.
18	MR. NOONAN: Before you answer, let me address my
19	question again. CYGNA has, I said before, done phases.
20	When you're done with all that, is CYGNA going to be
21	afforded the opportunity to see whether or not parts
22	that they have identified and implemented, will they be
23	involved in that process?
24	MR. BECK: The answer is yes. As I indicated
25	yesterday, any issue CYGNA as raised that is unresolved

1 in their mind will be resolved by the CPRT effort. We 2 are going to provide CYGNA -- they have -- let me back 3 up a little bit.

We asked them a couple of months ago to please provide us, in lieu of the fourth phase final report, which they're not prepared produce at that time, a listing of all concerns that they have identified throughout all phases of their effort, which they did.

9 That list of concerns and identified findings has 10 been gone over with a fine toothed comb by the design 11 adequacy following under CPRT, and factored into the 12 program plan.

We're going to provide shortly, after publication and distribution of the program plan, a road map snowing where each CYGNA identified issue is treated within the program plan and the specific action plans.

And we have asked CYGNA to iterate with the CPHT on the identified resolution path, and to satisfy themselves that the resolution we have identified will resolve any of the issues they put on the table. So in that context, we will have treated everything that's come from that program.

23 MR. NOONAN: Has CYGNA given you a date when they 24 will present this?

25

MR. BECK: To publish their fourth phase report?

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2046

17 1 think it will be only appropriate that they hold off 2 publication until they have looked at our program plan. 3 and we have gone through this reiteration. So it will 4 stand as a complete document. 5 MR. SHAO: Will CYGNA give you the root causes of 6 the problems they --7 MR. BECK: CYGNA will have made some comments about 8 root cause of the problem. But we in CPRT are not 9 relying on CYGNA's effort in that respect. 10 We're going to do our own root cause and generic 11 implications evaluation, and treat every one of the 12 CYGNA issues within that overall context. It would be 13 premature for us to rely on root cause identification by 14 CYGNA, simply because of the scope of the effort that 15 they did. I certainly won't ignore anything that they 16 might --17 MR. NOONAN: Not necessarily my point. But it 18 would probably be helpful if they had indication of root 19 cause, if they could identify them. 20 MR. BECK: Sure. 21 MR. MOLLONSON: My name is Jim Mollonson. I'm with 22 Teladyne. Back to your objective. I don't find any 23 records to what the quality assurance aspect, either the 24 identification of the quality assurance criteria, or 25 compliance with QA requirements.

18 1 I realize that can be picked up in the root cause 2 of the defect, but I would suggest that the quality assurance aspects of your review would be added to the 3 4 objectives. 5 Now, if you address this somewhere else in the 6 program, it may be more appropriate someplace else in 7 the program, but that certainly is one objectives we 8 view. 9 MR. LEVIN: Okay. You are correct in identifying 10 that it's through the root cause and generic 11 implications aspect of our program that, if there are 12 programs, whether they be quality programs or whatever, 13 that recommendations from approval of those programs 14 would involve that activity. 15 MR. MILHOAN: Howard, I was assuming when you were 16 talking about licensing commitments, you were not only 17 talking about on your previous slide about trending 18 deviations from licensing commitments, not only are 19 hardware commitments, but the commitments of the quality 20 assurance program to implementation of the ANSI 45.2.11 21 standard of QA requirements for design. 22 In other words, the trending, for example, of 23 documentation of engineering judgment or the lack of 24 documentation of engineering judgments, that type of 25 commitments would be trended also.

MR. LEVIN: That's correct. Okay. If we can get
 back to these elements from our program, now will be
 configured from an organization point of view to
 execute. This is a slide of our organizational chart,
 and I'd like to identify the key components and
 individuals that are assisting me.

19

7 The first is Frank Dougherty, who is serving in the 8 capacity as design adequacy manager. And Frank has a MS 9 in nuclear engineering and 16 years of nuclear power 10 industry experience. Twenty years with an AE and design 11 consultant experience. He's a past member of AS 50 12 Gyphene. Currently a member of ANS 3 on reactor 13 operations.

Frank was involved managing in the design aspects of the review in the Midland independent design and construction verification program. And ne brings with him a significant amount of experience in design, as well as design control.

19 Serving in the position of construction quality 20 interface manager is Dr. John Honecamp. John's 21 responsibilities include interfacing with the 22 construction aspects of the CPRT program. That 23 interface being with the work that John Hansel is 24 doing. It's an on site interface.

25

Principal responsibilities include interfacin; with

1 the site safety evaluation group; work where that group 2 is working under John Hansel in evaluating construction 3 deficiencies that he may uncover.

4 And in view of the fact that those deficiencies 5 need to be evaluated from the standpoint of design 6 implications, a very strong interface is required. And 7 John Honecamp is responsible for insuring that that 8 information gets back to the design adequacy team such 9 that the collective significance of that can be included 10 in an integrated sense with everything else that evolves 11 from the program.

John has a PhD. in chemical engineering, and over 13 25 years of engineering experience. He has 9 years of 14 experience in fuel and design startup operations, 11 in 15 nuclear reactor research and development, 5 years with 16 the utility. And in that capacity was deeply involved 17 in the design and construction verification of the 18 recent -- recently licensed facility.

And in the past two years, has been in the consulting world, participating in management and technical assessmentments that are much like the one we nave here.

23 MR. BOSNAK: Howard, will ne have any role in root
24 cause, or will that be in one of the other blocks?
25 MR. LEVIN: Okay. We -- I was about ready to get

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 to the individual that has that responsibility. As far 2 as root cause, Bob, that's -- everyone has that 3 responsibility. I want to say that that is -- that 4 extends throughout the program.

However, okay, there is a focus in dealing with that. And that comes in our programmatic engineering mplications program. We have a manager for that program. So it's really -- that focus occurs in that box. And that box is led by Ed Blackwood, whom I'm about to introduce.

11 MR. BOSNAK: I wondered whether or not that did 12 include root cause. That's wny I put a question mark by 13 that box. But yesterday when we talked with John 14 Hansel, there was the interface with QA and design, and 15 somehow or other I nope we're going to cover that 16 interface, where we can determine how root cause is 17 going to be here.

18 MR. LEVIN: Root cause is something that by 19 necessity -- see, the generic implications program was 20 created to provide an umbrella, okay. And oftentimes the root cause has a very important input into assessing 21 the generic implications of a problem. But root cause 22 23 oftentimes gets down to a very, very technical level. 24 okay. And it's best dealt with, okay, by the people 25 that are doing those evaluations, okay.

> GODFREY & AMES COURT REPORTING Metro 469-6100, (617) 460-2046

The focus for insuring that those root causes don't
 have generic implications and going through that is a
 systematic way, okay, is provided in this one element on
 the program.

22

5 MR. BOSNAK: But root cause may also be very 6 generic and very sweeping across the whole --

7 MR. LEVIN: And that's why there's a focus for
8 bringing all these various locals into one place.

9 MR. SHAO: Howard. Yesterday, when John Hansen 10 made a presentation, I didn't see in a lot of so-called 11 concrete QA/QC problems. They are identified in our 12 SSER, and John Hansen said it will be handled by Howard 13 Levin on the so-called structure QA/QC. But I don't see 14 any organization here to handle this compound.

MR. LEVIN: Okay. That actually -- Larry -- the -as I indicated, one interface in my description of the role that John Honecamp had with the construction quality interface. That's one interface with John Hansel. I described that role.

Another very important interface is one. And the second principal interface with him is through the programmatic and generic implications. And that coordinator, Ed Blackwood, has responsibility for cutting across our -- the responsibilities of review team leaders, okay. And most importantly into John.

	23
1	And particularly where there are QA or QC implications
2	of what we found. So it occurs in two locations.
. 3	MR. SHAO: But who would do the structure QA/QC,
4	you or John?
5	MR. LEVIN: It both. We have structural
6	reviewers that are involved dealing with issues in some
7	cases, and in other cases doing the self-initiated
8	reviews, okay, which are more. We'll get to that in a
9	moment.
10	But there are more design verifications oriented in
11	an additional sense with going forward and reviewing
12	selected areas.
13	And if through their activities, okay, there are
14	root causes identified or not identified, but suspected,
15	and there is a need for further evaluation in the
16	program or process, that gets communicated to John. And
17	John has a responsibility for evaluation of those
18	problems.
19	MR. SHAO: But right after John's view, doesn't
20	have any structure QA/QC.
21	MR. HANSEL: Do you want me to address that? John
22	Hansel, CPRT. We will investigate all GA/QC issues
23	regardless of where they're at, Larry. Several
24	structural, mechanical, electrical, INC. We have not
25	broken them down, specifically, by those disciplines.

Anything that we have that indicates a concern or an issue of QA/QC regardless of where it comes from, which discipline, we will investigate. Now we may find some issues in our reviews.

Howard's people and his teams may well also identify concerns and issues that looks like it's a process problem, a procedure problem, a craft problem, inspector problem, and they will send those to me and I will look at it from a QA/QC standpoint. However, make certain that the design process is proper.

MR. LEVIN: And the principal flow point, John, to you, is through this generic implications box. And Ed Blackwood has that responsibility for -- it's assuring that that's a very stong --

MR. NOONAN: Let me pick up on this. We will have a lot of questions about QA and on who is doing what. There's three areas that we need to make sure we fully understand.

19 The interface with John Hansel. The Stone and 20 Webster, how that interface because -- both my 21 viewpoints, both the Hansel work and the Stone and 22 Webster work, their starting points have to be correct. 23 It seems to me you're the one that's going to determine 24 that; is that correct? Is the design -- an I in effect 25 drawing whatever the program is?

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2045

1	So those starting points have to be corrected	
2	Seems to me you have to be out in front. Is that	the
3	way it's going? I'm just basing questions.	
4	But yesterday there was a lot of questions on	tne
5	QA, who is looking at QA, and I think they're stil	
6	doing it today.	
7	MR. LEVIN: Clearly, Vince, you're correct in	
8	observing that what where John starts and where	I
9	end, so to speak, they have to be reconciled. I d	on't
10	think that's a necessary impediment to initiate th	e
11	program and find reasons.	
12	Fundamentally, what I'm trying to do is verif	y the
13	adequacy of the design outputs. And those outputs	are,
14	typically, in the form of drawings and specificati	ons.
15	On the other hand, John takes those drawings	and
16	specifications and is attempting to determine whet	ner
17	or not the plant was constructed in accordance with	n
18	those.	
19	So we can start our evaluation. Now if somet	ning
20	changes in the design, it goes without saying, that	5
21	where and that's useful in assessing, you know,	how
22	well the project did in, let's say, constructing to	0
23	those drawings, or how well they did in arriving an	
24	those drawings.	
25	However, in terms of final design adequacy, i	

1	something changes, a drawing, something part of the	
2	evaluation is modified to a drawing change, or	
3	specification change occurs, obviously, and often times	
4	that occurs, or may be some modifications associated	
5	with that to bring the constructed facility in	
6	conformance, then John is going to have to verify that,	
7	in fact, those are congruent. But I don't think it's a	
8	necessary impediment, logistically, in starting the	
9	program.	
10	MR. CHANDLER: So if I understand the interface	
11	here, if you're tracking a design problem which has	
12	construction implications, that moves over to John.	
13	Likewise, if John is doing something which	
14	identifies a construction problem, it's moved over to	
15	you, to the design side, so that the process doesn't get	
16	lost. You would also pick up on the design potential	
17	question, anyway, to assure that, or to determine	
18	whether, there was a design associated problem that led	
19	to the construction problem that he's identified.	
20	MR. LEVIN: That's absolutely correct, Larry. And	
21	I will be showing you some of the logic for that.	
22	MR. MARINOS: Howard, am I understanding that your	
23	individual reviewers will have dual responsibilities?	
24	Namely, they will ascertain the quality of the design.	
25	And at the same time, keeping track of the quality	

26

	27
1	assurance or the design process that is used in order to
2	decide whether the process is correct?
3	It is one thing to determine that the final product.
4	is correct. And another one to decide whether the
5	process used was the appropriate process. So how are
6	you going to determine two of both of those elements
7	in the in your detailed review?
8	MR. LEVIN: Okay. The most important problem is
9	verifying the quality of the end products of that
10	process. But it's also important that if those
11	processes or programs had witnesses, that they be
12	corrected, with regard to ongoing processes, okay. And
13	it's the way we will determine that is through the
14	generic implications evaluation process that I will be
15	describing. So if we could get back to that.
16	MR. MARINOS: What my question is, is this
17	individual, will be in charge with the responsibility to
18	flag that there is a design process problem in spite of
19	the fact that the product is correct?
20	MR. LEVIN: Absolutely.
21	MR. MARINOS: So this man that you have assigned in
22	a particular area, he will be qualified to do both? An
23	engineer does not necessarily have both capabilities, or
24	is mindful of, or assess the same significance to
25	quality.

1 MR. LEVIN: The way it occurs, that engineers 2 within their discipline, okay, will be identifying those 3 potential witnesses. But -- and where there seems to be 4 something, you know, a systematic problem, possibly, 5 okay, that will be getting evaluated, you know, in the 6 generic implications thing. 7 But where there is a need to review a specific 8 program from the standpoint of looking at it on paper 9 and selecting implementation, okay, that is the 10 responsibility of John Hansen. When those needs are 11 identified, their request is sent for him to get 12 involved. 13 MR. MARINOS: Well, the individual reviewer will be 14 totally familiar with the N-45 211 process. 15 MR. LEVIN: Absolutely. And I will be describing 16 our methodology which parallels that process 100 17 percent. 18 MR. MARINOS: Parallels it through another process? MR. LEVIN: Through the 211 process. 19 20 MR. MARINOS: Other individuals will follow that 21 process, you say? 22 MR. LEVIN: That's in the program. If I could get 23 back --24 MR. CALVO: My turn. The foundation of the 25 construction adequacy review, the whole thing that

28

	29
1	depends on this population by the to population
2	areas. And then we're going to select some sample
3	populations, and we're going to apply to each population
4	different attributes.
5	You haven't quite yet got to the foundation of your
6	program. But I'm looking at the interface from your
7	program with that foundation. You're going to be
8	designed review and you also have some walkdowns.
9	How you decided adequacy review? How your
10	walkdowns, when you get into the construction? Somehow
11	is it going to interface with the concept of population
12	areas on the plant. Are you going to be a
13	coincidence that the same walkdowns you had, it may
14	affect certain areas, certain systems, that you
15	selected? Or will the systems that slow out the
16	shutdown systems? How are you going to interface with
17	the, say, construction adequacy review? Will you review
18	the interfaces?
19	MR. LEVIN: Okay. In several cases we anticipate
20	that those walkdowns may be done with teams that include
21	both quality people as well as engineering. I think
22	it's important to differentiate the fact that John is
23	looking for something a little bit different than what
24	we're looking for.
25	MR. CALVO: Are you going to take credit for

	30
1	something John has done, or are you going to go
2	independent with what John has done? Suppose John
3	selected a population on a certain system? You can
4	confer, if you want to.
5	MR. LEVIN: I'm sorry?
6	MR. CALVO: Suppose you go whatever system you
7	select, whatever task you selected, and you come back to
8	the construction to the walkdown, and you found out that
9	John Hansel already covered that area, are you going to
10	cover it too, or are you going to pick up a different
11	area?
12	If you don't know the answer, you can think about
13	it. But it I think it's an important interface.
14	There should be some way to address it.
15	MR. LEVIN: Jose, the answer varies from time to
16	time. It largely they're independent, and it gets
17	back to the fact that I am trying to confirm, okay, the
18	adequacy of the design as reflected on drawings and
19	specs. Okay. That's my goal.
20	And Jonn is starting from there. Oftentimes when
21	it is done together, it's because of efficiency in
22	execution. And there that may be a principal reason
23	from time to time.
24	MR. CALVO: Yean. But it can have advantage and
25	disadvantages. If Jonn Hansen does something and finds

	21
1	everything okay, and you go back and do something else,
2	and still find something wrong, you have got to
3	reconcile the difference, or you say, "I don't have to
4	do this in the walkdown, because John Hansen has done
5	it. Therefore he did the same thing I was going to do
6	anyway," and take credit.
7	Or you say, "I don't care what John Hansen has
8	done. I'm going to do anything else irregardless of
9	what he's done."
10	MR. LEVIN: John we're doing different things,
11	okay. I differentiate between a QC or QC inspection,
12	okay, in an engineering walkdown.
13	A QC inspection, okay, goes out with the predefined
14	set of attributes that and criteria for an
15	inspection.
16	Oftentimes, it's a black/white kind of process.
17	okay. It is either in conformance or it is not, and
18	that's indicated in that inspection process.
19	On the other hand, when we do engineering
20	walkdowns, we're looking for something a little bit
21	different, okay. Principal differences, the engineers
22	are going out to typically to understand, for example,
23	physical behavior of a system, you know, look at now
24	it's constructed, now you would expect it to behave,
25	such that that is input into a design evaluation

. .

process.

1

5	Judgments are	being made,	engineering	judgments	in
3	that process, that	are not typ	ically made i	in a	
4	construction qualit	y inspectio	n.		

5 MR. MARINOS: Such as what? Would you give us an 6 example of what you mean by that?

7 MR. LEVIN: Okay. For example, one of the issues 8 that has been -- one of the needs that has been 9 identified, has been to reconcile the benavior of pipe 10 supports in the plant, that which has been assumed in 11 the piping analysis.

A part of that activity, okay, includes going out in the field and understanding, getting better physical understanding, of how we expect those to respond. That is an engineering type of an activity, as opposed to John Hansen, where he says, "I have got to go out there and look at welds and size of the weld, maybe an important attribute."

He's simply going to gauge it and record what he found, okay.

21 There's not the same type of judgment in that
22 process. It's a different process.

23 NR. CALVO: I don't understand. Is that all the 24 judgments that you do? The design to be converted into 25 drawings, and those drawings are used to determine that

> GODFREY & AMES COURT REPORTING Netro 469-6100, (617) 460-2043

1.1					
1	the design	has been	- adequate	e? I don't see wha	at is
2	the differe	ence what	t you do	in a walkdown, and	I aon't
3	see the dif	fference what	at John Ha	ansen has done. Ar	nd I
4	don't see w	what John Ha	ansen laci	ks in this and cann	not do
5	what you do	o. If he la	acks the	expertise, I don't	see wny
6	he's going	to tell you	u the desi	ign deficiency that	t he's
7	found out,	to send bad	ck to you	to be taking care	of it.
8	Is there so	omehow you d	cannot an:	swer the question?	
9	MR. MA	ARINOS: I d	can see an	n example of walkdo	own
10	confirmatio	on, a two ov	ver one se	eismic kind of t	that
11	might be so	omething that	at you wou	uld look at. But	
12	supports, 1	I don't know	w. And I	'm not a supports e	expert,
13	but I don't	t know how t	to assess	well, I was hop	oing
14	that you wo	ould give me	e somethin	ng	
15	MR. LE	EVIN: A wal	lkdown fal	lls into that same	
16	category, a	and may have	e even bee	en a better example	b.
17	MR. MA	ARINOS: Or	high ener	rgy line interferer	nce.
13	MR. LE	EVIN: I thi	ink maybe	another way to loc	ok at it
19	is the engi	ineering wal	lkdown is	attempting to conf	firm the
20	adequacy of	f design. 🕯	Whereas th	ne construction ins	spection
21	is to try t	to determine	e the qual	lity of essentially	/ the
22	craft's wor	rk. And the	ose are tu	wo separate things.	
23	MR. CA	ALVO: Wnen	you're ta	alking about the ad	lequacy
24	of design,	now where i	is design	reflected into the	
25	drawing in	the documer	nt? It's	not those drawings	3

34 documents, also available to John Hansen. If ne's not 1 2 using the same document you're using, but looking at it 3 from a different place, that's the problem that I am 4 seeing. 5 MR. LEVIN: Jose, we may see the design reflected on 6 a drawing, and we may go out in the field and see the 7 same thing. 8 But, for example, that Angelos gave seismic two 9 over one, that's -- that type of evaluation is not 10 something that you can easily reflect in drawings. You cannot do that evaluation on drawings. You have to go 11 12 out, because of things like field run pieces of conduit, 13 all kinds of things --14 MR. MARINOS: You will confirm the same name plate 15 information and pumps, motors, valves, and rotation type 16 information? 17 MR. LEVIN: That's correct. 18 MR. MARINOS: This is your walkdown? You will give 19 us a detailed listing of how -- what the walkdown is 20 going to assess then, at one time or another? 21 MR. LEVIN: Yes. Absolutely. And walkdown will be 22 controlled by a procedure. 23 MR. CALVO: You also saying that what John Hansen 24 has done will be incomplete, something is missin; and 25 that part that is missing, you're going to take care of?

	35
1	MR. LEVIN: Together. They go together and create
2	a whole package.
3	MR. CALVO: This program so comprehensive, you'll
4	be as equally comprehensive to compensate for that
5	part. That's what you're saying?
6	MR. LEVIN: Yes.
7	MR. CALVO: And you're going to commit to do that?
8	MR. LEVIN: Yes.
9	MR. CALVO: Okay. Thanks.
10	MR. NOONAN: Maybe a couple of things before you
11	get to start the part up here called QA/QC review. I
12	would like a better definition of that.
13	MR. LEVIN: That is the QA/QC review team leader,
14	that is John Hansel.
15	MR. NOONAN: That's John Hansel?
16	MR. LEVIN: Yes. And it's shown him, of course,
17	reporting to the same senior review team, as I do. And
18	the dashed line indicates our interface.
19	MR. NOONAN: Okay. I see what you're saying. I
20	interpreted that somewhat differently. The price would
21	be sole duties. He's the interface between you and
22	Hansel, right, when Hansel is doing his inspection.
23	Will both of you be involved in those to some degree?
24	MR. LEVIN: He will be knowledgeable, as a minimum,
25	knowledgeable of those outputs. And provisions have

GODFREY & AMES COURT REPORTING Metro 469-6100, (617) 400-2040

1---

1 been made that that information will flow over his desk 2 entirely. And it's up to John Honecamp to determine, 3 basically -- sort through that, evaluate and determine 4 what needs to happen, if anything, if it has, for 5 example, design related concern, such as that, and he 6 will make sure it gets to the appropriate place in the 7 organization. 8 MR. NOONAN: I guess what I was talking to, any 9 future meeting with John, he will be fully knowledgeable 10 of John Hansen. He will be aware of what Hansen is 11 doing? 12 MR. LEVIN: Yes. 13 MR. CALVO: I have a suggestion. I think yesterday 14 and today, we keep going back to this interface in 15 construction and design. In some kind of way, when you 16 present, it appears that you have some of the answers. 17 But it also reflects maybe you had not considered as 18 fully as you should have considered. 19 I think you, maybe your action plan, when you 20 submit it to us, I will appreciate it if you can clearly 21 define those things, so we know now you're going to talk 22 to each other. 23 MR. LEVIN: You're undoubtedly aware of the format 24 for those, the past TRT action plans in, I believe, 25 Section 43, addresses the reponsibility of interfaces.

at across all the design work activities.

1

2 But I think the point you're missing, perhaps, is 3 that they aren't necessarily going to be looking at the 4 correlation between the hardware that he looks at, and 5 the specific components of design that Howard looks at. 6 There is not going to be a one to one correlation 7 between the things they're looking at. There may be 8 some cases where they have to look at the same thing, 9 and this is just part of those two.

30

10 MR. CALVO: John, I had not missed any point. All 11 I hear yesterday that Howard Levin was volunteering for a lot of stuff that John Hansel is supposed do. And 12 13 want to be sure Howard Levin understood what he 14 volunteered for. I understand what you say. I want to 15 be sure that -- Howard was not here yesterday, you 10 know. Every time John Hansen has a problem, Howard 17 Levin will be taking care of it.

18 And I'm glad that you don't say others have a 19 problem that somebody else is going to take care of it, 20 but somebody else. I will understand the difference. 21 But again the record shows that Howard Levin was joing 22 to do whatever John Hansen couldn't do, yesterday. And 23 I want to be sure that Howard Levin understands that. 24 MR. GUILBERT: Just to recall where that emanated 25 from yesterday, is Larry referred to some Appendix P

	39
1	items, which were going back, basically, what I'll
2	called the compendium of the TRT issues.
3	And referring back to, you have gone through a
4	Appendix P of SSER 11, and called out what you guys
5	believe to be the QA/QC implications of the TRT items in
6	civil, structural, mechanical, miscellaneous, and
7	electrical.
8	Now since Howard is also review team leader for
9	those disciplines as they relate to TRT issues, he wears
10	two hats, recognize the excuse me. For those
11	activities as well as review team leader for design
12	accuracy.
13	His charge has been to go out and resolve those
14	issues, and in the resolution of those issues to do
15	basically the same thing you do. It comes across
16	implications in those that relate to construction QA or
17	QC. He's been charged with identifying those from the
18	point of view of how they may have generic implications,
19	and passing those on to Mr. Hansen. And that has been
20	done through that activity.
21	What he's alluding to is, through his review of
22	these other aspects, if he happens to find any other
23	similar implications that may fall back to construction
24	or QA/QC, he will also pass those on to Mr. Hansen.
25	MR. CALVO: All I'm saying, when you consider your

	40
1	final plan, will you please, some kind of way, clearly
2	indicate this interface. Thanks.
3	MR. LEVIN: Yes. Okay. Getting on to the
4	organization, I'll run through the principal people
5	that are coordinating the activities in various
6	discipline. Martin Jones was also review team leader in
7	the TRT, through the electrical area, is leading this
8	effort, and I&C effort as well. Martin has over 27
9	years of engineering experience, 20 years of which were
10	in the nuclear utility involved in design construction,
11	construction management, quality control.
12	Martin was a manager of quality control for nuclear
13	unit, as well as manager of construction. Martin has
14	also participated in construction and design
15	verification activities, and served in the capacity of
16	construction verification manager in the Midland Review.
17	Tim Snyder is leading
18	MR. MILHOAN: Excuse me, Howard. Jim Milhoan. How
19	many years of direct design experience has Mr. Jones had
20	at on being a designer himself?
21	I assume the program plan your program plan will
22	assess or give us an idea of identifying separately the
23	direct design experience of your individual reviewers?
24	MR. LEVIN: Yes, in fact, Jim, we will be providing
25	you with resumes of all the people that will be involved

1	in I will be discussing here.
2	MR. MILHOAN: Will those resumes be of such a
3	nature that we can determine the years of direct
4	commercial design experience.
5	MR. LEVIN: Yes. Tim Snyder is coordinating the
6	piping and supports discipline. Tim brings with him 14
7	years of experience in nuclear power plant design and
8	operations. Six of which in directly in the piping
9	analysis and support area.
10	MR. SHAO: Howard, let me ask some question on this
11	diagram. Yesterday you say the cable trays support is
12	going to be done by Abasco. I don't see it on the graph
13	here which where will that fall on.
14	MR. LEVIN: That interface will be described in
15	detail later. And it is directly within the civil
16	structural coordinator's responsibility.
17	MR. SHAO: So Abasco cable tray would fall within
18	the civil structure here?
19	MR. LEVIN: There's an interface there that we will
20	be describing, yes.
21	MR. SHAO: Also, I have a general question nere.
22	If I look at pipe supports and piping, is another slide
23	out here of a third party coming, Stone and Webster,
24	they have a lot of horsepower and third party and
25	all the others is done by TUGCO support coordinator.

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2040

1		Does	that me	ean that	the TUGCO	people is go	ing to do
2	their	own	analys	is?			
3		MR. G	UILBERT	f: In t	he case of	piping and p	ipe
4	suppo	orts,	Larry,	just re	ferring to	that. As yo	u
5	recog	nize	that wa	as basic	ally a sepa	rate discipl	ine area
6	in th	ne way	the Co	omanche	Peak Projec	t was establ	isned, so
7	showi	ng St	one and	i Webstei	r there enc	ompasses all	items in
8	that	parti	cular d	iisciplin	ne problem.	Let me con	tinue.
9		In th	e area	of i	n the other	areas, in t	ne civil
10	struc	tural	area,	there a	re a number	of action p	lans that
11	you'r	e goi	ng to h	near abou	ut today, o	ne of which	goes to
12	cable	tray	s. The	notion	including	the TUGCO su	pport
13	coord	linato	r is ir	ndicated	who is	the interfac	e for
14	infor	matio	n and d	iata to a	assist thes	e team leade	rs in
15	obtai	ning	informa	ation.			
16		In so	me case	es bas	sically, in	some cases,	there
17	may b	e som	e work	being do	one by the	project that	15
18	requi	ring	a third	party d	overview.	The Abasco e	ffort
19	which	is b	eing do	one for t	the project	in the cacl	e tray
20	area	falls	under	that cat	tegory.		
21		In ot	her cas	es, esse	entially, a	ll of the act	tions
22	plans	in a	given	discipli	ine area ar	e being imple	emented
23	direc	tly o	y the t	nird par	rty. I thi	nk that	
24		MR. L	EVIN:	Larry, o	naybe it wo	uld be best .	What i
25	was t	rying	to do	here was	s give you	the overall	

framework, and as we get into the discipline descriptions, okay. In fact, that's the third portion of cur presentation today.

1

2

3

43

The first item we'll address in each of those discussions will be the organization and how it will be configured and the interfaces in those activities. So if we can get kind of -- develop the overall framework, and then fill in the middle -- in the rest of our presentation --

MR. SHAO: I have two general comments. I think --I have no problem with the middle column, because they have a lot of horsepower as an independent assessment. On the other column -- let me finish my comment. On the other column, first, I'm afraid of not enough horsepower. And the second comment is, will the review be independent?

MR. BECK: Let me ask you to be a little patient.
And we're going to spend half a day talking about
precisely how those boxes are going to be covered.
This is an organization chart. But I want to go
back for just for a moment, to one of the guiding
principals in the whole CPRT efforts.

Analyses, calculations, will either be done by a third party, or overviewed by a third party, in the case where a TUGCO project is doing analyses, their overview,

period.

1

2	There is no	instance	where	that's not	the case. So
3	it's either done	by third	party	or overview	ed by third
4	party to the sat	isfaction	of the	third part	у.

5 MR. NOONAN: I guess I'd like to go and get off the 6 organization chart. John, I want to make sure, one 7 point the staff is concerned about the organization, who 8 is doing the work. They want to fully understand who is 9 actually doing it, in all cases, the number of people 10 involved. And also how that all gets put back into that 11 organization. I think that these concerns being voiced 12 now, maybe later in the day, you will get to those. 13 They want an answer.

14 NR. CALVO: I had one more general comment. That 15 again, in view of this extensive effort that you're 16 going to embark on, doing -- I think it would be 17 appropriate to consider the make-up of this senior 18 review team, and maybe move there with some people who 19 has experience in construction, engineering, electric, 20 instrumentation.

I think, my opinion, I think you're lacking some of that. I know before you indicated that you're going to use consultants. But it was somebody else who minds the shop on a routine basis. I think it would be something for you to give very serious consideration.

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2040

44

	45
1	MR. LEVIN: We
2	MR. BECK: The point is made and well taken indeed,
3	Jose. Thank you.
4	MR. LEVIN: Jose, since you brought that up, it may
5	make sense to address that issue. And as you have
6	indicated, we have retained quite a few recognized
7	individuals in the field, in the piping area, supporting
8	us.
9	We have Everett Rodenball, who I'm sure many of
10	the staff know, who has a significant expertise in the
11	area of ASME components.
12	Jerry Slagas, who heads the ASME code analysis
13	piping work team. Moe <u>Carnon</u> , who is the committee on
14	the <u>NT</u> support committee. These individuals are
15	assisting us in the piping area.
16	In the civil structural area, we're being assisted
17	by Bill Hall and Bill Munci from the University of
18	Illinois. Cris Holly and John Bigg from Hansen. Holly
19	and Bigg and MIT. Ed Cosel and Daniel Luciano from
20	MIT.
21	And Paul Gunnes from Abasco, and he's assisting us
22	in the, specifically, in the testing area. And as we so
23	through our presentation, we might get into that in some
24	more detail.
25	These individuals participate at all levels,

	40
1	including review and evaluation on the front end of the
2	action plan participation in the execution of those
3	action plans and evaluation of results.
4	MR. CALVO: You took care of our group, but you
5	left me out.
6	MR. BECK: Jose, we're not going to leave you out.
7	MR. LEVIN: In that regard, I specifically mentioned
8	Daniel you're being too nice.
9	I specifically mentioned two disciplines that are
10	under Larry's responsibility. However, I wanted to
11	point out that the the electrical I&C area has just been
12	initiated. It is self-initiated, and it's clear to me
13	that the need may arise in the future. We will
14	supplement our staff as required.
15	MR. CALVO: Don't make me work too nard.
16	MR. MARINOS: So you want to talk to us about the
17	mechanical systems a little bit, too? Howard, who are
18	the people that will man these, not the components
19	necessarily, the hydraulic?
20	MR. LEVIN: Just point out the mechanical meeting
21	systems and it is Fred Schaffer, okay. Fred has an
22	MS in nuclear engineering. He has eight years of
23	arcnitect engineering experience in design and
24	construction, nuclear plants.
25	The experience is it's focused in particular on

47 1 AFW systems design, and additionally the types of 2 evaluations that are involved in some of the 3 multi-discipline area tasks that I think you brought up 4 before. 5 MR. MARINOS: The hydraulics aspects of the design 6 he has experience in or others --7 MR. LEVIN: That's correct. At the particular --8 that he was previously associated with -- Fred was the 9 lead in the AFW systems designs, was his focus. So he's particularly well suited for this effort, in view of the 10 11 fact, as you will be hearing, the AFW system is one that 12 we have selected as a further test of the design 13 adequacy as planned. 14 MR. CALVO: Who will take care of the testing 15 aspects? John Hansel? 16 MR. LEVIN: No, the testing here is a little bit 17 different than the testing that John is involved with. 18 The testing that John is involved with is in some cases 19 non-instructive examination. In our case, we're talking 20 about structural testing and that's -- the 21 responsibility for that is with ANCO engineers. 22 Leading the civil structural effort is Dr. Cris 23 Marquet from Stanford. He has nine years of nuclear 24 experience with a specialty in seismic hazards analysis, 25 structural design in civil engineering. He's a member

113	40	
1	of the ASC committee on cable tray design.	
2	Cris also participated in the design verification	
3	efforts, where he had a similar responsibility.	
4	MR. MILLS: Excuse me, Howard. Does he have any	
5	direct commercial AE design experience?	
6	MR. LEVIN: Yes.	
7	MR. MILHOAN: How many years?	
8	MR. LEVIN: Several. I don't have the exact	
9	number.	
10	MR. CALVO: Can your program plan when you	
11	submit it to us, you're going to emphasize	
12	MR. LEVIN: It will be on the resumes. What I'd	
13	like to do here is clarify the roles of two principal	
14	entities that are contributing to the CPRT efforts. And	
15	those entities being the third party efforts as well as	
16	the project. And both are contributing to meeting the	
17	goals of the CPRT program.	
18	On part of the third party, these individuals have	
19	responsibility for defining the overall program plan,	
20	also providing an end process overview and guidance to	
21	the project during any activities that they may have	
22	that are associated with the program.	
23	Concurrence with project quality program design	
24	procedures and specs governing the current CPRT work.	
25	Selected verification of project implementation of their	

	49	
1	design basic activities, where these may be required,	
2	including verification of design criteria, analyses, and	
3	the outputs of that process, the drawings, and specs.	
4	And most importantly, the third party is	
5	responsible for the evaluation of root cause generic	
6	implications and safety significance.	
7	MR. BOSNAK: Howard, what is the role with the	
8	third party, with groups like Stone and Webster, and	
9	Abasco?	
10	MR. LEVIN: Okay. I will be getting into that in	
11	more detail. But in a nutshell, Bob, we will be	
12	verifying their work.	
13	MR. BOSNAK: All of their work.	
14	MR. LEVIN: Design verification overview. It's an	
15	overview of their the project, as John pointed out	
16	earlier, is responsible for the execution of design	
17	basis analysis. It's their responsibility. And third	
18	party will not be involved in that, although we will be	
19	overseeing.	
20	The project also gets involved in the collection of	
21	information that the third party may need to conduct its	
22	evaluation. And also goes without saying, the project	
23	is responsible for implementing any corrective action	
24	that's identified as part of the program.	
25	We come to the second segment of my presentation.	

	50
1	In this segment, I plan to go through the methodology
2	for the design adequacy program.
3	First, I will provide a general overview of that,
4	and then get into the specific functional parts of the
5	program. That is, the external sources evaluation,
6	self-initiated evaluations, root cause and generic
7	implications evaluation, and how we will close the
8	program.
9	As many of you are aware, we have to have a
10	mechanism for controlling our activities. There needs
11	to be traceability of our process, our results. And in
12	an effort to we have defined an issue classification
13	system that will help us manage that. And specifically,
14	identify three categories of issues.
15	The first being that of a discrepancy. A
16	discrepancy, a situation, where we're meeting
17	inconsistency in criteria or documentation. And
18	typically that will be something that is trivia and a
19	insignificant typo, or math error.
20	I think it's important to note that those things
21	will be detected by the system, and that judgment will
22	be made, in fact, to this insignificant or the
23	alternative.
24	MR. MARINOS: Do you intend to retain records for
25	viewing of all these errors that you have passed

[_____

	21	
1	judgment as insignificant? Of course the significant	
2	ones we have no problem. But identify	
3	MR. LEVIN: These will be obtained in audible form.	
4	MR. MARINOS: Okay.	
5	MR. LEVIN: The second category is that of a	
6	deviation, which is simply a failure to meet the	
7	criteria. An example might be an FSAR commitment that	
8	is not met.	
9	MR. BOSNAK: But if that commitment were a failure	
10	to meet a general design criteria, I hope it would not	
11	be a deviation. It would be done in an efficiency	
12	column.	
13	Do you have a set of attributes that you pass out	
14	to the people doing this, so they can determine what is	
15	a discrepancy, what is a deviation, and what is a	
16	deficiency? In other words, how will they know whether	
17	to put something like a general design criteria failure	
18	in one column or another column? I hope it would be	
19	fairly clear.	
20	MR. LEVIN: Well, yean. I guess my reply to that,	
21	Bob, is everything will get reviewed. It will be	
22	documented. The classification will be apparent. And	
23	the judgments that are made in that regard can be	
24	well, you know, it will be traceable and can be	
25	reviewed. I really believe that the definitions here	

- -

are fairly straightforward.

1

2	The principal if it's really almost a binder
3	scheme, the discrepancy's there, primarily because we
4	need to manage the program. But the key things are
5	deviations and deficiencies. And the deviation is a
6	commitment made, may not have been met. That's pretty
7	straightforward. A deficiency is something that has
8	safety significance.
9	MR. BOSNAK: Well, we're getting back to the same
10	question again, as to what safety significance. But I
11	think
12	MR. SHAO: What do you include right now?
13	MR. BOSNAK: We need a set of attributes that you
14	will be using to come to some degree of judgment on
15	this.
16	MR. LEVIN: Bob, where you will have an opportunity
17	to see that is in your check list, and I will be setting
13	to that in a moment.
19	MR. CALVO: It's too late. Again, you will be
20	asking us to review a program plan and approve it. So
21	we have got to have that front only if you submit the
22	check list at the same time
23	MR. LEVIN: I will be describing our approach and
24	our timetable for submitting that, Jose. But I assure
25	you that this is something that is happening on the

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048 52

		53
1	front, and it's not a situation where it's being m	ade up
2	as it goes along.	
3	MR. CALVO: So you're going do make a commitm	ent to
4	provide information to what Bob is asking?	
5	MR. LEVIN: We will be making that commitment,	and
6	it will be a fine point in time where you will hav	e an
7	opportunity to look at.	
8	MR. TRAMMELL: Howard, what bothers me in loo	king
9	at this list is it sort of implies, but it doesn't	say,
10	that discrepancies are okay. Deviacions is a mayb	e,ī
11	think. And the deficiency probably will be correc	tea.
12	But I think that's causing a lot of trouble here.	
13	MR. BECK: No, Charlie. Let me go back to wh	at we
14	said yesterday to make it very clear, that anythin	5
15	CPRT discovers goes to the project. Deviations th	at
16	they are discrepancies, if they need to be correct	ed,
17	will be. Deviations, certainly, will either be	
18	corrected and/or the commitment that is not being	et
19	will be pointed out as an exception requested.	
20	Now until we get do specific issues, I can't	say
21	which way it will be resolved. But it will either	be
22	resolved either by correcting it, or by seeking an	a
23	obtaining NRC's staff's approval let me finish.	
24	That's not CPRT 's job to do. That's our job, as	rugco,
25	to make sure that it happens.

55 1 MR. CHANDLER: So how your check list will provide 2 us the road map necessary for the reviewer then to look 3 at a typo or a math error, for example, to determine 4 whether it fits simply is a discrepancy, or perhaps that 5 math error indeed could be a deviation, or perhaps even 6 a deficiency. 7 MR. LEVIN: Absolutely. 8 MR. CHANDLER: These are not exclusive categories 9 as they're listed here? 10 MR. GUILBERT: They're the end. after all that process has been done, everything is going to fit into 11 12 one of these three bins. Everything starts at 13 discrepancy level. 14 MR. CHANDLER: Just so that the math error doesn't 15 remain forever. Only a discrepancy? 16 MR. NOONAN: One thing, the way you said it, John, you said if FSAR commitment -- if you can't meet the 17 18 FSAR, you will ask for an exception. 19 MR. BECK: No, I didn't. I said we will resolve it 20 one of two ways. We will meet the commitment, or it 21 appears that we cannot or don't want to, we'll tell you 22 about it. 23 But I can't predict. I say the very migh 24 percentage of the time we're going to change whatever it 25 is that doesn't meet the FSAR commitment. Very high.

	50
1	But I'm not going to make that hundred percent guarantee
2	that will be the case.
3	MR. NOONAN: The point I'm going to make, is the
4	staff is going to look at the FSAR.
5	MR. BECK: Yes, sir. That's the driving force on
6	the our side of the fence. I'm just not going to say
7	one hundred percent right now. Not knowing what may be
8	on the table that we won't that we won't make a
9	change in a commitment that's been made in the past.
10	And it will be wide open for everybody to look at and
11	approve, if that's the case.
12	MR. TRAMMELL: Thank you for the response. That's
13	the reason I asked the question. And I certainly agree
14	with grading the seriousness of the things that you
15	find.
16	MR. BECK: We have to.
17	MR. TRAMMELL: And I mentioned that yesterday. And
18	I gather from your response that any or all of these
19	could lead to corrected action and all to be evaluated?
20	MR. BECK: Yes, sir.
21	MR. CALVO: All I want to say, that if you want to,
22	we like to know the criteria they are covering, going to
23	cover your decisions, what you're doing here, your own
24	choice, you want to wait to the end, you want to put at
25	the beginning. We will look at it at that time. That

is your choice.

1

2	MR. BECK: I appreciate that, Jose. And I think
3	something that I want to get in the record, is that
4	we're not asking, on the basis of our presentation
5	today, for staff to approve or disapprove anything.
6	This is intended as an overview to get give you a
7	good feel for what's going to be coming down, and give
8	us the opportunity for your feedback. And that's very
9	important that we get that. And that's the purpose.
10	But in this overview context, many of the comments
11	that have been made certainly have been helpful to me in
12	making sure that our focus in that written documentation
13	is appropriate to the concerns the staff is pressing.
14	And in every instance, it may not be right now, but
15	week and a half from now, it will be.
16	But I don't either want to leave the impression
17	that we're asking, the day after the written
18	documentation is on the table, that NRC staff give a
19	judgment, yea, nay, it's on the mark or not.
20	I suspect there will be further modifications after
21	that point. And when we get to the intense examination
22	of the implementing procedures and the documentation and
23	the check lists, I dare say there may be further
24	question and further change at that point.
25	But we're not professing to be one hundred percent

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048 57

1 pressient of what staff may or may not find acceptable. 2 I think we're going to have a very high success 3 rate in understanding it as a result of meetings such as 4 we're having today and ones we have had before, and ones 5 that will continue. 6 MR. CALVO: I just want to say, also, within the 7 same subject, that what we're trying to do is bring 8 these things to you for consideration. We are not 9 trying to dictate you in any way, you want to do it. 10 But tell you those are the things -- kinds of 11 things we don't get a warm feeling in your program. I 12 hope you take it in that kind of a context. 13 MR. BECK: Absolutely. We do. We're structuring 14 the program. We think will be sufficient to satisfy 15 ourselves. It's obviously a program that's going to 10 require, and as our system does require, rigorous 17 regulatory review. And this is part of it. and we 18 welcome --19 MR. SHAO: As Vince said, unless you have very 20 strong justification, the staff is looking for 21 FSAR commitment. 22 MR. BECK: Yes, sir. 23 MR. NOONAN: Yes. As I said, we will not be giving 24 you an approval or disapproval by your program today. 25 We will giving ourselves to basically provide that kind

58

	59
1	of response within 30 days after we receive the
2	completed plan. And we'll do it that way.
3	The staff feedback here today is basically to give
4	you a feel of areas you need to concentrate, in
5	particular by design effort. We're looking at that very
6	hard. I don't think I think I want to get on. I
7	think the reporter needs a break.
8	(Whereupon there was a recess.)
9	MR. LEVIN: The next element of the presentation,
10	I'd like to describe our process for documentation of
11	the review in terms of the process and our conclusions.
12	And there are various mechanisms that we have
13	established for that.
14	I might add, for example, Jim Milhoan, that it's
15	very similar to things you have seen before, okay, in
16	terms of, you know, how we're going to document, you
17	know, the evolution, both now we approach the process,
18	now we where we document a conclusion.
19	MR. MILHOAN: Howard, I think you ought to put that
20	in context of what I have seen before from the
21	standpoint that I'm from INE. Ne're responsible for the
22	integrated design and construction program and the
23	independent design verification program. I have not
24	seen anything, previously in Comanche Peak in this area.
25	MR. LEVIN: Comanche Peak, yes. What I was

-

	60	
1	referring to is programs we have been responsibility for	
2	managing that that INE has been reponsibility for	
3	reviewing before.	
4	MR. CHANDLER: Howard, on the issue of	
5	documentation, I'm sure that the message that was passed	í
6	on a number of times to John Beck about frequency of	
7	reporting. And things like that will also be applicable	2
8	to your activity here.	
9	MR. BECK: Yes.	
10	MR. LEVIN: Okay. Fundamentally, going through the	
11	mechanisms. The first being check lists. And the	
12	purpose of check lists are to assure the completeness of	
13	due process and the traceability of items reviewed.	
14	More specifically, these check lists correlate the	
15	systems design criteria to system design documents.	
16	They're used during the system document review to verify	t
17	commitments are incorporated into the system design.	
18	The check lists also documents the method of	
19	verification used by the reviewer, and summarizes the	
20	adequacy of the design criteria and implementation.	
21	Check lists also provides a cross reference to	
22	calculations and evaluations performed by the third	
23	party. And the check list also cross references to any	
24	of the reports that are generated to the classification	
25	system that I described earlier.	

We plan to have the full set of check lists
available in the August time frame, such that they would
be available to look at both the breadth and the depth
of the investigation in the specific design areas. And
we'll get back to that in a moment. But if we could
leave that for a moment.

61

7 There's another category. The results of the bores 8 which document the results of specific action plans. 9 Now there are segments that may be documented in 10 engineering evaluations, okay. For example, if a 11 particular action plan is more comprehensive than 12 others, it may require some subordinate documentation 13 that would then get wrapped up, finally, in the results 14 report.

But fundamentally, we're committing to provide a results report on each and every action plan. And most importantly, we intend to wrap the results of those individual reports into an overall design adequacy report, which will document the overall conclusions of design adequacy of Comanche Peak.

At this point I need to note in the handout, there are several pages that have been folded ever. I will be getting to those in a few moments. They should be inserted at the location of the paperclip in the package.

So if we go to the slide directly after the folded corner, I will proceed with the presentation. Frank, could you put up the agenda, so I can show people where we are in the program?

5 I have just completed the overview of various 6 aspects of the program that are relevant to managing of 7 our process. And what I'm going to get into next are 8 the three functional elements of the program.

9 Starting first with the methodology for evaluation 10 of external source issues. I do not plan to go through 11 this busy diagram in detail. It's a logic diagram that 12 governs the process for evaluating external source 13 issues.

We discussed it in a fair amount of detail in the past in another public meeting. But what I have done is broken it down into its six major components. And we will go through them in summary fashion, starting with the first, which is the identification of issues.

And our objective in this phase of the program is
essentially to capture all potential issues from
important sources. We have some examples here, and we
discussed them at the beginning of the presentation.
This process will include a review of
documentation, an attempt to qualify these potential

25 issues, and identify issues that require further review.

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2043 62

63 1 MR. CHANDLER: Howard, very quickly, for those of us who didn't have the benefit of any earlier meeting on 2 3 this, the initials in the boxes, CD and E, refer to 4 what? 5 MR. LEVIN: Yes. They just refer to continuation. 6 match points, or continuation down into another location 7 in the logic. 8 MR. CHANDLER: Okay. 9 MR. MARINOS: Where is CD, E? Where are you? MR. CALVO: You discussed before? This is the 10 11 first time I -- I'm sorry. You say that I mentioned 12 this to you. You had discussed this previously with the 13 NRC. That's what you're saying? MR. LEVIN: Yes, this was at a meeting on the 14 15 site --16 MR. NOONAN: Yeah. There was the meeting we had in February, March time frame. I can't remember exactly 17 18 what week time it was, but the staff refers to these as 19 the Howard charts. 20 MR. CALVO: The what? MR. LEVIN: The Howard charts. Based upon that 21 22 earlier reaction, we are dissecting this block by 23 block. And we'll go on to the next block. 24 MR. CALVO: You will tell us about it? 25 MR. TRAMMELL: I'll teil you about it.

MR. LEVIN: I think the diagram indicates the rigor 1 2 of the processes required and the complexity. The next 3 stage, having identified issues, having captured them 4 from all sources, we're -- next step is define them. 5 And what we're trying to do is identify the potentially 6 affected scope and hardware and group issues. And this 7 is being done such that it will lead into the 8 development of action plans and to determine just now to 9 structure the response of it. 10 MR. MARINOS: Howard, you have a special group of 11 people that will be doing all these things? How are 12 you -- the organization that you identified earlier will 13 be the ones that sit down and identify the issues and 14 define them, or you have a special group that will do 15 that? 16 MR. LEVIN: That is correct. 17 MR. MARINOS: What? 18 MR. LEVIN: Wnich? The responsibility for 19 coordinating that effort is with Ed Blackwood and the 20 generic implications. And, if you will, he is our issue 21 manager. It's his responsibility to capture them, track 22 them. I guess you might say he is the guy with the 23 responsibility for making sure every issue is in a 24 nopper, and that there are no loose ends, and something doesn't fall through the cracks. 25

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

64

	CO
1	MR. MARINOS: By definition, you will define the
2	issues also?
3	MR. LEVIN: No, the technical issues will define
4	the issues. It has responsibility. We need to have
5	some central point of coordination. For example, going
6	through all the source documents, as there will be
7	spreadings and outputs and doing that in a systematic
8	way. It just happens that's where it resides in the
9	program.
10	MR. MARINOS: Okay. And the definition will be
11	done by experts?
12	MR. LEVIN: Technical, in their specific
13	disciplines, that's correct.
14	MR. MARINOS: The people that you have in table,
15	that you show us before?
16	MR. LEVIN: That's correct, yes. Okay.
17	Now I guess at the process of identification, it
13	may include, to try to get these things into these
19	various groups, a degree of evaluation, possibly
20	walkdowns, it there may come a point where right at
21	that stage, it's judged that some direct corrective
55	action is needed as opposed to an investigation or
23	exploratory type effort, which is oftentimes included in
24	action plans to try to, you know, qualify the
25	significance of issues or boundaries of issues.

i carried out or left out?

2	MR. LEVIN: This really isn't an assessment of
3	significance as much as an identification of issues that
4	have potential significance, issues that require further
5	investigation. That's what occurs at that stage.
6	MR. MARINOS: And when you make that decision then,
7	you will develop the action plan to address the ones
8	that you have put in one category
9	MR. LEVIN: And that's the reasonably low
10	threshold. It gets in that box fairly easily.
11	MR. MARINOS: And at this stage we will have an
12	opportunity to comment and look at your decisions
13	before you develop the action plan, or what is your plan
14	in that regard?
15	MR. LEVIN: I guess, you know, there is an
16	opportunity to see it before. But it's my understanding
17	that you will see it at the action plan stage. And the
18	action plan will address the issues and the process that
19	led to develop identification of those initiatives. So
20	you would be able to see that in the action plan.
21	MR. CALVO: Review the mechanism to do this?
22	MR. LEVIN: Yes.
23	MR. MARINOS: So assuming this agrees with your
24	categorization, is your action plan will be
25	comprehensive and broad enough to include other things

67

	68
1	that we may convince you you should have been included,
2	or would require restructuring your action plan to meet
3	this need?
4	MR. LEVIN: It could be either. But I
5	MR. MARINOS: I'm trying to save you time.
6	MR. LEVIN: The process is flexible enough that it
7	can accommodate that. They're not cast in concrete.
8	And these action plans aren't. Notwithstanding your
9	involvement in the in overview, you know, reviewing
10	our process. The nature of the program itself is that
11	way. It's a series of decisions that are made that lead
12	to restructuring in the plant continuously. It's a
13	dynamic process. As you learn something, go off in a
14	different direction.
15	The implementation is straightforward.
16	Fundamentally, what we're after there is determined in
17	the E-4 corrective action. Essentially in that phase,
18	we will execute our action plan tasks. At the same time
19	determine the root cause and generic implications.
20	And the corrective action phase will determine
21	specific corrective actions that may be required. In
22	terms of the process for deviations, for example, with
23	safety significance, the deviation would be corrected,
24	either most typically with a hardware modification.
25	However, for deviations without safety

	69
1	significance, the resolution of that could involve
2	either hardware modifications or changes in
3	documentation. Or both.
4	As I have mentioned earlier, the last we plan
5	to document the results of our process and our
6	conclusions. And I described the forms of that
7	documentation that will take place.
8	MR. MOLLONSON: Excuse me, Howard. I'm Jim
9	Mollonson. May we go back to corrective action for a
10	minute? Within the design process you say corrective
11	action. Corrective action method and design crosses are
12	by, for example, modification design deviation
13	reports, design change authorizations in some other form
14	of documentation.
15	Is it proposed that the corrective action will be
16	kept within the constraints of the engineering
17	department, or is the corrective action proposed to be
18	accomplished under the site QA system?
19	MR. LEVIN: Site QA.
20	MR. MOLLONSON: Under site QA?
21	MR. LEVIN: Yes.
22	MR. MOLLONSON: Thank you.
23	MR. NOONAN: I'm not sure I understand that,
24	Howard. Would you please explain that a little bit?
25	Elaborate a little bit more?

	70
1	MR. LEVIN: Well, essentially the project has
2	responsibility for implementing corrective action. And
3	site quality people ultimately have the responsibility
4	for insuring that it's carried out.
5	MR. CALVO: The same thing we discussed yesterday.
6	MR. NOONAN: That's why I'm asking.
7	MR. CALVO: They find something wrong with the
8	construction adequacy review, the same quality review,
9	they give it to the project. The project will use their
10	own QA/QC, assisting QA/QC. And we brought the
11	question, will you please consider the fact that it has
12	· challenged to your program?
13	And you say, you are going to look at it. And then
14	determine whether you're willing to proceed at your own
15	risk or whether you're going to correct it.
16	MR. NOONAN: I guess my question is a little bit
17	different than it was yesterday. And what I'm looking
18	at more is your interface with site QA in these
19	corrective action processes, the interface between your
20	group. You just give it to them and they go back and
21	correct it?
22	MR. LEVIN: Yeah. Basically my interface, the most
23	direct interface, is through John Beck. And he serves
24	as a I will raise the issue up to the SRT, who is
25	overseeing review team leaders' activities.

And John has met both in the capacity as a member of CPRT and involved in the TUGCO management chain and will forward it, incorporate it into the TUGCO organization.

71

5 MR. BECK: This will be a documented transfer of 6 problem. Recommendation for resolution, or what will be 7 adequate to resolve it in the eyes of third party. And 8 it's up to the TUGCO project to implement that 9 correction, whatever it may be, whether it's a change in 10 design, modification of hardware, whatever the 11 correction process is. And it falls under our 12 QA/QC program by regulation.

13

MR. NOONAN: Okay.

MR. MOLLONSON: Can we have a very simple
explanation of that, modification to support, the two
people that determined it necessary from a design
standpoint? There will be a deficiency report,
nonconformance report, evolved from your review, or your
results of your review, and QA would then implement the
corrective action?

21 MR. BECK: QA doesn't implement corrective action.
22 Within our program -- and you are proper and correct in
23 saying that NCR 's will be generated for deficiencies
24 that come out of this program or any other source.
25 MR. LEVIN: The project will have -- will be

	72
1	delivered, our report, like, for example, a deficiency
2	report that is generated within the design adequacy
3	program.
4	MR. MOLLONSON: Even in the design adequacy program
5	a result in QA forcing the issue for corrective action.
6	MR. LEVIN: That's correct.
7	MR. MOLLONSON: Okay. Thank you. That's site QA?
8	MR. BECK: Yes, sir.
9	MR. CALVO: Can we some way correlate the way the
10	quality I mean the construction adequacy review is
11	going to do let's look at the TRT team action plans.
12	What is the role of the QA/QC? Let's say in the
13	electrical specific issue action plan? The QA/QC third
14	party is what you use to implement the plan.
15	What kind of support it provide to the TRT
16	electrical group, the QA/QC group to do, actually, is
17	verify that it has been done correctly? Can you
18	MR. LEVIN: The answer is yes. But John Hansel can
19	answer it much better than I.
20	MR. HANSEL: Martin Jones was the issue coordinator
21	for the electrical issues. And Martin Jones defined
22	what he wanted to be done in terms of investigation or
23	inspections.
24	When it got down to the inspection, he came to see
25	us. We worked with him to develop the inspection check
	73
----	--
1	list that would satisfy his requirements. We trained
2	the inspectors. We went and conducted the inspections,
3	. and then provided him with a report on those
4	inspections. And then from that data plus the other
5	data he has derived, he's drawing conclusions.
6	MR. CALVO: And the QA/QC or that particular
7	inspection was governed by your own QA/QC? Developed by
8	you?
9	MR. HANSEL: Exactly.
10	MR. CALVO: How do you do that? When you go to the
11	walkdowns adequacy review, how do you accomplish? Are
12	you going to call upon somebody like John Hansel to help
13	you with the assessing of these as built configurations?
14	MR. LEVIN: If there is a need for
15	MR. CALVO: How do you do it?
16	MR. LEVIN: Okay.
17	MR. CALVO: You develop a plan for the walkdown
18	MR. LEVIN: That's right.
19	MR. CALVO: and then you know what to do now.
20	Somebody have inspect it now? Who is going to do that?
21	MR. LEVIN: If there is a requirement for a
22	QC inspection, I ask John to do it.
23	MR. CALVO: If it's a requirement to verify the
24	design, this is the next step, you're going to go
25	walkdown, you selected a system

1 MR. LEVIN: It depends on the nature, Jose. I 2 think we kind of got to this a little bit earlier. If 3 you're trying to qualify an aspect of design that's 4 related to construction qualities. I used the example 5 of well sites. I will ask John to do those 6 inspections. Okay. 7 If it's to make judgments as to something like 8 seismic two over one, okay, I will have design engineers 9 walking down the plant to procedures, doing that 10 activity. And they're --11 MR. CALVO: So you're going to come up with your 12 own QA/QC program procedures to reflect that kind of the 13 judgment you expect from the engineers? 14 MR. LEVIN: Yes, there will be procedures. 15 Definitely. 16 MR. CALVO: So you can go -- you have got two 17 forks. One going to him worrying about QA/QC aspect. 18 And then you have got our own program doing that. 19 MR. LEVIN: For design, that's correct. 20 MR. CALVO: And the results of those inspections, 21 in both cases, you have got corrective actions. You go 22 back to the CPRT, and you go back and you forward this 23 to the project. 24 MR. BECK: Go through the established procedures, 25 NCR's be generated, and it will go into the corrective

74

(

1	mode.
2	MR. CALVO: Okay. So if I can understand when John
3	when the inspection, John does, and goes to you and
4	forward it to the project. You use the project QA/QC.
5	But what kind of QA/QC do you use when Howard Levin
6	sends you something that it was predicated on that
7	judgment, that he's looking into the design? How are
8	you going to implement that one? That was a judgment.
9	How what kind of QA/QC do you use that one?
10	MR. BECK: That would be executed within the TUGCO
11	QA/QC program, appropriately dealt with.
12	MR. CALVO: So that type of program deals with the
13	program.
14	MR. BECK: Yes, sir. Wherever the source may be;
15	whatever the source may be.
16	MR. CHANDLER: John, the point of corrective action
17	for a moment. Something gets funneled back to the
18	project with a recommendation for corrective action. Is
19	there any discretion left with the project to decide
20	whether corrective action will in fact be taken? You
21	mentioned it does everything then go into an NCR that
22	must be resolved?
23	MR. BECK: Yes.
24	MR. CHANDLER: So no identified need for correction
25	action will go will subsequently be determined to be

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 450-2048

	76
1	unnecessary by the project?
2	MR. BECK: That's a possibility. It could be used
3	as is. If that's the case, that will have to be
4	documented and justified to the satisfaction of the
5	system.
6	MR. CHANDLER: The judgment on use as is, is whose
7	judgment now?
8	MR. BECK: Project's. He will have to be satisfied
9	that that resolves the issue.
10	NR. CHANDLER: All right.
11	MR. BECK: If he's not, there's an issue still
12	outstanding.
13	MR. CALVO: I don't know too much about QA/QC, so
14	help me with this one. The problem that we had, the NRC
15	has reviewed it, was construction QA/QC. Now all of
16	this, it's another program that is designed QA/QC. We
17	can never review that program. Well, we can never
18	address that particular program QA/QC for the design;
19	right?
20	MR. TRAMMELL: Yes, it was reviewed in the FSAR.
21	MR. CALVO: All right.
22	MR. LEVIN: I think that
23	MR. CALVO: He tells me it had been reviewed in the
24	FSAR. That's all right.
25	MR. LEVIN: We can forget all right.

 \Box

	77
1	MR. MARINOS: Howard, I think your explanation to
2	my question, and I'm going to restate it, you know, my
3	understanding, when I asked about design process, I got
4	the message that N-45-211 will be your guideline to
5	establish the design process as correct, as you, at the
6	same time, reaffirming the design of the quality of the
7	design; is that correct?
8	MR. LEVIN: Yes.
9	MR. MARINOS: And that will be your tool of QA, so
10	to speak?
11	MR. LEVIN: Right. About to get into that
12	discussion. Good timing.
13	But before I get into that, I wanted to identify
14	several of the external issues that will be discussed
15	in the third segment of our program. And that goes
16	along discipline lines.
17	But as many of you are aware, for example, in the
18	civil structural area, this has been identified in the
19	cable tray conduits supports area. That's an external
20	issue that falls under that coordinator's
21	- responsibility.
22	There were several issues that were raised by the
23	independent assessment program in the mechanical
24	systems, electrical systems area. Those issues are also
25	being addressed.

	경험에 집에 있는 것 같은 것 같
1	In the piping and supports area, the issues
2	identify there. But in the ASLB, as well as the
3	assessment program, all fall into this general category.
4	MR. SHAO: About valves. Are you going to talk
5	about valves?
6	MR. LEVIN: Yes. In another broad category within
7	the external issues, however, are TRT design related
8	issues. These are issues that evolved out of the TRT
9	investigation that had some design relevance. And for
10	purposes of creating an umbrella over all issues that
11	have design implications, they are programmatically
12	being considered herein, so that we can form an
13	integrated assessment of significance of all issues.
14	Examples, we include, for example, Larry in the
15	piping area, item 5C. You know, the pipe between
16	buildings and the piping isolation type issues?
17	We can move on. We can get into yeah, we're now
18	back to the folded pages. We get into the second
19	functional element of the program. That is the
20	self-initiated evaluation.
21	The purpose of self-initiated evaluation is to
22	verify that design related issues identified by the
23	various external sources do not exist in the same or
24	similar form elsewhere.
25	It's intended that this evaluation would compliment

-

78

the scope of activities that I just completed a
 description, in that together, the external issues
 evaluation with the self-initiated evaluation, will
 basically give us complete coverage of all the design
 disciplines, areas, design activities, and processes.

79

6 Okay. And I will be getting -- the next part of my
7 presentation will specifically address how we're going
8 to accomplish that.

9 We have in our determination, as scope for the 10 self-initiated effort, divided into this four distinct 11 phases. First two phases are associated with our 12 initial determination and scope, which will be described 13 today. And there are two additional phases that are 14 associated with our final determination.

15

25

Phase one --

16 MR. MILHOAN: Excuse me, Howard. On the previous 17 slide -- Jim Milhoan. The previous slide, correct me if 18 I am wrong, issues do not have to be necessarily limited 19 to those identified by the external sources, your first 20 bullet, to be included in the self-initiated program?

21 MR. LEVIN: In fact, those issues are not in the 22 program, Jim, in the self-initiated program.

23 Specifically the self-initiated program starts without 24 any prior knowledge of any issue. Okay.

If you will, it's a test of another area where,

	80
1	typically, where issues are currently unidentified.
2	MR. MILHOAN: That was my impression. But reading
3	the slide alone does not give me that assurance.
4	MR. LEVIN: Okay. I was attempting to do that in
5	the second slide, but I hope my comments clarify that.
6	In phase one, we have taken a step back and
7	evaluated industry and NRC design verification type
8	programs, such as IDVP's and IDI's. And we have taken a
9	look at the areas these programs have addressed and
10	basically
11	MR. MARINOS: You will identify which ones you are
12	assessing or using
13	MR. LEVIN: Well, basically what we have done,
14	Angelos, is from the union of everything that IDVP's
15	have looked and IDI have looked at, we developed the
16	list of areas that have been addressed.
17	And then what we did is, we develop a profile of
18	our initial scope in the design adequacy program against
19	that list. Okay. It's to determine, just in a general
20	sense, okay, did we have the breadth and depth of those
21	types of evaluations. What we also took a look at was
22	the findings that came out that.
23	Now we not only compared our initial scope, but we
24	also compared the scope of previous evaluations on the
25	Comanche Peak Project. So what we took a look at was

-

the CYGNA Independent SESNA Program, NRC activities, and
 all those activities that generally fall into the design
 verification type box, and looked at what they covered.

And basically what we confirmed is, is that, through the combination of those efforts and this effort, that the initial scope of the self-initiated review, that in fact, we had pretty good coverage of all those design areas. It turns out that the coverage in that evaluation -- we determined that the coverage even went beyond that.

MR. SHAO: I have one question. I don't know
whether it's called external source or self-initiated
action. Let me give an example. Suppose I don't see a
deficiency. Well, that deficiency was created by
certain design relation, certain group, certain company.

And the same group of people now working on this particular area, you found deficiency, but they made the -- also they're in charge of other conformance or structures, how they handle this situation?

20 MR. LEVIN: Okay. By the end of -- I'm going to 21 get to that. By the end of phase three of this scope 22 determination, you will be able to ask me the question. 23 Okay.

24 You may address, "What have you found in the 25 particular design area?"

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

81

.

82 1 And I will be able to tell you either that we have 2 directly evaluated that area, or that it has been 3 enveloped by some other evaluation, i.e., we have tested 4 that area by some other means, such that we have 5 complete coverage of specific design areas and 6 activities. 7 MR. SHAO: Are not design area and design 8 organizations? 9 MR. LEVIN: Yes, that's true. I will be getting to that in a moment. And I hope you will get a better idea 10 11 of what that is. 12 MR. CHANDLER: Howard, you were asked a minute ago 13 whether you would be identifying those presumably 14 external IDVP type of activities that you looked at in assuring the adequacy of your scope. 15 16 MR. LEVIN: That's the initial scope. 17 MR. CHANDLER: Right. And you answered by 18 referring to basically NRC internal activities and 19 Comanche Peak related activities. Did you look at other 20 IDVP's performed in the industry, which is what I think 21 you're saying here? 22 MR. LEVIN: Yes. We have looked at both together. 23 MR. CHANDLER: And will you be identifying those 24 that you looked at? 25 MR. LEVIN: Yes. I can tell you that, in terms of

	83
1	IDI's, we reviewed the Callaway, the Seabrook, the
2	Byron and Harris IDI's, okay.
3	And in terms of IDVP's, we took a look principally
4	at Midland and Diablo, because those were the most
5	robust programs in the industry. And it was through
6	looking at the activities in those six individual plant
7	investigations that we developed a an integrated set
8	of what is the yardstick, so to speak, the biggest
9	yardstick that has been applied.
10	And it was to that that we compared the past
11	activities, as well as our initial scope. And the
12	reason is simply to see, do we have a reasonable point
13	of departure for getting started. And I will describe
14	next how we're going to confirm that our final point is
15	correct, okay?
16	MR. CHANDLER: Okay.
17	MR. LEVIN: And next we phase two. We have
18	selected two systems that concentrate our activities.
19	Actually it's some may interpret it to be broader
20	than two systems, but essentially it was the we're
21	going to take a cut through the AFW system, mechanical
22	system, as well as the total scope of Class 1E, on site
23	electrical system, okay.
24	And that's, as you are all aware, includes quite a
25	few systems. But essentially we're covering the full

	84
1	scope of electrical power on the site, as well as the
2	I&C consideration is back into the AFW system.
3	MR. MARINOS: This phase two doesn't reflect
4	this is more general. You just adding
5	MR. LEVIN: No, what I have done, Angelos, is to
6	try to develop a profile of those systems versus other
7	safety related systems in the site, so that we can
8	insure that, in fact, they are fairly good tests of the
9	safety related design effort of the site on the
10	project, as compared to other systems.
11	MR. SHAO: Well, when you say, "systems", are they
12	including any buildings?
13	MR. LEVIN: This effort is related to systems.
14	We'll get to how we treat buildings later. This was,
15	you know, it turns out that buildings are somewhat
16	unique, and most of them are safety related, with the
17	exception of one.
18	MR. SHAO: When you cut to the system, does that
19	include all the organizations that can be involved in
20	the plant?
21	MR. LEVIN: Yes. And basically what we did, we
22	developed categories of attributes in the comparison of
23	these systems. We took a look at the applicable general
24	design criteria, the design organizations, the design
25	disciplines, the design interfaces, system functions,

[]

applicable operating modes, type of hardware involved,
 type of calculations performed, and the applicable
 design procedures.

Now at this stage, the comparison is being done at
the area, design area level. In a moment, I'm going to
describe an even more intense activity that occurs at
the activity level or process level, an area being,
let's say, area concrete design.

9 Okay. Phase 3. We even cut it even finer. But 10 we're looking at a subset of that. To be sure that you 11 can create a thread and answer the question you just 12 asked, to get down to smaller homogenous units like, not 13 people, but organizations or groups, what percentage 14 were they found?

15 MR. SHAO: Concrete may be found designed by many
 16 organizations.

MR. LEVIN: That's correct.

17

25

18 MR. SHAO: Maybe one organization and other
 19 organization --

20 MR. LEVIN: What we're seeking in phase 3 is to get 21 the lowest common denominator, the smallest homogenous 22 block, and say that we have tested that in some way, 23 either directly, or have enveloped it to some other 24 path.

MR. MARINOS: Howard, have you covered, or should I

	86
1	wait, to discuss the basis of your selection? Or is it
2	I don't want to steal your show
3	MR. LEVIN: We will be getting to that. And if you
4	have any questions, I will be glad to answer them.
5	MR. MILHOAN: Howard, similar question. Once you
6	have selected these systems, named the systems, maybe
7	you will address it later on, is how will you maintain
8	the confidence that these systems that you selected are
9	still representative of the design process?
10	In other words, that calculations have not gone in,
11	or special reviews have not gone in to look at these
12	systems that you selected.
13	MR. LEVIN: Okay. I think there maybe two aspects
14	to your question. Number one, we already are aware, as
15	you can well imagine, it's very, very difficult to
16	select a system that can cover every aspect of the
17	design.
18	And we're trying to do that. And there will be
19	selected areas that fall out of this evaluation process,
20	that may not fall within the boundaries of these
21	systems, that will be added to the scope. And that will
22	occur principally in phase 3, which I'll get to in a
23	moment. Does that
24	MR. MILHOAN: That does not answer the question.
25	MR. LEVIN: I'm sorry. Oh, the okay.

L

87 We have established a cutoff in time that we're 1 2 essentially -- we have frozen what we're going to look 3 at. And essentially, that's the point in time that we 4 in the CPRT recommended to the review team, my team, made a recommendation to the SRT that we felt these were 5 6 pretty good systems to consider. And that's 7 approximately the April 1st time frame. 8 So therefore, we will not be taking a look at 9 design effort, you know, for calculation was done after 10 that point in time. We will not be looking at that. We 11 want to look at before the point it was frozen. 12 MR. MILHOAN: Okay. Thank you. 13 MR. TRAMMELL: Howard, just a question on testing. 14 I know this isn't exactly what you're talking about 15 here, but this plant is largely constructed, if not 16 totally constructed. And it's been tested to quite an 17 extent. 18 And I wonder if you could address now or later to 19 what extent the testing that has gone on, would help you 20 cut across some of these design boundaries? 21 For example, component cooling is a nightmare of 22 pipes that go to maybe 80 different heat exchangers. 23 And I would hate to see you spend your time verifying. 24 say, the flowing of each one of these legs with design 25 calculation, when, for example, the startup test on that

system might have been totally successful, that would be
 a waste of your time.

3 At the same time, I would hate to see you go 4 through and do a design verification on a system, and 5 declare it totally healthy, when the test results were 6 unfavorable. I mean you have got to consider that. It's like Stone and Webster is doing some reanalysis of 7 8 piping. I hate to see them reanalyze the piping, only 9 to find out in the field the as built are not what the 10 design called for to begin with.

11 So we would address at some point to what extent 12 the testing program going on can help you with this 13 design process, and at the same time provide a benchmark 14 for your conclusion. Maybe not now. Maybe later. But 15 at some point, I think it can help you, and might add 16 some credibility to your results.

MR. LEVIN: Okay. I think there are several good 17 18 examples of that. And possibly in our discussion, the 19 electrical area would be a good one, Charlie. I 20 certainly agree with your -- what you're suggesting. And at this point, I might suffice to say that that 21 22 information, that testing information that's available, 23 certainly would be used to reconcile things. 24 And, you know, we're using any piece of information

25 we can get to direct this effort. We want to get the

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 biggest benefit for our activity.

And to the extent that that can assist, it's certainly going to be considered.

MR. NOONAN: Just makes a note of it now and consider it, because that's something I think would be valuable to you in terms of cutting across some of these design lines, and at the same time helping us in seeing a brief assessment of how the tests went, and to what extent it confirmed your conclusions. It would help us.

MR. CALVO: I think it would be helpful to add what is a -- what -- all Charlie is saying here, will be just another element that is going to help at the end to prove the reasonable assurance.

And what he's saying, don't discard, because it can be very important, especially in those areas that you indicated yesterday.

17 Your sampling program, you have no access to it.
18 You're going to select another one. It could be those
19 you can rationalize. We had some preoperational testing
20 we can do. We got normal operation.

Others, we have got some tech specs that govern
that equipment. So you can use that as an element, will
govern in overall reasonable assurance.

24 MR. MARINOS: One more question. You have decided 25 on the cutoff date already for that system. Can you

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

90 tell me that date? Is it before or after the PRA was 1 2 submitted and evaluated by the staff on the agile 3 field water system. 4 MR. BECK: I'm sorry. What PRA are you referring 5 to? 6 MR. MARINOS: You have submitted a PRA on the 7 agile field water system on 1980 -- I'm not certain of 8 the date that -- and that PRA may have resulted in some 9 redesign. I am not certain about the real 10 facts. And I was asking with regard to the cutoff 11 date in evaluating the design, whether that would include or exclude that PRA result. 12 13 MR. BECK: The cutoff date Howard referred to is 14 April 1, 1985, and that --MR. MADDEN: That reliability analysis was done 15 16 several years ago. 17 MR. BECK: That's Fred Madden, TUGCO. MR. CALVO: I guess the question we have, when you 18 19 did that reliability analysis for the feed water system, 20 you can come out with some kind of implications that may 21 reflect it back on how the design was being done. 22 And those implications, the design was corrected. 23 The reason behind it that was done, you had selected a 24 system pretty much going to look all right because of 25 the PRA indicated.

91 1 So you want to know whether you found out about the PRA, that thing reflected back into the design. And you 2 3 made those corrections, or didn't do nothing to the 4 design? That's what I want to do. 5 MR. MADDEN: Fred Madden, TUGCO project. The 6 reliability analysis is a simplified reliability 7 analysis which was done in accordance with the 8 guidelines. And the FSAR did not result in any system 9 guidelines. It was used as a yardstick to compare the reliability of the Comanche Peak feed water system 10 11 against other systems. 12 MR. CALVO: Was that because of the TMA? Does the 13 sample -- reliability to demonstrate the --14 MR. MADDEN: Yes. 15 MR. CALVO: You mean check the result of what he 16 found out, and the impact and how the design, or -- for 17 maybe that was not -- maybe somebody did something to 18 it. 19 MR. LEVIN: You want to be sure you're testing. 20 MR. CALVO: Nice and clean. And all the 21 information that you hope to obtain is right on that 22 system. 23 MR. LEVIN: I understand your objective. 24 Could we move on to phase 3 in the phase 3 25 evaluation? We will assure that the scope of the

1 self-initiated view is adequate and broad there, as I 2 mentioned earlier, is a more detailed evaluation than 3 conducted in phase 2 to assure that all the activities 4 will be directly sampled, or that the activity is 5 sufficiently similar to that already sampled, and is 6 representative. This effectively assures that all 7 homogenous design activities are covered to assure 8 complete coverage of design activities.

9 These will be correlated with safety related 10 structures systems and components at Comanche Peak. So 11 at the conclusion of phase 3, we will have confirmed or 12 enlarged, which is -- there are some areas that we 13 believe -- for example, the main steam isolation valve, 14 for example, is a critical valve. But is not within the 15 boundaries of this system, that we are considering 16 adding to scope for that reason, that you just didn't 17 get coverage.

18 And in similar situations, like that would come out 19 of this activity, and would possibly be to 20 supplementation of the scope. But we will have 21 determined the coverage. But at the same time, we will 22 also have to find the minimum depth, and that warrants, 23 of our program, and that warrants some explanation. 24 We intend at the conclusion of phase 3, which is 25 targeted approximately the August time frame, that in

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

	93
1	addition to having this evaluation, you know, down to
2	the activity level complete, we would also have
3	available our check list, which would really define, in
4	many respects, define the depth of the investigation
5	available. So that, at that time, notwithstanding,
6	findings that may evolve later, I, you know, you
7	essentially defined the minimum scope. That scope may
8	increase even further, because of where findings have
9	led you. And that's how we get to phase 4.
10	Phase 4 is really the final scope determination.
11	MR. BOSNAK: Howard, before you go on. How would
12	you are you going to cover, how you would extrapolate
13	to other systems? Is this in your minimum guidelines
14	that you would have had? Is that what you mean my
15	extrapolation?
16	MR. LEVIN: Yes.
17	MR. BOSNAK: You will have a set of guidelines,
18	then, that
19	MR. LEVIN: This will justify it. It gets back to
20	the question that imposed to Larry, that he could ask me
21	a question, and I would be, you know, "Did you cover
22	this," or, "How did you evaluate that?"
23	And I would be able to say, I did directly, or I
24	could show him the road map to why I could extrapolate
25	to that.

-

	94
1	MR. BOSNAK: The same design organization, for
2	instance, in other things that would make it similar.
3	MR. LEVIN: Controlled by the same process, the
4	same organization did it, the same yeah.
5	MR. CHANDLER: How would you pick up the interface
6	issue in this one?
7	MR. LEVIN: Similar interfaces would be another
8	attribute that would be considered. For example
9	MR. CHANDLER: But when you you're not
10	necessarily when you say AE design scope, that would
11	pick up all associated interfaces, I presume?
12	Excuse me. It wasn't a response to your answer.
13	MR. CALVO: Repeat your question, Larry.
14	MR. LEVIN: The answer is yes.
15	MR. CHANDLER: Okay. See, that one passed.
16	MR. LEVIN: The final determination is as
17	important, I guess, is a derivative where all design
18	verification processes should lead you. And in effect
19	what occurs there is that we take a step back, we look
20	at the specific root causes that have been identified,
21	the generic implications, the deficiencies that have
22	been identified, and then taking one step back, looked
23	at that collectively, and made a judgment as to, you
24	know, do we need to expand the scope further on the
25	basis of what we found.

-

And so that at the completion of phase 4, you will
 have already confirmed the coverage and breadth. We
 will have confirmed the final scope. Effectively, phase
 4 occurs at completion of the program.

95

5 In other words, the scope determination never 6 really ends until it's over.

7 MR. CALVO: I guess you get to the foundation of 8 your program. This is the most important part of the 9 program. The determination of that scope so you, at the 10 end, come out with reasonable assurance, even though you 11 don't find anything wrong with it. Enough correlation, 12 therefore, with the depth and the breadth, equivalent to 13 John Hansen talking about the formulation, all those 14 populations there. That's also equivalent to what he's 15 doing. That's the two key elements.

16 And all I'm saying, when you submit the program 17 plan to us be sure that you have anchored those things 18 up with good -- with a good basis, good rationales. 19 Because if you failed your test, your program will collapse. That goes the same for the construction 20 21 effort. So do the best you can on that one, because 22 that will be the point of departure for everybody. 23 So you have been giving us some good works in 24 here. But still you have got those anchor bolts in there to hold it down, because that -- everything is 25

1 depending on those two.

2	And	be sure	that	they	are le	evel,	50	you	can
3	interface	from o	one to	the o	other.	And	I	think	you're
4	missing s	some of	that :	in det	tail.	Okay.			

5 MR. MILHOAN: Howard, with respect to your comment 6 about phase 3. You gave us an August date. Would you 7 explain that August date again?

8 MR. LEVIN: Okay. That's the time frame that we're 9 targeting completion of this process of correlation down 10 to the activity level, where we will have made a 11 determination of, you know, areas that we may -- scope 12 that may need to be added, okay, to insure that we have 13 the coverage of those activities.

14 So in addition to the scope that you will hear 15 about today, you may hear items like main steam 16 isolation valves, electrical penetrations, fault current 17 type considerations, that we may have added, because we 18 didn't really feel we had an adequate test in that 19 design activity.

20 MR. MILHOAN: Does the August time frame now on 21 this determination of scope, does that include the 22 completion of your independent reviews?

23 MR. LEVIN: No, not at all. That is a stage where
24 we have the --

MR. CALVO: The anchor, the foundation.

25

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

	97
1	MR. LEVIN: It's Jose's anchor. And also, at that
2	point in time, Jim the check list would, the full set
3	would be available such that you could get some insight
4	into the depth of the review as well.
5	MR. MILHOAN: I know John went through an overall
6	schedule later in the day. Do you plan going through an
7	overall schedule on your program at the end of this?
8	MR. LEVIN: Yes.
9	MR. MILHOAN: Okay. Thank you.
10	MR. LEVIN: Okay. Now we need to go back to the
11	paperclip.
12	MR. NOONAN: Before you go on. The you say
13	you're going to ta'k about the scheduling aspects later
14	on?
15	MR. LEVIN: Yes.
16	MR. NOONAN: I'm looking for a place where we
17	interface between these into this whole thing here.
18	MR. LEVIN: Okay. I believe that, for example, the
19	August time frame is one example where we clearly were
20	going to interface. There may be others. But that
21	seems like a critical junction.
22	MR. NOONAN: I guess in that respect, John, I will
23	be talking to you about the overall program plan and
24	MR. BECK: Yes. I think it's clear that that's a
25	required interface. Between now and then we may well

	98
1	want to or you may well want to examine. And I would
2	encourage that.
3	MR. NOONAN: Okay. All right.
4	MR. BECK: That's clearly one.
5	MR. LEVIN: Okay. Now after having described, you
6	know, how we're going to address our scope, I would like
7	to address our general approach to self-initiated
8	review. And as I indicated earlier, the approach
9	parallels that of the ANSI N-45-211 process.
10	And I guess what I would like to do is characterize
11	this review a little bit differently than the external
12	issues review, to the extent that, what we're doing here
13	is we're starting from the foundation, if you will, in
14	terms of the criteria. How those criteria were
15	implemented and through that implementation, where they
16	appropriately portrayed on design output, design
17	outputs, such as drawings and specifications.
18	That's a process that I characterize as kind of a
19	broad band filter that marches systematically through
20	the areas that we're looking at, as compared to, in some
21	other cases, some other external sources evaluation,
22	where it's a much more directed type of an
23	investigation, where the problems identified, and you're
24	trying to sort out the boundaries.
25	What we're trying to do here is take an entirely
1	

new untouched area and march to it in a systematic way,
 and catch a couple of things. And when you do catch it,
 we get into that investigation type of phase. This
 process will do that.

5 We start off by capturing the design inputs, using 6 N-45-211 terminology in the form of esoteric commitments 7 codes standards. Anything that govern the design.

8 Then given that, okay, how were these things 9 implemented and utilized, and calculations or 10 engineering evaluations by the project. And, 11 ultimately, given those implementing documents, where 12 they probably reflected on drawings and specs such that 13 we have an assurance that in fact the design criteria 14 were implemented.

MR. MILHOAN: Excuse me, Howard. On that design
analysis portion of your slide, a lot of computer codes
are used in design. What are your plans with respect to
the review of computer codes?

MR. LEVIN: We plan to verify in fact, that the codes were -- that there was a -- in fact, the codes were verified, and take a look at the actions that the project took to verify the use of codes. But we didn't anticipate completing that verification ourselves. Criteria identification and review.

MR. MARINOS: Howard, can I go back to that design

25

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

100 1 input area? This leg of review is actually the 2 paperwork, and you will be checking it against the 3 N-45-211 criteria to establish that design process was, 4 you know, was carried out, basically, along the lines of 5 that? 6 At the same time, my understanding is, your actual 7 reviewers, your reviewers will do independent 8 calculations in some areas or all areas, to confirm that 9 the design inputs that have resulted from the process 10 are the right ones that the guys used to arrive at the 11 correct calculations. Are we doing that? 12 MR. LEVIN: That's exactly correct. And the 13 methods will be somewhat multi-faceted in some cases. It may be just a review of a calculation. It may be an 14 15 alternate calculation, may be completed. Essentially, 16 those verification techniques that are described in N-45-211 are within the tools that we will apply in the 17 18 verification process. 19 MR. MARINOS: The point being that the design 20 process may be very good. The inputs are brought down 21 correctly, but the wrong ones, and vice versa, the other 22 guy is doing the calculation wrong so --23 MR. LEVIN: Exactly, yes. 24 MR. MARINOS: We're going to confirm those too. 25 MR. MILHOAN: Howard, let me follow up with a

101 1 comment on that, or question on that one. With respect 2 of -- to your performance of independent calculations. 3 the purpose of those, I would assume, would not be to 4 justify the design itself, but to review the design, the 5 justification. If you find something wrong, we'd go 6 back to projects for their input. 7 MR. LEVIN: That's correct. And those calculations 8 would not be design basis calculations. 9 MR. MILHOAN: Thank you. 10 MR. LEVIN: Okay. The objectives of the initial 11 phase criteria identification and review would be to 12 determine the criteria that the design was intended to 13 meet, okay, and then factor that into our subsequent 14 reviews. 15 Now this doesn't mean to say that we are accepting 16 that carte blanche. We're going to take a look at that 17 with a critical eye to assess it. It's complete and 18 also consistent. The process will be to simply identify 19 these design inputs from a variety of sources such as 20 the FSAR codes and standards, interface criteria that 21 may have been promulgated by Westinghouse, and then note 22 these. In fact, many of these things will be noted on 23 our check list. 24 MR. SHAO: What do you mean by Westinghouse 25 interface criteria?

MR. LEVIN: Okay. Westinghouse may have a 1 2 requirement for balance of -- for example, in the 3 AFW system, may have flows or heat removal requirements, 4 that Gibbs & Hill, for example, was required to meet. 5 And what we will do is, given that requirement, that interface with the interboles, determine whether 6 7 or not that was a method. 8 MR. MARINOS: You then, independently will try to 9 sort of develop a design -- a design description 10 document to evaluate the design. Or you will use what 11 Gibbs & Hill may have used to confirm that design? 12 MR. LEVIN: It's really a performance. We will 13 have effectively have created that kind of a document. 14 And that document will effectively be the check list. 15 The check list will have that kind of information 16 there. So if you looked at everything on there, you 17 might say that was the criteria spec, so to speak, for 18 the system. 19 MR. MARINOS: You will not develop a design 20 description document then? 21 MR. LEVIN: It's not our intent to do that, 22 specifically. There's certainly analogies to what will 23 be created, and what a document like that typically is. 24 MR. BOSNAK: Howard, are you going to look for, I 25 might call it, design improvements? In other words,

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

	103
1	things that the original designer did that may have not
2	been optimal? Could have been done differently? Not
3	that they didn't meet the criteria, but they could have
4	been improved?
5	For instance, a snubber that was not needed.
6	That's going to be included in your process?
7	MR. LEVIN: We I guess the way I generally
8	characterize that, Bob, is that I think that into a
9	category of practice as opposed for example, there
10	could be a snubber that's not needed. And with or
11	without the snubber, you know, the commitments codes and
12	requirements could be met, but it's not a good practice
13	to have that in there.
14	MR. BOSNAK: That's what I'm talking about, good
15	practice.
16	MR. LEVIN: We will identify good as well as bad
17	practices in the process, because our interest is not
18	only in verifying the quality of the design, but
19	insuring that there are improvements to make
20	MR. BOSNAK: The reliability of the design. That's
21	what I would be looking toward.
22	MR. LEVIN: Yeah. And even carrying that further,
23	if we can make recommendations that will help TUGCO
24	improve their programs for future work, then we want to
25	make sure that that information gets communicated.

	104
1	MR. BOSNAK: In other words, you won't crossover
2	something that is maybe, met all of the standards,
3	but in fact is, perhaps, poor engineering practice. You
4	would make that recommendation and change.
5	MR. LEVIN: Yes.
6	MR. MARINOS: Howard, I want to continue a little
7	more on that design description. Your check list is not
8	going to be an adequate document, at least for our
9	purposes, to determine whether the design is correct
10	the requirements from the various needs of the various
11	systems that it serves.
12	So a design description document serves that
13	purpose, to put together all the requirements that had
14	to be met. Now unless you make a judgment about the
15	design description that has already it's in place
16	through Gibbs & Hill, I would not be able to tell
17	whether your check list reflects the correct one or
18	anything else.
19	MR. LEVIN: That judgment will be documented and
20	for an evaluation the check list. We're doing that to
21	catch everything and to insure that that we're complete
22	as we march through our evaluation of various criteria.
23	MR. MARINOS: If you make judgments about the
24	design description as it exists today, and you find some
25	flaws problems, deficiencies, unless you define what

1 should be the correct one so that we can decide on that 2 basis, we will not be able to get that from your check 3 list.

4 MR. LEVIN: Not through the check list. But the 5 combination of the check list and our engineering 6 evaluations and other category documentation I 7 described, you will be able to get that. Checking the 8 evaluation isn't done on the check list. Our evaluation 9 of the adequacy occurs elsewhere. Occurs in the 10 engineering evaluation, the results reports and even 11 more broadly --12 MR. MARINOS: But the design document is a living 13 document, it tells you, it carries you, it's a 14 walkthrough of the system. What the system is designed 15 to do, and how it's going to achieve it. And unless you 16 give me some write-up that would parallel that or 17 supplement it --18 MR. LEVIN: One thing I want to make sure that we 19 are understanding, is that the check list will not 20 describe how it's going to be achieved, but it will

21 describe the requirements. Okay.

MR. MARINOS: Okay.

22

MR. LEVIN: Whether it was achieved will be
evaluated in the engineering evaluation. Our evaluation
of how it was achieved or wasn't will be documented in

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048 105

.

1 those documents. Okay.

2	Those documents, the calculations, evaluation
3	studies, that group of documentation that implemented
4	the criteria, will be reviewed to be sure that these
5	criteria were, in fact, correctly implemented. We will,
6	as part of that process will evaluate the adequacy of
7	these analyses and evaluation. And what we intend to do
8	is be sure that there is traceability to that decision
9	process. Okay.
10	That the relevant documents would be identified,
11	would be a cross reference between the design inputs and
12	the documents that dealt with these design inputs. Key
13	assumption, inputs and assumptions, would be identified
14	and evaluated.
15	And as we mentioned earlier, the tools for doing
16	that are some of the same tools documented in N-45-211
17	to include the review of calculations, alternate
18	calculations, whatever is required to reach that
19	judgment.
20	MR. BOSNAK: That would include possibly things
21	that are missing. In other words, if there are no
22	implementing documents, that would take the design
23	inputs and be able to translate them into outputs, or
24	that would be flawed in your mind. Either missing or
25	flawed, they would be identified.

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

107 1 MR. LEVIN: They would be identified, and, most probably, in that case, directed to the project. And 2 that deficiency would have to be corrected. 3 4 Essentially, we want to be sure as a bases -- there's a bases that -- for those inputs to having been 5 6 implemented. 7 MR. BOSNAK: That's right. I want to be sure that you are not just looking at whatever is provided. That 8 you're looking to make sure that something that's not 9 10 there and should be there, will be there. 11 MR. LEVIN: That occurs at -- not only, for example, is there a missing -- we had, I think the 12 13 example you gave there, is an input. And there's a 14 drawing or a spec, but you didn't see -- it wasn't an intermediate or inputting document that took you to 15 16 that. 17 So obviously that would be the other category, where we capture all the commitments that the project 18 may -- even at the criteria level, while there is a fair 19 20 amount of given NRC's review and other type reviews at that level, relatively low likelihood that things are 21 releasing from the company criteria level. If they are, 22 we would identify it there, too. 23 24 And add that to our list. You might say ours is an integrated list of what we believe is necessary for 25

1 those systems.

2	MR. MILHOAN: Howard, before you go to the next
3	slide on implementing document review slide, you earlier
4	said you had reviewed NCR integrated design inspection
5	report with respect to the depth of review.
6	I assume you got a fairly good feeling with respect
7	to the depth of review we do in an integrated design
8	inspection. Would it be your intent that this
9	self-initiated review would be consistent with that
10	depth of review or greater than what we do?
11	MR. LEVIN: I would characterize it as being
12	significantly greater.
13	MR. MILHOAN: The depth of review?
14	MR. LEVIN: Yes, greater.
15	MR. MILHOAN: Thank you.
16	MR. LEVIN: Design output review. And that's on
17	drawing and specifications. We are going to determine
18	the consistency of the design outputs with the design
19	inputs and implementing documents. In that process, we
20	would identify the documents relevant to the system
21	structure component, ensure that there's a correlation
22	or cross reference between those outputs, and the
23	criteria in implementing document results.
24	And lastly evaluate whether design outputs are
25	consistent with those documents. You know, it's one

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048
	109
1	thing to have a calc that said this is the way it ought
2	to look. We want to be sure that the drawing in fact
3	reflects that.
4	MR. MILHOAN: Howard, with respect to design, are
5	you also considering the design change process, both at
6	the site and at the AE's organization?
7	MR. LEVIN: Yes.
8	MR. MILHOAN: Okay. Thank you.
9	MR. BECK: Vince, could we take a five minute stand
10	in place stretch, and
11	MR. CALVO: That's a good idea. Don't go away.
12	(Whereupon there was a recess.)
13	MR, LEVIN: Can we get started? We're at a point
14	in our presentation where we can go through the generic
15	implications and closure, I believe easily before a
16	lunch break.
17	And then we're at a stage where we can do the
18	detailed review, discipline review descriptions after
19	lunch. So in fact we will have completed the first two
20	segments of the presentation.
21	And those presentations, for planning purposes,
22	have prepared presentations are approximately 20
23	minutes apiece. There are four. So notwithstanding
24	discussion, it should be, you know, approximately an
25	hour and a half after lunch, we should be able to

	110
1	conclude.
2	MR. BECK: That's not a commitment.
3	MR. SHAO: Just you talking?
4	MR. LEVIN: Yes. There will be other speakers in
5	the discipline group.
6	MR. MOLLONSON: Before we go on to a new subject,
7	please? I would like to go back to the criteria
8	indication and review. In all of those subjects,
9	implementation document review, where you stated an
10	objective, we find that one of the outstanding issues is
11	a statement on a fully implemented QA program. An
12	implemented program may have detected some of those
13	deficiencies in the design area.
14	I believe it's rather important that you state in
15	your objectives for each one of those criteria, where we
16	didn't include QA in the beginning sections of this
17	outline, that you state that your objectives in all of
18	these reviews, also include the satisfaction of the
19	QA/QC requirements.
20	I think even to the extent that that may be added
21	to your check list, that attribute for QA/QC
22	requirements, should be adequate for the check list. I
23	think that should be highlighted in the objectives
24	portion of the program.
25	MR. CALVO: Do you agree? Do you want to make a

.

111 1 commitment, or do you want to think about it? 2 MR. LEVIN: Yeah. You know it's something that I think I'd like to consider -- I think it's a comment 3 4 well taken. I'd like to consider it. I think that 5 aspect kind of weaves through the entire program, and 6 that's probably why you don't -- it's just indigenous to 7 our process. 8 MR. MOLLONSON: I don't have any problem 9 understanding the collective assessment of it. Place 10 it's in between the different groups. The end of 11 phases, between the different groups who evaluate 12 whatever the results of groups are. I think, however, 13 that the QA/QC aspect of every function performed by the 14 response team is a significant item in that assessment. 15 MR. LEVIN: I agree. 16 MR. CALVO: So you agree you cught to do it, right? 17 MR. LEVIN: We think we are, Jose. 18 MR. CALVO: You agree -- okay. All right. 19 MR. LEVIN: If we can get into the generic 20 implications program. I will define the purpose of that 21 program, the scope of it, and the source of inputs into 22 the program, and the description of our approach, and 23 how we will draw conclusions. 24 Our statement of purpose is to establish a 25 framework for systematic identification and evaluation

of generic implications related to the Comanche Peak
 design programs, processes or controls.

3 We will develop action plans or expand 4 self-initiated action plans to, one, identify potential 5 generic implications of design related deviations 6 deficiencies and their potential causes; to determine 7 the extent of applicability of design related 8 deficiencies and potential root causes; to ensure that 9 any resulting adverse effects on hardware are evaluated 10 and resolved; to identify necessary corrective actions; 11 to preclude reoccurrence; to provide reasonable assurance that generic effects of root causes and design 12 13 deficiencies have been identified and resolved.

14 Now on this diagram, I think this reflects a 15 concept that we discussed earlier. And the concept of 16 feedback. And I look at the generic implications 17 program as an integrator information, will flow both 18 ways, from the various functional elements of our 19 program. That is, where we're dealing with external 20 issues, where we have self-initiated actions in 21 progress, design related deviations, or deficiencies or 22 root causes get considered within the generic 23 implications program.

And after that consideration, generic effects on
hardware, design are then, oftentimes, go back the other

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 way.

5

2	And suffices to say that this process not only
3	occurs within the design adequacy program functional
4	elements, but also between our program and John Hansel's
5	construction and QA/QC program, to the extent that there
6	are issues that are design related.
7	The first step of the process includes a definition
8	of issues. And that is generic issues. And our
9	objective in that process is to identify common
10	attributes among identified deviations, deficiencies,
11	and potential root causes.
12	What we're trying to do here is to find the lowest
13	common denominator, so to speak, so that we can put
14	these items into like hoppers, such that we can then
15	identify whether or not there is a generic implication.
16	And the attributes that we might consider, would be
17	the sources, the symptoms, the bounds, the affected
18	organizations, the inner relationship with other issues,
19	et cetera.
20	Fundamentally, the question that we ask as we go
21	through the process are, what common attributes exist
22	among these various inputs into the generic implications
23	program? Where else have deviations or deficiencies
24	surfaced?
25	And ultimately, we're trying to answer the

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

	114
1	question, where else could deviations or deficiencies
2	erist?
3	MR. CHANDLER: Howard, you have here, seemingly,
4	with some deliberation, I would assume, omitted
5	discrepancies. Now you have included, for example,
6	under discrepancy, math errors. Could you explain why
7	discrepancies, for example, are not included on in
8	the generic implications program?
9	MR. LEVIN: Okay. We need to get back to, I think
10	an earlier comment, that math errors was an example, and
11	the way
12	MR. CHANDLER: I just used that example.
13	MR. LEVIN: But the way it was being used, was that
14	already was would have to be determined to be
15	inconsequential and isolated for it to remain a
16	discrepancy.
17	Essentially a discrepancy category cannot be an
18	item that has a consequence at all, okay. So there's
19	really no need. If you will, Larry, we created that
20	category, okay. It's more a logistical need for
21	managing programs.
22	You have to have, ultimately, a state of final
23	disposition for anything that flows into the hopper.
24	MR. CHANDLER: Then you would associate no generic
25	implications or no significance to a discrepancy which

	115
1	has generic implications? That is to say, if you find a
2	pervasive discrepancy, it says nothing to you from a
3	programmatic standpoint?
4	MR. LEVIN: No. That is a possibility that it
5	could say something.
6	MR. CHANDLER: But where does it get picked up, if
7	you're not looking into discrepancies in this category?
8	MR. LEVIN: It essentially wouldn't be a
9	discrepancy if it had that has significance, Larry.
10	MR. CHANDLER: But you're going to lose it in the
11	front end of the process, it seems to me, if you
12	determine that it's simply a discrepancy under the
13	definition you have given it. And if you have lost it
14	at the front end, how is it going to be retained over
15	here in the generic implications area?
16	MR. LEVIN: I don't recall a single discrepancy
17	that's inconsequential, okay? And I guess you're
18	concerned about a series of discrepancies that are also
19	inconsequential.
20	MR. CHANDLER: In terms of safety significance,
21	inconsequential. But in terms of programmatic
22	questions, are you going to pick that up?
23	MR. LEVIN: I'd say they're inconsequential in
54	terms of other things, too, if they didn't a failure
25	to meet a commitment. I mean, they have absolutely no

	116
1	consequence to the design at Comanche Peak. So I guess
2	our view is there is no need
3	MR. CHANDLER: You are making some assessment,
4	aren't you, about adequacy of QA/QC?
5	MR. LEVIN: Yes, that's correct.
6	MR. CHANDLER: And that factor, then, doesn't plug
7	into that determination.
8	MR. LEVIN: My belief, Larry, is that we're talking
9	about items of such a low level of consequence, that
10	they're below the threshold of really concern, from the
11	standpoint of QA/QC.
12	I think we all have to recognize that there is a
13	level of discrepancies that we'll never be able to get
14	out of this system or any other system, and they will
15	remain.
16	MR. CHANDLER: You will build in some kind of
17	definition then, perhaps, to put bounds on that; right?
18	MR. LEVIN: Yes.
19	MR. GUILBERT: Perhaps, I think in reality now,
20	what we tend to do is for anything to remain a
21	discrepancy, you would have to reach a conclusion that
22	it did not have generic implications that could be
23	safety significant, i.e., it's inconsequential.
24	MR. CHANDLER: I'm staying away
25	MR. GUILBERT: In order to stay in that category

-

117 MR. CHANDLER: I'm staying away from safety 1 2 significance. I have raised in the context of 3 QA/QC from a programmatic standpoint rather than from a 4 hardware standpoint. 5 MR. GUILBERT: Okay. 6 MR. LEVIN: Yes. 7 MR. BOSNAK: Howard, maybe what Larry was trying to 8 get at, you could kind a lot of errors that would be 9 indicative of sloppiness in the process. But, yet, each one in themselves is, you know, is not of consequence. 10 Maybe each one is taken care of by the margin that 11 12 you have in the particular piece of equipment that 13 you're looking at. But accumulatively, if you got rid 14 of all of them, you would never know that the whole 15 process is sloppy and --16 MR. LEVIN: As part of insuring that, we also have to determine that a collection of discrepancies have no 17 18 adverse cumulative effects. I mean they're truly 19 isolated. They're inconsequential amongst the individual item, as well at when considered as a group. 20 21 And I guess maybe we need some examples. 22 Suppose, for example, is, you know, we had a 23 typographical error, and it had to do with primary cooling system pressure, okay. And that pressure, we 24 all know, is of the order of 2500 pounds. But it said 25

1

1 it was 250. Decimal point was off.

2	And we do an assessment to determine, well, no one
3	has misinterpreted that, you know, it's and it's kind
4	of hard for someone to have a lack of understanding of
5	an order of magnitude, such that that could I mean,
6	we needed a way to deal with that. I think you need to
7	appreciate that our system is going to have the ability
8	to capture something like that, and we want to be able
9	to to deal with it.
10	MR. BOSNAK: Like modeling errors, where somebody
11	picks off the wrong dimension, and in itself, it doesn't
12	make any difference. But if you do that, and it's
13	pervasive, then there's some indication that this design
14	process is not as good as it should be. That kind of
15	thing.
16	So that that doesn't get eliminated at the top end
17	of your process.
18	MR. LEVIN: I agree. Certainly the cumulative
19	effects have to be considered.
20	MR. MARINOS: Howard, can you give me an example of
21	common attributes among the inputs? I do not understand
22	what that means.
23	MR. LEVIN: Okay. Yeah. We have got an example,
24	in fact, in the next slide.
25	MR. CALVO: Wait a minute. What are you going to

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 do with this one?

25

2 MR. LEVIN: I'm going to -3 MR. CALVO: No, no, not this one.
4 MR. CHANDLER: My question --

5 MR. CALVO: It looks to me like you're thinking of 6 doing the same thing that you're doing for the 7 deficiencies and deviations in some kind of way, not 8 quite coming through it. Do you want to consider it?

9 MR. CHANDLER: My concern again, Howard, is that
10 discrepancies don't get lost in the process in terms of,
11 not only potential significance from a safety
12 standpoint, but also from a quality assurance
13 programmatic standpoint.

MR. SHAO: I think you should treat this the same way you treated appendix P in John's section. We have appendix P, we have a lot to find out -- a lot of incidences that we assembled in appendix P. This is the same way.

MR. NOONAN: That's going to be hard. You're basically saying what you feel is the discrepancy at such a level that they're not really going to get involved, at least from your standpoint.

23 MR. LEVIN: We anticipate to maintain them at such
24 a level that it would not have a --

MR. NOONAN: Substantially, would require about --

1 you have a number of discrepancies. If you put them all 2 together, they don't add to some significant matter. 3 maybe I can associate that with an individual who is at 4 work. Maybe a number discrepancies may prove 5 insignificant to me, but the fact that he allowed them 6 may indicate poor quality of work or something. I think 7 that's what they're worried about. 8 MR. SHAO: You have to address programmatically.

120

9 MR. LEVIN: Yeah, I guess, you know, I think the
10 comments are well taken, and we'll consider that in our
11 program description.

Getting back to your question, Ed. On this slide 13 it may give you a conceptual idea of how we're going to 14 try to get these common attributes and deal with them.

MR. MARINOS: Can you give me an example? I'm
having difficulty understanding. What are the common
attributes? Or something specific?

MR. LEVIN: Okay. They start off at several levels. This diagram shows a three level approach. Really, what we have, a three dimensional matrix, if you would. And remember what's coming into this process is a potential root cause, a deviation or a deficiency, and we're trying to -- or a series, okay.

And what we're trying to do is find out, okay,
basically, keep being on -- you know, what activities it

applied to, what discipline was involved, what
 organization, what procedure may have been involved.
 And that's at the highest level.

Then we go down into the next level. And each of those broad categories, they subdivide into another category. You get, for example, out of the design activity area, you see the arrow coming down. It may affect a program. It inputs the process, the design verification itself, design change control, and discipline area.

11 Obviously, it could affect any discipline 12 organizations. It could affect any organizations or 13 subtier organizations within those, and the design 14 verification. It may have involved, when we get down to 15 even a further level, specific methods that were 16 selected to conduct the design verification in review of 17 correcting 45-211.

18 It could have been alternate calc. Or it could 19 have been a test that was in question. What we're 20 trying to do is take the series of deviations, and find 21 out, is there a common thread through all these things? 22 And through identification of that, and getting it down 23 to the lowest common denominator. Identify in some 24 respects. Confirm the root cause and generic 25 implication. Now that's kind of a first step.

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

122 1 The next step is, once you have suspected that, you want to define the boundaries on -- it's one thing to 2 3 say, "I think this is the root causes. This program is 4 weak." 5 Then you have to ask yourself, "Okay. That program 6 was weak. What could it have affected? Where was it 7 applied? What hardware did it apply to? What design 8 products did it apply to, okay? And then you go out and 9 test that. 10 And then those boundaries see -- whether or not, 11 you see the same kinds of problems. If you do you have 12 a generic problem here. And that's what this is all 13 about. 14 MR. SHAO: One suggestion on mechanical. I presume 15 all the pipe and pipe supports are in the mechanical. 16 MR. LEVIN: Piping and pipe supports is -- well, 17 okay, you're looking at this chart? I mean, this just 18 served as an example, Larry. This is to provide a 19 conceptual idea, how it would work. Piping and pipe 20 supports is a discipline. 21 MR. SHAO: What I suggest, is on the discipline, I think you group a mechanical, including mechanical --22 23 consistent. And mechanical component together. Is 24 there really two disciplines? 25 MR. LEVIN: Yeah, I agree.

	123
1	MR. SHAO: Different depth. Different people.
2	MR. MARINOS: Howard, can you walk us through this
3	with the physical system? Take a component system and
4	whatever, and walk us through the attributes and the
5	various decisions you make for the benefit of more than
6	just me? I understand more of us do not understand this
7	process.
8	MR. LEVIN: I'm trying to, Angelos.
9	MR. MARINOS: Pisk up something. I can suggest to
10	you, or you can give us a physical
11	MR. LEVIN: So that I can do that completely, could
12	I suggest that we, for example, mark up on this with an
13	example, and do that right after we come back from
14	lunch?
15	MR. MARINOS: That's fine.
16	MR. LEVIN: As opposed to going off the top of my
17	head? I may hold together.
18	MR. MOLLONSON: Excuse me. When we come down the
19	right-hand side, level two, identifying TUGCO the A need
20	and contractors. I don't know whether it's appropriate
21	to say contractors/vendors, because I don't know what
22	level of contractor you're talking about, whether or not
23	we should be adding vendors to supply us. We have some
24	principle equipment supplies that weren't contractors.
25	MR. LEVIN: Correct. This is meant to be a

124 1 conceptual framework, okay. This list at every level is 2 not complete on this diagram. However, it is complete 3 in our program. 4 MR. MOLLONSON: What I'm -- I guess what I'm after 5 is that your reviews don't start at contractor level, 6 because there is a definition, I guess, of contractor, 7 to go beyond the contractor level. Supply a vendor. 8 MR. LEVIN: Yes, that's correct. 9 MR. MOLLONSON: Okay. 10 MR. CALVO: I guess, Howard, when you submit to us 11 the limitation plan -- I mean the program plan, be sure 12 that you reflect -- consider that happening. MR. LEVIN: Yes. In fact, the list of the 13 14 attributes in those categories will be provided. 15 The next step, having identified a potential 16 generic concern, we have to determine, you know, what 17 areas of the design have been affected, okay. 18 And in many cases, the simple identification of a 19 generic concern will lead to an action plan. We're 20 going to have to carry out certain tasks and activities 21 to define those boundaries. And after having defined 22 those boundaries, evaluated the problems we find within 23 that box. 24 Basically, the investigation techniques that, you 25 know, we have talked about, are very similar. It may

1	include some sampling. We may have to expand the depth
2	or breadth of our review to accomplish that goal. But
3	after completing that, we will have fully defined the
4	boundaries of the issue. That is, its extent, where has
5	this generic problem promulgated?
6	We will have identified the impact on specific
7	hardware down to, you know, individual item level. And
8	also where applicable, in most cases generic problems,
9	get back to some need to improve a program. We will
10	provide recommendations for improvement of those
11	programs, processes or, controls.
12	MR. CALVO: I guess the question that I have, as
13	you have evaluated in the generic implications, that you
14	have found discipline. That you can look at, and you
15	say, "Well, this looks like." You may be problems in
16	some other areas.
17	Now you also may have another effort in the other
18	areas, and you could, possibility, could have been that
19	you missed some of those generic implications.
20	So there's got to be some kind of reconciliation.
21	And you have got to feed it back into the front end of
22	the program, and say, "Maybe what we did in here was not
23	quite kosher," or something like that. How do you cover
24	that?
25	MR. LEVIN: I agree, and those things are

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

	126
1	dovetail. And I guess that flow chart that I showed
2	previously shows that. I agree entirely, because the
3	generic implication it could be interdisciplinary.
4	MR. CALVO: But it could very well be the random
5	sampling. Whatever you do, you miss something in one
6	discipline, but is reflected in the other one, who shows
7	probably what this discipline is.
8	MR. LEVIN: Absolutely. When you develop those
9	plans, you develop means of testing, whether or not
10	that's the case across the boundary.
11	MR. CALVO: I think that's a good point. You are
12	checking all over from one discipline to the other at
13	different levels.
14	MR. LEVIN: That's correct. Having identified the
15	specific hardware affected, we then move in to resolving
16	and closing the generic issue. And we consider that the
17	issues are resolved and closed when we have nailed the
18	extent, the corrective action is developed, fully
19	defined and evaluated by the third party as being
20	acceptable.
21	This corrective action, as I implied, could apply
22	to a design process, program, or the design control.
23	And may include hardware deficiencies that need to be
24	corrected.
25	In either case, the results of this program are fed

-

127 1 back into the self-initiated design evaluation. And 2 that program might be evaluated -- expanded 3 accordingly. May be a need -- just want to get into 4 other areas in more detail than you have been. 5 Finally, the bases for these conclusions drawn in 6 this generic implication will be documented in the 7 results. There will be a section in each results report 8 that will address the generic implications of the 9 activities governed by that report. 10 Part and parcel to this entire process, whether it 11 be generic implications or just the execution of the 12 action plans, is the need from time to time to consider 13 expanding scope. The reasons are many. 14 One, we may need to investigate the trends of deviations further. May need to investigate root cause 15 16 further. We oftentimes will have to identify whether 17 we're talking about a random or programmatic type of 18 deficiency. We want to provide reasonable assurance 19 that all the -- all deficiencies are identified and 20 corrected. That is, the areas that are reviewed or 21 bound the problem. 22 There are specific conditions that require 23 expansion. Clearly deficiencies require expansion to 24 confirm that there are not other deficiencies. 25 Deviation, a deviation or deviations that could be

1 a deficiency if occurring elsewhere. That is, we're 2 not just going to say that -- we're going to recognize 3 the fact, this may get back to a train of thought that 4 you had indicated earlier, Larry, that a deviation here 5 may be found not to be a deficiency because of inherent 6 margin in that particular location.

However, we want that deviation in another
8 location.

9 MR. CHANDLER: And I would make my same comment
10 here, Howard, that perhaps you ought to consider,
11 including discrepancies in this exercise as well.

MR. LEVIN: Okay. We'll consider that. I think, as I committed to earlier -- but it recognizes the fact that the margin may be here. But we had the deviation over here and the margin wasn't there, it could be a deficiency.

MR. SHAO: I think what Larry suggested, including
 deficiency and disciplines.

MR. CHANDLER: Yes. My concern in this area, in particular, Howard, is that when you talk about expansion of scope, conceivably, if one found a number of relatively minor discrepancies, it may suggest a programmatic type of problem, which might lead you then to a deviation or deficiency in the next piece of work that went through the same process.

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

- 1	
1	But what you found earlier was simply a
2	discrepancy, and you may have several of those
3	discrepancies. If you would include that through
4	generic complications, it may lead you to a point of
5	identification. Something of more significance.
6	MR. LEVIN: Thank you. Another condition requiring
7	expansion would be identified group causes that can
8	affect design activities outside or inside the scope of
9	review.
10	And fundamentally, you know, after the decision to
11	expand, you need to expand to within a certain
12	population. The scope would be extended to similar
13	designs or processes, based upon the nature of the
14	potential root cause. It's not just a, you know, a
15	random process. It's a directed process, based upon the
16	nature of the issue that you're dealing with.
17	This gets us back to the basis for closure of the
18	design adequacy program. Fundamentally, closure occurs
19	when third parties activity associated with a specific
20	issue or group of issues have provided reasonable
21	assurance that no significant design deficiency remain
22	undetected, and there are certain conditions associated
23	with that.
24	And that statement is very close to the goal of our
25	program that must be met. For an issue to be closed

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1	130
1	safety significant, deficiencies and trends of
2	non-safety significant deviations must be identified.
3	. Conclusions regarding root causes and generic
4	implication for each, and determinations for corrective
5	action made.
6	Program closure occurs when all issues are closed,
7	and the third party has completed an integrated
8	assessment, enabling us to make recommendations for
9	improvement of construction and operation of management
10	and quality programs.
11	Since we have reached a stage in our presentation,
12	the end of the second phase, where it might be useful to
13	break for lunch. We could go on to the next review
14	description discipline review description. It's up
15	to you.
16	MR. NOONAN: I think I'd prefer to go ahead and
17	break for lunch.
18	MR. LEVIN: Okay.
19	MR. NOONAN: But before we do that, I'd like to
20	Mrs. Ellis with CASE has asked me to, along with Billie
21	Garde, to address this group. She has to catch an early
22	plane, and there's no reservations to catch a later
23	plane. So if it's okay with you, John.
24	MR. BECK: Sure. Hot seat Billy.
25	MR. COUNSIL: Okay. John, I'm starting to. I just

1 have some comments I want to share on this morning's 2 program. And I'm disappointed I'm not going to be able 3 to hear the rest of it. But I knew Howard was giving 4 the program, wouldn't get it all done this morning. 5 There was a few comments which go to the scope of 6 the program, now that I have seen Howard's presentation. 7 that I think are significant. The most significant 8 being that the third party groups' exit from this 9 project is, in my view, extremely premature. As, you know, both John and Howard, at the Midland 10 11 Project, which you, you know, referred to this morning 12 as kind of one of the bases for putting your program 13 together here. 14 A very significant part of what you did and why we 15 the intervenors and the public relied on the program, 16 was because you retained a large degree of overview and 17 accountability over your recommendations. 18 And I think in this particular case, that that type 19 of authority is extremely significant. I don't think 20 it's enough for you to just recommend closure of an 21 item, and then draw the conclusion that there is no --

23 conclusion cannot be drawn until the implementation is 24 acceptable and, in fact, has been accomplished.

that there is reasonable assurance. I think that

22

25

And if that is not retained, then I don't see how

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

	132
1	you can draw that particular conclusion which I
2	understand is your objectives.
3	So that I have a real problem with.
4	Second, I don't see any hold points or integrated
5	points at which either the NRC or the public puts their
6	comments in at a in a way that is meaningful in terms
7	of designated resolutions.
8	Clearly, your recommendations may include, you
9	know, there may be two or three other ways to solve a
10	particular problem that you have identified. You give
11	those recommendations over to the project a project,
12	and the correct solution is chosen, and then the project
13	jumps into corrective action.
14	Well, that point, obviously, is going to be reached
15	for different particular systems at different times.
16	It isn't going to be a single line where the whole
17	operation gets to that point, and then you move into
18	corrective action. And I understand there will be some
19	dynamics involved.
20	But I think if the NRC and, of course, the public
21	doesn't have input into those decisions, that you will
22	enter into corrective action, and that may not be the
23	choice that the NRC accepted. And intervenors may have
24	some strong reason why we don't believe that that type
25	of solution is acceptable.

[

1

And I think that you need to consider integrating
 hold points, I think, as a matter of efficiency, as well
 as making sure that all your bases are covered with NRC
 before you proceed into corrective action.

5 Piggybacking on one of the concerns discussed a lot 6 this morning in terms of the deviations, and not 7 trending the types of deviations that I understand 8 you're referring to as very, very minor.

9 I think I see the frustration on your face, Howard,
10 because I know what you're thinking of as very, very
11 minor problems, and you want to be very thorough. You
12 want to identify everything.

You have got some splatter on a weld, you have got
a particular type of bolt that has a very minor problem,
which is essentially cosmetic, that you could get real
bogged down on a lot of paperwork for not a lot of
problem.

18 The problem I see with that particular approach is 19 that, unless you're willing to assume a worse case analysis, unless you're willing to go into that cosmetic 20 21 problem and say that there are all -- all welds have 22 splatter and all welds with that type of cosmetic 23 problem, even if they all have that, it won't matter. 24 Unless you're willing to integrate that kind of 25 review, I don't see how you can exit at the front end on

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 minor deviations, particularly when you get to the issue 2 of sloppiness and poor workmanship, because that's 3 extremely significant in making some kind of 4 determination when you evaluate workmanship later.

5 That has to all be included. And if you're 6 operating on the assumption that you get from a lot of 7 small minor housekeeping or cosmetic problems, you have 8 got to take that into consideration when you consider 9 the larger problems.

10 So I think that that's a problem. Two things that 11 --- overall comments that I heard yesterday and today 12 that I want to make, and this goes both to what I have 13 heard this morning and yesterday, is that I'm really 14 afraid that this program is too confusing.

And that's a very simplistic way of saying that, from what I have seen, at least at this point, and -there are too many overlays, there are too many consultants, there are too many contractors with different charges.

And I don't see this ever coming together as a cohesive working well-oiled machine that is going to be able to very easily identify all the problems on this project, come to some kind of overall view of what the corrective actions need to be, and move into a corrective action phase.

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 The more people and the more systems and the more different methodologies and the more separate 2 3 QA/QC programs you have got, it's just going to become 4 extremely cumbersome. It's always been our position 5 that the best way to do this type of thing is to bring 6 in one major contractor, for instance, Stone and 7 Webster, which did a very good job at Midland to the 8 point until the project was cancelled, that came in, did 9 a particular thing, had a particular charge, and there we just worked with one or two contractors and one or 10 11 two charters. 12 This just is almost mind boggling in the different 13 levels that are supposed to be integrated. And I don't 14 think that goes just to me sitting here listening to 15 this. I think that goes to implementation. 16 Second point I want to make in terms of an

17 overview, and I didn't make this one yesterday. There 18 was some discussion yesterday about the harassment and 19 intimidation issued, and how Mr. Hansen was going to 20 handle that.

And his statement today, which was the same thing that he said back in February on the harrassment/intimidation issue, was that, based on the summaries provided by TUGCO attorneys, he had, as I understand it, pulled out the technical issues. He was

> GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 going to check those technical issues, and then if the 2 technical issues resulted in hardware problems, could be 3 a problem.

And if they did not, if the hardware was okay, then he had to assume that the problem wasn't there.

6 And Mr. Hansen, you consistently abused the phrase 7 that you can't get your arms around the problem any 8 other way. And I want to be on the record saying I 9 think that's a radically incorrect approach. And that 10 if I was in your position, Mr. Spencer -- or Mr. Beck, I 11 would make sure that he got his arms around the problem 12 in a way that's acceptable to the staff and to the board 13 at the front end. Because the problem isn't going to go 14 away.

The question is still going to be raised, and this isn't the definition given by Mr. Hansel, is not one, as I understand it, that is being accepted by the board.

And I don't think that that adequately resolves the problem, particularly when the basis of Mr. Hansel's information is given by the attorneys that have to advocate a particular position in the hearings, and have done so.

And so I want to be on the record as being
extremely concerned about how you, and I think it is
your problem, how you are going to handle that. I would

GODFREY & AMES COURT REPORTING Metro 469-6100, (817) 460-2048

1 2	be glad to sit down at a meeting, because I have some
2	ideas on how you could get your bands around it. And T
	rueas on now you could get your hands around it. And i
3	think that it can be done. And I think it needs to be
4	done.
5	Okay. Thanks. And I thank you for interrupting
6	your regularly scheduled program.
7	MR. NOONAN: Okay. Thank you, Billie. John, I
8	guess I would like to go ahead and break for lunch.
9	MR. BECK: One o'clock?
10	MR. SHAO: Can we
