## 1. EXECUTIVE SUMMARY

This Final Status Survey (FSS) Release Record for Survey Unit 10214A, “Construction Parking Area,” has been generated for the Zion Station Restoration Project (ZSRP) in accordance with ZionSolutions procedure ZS-LT-300-001-005, “*Final Status Survey Data Reporting*” (Reference 1) and satisfies the requirements of Section 5.11 of the “*Zion Station Restoration Project License Termination Plan*” (LTP) (Reference 2).

An FSS package (L2-10214A-F) was developed in accordance with ZionSolutions procedure ZS-LT-300-001-001, “*Final Status Survey Package Development*” (Reference 3), the LTP, and guidance from NUREG-1575, “*Multi-Agency Radiation Survey and Site Investigation Manual*” (MARSSIM) (Reference 4).

This open land survey unit has a MARSSIM classification of two. A survey plan was designed based upon use of the Sign Test as the nonparametric statistical test for compliance. Both the Type I ( $\alpha$ ) and Type II ( $\beta$ ) decision error rates were set at 0.05. Eighteen (18) systematic surface soil samples were acquired from the survey unit. In addition, surface scanning was performed on approximately 52% of the total surface area in the survey unit. Four (4) small areas of elevated activity were detected during the scans (see Section 9 for further discussion). The analytical results for all soil samples (systematic and investigation) taken in survey unit 10214A indicate that the Sum of Fractions (SOF) for each sample, when compared to the Operational Derived Concentration Guideline Levels (OpDCGL), was less than 1.0. For the systematic samples, the maximum Operational SOF (OpSOF) was 0.059 with a mean OpSOF of 0.036. The mean Base Case SOF (BcSOF), when the analytical results were compared to the Base Case DCGLs (BcDCGL), was 0.009, which results in a dose assigned to the survey unit of 0.230 mrem/year Total Effective Dose Equivalent (TEDE). Therefore, the null hypothesis is rejected and survey unit 10214A is acceptable for unrestricted release.

## 2. SURVEY UNIT DESCRIPTION

Survey unit 10214A, “Construction Parking Area,” is a Class 2 open land survey unit and is 8,542 m<sup>2</sup> in size. It is bounded on the west by a non-impacted area, the east by survey unit 10214B, the north by a non-impacted area and the south by survey unit 10205.

The topography of the survey unit is mainly flat with some small dips and depressions. Since this area was used for parking, the top surface is a mixture of gravel and loam. A paved road runs east to west in the northern part of the survey unit.

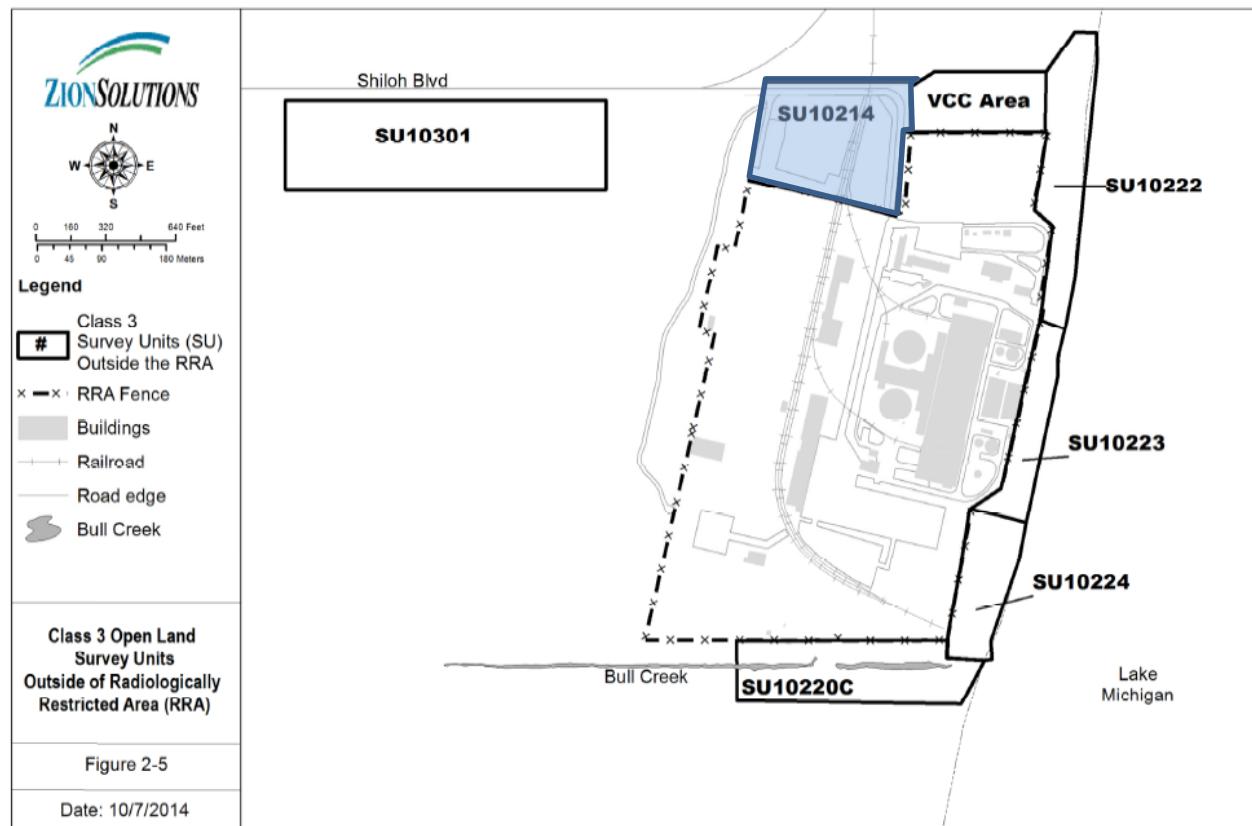

The boundary of the survey unit was defined using a Global Positioning System (GPS) based on the Illinois State Plane System North American Datum (NAD) 1983 East. The Illinois State Plane System Coordinates associated with the sample locations in this survey unit are presented in Table 8.

### 3. CLASSIFICATION BASIS

Survey unit 10214A was classified in accordance with ZionSolutions procedure ZS-LT-300-001-002, “Survey Unit Classification” (Reference 5).

The area encompassing this survey unit was described in the “Zion Station Historical Site Assessment” (HSA) (Reference 6) as the “Construction Parking Area” and was located within survey unit 10214 as identified in Figure 4 of the HSA. This area was subsequently described as the “Construction Parking Area” (survey unit 10214) in Table 2-4 of the LTP as represented in Figure 2-5 of the LTP and replicated below as Figure 1.

**Figure 1 - Class 3 Open Land Survey Units Outside of “Radiologically Restricted Area” from Figure 2-5 of the LTP**

The HSA states that this area contained the construction parking area which consisted of crushed rock.

Characterization surveys were performed in September and October of 2013 for the Class 3 survey unit 10214. The following data was obtained:

- Thirteen (13) judgmental surface samples taken at the direction of the cognizant Radiological Engineer (RE).
- Seventeen (17) random surface samples and three (3) random subsurface samples.
- One (1) investigation surface sample taken in an area identified by a scan alarm.
- Sodium iodide (NaI) walkover scans of approximately 10% of the surface area in survey unit.

The results of the characterization survey were:

- Three (3) of the thirteen (13) judgmental surface samples were positive for Cs-137 with the highest result being 0.11 pCi/g.
- All seventeen (17) of the random surface samples and the three (3) random subsurface samples were < Minimum Detectable Concentration (MDC) for the Radionuclides of Concern (ROC).
- The one (1) investigation surface sample was positive for Cs-137 with an activity of 0.09 pCi/g.

On June 12, 2017, due to changing radiological and operational conditions brought about by site decommissioning activities inside or adjacent to this area, survey unit 10214 was reclassified as Class 2, and divided into four survey units: 10214A, 10214B, 10214C and 10214D to comply with the survey unit size recommendations from MARSSIM Section 4.6.

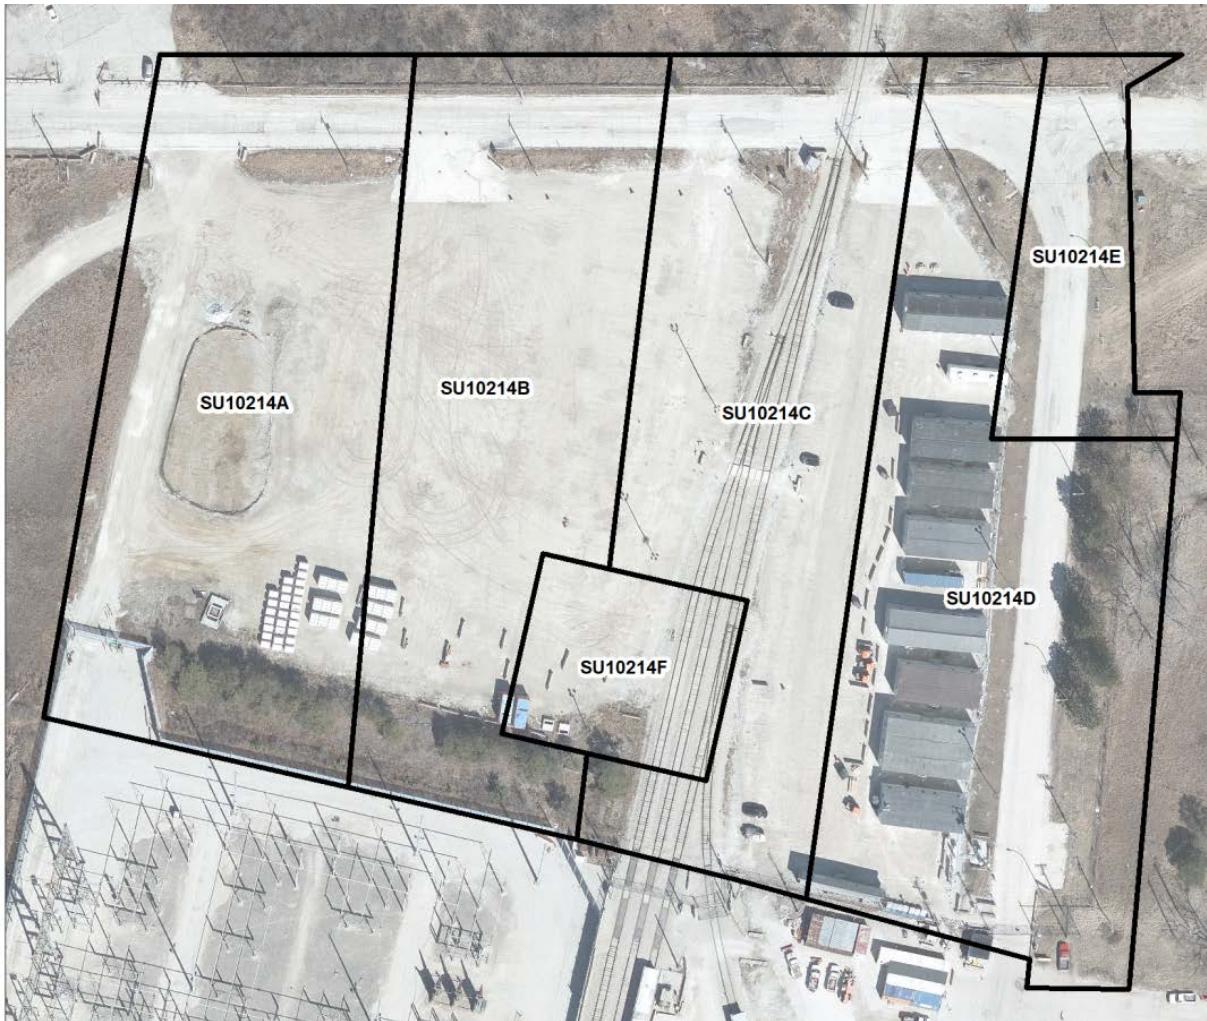

While performing an Radiological Assessment survey in March of 2019, a particle was found in the northeast portion of survey unit 10214D with an activity of 1.26  $\mu$ Ci. This area was subsequently reclassified as Class 1 and designated survey unit 10214E.

In November of 2019, a 0.02  $\mu$ Ci particle was discovered by the Radiation Protection group in the southwest portion of survey unit 10214C. This area was reclassified as Class 1 and designated survey unit 10214F.

These changes in classification, discussed above, were a conservative response and ensured that the survey unit was surveyed with the appropriate rigor.

Figure 2 below shows the boundaries of the 10214 survey units.

**Figure 2 - The Four Class 2 and Two Class 1 Open Land Survey Units Created from the Original Class 3 Survey Unit 10214**

An RE and a Characterization/License Termination (C/LT) Supervisor performed a visual inspection and walk-down of the survey unit on December 16, 2019, prior to performing FSS. The purpose of the walk-down was to assess the physical condition of the survey unit, evaluate access points and travel paths and identify potentially hazardous conditions. A final classification assessment was performed in accordance with ZS-LT-300-001-002, as part of the survey design for FSS. The assessment confirmed that survey unit 10214A was correctly classified as Class 2.

#### **4. DATA QUALITY OBJECTIVES**

FSS planning and design hinges on coherence with the Data Quality Objective (DQO) process to ensure, through compliance with explicitly defined inputs and boundaries, that the primary objective of the survey is satisfied. The DQO process, utilized in accordance with MARSSIM, is described in the LTP. The appropriate design for a given survey is developed using the DQO process as outlined in Appendix D of MARSSIM.

The DQO process incorporated hypothesis testing and probabilistic sampling distributions to control decision errors during data analysis. Hypothesis testing is a process based on the scientific method that compares a baseline condition to an alternate condition. The baseline condition is technically known as the null hypothesis. Hypothesis testing rests on the premise that the null hypothesis is true and that sufficient evidence must be provided for rejection. In designing the survey plan, the underlying assumption, or null hypothesis, was that residual activity in the survey unit exceeded the release criteria. Rejection of the null hypothesis would indicate that residual activity within the survey unit does not exceed the release criteria. Therefore, the survey unit would satisfy the primary objective of the FSS sample plan.

The primary objective of the FSS sample plan is to demonstrate that the level of residual radioactivity in survey unit 10214A does not exceed the release criteria specified in the LTP and that the potential dose from residual radioactivity is As Low As Reasonably Achievable (ALARA).

ZionSolutions Technical Support Document (TSD) 11-001, “*Technical Support Document for Potential Radionuclides of Concern During the Decommissioning of the Zion Station*” (Reference 7), established the basis for an initial suite of potential Radionuclides of Concern (ROC) for the decommissioning of the Zion Nuclear Power Station (ZNPS).

ZionSolutions TSD 14-019, “*Radionuclides of Concern for Soil and Basement Fill Model Source Terms*” (Reference 8), was written to refine the initial selection of ROC for decommissioning at ZNPS. The list of ROC was evaluated using Containment and Auxiliary Building concrete core analysis data to evaluate the dose significance of each radionuclide in the end state model. Section 4.4 of TSD 14-019 evaluated the results of the characterization data of surveys taken of soils. The following conclusion was reached: “*The results of surface and subsurface soil characterization in the impacted area surrounding Zion indicate that there is minimal residual radioactivity in soil. Essentially all of the soil results were reported as non-detectable. Other than Cs-137 at very low levels, and Co-60 at a concentration of 0.24 pCi/g in one sample, the results for all radionuclides were less than MDC. Therefore, the direct determination of radionuclide mixture fractions for initial suite radionuclides in soil is not technically feasible due to the MDC biasing issues discussed above. Based on a generalized assumption that the contaminated water that caused concrete contamination would be similar to the source of soil contamination, the ROC and radionuclide mixture derived for the Auxiliary Building concrete was considered to be reasonably representative of soils for FSS planning and implementation.*”

The ROC for surface soils are listed in Table 1 below (from Table 5-2 of the LTP):

**Table 1 - Dose Significant Radionuclides and Mixture**

Radionuclide	Auxiliary Building % of Total Activity (normalized) <sup>(1)(2)</sup>
Co-60	0.92%
Ni-63	23.71%
Sr-90	0.05%
Cs-134	0.01%
Cs-137	75.32%

(1) Based on maximum percent of total activity from Table 20 of TSD 14-019, normalized to one for the dose significant radionuclides

(2) Does not include dose significant radionuclides for activated concrete (H-3, Eu-152, Eu-154).

A fundamental precursor to survey design is to establish a relationship between the release criteria and some measurable quantity. This is done through the development of DCGLs. The DCGLs represent average levels of radioactivity above background levels and are presented in terms of surface or mass activity concentrations. Chapter 6 of the LTP describes in detail the modeling used to develop the DCGLs for soils.

Surface soil is defined as soil residing in the first 0.15 m (6 inches) layer of soil. A subsurface soil category, which is defined as a layer of soil beginning at the surface but extending to a depth of 1 m, is also assessed to allow for flexibility in compliance demonstration if contamination deeper than 0.15 m is encountered. Site-specific DCGLs for soil were calculated for both the 0.15 m and 1 m thicknesses. Based on characterization data and historical information, there are no expectations of encountering a source term geometry that is comprised of a clean surface layer of soil over a contaminated subsurface soil layer. ZionSolutions TSD 14-011, “Soil Area Factors” (Reference 9) and LTP, Section 6.8 provide the exposure scenarios and modeling parameters that were used to calculate the site-specific DCGLs for soils (referred to as BcDCGL in this Release Record).

At ZNPS, compliance is demonstrated through the summation of dose from four distinct source terms (basements, soils, buried pipe and groundwater) for the end-state. Basements are comprised of the summation of four structural source terms (surfaces, embedded pipe, penetrations and fill). When applied to soil, the DCGLs are expressed in units of activity per unit of mass (pCi/g). The “unity rule” is applied when there is more than one ROC. The measurement results for each singular ROC present in the mixture are compared against their respective DCGL to derive a dose fraction.

The surface and subsurface soil BcDCGLs for the unrestricted release of open land survey units are listed in Tables 5-5 and 5-6 of the LTP and are provided in Table 2 and Table 3, respectively.

The Insignificant Contributor (IC) dose percentage of 10% was used to adjust the DCGLs in soils to account for the dose from the eliminated IC radionuclides.

**Table 2 - Base Case DCGLs for Surface Soils (BcDCGLss)**

Radionuclide	Surface Soil DCGL (pCi/g)
Co-60	4.26
Cs-134	6.77
Cs-137	14.18
Ni-63	3,572.10
Sr-90	12.09

**Table 3 - Base Case DCGLs for Subsurface Soils (BcDCGLSB)**

Radionuclide	Subsurface Soil DCGL (pCi/g)
Co-60	3.44
Cs-134	4.44
Cs-137	7.75
Ni-63	763.02
Sr-90	1.66

Each radionuclide-specific BcDCGL is equivalent to the level of residual radioactivity (above background levels) that could, when considered independently, result in a TEDE of 25 mrem/year to an Average Member of the Critical Group (AMCG). To ensure that the summation of dose from each source term is 25 mrem/year or less after all FSS is completed, the BcDCGLs are reduced based on an expected, or *a priori*, fraction of the 25 mrem/year dose limit from each source term. The reduced DCGLs, or “Operational” DCGLs, can be related to the BcDCGLs as an expected fraction of dose based on an *a priori* assessment of what the expected dose should be based on the results of site characterization, process knowledge and the extent of planned remediation. The OpDCGL is then used as the DCGL for the FSS design of the survey unit (calculation of surrogate DCGLs, investigations levels, etc.). Details of the OpDCGLs derived for each dose component and the basis for the applied *a priori* dose fractions are provided in ZionSolutions TSD 17-004, “*Operational Derived Concentration Guideline Levels for Final Status Survey*” (Reference 10).

The OpDCGLs for the FSS of surface and subsurface soils are listed in Tables 5-7 and 5-8 of the LTP and are presented in Table 4 and Table 5, respectively.

Ni-63	914.458
Sr-90	3.095

**Table 5 - Operational DCGLs for Subsurface Soils (OpDCGL<sub>SB</sub>)**

Sr-90	0.425

In accordance with NUREG-1757, Appendix G, if the HSA indicates that there is no likelihood of substantial subsurface residual radioactivity, subsurface surveys are not necessary. The HSA, as well as the results of the extensive characterization of subsurface soils in the impacted area surrounding the Zion facility have shown that there is minimal residual radioactivity in subsurface soil. Consequently, the ZSRP performed minimal subsurface sampling during FSS.

Instrument DQOs included a verification of the ability of the survey instrument to detect the radiation(s) of interest at the required scan MDC, which for Class 2 open land survey units, is less than or 50% of the applicable OpDCGL. Survey instrument response checks were required prior to issuance and after the instrument had been used. Control and accountability of survey instruments was required to ensure the quality and prevent the loss of data.

As part of the DQOs applied to laboratory processes, analysis results were reported as actual calculated results. The actual recorded value was used as the recorded FSS result for measurement and/or sample values that are less than MDC. Negative values were recorded as “zero.” For radionuclides less than MDC, the value representing the highest abundance was selected. Results were not reported as “less than MDC.” Sample report summaries included unique sample identification, analytical method, radionuclide, result, uncertainty, laboratory data qualifiers, units, and the observed MDC.

In accordance with the LTP, for laboratory analysis, MDCs less than 10% of the OpDCGL were preferable while MDCs up to 50% of the OpDCGL were acceptable. The maximum acceptable MDC for measurements obtained using field instruments was the *a priori* DCGL<sub>EMC</sub>, which was calculated using the methodology described in the LTP, Section 5.6.4.3.

## 5. SURVEY DESIGN

The level of effort associated with planning a survey is based on the complexity of the survey and nature of the hazards. Guidance for preparing FSS plans is provided in ZS-LT-300-001-001, “Final Status Survey Package Development.”

The DQO process determined that Co-60, Ni-63, Sr-90, Cs-134 and Cs-137 would be the ROC in survey unit 10214A. During FSS, concentrations for Hard-to-Detect (HTD) ROC Ni-63 and Sr-90 were inferred using a surrogate approach. Cs-137 is the principle surrogate radionuclide for Sr-90 and Co-60 is the principle surrogate radionuclide for Ni-63. The mean, maximum and 95% Upper Confidence Level (UCL) of the surrogate ratios for concrete core samples taken in the Auxiliary Building basement were calculated in TSD 14-019, “Radionuclides of Concern For Soil and Basement Fill Model Source Terms,” and are presented in Table 6. The maximum ratios were used in the surrogate calculations during FSS unless area specific ratios are determined by continuing characterization.

**Table 6 - Surrogate Ratios**

Ratios	Auxiliary Building		
	Mean	Max	95%UCL
Ni-63/Co-60	44.143	180.450	154.632
Sr-90/Cs-137	0.001	0.002	0.002

For the FSS of survey unit 10214A, the surrogate OpDCGLs for Co-60 and Cs-137 were computed based on the maximum ratios from Table 6.

The equation for calculating a surrogate DCGL is as follows:

**Equation 1**

$$\text{Surrogate}_{DCGL} = \frac{1}{\left[ \left( \frac{1}{DCGL_{Sur}} \right) + \left( \frac{R_2}{DCGL_2} \right) + \left( \frac{R_3}{DCGL_3} \right) + \dots \left( \frac{R_n}{DCGL_n} \right) \right]}$$

Where: DCGL<sub>Sur</sub> = Surrogate radionuclide DCGL

DCGL<sub>2,3...n</sub> = DCGL for radionuclides to be represented by the surrogate

R<sub>n</sub> = Ratio of concentration (or nuclide mixture fraction) of radionuclide “n” to surrogate radionuclide

Using the OpDCGLs for surface soils presented in Table 4 and the maximum ratios from Table 6, the following surrogate calculations for surface soils were performed:

**Equation 2**

$$Surrogate_{DCGL(Cs-137)} = \frac{1}{\left[ \left( \frac{1}{3.630_{(Cs-137)}} \right) + \left( \frac{0.002}{3.095_{(Sr-90)}} \right) \right]} = 3.622 \text{ pCi/g}$$

The surrogate OpDCGL for surface soils that was used for Cs-137 in this survey unit for direct comparison of surface soil sample results to demonstrate compliance is 3.622 pCi/g.

**Equation 3**

$$Surrogate_{DCGL(Co-60)} = \frac{1}{\left[ \left( \frac{1}{1.091_{(Co-60)}} \right) + \left( \frac{180.45}{914.458_{(Ni-63)}} \right) \right]} = 0.898 \text{ pCi/g}$$

The surrogate OpDCGL for surface soils that was used for Co-60 in this survey unit for direct comparison of surface soil sample results to demonstrate compliance is 0.898 pCi/g.

The surrogate OpDCGL for Co-60 while inferring Ni-63 is 0.898 pCi/g, the surrogate OpDCGL for Cs-137 while inferring Sr-90 is 3.622 pCi/g and the OpDCGL for Cs-134 is 1.733 pCi/g. Using the normalized mixture for gamma emitting ROC from Table 1, the surrogate adjusted gamma DCGL is then calculated as follows:

**Equation 4**

$$Surrogate_{DCGL(gamma)} = \frac{1}{\left[ \left( \frac{0.012}{0.898_{(Co-60)}} \right) + \left( \frac{0.0001}{1.733_{Cs-134}} \right) + \left( \frac{0.988}{3.622_{(Cs-137)}} \right) \right]} = 3.494 \text{ pCi/g}$$

The surrogate adjusted gamma DCGL that was used in this survey unit is 3.494 pCi/g.

For this Class 2 open land survey unit, the “Investigation Levels” for area scanning and soil sample measurement results are those levels specified in LTP, Table 5-25, and are reproduced below in Table 7.

**Table 7 - Investigation Levels**

Classification	Scan Investigation Levels	Direct Investigation Levels
Class 2	>Operational DCGL or >MDC <sub>scan</sub> if MDC <sub>scan</sub> is greater than Operational DCGL	> Operational DCGL

The MDC<sub>scan</sub> for the 2350-1/44-10 was calculated using the methodology of ZionSolutions TSD-11-004, “Ludlum Model 44-10 Detector Sensitivity” (Reference 11) with the following parameters:

- background count rate of 3,000 counts per minute (cpm)
- scan speed of 0.5 m/sec
- distance from detector to surface of 2 inches
- isotopic mix of 95% Cs-137 and 5% Co-60

The calculated MDC<sub>scan</sub> value was 2.90 pCi/g, which is less than the surrogate adjusted gamma DCGL calculated above. However, as a conservative measure, the scan investigation level was set at the MDC<sub>scan</sub> of the 2350-1/44-10. The collimator was used during the scan surveys to lower the background count rate.

The Sign Test was selected as the non-parametric statistical test. The use of the Sign Test did not require the selection or use of a background reference area, which simplified survey design and implementation. This approach was conservative since it included background Cs-137 as part of the sample set.

The number of soil samples for FSS was determined in accordance with ZS-LT-300-001-001. The relative shift ( $\Delta/\sigma$ ) for the survey unit data set is defined as shift ( $\Delta$ ), which is the Upper Bound of the Gray Region (UBGR), or the DCGL (SOF of 1), minus the Lower Bound of the Gray Region (LBGR) (SOF of 0.5), divided by sigma ( $\sigma$ ), which is the standard deviation of the data set used for survey design. The optimal value for  $\Delta/\sigma$  should range between one and three. The largest value the  $\Delta/\sigma$  can have is three. If the  $\Delta/\sigma$  exceeds three, then the value of three will be used for  $\Delta/\sigma$ . A conservative estimate of the sample variability of 0.30 was used as the coefficient of variation to calculate  $\Delta/\sigma$ .

The calculated relative shift was 1.67. Both the Type I error, or  $\alpha$  value and the Type II error, or  $\beta$  value was set at 0.05. The sample size from Table 5.5 of MARSSIM that equates to the Type I and Type II error of 0.05 for use with the Sign Test is an N value of 17.

The computer program Visual Sample Plan (VSP) was used to generate the sample map, in accordance with ZS-LT-300-001-001. The map used was provided by the Survey Mapping/Computer Assisted Design Specialist, with coordinates based on the Illinois State Plane NAD 1983 standard topographical grid coordinate system. The number of samples generated by VSP for a systematic triangular grid was seventeen. The Prospective Power Curve generated by VSP showed adequate power for the survey design.

The calculated MDC<sub>scan</sub>, 2.90 pCi/g, is less than the surrogate adjusted gamma DCGL calculated above, therefore, the spacing of the statistical systematic sampling and measurement locations was adequate. No adjustment to the sample number was required.

The implementation of quality control (QC) measures as referenced by LTP, Section 5.9 and ZionSolutions procedure ZS-LT-01, “*Quality Assurance Project Plan (for Characterization and FSS)*” (QAPP) (Reference 12) includes the collection of a soil sample for “split sample” analysis on 5% of the soil samples taken in a survey unit with the locations selected at random. One (1) surface soil sample (L2-10214A-FQGS-002-SS) was selected randomly for split

sample analysis for the FSS of this survey unit.

ZionSolutions procedure ZS-LT-01 also requires that replicate surveys be performed on 5% of all scan locations chosen at random. This requirement is being met by performing QC replicate scans on 5% of the total area scanned in Class 2 open land areas. A replicate measurement is an independent direct measurement performed by a qualified technician, other than the one who obtained the original measurement, with a separate but similar instrument. Rows 71 through 77 were chosen at random for QC replicate scans. These rows represent approximately 9% of the total area scanned in this survey unit (403 m<sup>2</sup> of 4,483 m<sup>2</sup> total area scanned).

The locations of the seventeen (17) systematic samples are listed in Table 8. A map of the systematic sample locations is included in Attachment 1.

LTP, Section 5.1 states that soil samples will be collected during FSS to confirm the HTD to surrogate radionuclide ratios (provided in Table 6). Ten percent (10%) of the FSS samples collected from open land survey units will be analyzed for HTD ROC. Only HTD radionuclides included as ROC (Ni-63 and Sr-90 for soils) will be analyzed in the FSS confirmatory samples. For soil samples with positive results for both a HTD ROC and the corresponding surrogate radionuclide (Cs-137 or Co-60), the HTD surrogate ratio will be derived and compared against the maximum ratio. The maximum ratios will be used unless specific survey information supports the use of a surrogate ratio that is specific to the area. In

these cases, the survey unit-specific radiological data and the derived surrogate ratios will be submitted to the NRC for approval. If approved, then the survey unit-specific ratios used and the survey data serving as the basis for the surrogate ratios will be documented in the release record for the survey unit.

In addition, LTP Section 5.1 states that if levels of residual gamma radioactivity in an individual soil sample exceed an OpSOF of 0.1, then the sample(s) will be analyzed for HTD ROC. This threshold was not encountered during the FSS of survey unit 10214A.

Three (3) soil samples, L2-10214A-FIGS-001-SS, L2-10214A-QIGS-001-SS and L2-10214A-FIGS-002-SS, were selected to meet the requirement that 10% of the samples collected during FSS of open land survey units be analyzed for HTD ROC. These samples were selected based on exhibiting the highest concentrations of Cs-137 among all the samples. Each sample was sent off-site (Eberline Analytical) for analysis of the HTD ROC as specified in LTP, Section 5.1. Eberline analytical reports are provided in Attachment 8.

Table 9 provides a synopsis of the survey design for survey unit 10214A.

## 6. SURVEY IMPLEMENTATION

Survey instructions for this FSS were incorporated into and performed in accordance with FSS sample plan L2-10214A-F, which was developed in accordance with ZS-LT-300-001-001. The FSS unit was inspected and controlled in accordance with *ZionSolutions* procedure ZS-LT-300-001-003, “*Isolation and Control for Final Status Survey*” (Reference 13).

For survey unit 10214A, compliance with the unrestricted release criteria was demonstrated through a combination of surface scanning with a Ludlum Model 44-10 gamma detector and the sampling of surface soil for isotopic analysis. In accordance with the LTP Chapter 5, if during the performance of FSS, the analysis of a surface soil sample, or the results of a surface gamma scan indicated the potential presence of residual radioactivity at a concentration of 75% of the subsurface OpDCGL, then a biased subsurface soil sample(s) would have been taken to the appropriate depth within the area of concern as part of the investigation. This threshold was encountered during the FSS of survey unit 10214A while performing gamma scans in rows 5, 6, 10 and 56 (see Section 9 for further discussion). Surface and subsurface investigation soil samples were taken at these locations (L2-10214A-FIGS-001-SS to L2-10214A-FIGS-005-SS and L2-10214A-FIGS-001-SB to L2-10214A-FIGS-005-SB).

FSS field activities were conducted under FSS sample plan L2-10214A-F. A “Field Log” (ZS-LT-300-001-001, Attachment 14) was used to document field activities and other information pertaining to the performance of the FSS.

Daily briefings were conducted to discuss the expectations for job performance and to review safety aspects of the job. The survey required field activities were performed during normal working hours starting on December 16, 2019, and concluding on December 17, 2019. The QC replicate scan surveys were performed on December 17, 2019.

The seventeen (17) systematic surface soil sample locations were marked with flags based on GPS coordinates provided by VSP. Two (2) samples were relocated due to the original locations being located over a fiber optic cable. The relocated sample points are listed in Table 22.

Gamma scans were performed on approximately 52% (4,483 m<sup>2</sup>) of the surface area of the survey unit (8,542 m<sup>2</sup>) using a Ludlum 2350-1 paired with a Model 44-10 (2” x 2”) NaI detector operated in the rate-meter mode and using audio response. The probe was positioned within 2 inches of the ground and was moved at a scan speed of approximately 0.5 meters per second. Four (4) areas of elevated activity were detected on the scans (see Section 9 for further discussion).

Daily, prior to and following use, each detector was subjected to an Operational Response Check in accordance with *ZionSolutions* procedure ZS-RP-108-004-011, “*Operation of the Ludlum Model 2350-1 Data Logger*” (Reference 14). The daily Operational Response Check compared the background response and the response to check sources ranges established for normal background and detector source response to ensure that the detector was working properly. The

instruments and detectors used for this survey are presented in Table 10. The instruments and detectors were verified to be properly calibrated prior to use.

In accordance with the survey design, seventeen (17) surface soil samples were collected at the designated systematic sample points. In addition, five (5) surface samples and five (5) subsurface samples were collected as part of the investigation of four (4) areas of elevated activity identified during the surface scans.

Three (3) samples (L2-10214A-FIGS-001-SS, L2-10214A-QIGS-001-SS and L2-10214A-FIGS-002-SS) were selected for HTD radionuclide analysis. One (1) surface soil sample (L2-10214A-FQGS-002-SS) was selected randomly for QC sample analysis. One (1) additional QC split sample was obtained at investigational sample location L2-10214A-QIGS-001-SS.

## 7. SURVEY RESULTS

Approximately 52% (4,483 m<sup>2</sup>) of the surface area of the survey unit (8,542 m<sup>2</sup>) was scanned for elevated radiation levels. Seventy-nine (79) 1-meter wide scan rows, as shown on the map in Attachment 1, were marked in the field and scanned with the 2350-1/44-10 using latching mode. Readings were recorded at approximately 10-meter intervals during the scans. Four (4) elevated measurement locations were identified by surface scan in rows 5, 6, 10 and 56 (one area in each row). See Section 9 for further discussion. Table 11 provides an overview of the scan results. Complete scan results are provided in Attachment 2.

The seventeen (17) systematic surface soil samples taken for non-parametric statistical testing, the five (5) biased surface soil samples (investigation) and the five (5) subsurface soil samples (investigation) were analyzed using the on-site gamma spectroscopy system. Summaries of the sample analysis results are provided in Tables 12, 13 and 14, respectively. The basic statistics for the systematic sample population are summarized in Table 21. For the systematic samples, the gamma spectroscopy results revealed three (3) samples with activity levels above MDC for Cs-137 and no samples with activity levels above MDC for Co-60 or Cs-134. The concentration for Ni-63 and Sr-90 were inferred based on the maximum ratios as specified in Table 6. The mean of the gamma spectroscopic analysis results for the sample population indicated that Cs-137 was present at levels lower than the concentrations of Cs-137 expected to be found in off-site soil in the vicinity of the ZNPS as presented in ZionSolutions TSD 13-004, “*Examination of Cs-137 Global Fallout In Soils At Zion Station*” (Reference 15). The complete gamma spectroscopy reports are presented in Attachment 7.

The off-site laboratory, Eberline Analytical, processed the three (3) samples selected for HTD ROC analysis as specified in the survey design. Samples L2-10214A-FIGS-001-SS-A, L2-10214A-QIGS-001-SS-A and L2-10214A-FIGS-002-SS-A were selected. Only HTD radionuclides included as ROC (Ni-63 and Sr-90 for soils) were included in the analysis. All analyses met the required MDC. Only Cs-137 was positively detected in the samples at a concentration greater than MDC. Consequently, comparison of existing ratios versus the maximum ratios from Table 6 was not required. The off-site analysis results are provided in Table 15.

The implementation of survey specific QC measures included the collection of one (1) systematic sample (L2-10214A-FQGS-002-SS) and one (1) biased sample (L2-10214A-QIGS-001-SS) for “split sample” analysis. The on-site laboratory analyzed the designated QC samples using the on-site gamma spectroscopy system. Gamma spectroscopy results are summarized in Table 16. The concentration for Ni-63 and Sr-90 are inferred based on the maximum ratios as specified in Table 6.

The SOF or “unity rule” is the mathematical test used to evaluate compliance with radiological criteria for license termination when more than one radionuclide has been determined to be potentially present. The equation for the unity rule is:

### Equation 5

$$\frac{C_1}{DCGL_1} + \frac{C_2}{DCGL_2} + \dots + \frac{C_n}{DCGL_n} \leq 1$$

Where:  $C_n$  = concentration of radionuclide  $n$

$DCGL_n$  = DCGL of radionuclide  $n$ .

The results of the unity rule calculations for the ROC in the systematic sample population when compared against the OpDCGLs for surface soils for survey unit 10214A are provided in Table 17. The results of the unity rule calculations for the ROC for the biased surface samples are provided in Table 18, the results for the subsurface samples are provided in Table 19, and the results for the QC samples are provided in Table 20.

The mean BcSOF for survey unit 10214A is 0.009, which equates to a dose of 0.230 mrem/year TEDE.

The mean of all identified isotopes are less than the Consultation Triggers for Residential and Commercial/Industrial Soil Contamination depicted in Table H.1 of NUREG 1757, Vol. 1, (MOU Table 1). The full table is included in Attachment 3 of this Release Record.

## 8. QUALITY CONTROL

The on-site laboratory processed two (2) split samples, L2-10214A-FQGS-002-SS and L2-10214A-QIGS-001-SS, using gamma spectroscopy analysis. The data was evaluated using

acceptance criteria specified in ZS-LT-01, “*Quality Assurance Project Plan (for Characterization and FSS)*.” For the systematic sample L2-10214A-FQGS-002-SS, the standard sample and the QC did not both have a positive result for a gamma emitting ROC; therefore, K-40 was used in the QC comparison. For investigation sample L2-10214A-QIGS-001-SS, the standard sample and QC sample both had positive activity for Cs-137. There was acceptable agreement between standard and comparison results. Refer to Attachment 5 for data and QC analysis results.

QC replicate scans were performed in rows 71 through 77 of the survey unit. These rows represent approximately 9% of the total area scanned in this survey unit ( $403\text{ m}^2$  of  $4,483\text{ m}^2$  total area scanned). The results were evaluated using acceptance criteria specified in the ZS-LT-01. The QC replicate scans were in agreement with the original scans. No elevated measurement locations were identified in either the original survey or the replicate survey in these rows. Complete QC replicate scan results are provided in Attachment 2.

## 9. INVESTIGATIONS AND RESULTS

Investigations were performed following scan alarms in rows 5, 6, 10 and 56 on December 16, 2019. Four (4) areas were identified: a  $2\text{ ft}^2$  area in row 5, a  $2\text{ ft}^2$  area in row 6, a  $3\text{ m}^2$  (1 meter by 3 meters) area in row 10 and a  $1\text{ ft}^2$  area in row 56. The maximum count rates were 2,301 cpm, 2,198 cpm, 5,038 cpm and 4,486 cpm respectively (a map of the areas is included in Attachment 1. One (1) surface and one (1) subsurface soil sample were taken in each elevated area in rows 5, 6 and 56: L2-10214A-FIGS-001-SS, L2-10214A-FIGS-002-SS, L2-10214A-FIGS-005-SS, L2-10214A-FIGS-001-SB, L2-10214A-FIGS-002-SB and L2-10214A-FIGS-005-SB. Two (2) surface and two (2) subsurface soil samples were taken in the elevated area located in row 10: L2-10214A-FIGS-003-SS, L2-10214A-FIGS-004-SS, L2-10214A-FIGS-003-SB and L2-10214A-FIGS-004-SB. Gamma spectroscopy results revealed three (3) samples with activity levels above MDC for Cs-137 and no samples with activity levels above MDC for Co-60 or Cs-134. The OpSOF for the investigation samples were all less than 1.0, with a maximum OpSOF of 0.084 for sample L2-10214A-FIGS-002-SB.

On December 17, 2019, the area identified in row 56 was re-scanned because it exhibited the highest maximum count rate of 2,765 cpm above the alarm set point (1,721 cpm) on the initial scan. The alarm could not be reproduced and the maximum count rate was 1,426 cpm. No further action was necessary.

The investigation is documented in an Attachment 13 (from ZS-LT-300-001-004), “Final Status Survey Investigation.” The gamma spectroscopy results are summarized in Table 13 for the surface samples and Table 14 for the subsurface samples. The OpSOF are summarized in Table 18 for the surface samples and Table 19 for the subsurface samples.

## 10. REMEDIATION AND RESULTS

No remediation was performed in Class 2 open land survey unit 10214A. In accordance with LTP Section 5.6.4.6.1, if contamination is present in a Class 2 open land survey unit in excess of the OpDCGL, then all or part of the survey unit will be reclassified as Class 1 and the survey strategy for that survey unit will be redesigned as discussed above for Class 1. This threshold was not encountered during the FSS of survey unit 10214A.

## 11. CHANGES FROM THE SURVEY PLAN

Two (2) systematic soil samples were relocated to the closest adjacent suitable location (a distance of one meter) due to the original locations being located over a fiber optic cable. The coordinates of the relocated samples are listed in the table below.

**Table 22 - Relocated Systematic Sample Locations**

MEASUREMENT ID	NORTHING (meters)	EASTING (meters)
L1-10214A-FSGS-001-SS	642051.50	343476.69
L1-10214A-FSGS-002-SS	642072.37	343440.56

## 12. DATA QUALITY ASSESSMENT

The DQO sample design and data were reviewed in accordance with ZionSolutions procedure ZS-LT-300-001-004, “Final Status Survey Data Assessment” (Reference 16) for completeness and consistency. Documentation was complete and legible. Surveys and sample collection were consistent with the DQOs. The sampling design had adequate power as indicated by the Retrospective Power Curve.

The analytical results of all samples were less than an OpSOF of one when compared to the OpDCGLs.

Although MARSSIM states that the Sign Test need not be performed in the instance that no measurements surpass the DCGL, the test was conducted to demonstrate coherence to the statistical principles of the DQO process. The Sign Test was performed on the data and compared to the original assumptions of the DQOs. The evaluation of the Sign Test results clearly demonstrates that the survey unit passes the unrestricted release criteria, thus, the null hypothesis is rejected. The Sign Test is included in Attachment 4.

The preliminary data review consisted of calculating basic statistical quantities (e.g., mean, median, standard deviation). All data was considered valid including negative values, zeros, values reported below the MDC, and values with uncertainties greater than two standard deviations. The mean and median values for each ROC were well below the respective OpDCGLs. Also, the retrospective power curve shows that a sufficient number of samples were

collected to achieve the desired power. Therefore, the survey unit meets the unrestricted release criteria with adequate power as required by the DQOs.

The data for Co-60 and Cs-137 is represented graphically through a frequency plot and a quantile plot. All graphical representations are provided in Attachment 6.

### 13. ANOMALIES

The technicians who collected the systematic soil samples did not document in their FSS field log, as per ZS-LT-300-001-001, that two (2) samples were relocated as discussed in Section 11 above. This was due to an oversight by FSS supervision and the technicians.

### 14. CONCLUSION

Survey unit 10214A has met the DQOs of the FSS plan. The ALARA criteria for soils as specified in Chapter 4 of the LTP were achieved.

All identified ROC were used for statistical testing to determine the adequacy of the survey unit for FSS. Evaluation of the data shows that none of the ROC concentration values exceed the OpDCGL or any investigational levels; therefore, in accordance with the LTP Section 5.10, the survey unit meets the release criterion.

The sample data passed the Sign Test. The null hypothesis was rejected. The Retrospective Power Curve showed that adequate power was achieved.

The mean BcSOF, when the analytical results were compared to the BcDCGLs, was 0.009, which results in a dose contribution from soil in survey unit 10214A of 0.230 mrem/year TEDE, based on the average concentration of the ROC in samples used for non-parametric statistical sampling.

The conclusion of this Release Record is that survey unit 10214A is acceptable for unrestricted release.

**CONSULTATION TRIGGERS FOR RESIDENTIAL AND  
COMMERCIAL/INDUSTRIAL SOIL CONTAMINATION**

**Table H.1 Consultation Triggers for Residential and Commercial/Industrial Soil Contamination (MOU Table 1)**

Except for radium-226, thorium-232, or total uranium, concentrations should be aggregated using a sum of the fraction approach to determine site-specific consultation trigger concentrations. This table is based on single contaminant concentrations for residential and commercial/industrial land use when using generally accepted exposure parameters. Table users should select the appropriate column based on the site's reasonably anticipated land use.

Comments/Corrective Actions:					Table 4-1 from the QAPP is reproduced below to show acceptance criteria used to assess split samples.																	
For systematic sample #2, the standard sample and QC sample did not both have a positive result for a gamma emitting ROC, therefore K-40 was used in the QC comparison. There was acceptable agreement when using K-40. ANALYTICAL METHODS

Total Strontium was analyzed using EICChroM Method SRW01 Modified. Tritium was performed using Method LANL ER-210 Modified. Nickel-63 was performed using Method ASTM 3500-Ni Modified. Gamma Spectroscopy was performed using EPA Method 901.1 Modified.

Laboratory qualifiers are as follows:

U - Result is less than the MDA.

ANALYTICAL RESULTS

Combined Standard Uncertainty is reported at 1-sigma value.

Minimum Detectable Activity (MDA) values for data represented in this report are sample-specific. MDA measurements are determined based on factors and conditions including instrument settings, aliquot size and matrix type.

## ANALYTICAL RESULTS CONTINUED

### TOTAL STRONTIUM

Samples were prepared by acid digestion as appropriate for the matrix. Digested samples were acidified and were selectively extracted and precipitated. Precipitates were then mounted on 47mm filters. Filters were reweighed to determine aliquot size. Sample activities were determined by gas flow proportional counting.

Samples demonstrated acceptable results for all Total Strontium analyses. Strontium-90 results are reported from Total Strontium. Chemical recovery was acceptable for all samples. The Total Strontium method blank demonstrated an acceptable result. Results for the Total Strontium duplicate demonstrated an acceptable relative percent difference and normalized difference. Results for the Total Strontium laboratory control sample demonstrated an acceptable percent recovery.

### TRITIUM

A representative aliquot of each sample was equilibrated with Tritium free water. Equilibrates were transferred into round-bottomed distillation flasks and attached to single stage stills. A portion of each middle distillation fraction was transferred to a liquid scintillation vial and cocktail was added. Samples were counted by beta liquid scintillation.

Samples demonstrated acceptable results for all Tritium analyses. The Tritium method blank demonstrated an acceptable result. Results for the Tritium duplicate demonstrated a high relative percent difference; however, normalized difference is within acceptable limits for the analytical technique. Results for the Tritium laboratory control sample demonstrated an acceptable percent recovery.

### NICKEL-63

A representative aliquot of each sample was prepared by leaching in acids. Aliquots were placed into appropriately sized beakers. Stable elemental Nickel carrier was added to each sample prior to digestion. Samples were digested in concentrated Nitric acid. After digestion, each sample pH was adjusted and Nickel-63 was precipitated selectively with Dimethylglyoxime. Precipitates were selectively separated, redissolved, and residual acid was effectively neutralized. Sample residuals were placed into scintillation vials, scintillation cocktail was added and Nickel-63 activity was determined by beta liquid scintillation.

Samples demonstrated acceptable results for all Nickel-63 analyses. The Nickel-63 method blank demonstrated an acceptable result. Results for the Nickel-63 duplicate demonstrated a high relative percent difference; however, normalized difference is within acceptable limits for the analytical technique. Results for the Nickel-63 laboratory control sample demonstrated an acceptable percent recovery.

### GAMMA SPECTROSCOPY

Samples for Gamma Spectroscopy analysis were prepared by transferring a known mass of each homogenized sample to a standard geometry container. Samples were counted on High Purity Germanium (HPGe) gamma ray detectors.

## ANALYTICAL RESULTS CONTINUED

### GAMMA SPECTROSCOPY CONTINUED

Samples demonstrated acceptable results for all gamma-emitting radionuclides as reported. The method blank demonstrated acceptable results for all radionuclides as reported. Results for the Actinium-228, Bismuth-214 and Potassium-40 replicate demonstrated an acceptable relative percent difference and normalized difference. Results for the Cobalt-60 and Cesium-137 laboratory control sample demonstrated an acceptable percent recovery.
