NOTICE

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, or any of their employees, makes any warranty, expressed or implied, or assumes any legal liability of responsibility for any third party's use, or the results of such use, of any information, apparatus, product or process disclosed in this report, or represents that its use by such third party would not infringe privately owned rights.

NOTICE

Availability of Reference Materials Cited in NRC Publications

Most documents cited in NRC publications will be available from one of the following sources:

1. The NRC Public Document Room, 1717 H Street, N.W.
Washington, DC 20555
2. The Superintendent of Documents, U.S. Government Printing Office, Post Office Box 37082,
Washington, DC 20013-7082
3. The National Technical Information Service, Springfield, VA 22161

Although the listing that follows represents the majority of documents cited in NRC publications, it is not intended to be exhaustive.

Referenced documents available for inspection and copying for a fee from the NRC Public Document Room include NRC correspondence and internal NRC memoranda; NRC Office of Inspection and Enforcement bulletins, circulars, information notices, inspection and investigation notices; Licensee Event Reports; vendor reports and correspondence; Commission papers; and applicant and licensee documents and correspondence.

The following documents in the NUREG series are available for purchase from the GPO Sales Program: formal NRC staff and contractor reports, NRC-sponsored conference proceedings, and NRC booklets and brochures. Also available are Regulatory Guides, NRC regulations in the *Code of Federal Regulations*, and *Nuclear Regulatory Commission Issuances*.

Documents available from the National Technical Information Service include NUREG series reports and technical reports prepared by other federal agencies and reports prepared by the Atomic Energy Commission, forerunner agency to the Nuclear Regulatory Commission.

Documents available from public and special technical libraries include all open literature items, such as books, journal and periodical articles, and transactions. *Federal Register* notices, federal and state legislation, and congressional reports can usually be obtained from these libraries.

Documents such as theses, dissertations, foreign reports and translations, and non-NRC conference proceedings are available for purchase from the organization sponsoring the publication cited.

Single copies of NRC draft reports are available free, to the extent of supply, upon written request to the Division of Technical Information and Document Control, U.S. Nuclear Regulatory Commission, Washington, DC 20555.

Copies of industry codes and standards used in a substantive manner in the NRC regulatory process are maintained at the NRC Library, 7920 Norfolk Avenue, Bethesda, Maryland, and are available there for reference use by the public. Codes and standards are usually copyrighted and may be purchased from the originating organization or, if they are American National Standards, from the American National Standards Institute, 1430 Broadway, New York, NY 10018

I. EXECUTIVE SUMMARY

This section summarizes the key elements of the preliminary Strategic Data Plan for the Corporate Data Network (CDN). Our summary is presented as follows:

- Background of the Data Requirements Task;
- Objective of the Strategic Data Plan;
- Overview of the CDN and the logical databases in the CDN;
- Approach to developing the plan;
- Evaluation criteria and methodology;
- Qualitative factors potentially affecting development priority;
- Development strategy summary; and
- Schedule and budget estimates.

This report contains terms which may not be familiar to the non-technical reader. To assist the reader, a short glossary of terms has been included as Appendix A.

A. BACKGROUND

The NRC has planned to centralize its information processing in a Corporate Data Network over a five year period. The new information processing environment will include shared databases, telecommunications, office automation tools, and state-of-the-art software. In order to implement this concept, Touche Ross & Co. was contracted to perform a general data requirements analysis for the shared databases and to develop a preliminary implementation plan. Other tasks associated with the CDN are also currently in progress through other contractors and Resource Management.

The Strategic Data Plan is the final step in the initial analysis and planning process for the shared databases. The Strategic Data Plan is based on information contained in the Enterprise Model, Data Dictionary, and Data Model developed by Touche Ross during January - June, 1985.

The Enterprise Model provided the NRC with:

- Agency-wide information requirements in the form of data entities; and

- Organizational demand patterns as the basis for clustering the entities into logical groups.

The Data Dictionary provided the NRC with:

- Definitions and example attributes for each entity; and
- Properties for each entity, including origin, access, volume, and frequency.

The Data Model further refined the data entity list and defined:

- Logical databases; and
- Entity relationships within databases and between databases.

Information from all three of these interim products formed the basis upon which the preliminary Strategic Data Plan has been developed.

B. OBJECTIVE

The objective of the Strategic Data Plan is to provide the NRC with a preliminary plan for implementing the shared database component of the Corporate Data Network. To support this objective, the plan includes a recommended schedule for development along with an analysis of qualitative factors that NRC management should consider in finalizing the plan. Recommendations are also provided on activities that should be accomplished prior to the start of development of the individual databases.

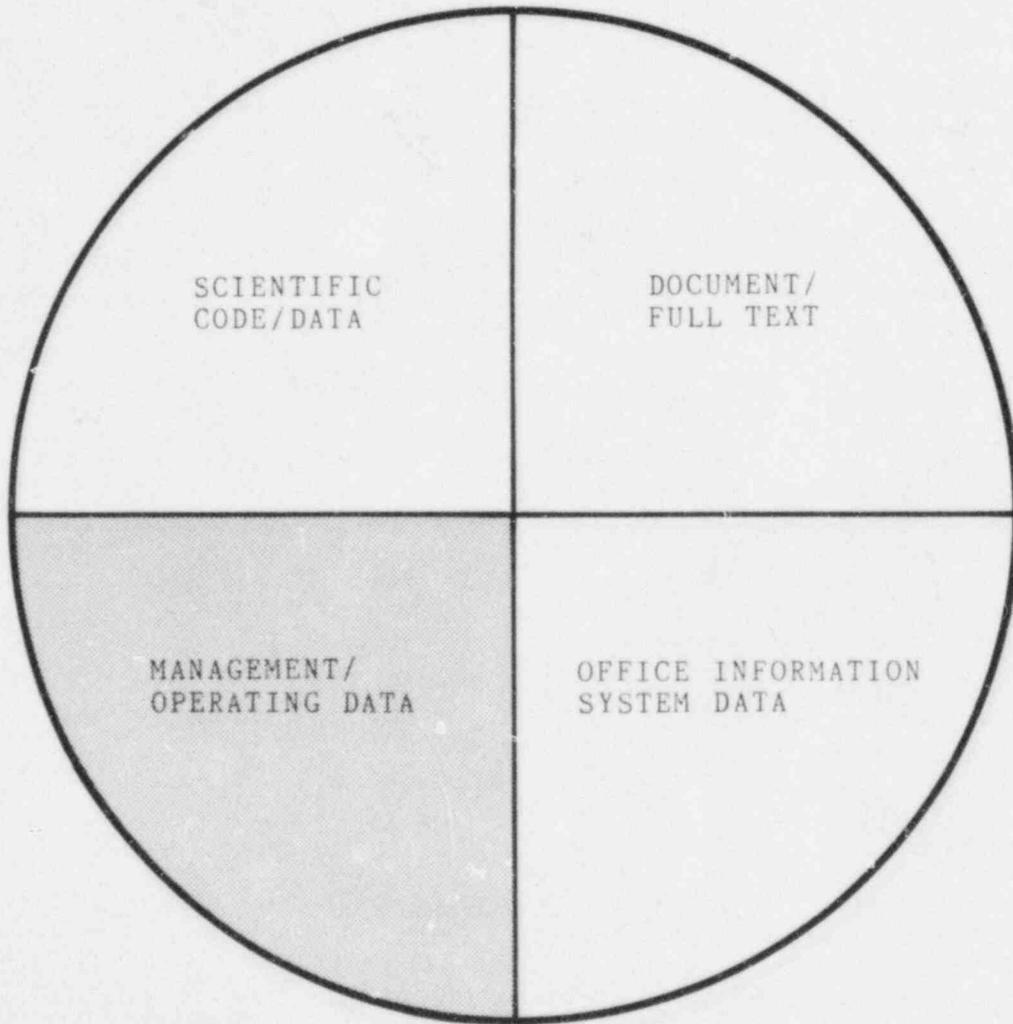

C. OVERVIEW OF CDN AND CONTENTS OF LOGICAL DATABASES

1. CDN Components

As shown in Exhibit I-1, the CDN will encompass four components -- management/operating data, scientific code/data, document/full text, and office information system data. The focus of the CDN Data Requirements Task performed by Touche Ross is on the management/operating data component of the CDN. The emphasis is on the data required for monitoring public health and safety and the necessary supporting administrative information. Therefore, the Strategic Data Plan does not include detailed information requirements for text, scientific code/data, or office information system data. The requirements for textual or scientific data were identified in the Enterprise Model and were grouped under the entity headings "document" and "scientific code/data", respectively.

EXHIBIT I-1

SCOPE OF DATA REQUIREMENTS TASK

CORPORATE DATA NETWORK

COMPONENTS

Some information will reside in both the data component and the document/full text component. For example, the full text of a report may be stored as a document, but data on that report might be collected and tracked in the data component. Similarly, scientific algorithms and resulting computations will be contained in the scientific code/data component, but the permanent record of the results might be placed in the data component of the CDN.

Some of the general purpose entities identified in the Enterprise Model (e.g., "meeting", "committee") may be stored in the office information system component. The decision to store the entities in this component will be made as a result of more detailed work in the development phase.

A CDN Index will allow the user to determine the location and access method for information in any one of the four components as shown in Exhibit I-2.

2. Logical Databases

The logical databases generated through the data modeling activities are shown in Exhibit I-3. The exhibit shows:

- 22 logical databases composed of 84 entities,
- 1 special purpose category containing 8 entities, and
- 1 general purpose category containing 6 entities.

The special purpose category was designed to accommodate entities which:

- Relate to other entities but cannot be logically clustered with any of the 22 groups (e.g., "fee", "cost standards"); or
- Contain data that is of a temporary nature (i.e., "open TMI item").

The general purpose category was designed to accommodate entities which are:

- Not closely related to any entities in the other 22 groups, and
- Required by most organizations.

These logical databases, special purpose entities, and general purpose entities were analyzed in developing the plan.

D. APPROACH

Our approach to developing the Strategic Data Plan involved the following major activities:

- Determining the quantitative criteria to be used in establishing priorities for development;
- Ranking each database on each of the criteria;
- Summing the ranks on each of the criteria for each database;
- Classifying the databases into three priority classes based on the sums of the ranks for each database;
- Identifying qualitative factors that could impact development priority;
- Preparing a detailed schedule for development based on quantitative factors only;
- Preparing an overall development strategy for finalizing and implementing the plan; and
- Estimating the order of magnitude cost of implementing the plan.

Our detailed analysis is presented in Section II.

E. EVALUATION CRITERIA AND METHODOLOGY

Six development priority criteria were selected to assess each of the databases. These criteria are:

- Man-days required to:
 - Develop and implement the databases and update applications,
 - Convert existing data, and
 - Develop user applications;
- Productivity gains estimated to be derived from implementing each database;
- Number of application subject areas supported by each database;
- Sequence of databases to maximize the development of health and safety application subject areas;
- Organizational usage of each database; and

- Record volume of each database.

The logical databases were ranked on each of these criteria. These ranks were then summed to obtain a total score. A summary of the total scores and relative priority classification of each of the databases is shown in Exhibit I-4. The databases were classified into priority categories of A, B or C with A as the highest priority.

General purpose entities and special purpose entities were analyzed as part of the overall evaluation. However, these entities were not ranked with the logical databases since they are not considered to form a logical database. The development schedule for these entities are addressed as part of our development strategy recommendations below.

Each of the criteria, evaluation of each of the databases on each of the criteria, and the assumptions used are presented in detail in Section II.

F. QUALITATIVE FACTORS POTENTIALLY AFFECTING DEVELOPMENT PRIORITY

In addition to considering the results of the quantitative evaluation of priority, there are qualitative factors which can potentially affect the development priority of the databases. Some of these qualitative factors were identified in the Enterprise Model. Other qualitative factors which must be analyzed concern management considerations. Our assessment of each of these factors is summarized in Exhibit I-5. A more detailed discussion of these issues is presented in Section II.

G. DEVELOPMENT STRATEGY RECOMMENDATIONS

We recommend that the NRC develop the CDN databases in three phases:

- PHASE I--FINALIZE DATABASE PRIORITIES AND DEVELOPMENT TOOLS
- PHASE II--DEVELOP AN INFRASTRUCTURE FOR DEVELOPMENT
- PHASE III--IMPLEMENT DATABASES

Below we summarize the key activities that should be included in each phase. Exhibit I-6 illustrates the overall schedule. Detail costs and schedules for Phase III can be found in Section III.

PHASE I--FINALIZE DATABASE PRIORITIES AND DEVELOPMENT TOOLS

The purpose of this phase is to make final assessments on the priority of database development as well as the tools to be used in

EXHIBIT I-6
OVERALL CDN DATABASE DEVELOPMENT SCHEDULE

developing the databases. Modifications to the preliminary strategic data plan should be made as required.

I-1 Evaluate qualitative factors.

RM/D should evaluate the qualitative factors discussed in Section II, consult with the CDN liaisons to obtain the perspective of each of the offices, and make recommendations on any changes in development priorities to the ADP Steering Group. Each of the qualitative factors can affect the relative priority of development for the databases (currently, priority is established on a quantitative basis). The ADP Steering Group should make a decision on whether or not the development priority should be modified based on RM/D's recommendations. If priorities are changed, the detail schedules for Phase III should also be updated.

I-2 Finalize the approach for general/special entities.

Currently, the entities that are included in the general and special purpose categories are not priority ranked, because these categories are not considered to be logical databases. Each entity should be reviewed and a decision made on when to implement the entity. For example, the "Fee" entity could be implemented at the same time as the Finance/Accounting database; the "Training" entity could be implemented at the same time as the Personnel database.

I-3 Conduct a pilot program to test development tools.

A major strategy in the development of the CDN databases will be to use DBMS, fourth generation language, and microcomputer-based development tools. In order to properly utilize these tools in the context of this plan, the NRC should demonstrate and evaluate the development process using these tools prior to beginning full-scale development. These tools should be used to develop prototypes of one or two key entities for:

- Detail user requirements;
- A database and its associated update application; and
- A user (reporting) application.

Each prototype should be assessed and evaluated. Recommendations for improvement in the use of each tool should be made. Key management issues should also be identified and proposed strategies for their resolution documented.

Based on the results of the prototypes, refinements to the preliminary strategic data plan should be made as necessary.

PHASE II--DEVELOP AN INFRASTRUCTURE FOR DEVELOPMENT

The purpose of this phase is to organize various NRC offices into an infrastructure that will accommodate both the development and operation of the CDN.

II-1 Develop database functions within RM/D.

Key database functions should be developed within the RM/D organization to address database administration and data analysis. These functions will be critical to the development and operation of the CDN by establishing standards and guidelines for software development, use of the data dictionary, and communications between technical, data administration and user personnel.

II-2 Develop a strategy for integrating other tasks of the CDN.

In developing the shared databases the NRC must ensure that other related activities are integrated with the those identified in this plan. Key areas that should be addressed include:

- Telecommunications;
- Hardware (e.g., time-sharing and microcomputers);
- Software (both mainframe and microcomputer); and
- Office automation tools.

The NRC needs to plan for the integration of these activities and establish an integration team with responsibility for monitoring the integration.

II-3 Assign Data Maintenance Responsibilities.

Before any development activities can begin, responsibility for maintaining (i.e., creating and updating) data in the various databases must be established. The organizations who are identified as having data maintenance responsibility should be the lead organizations in the design, development and implementation efforts. Appropriate user staff in these organizations should be designated to work with the development team. These individuals should also form the membership of the ADP Working Groups for each of the database projects.

II-4 Expand the Phase I pilot program.

The entity level prototypes developed in Phase I should be expanded to simulate a more complete operation. Expansion can occur by converting current operational data into the prototype system, adding more entities to the prototype, and by increasing the number of users who have access to the prototype. This will provide the NRC with the opportunity to increase its experience with the various development tools and in the actual operation of a database (i.e., both users and technical staff will begin to "climb up" the learning curve before full scale implementation begins in Phase III).

PHASE III--IMPLEMENT DATABASES

The purpose of this phase is to implement the databases identified in this plan. Databases should be implemented sequentially (i.e., one-by-one) in the first one to two years to allow for an orderly progression of development. After the NRC has gained sufficient experience, development should occur in parallel (i.e., multiple, concurrent projects).

H. SCHEDULE AND BUDGET ESTIMATES

A summary schedule based on this strategy is shown in Exhibit I-7. Since site data will be frequently referenced by other databases including all of the Class A priority databases (Events, License, Inspection), we scheduled the Site database as the first development project. All other databases are scheduled in the order of priority based strictly on quantitative factors. This schedule plans for all work to be completed in a five year period from the start of Phase III, and assumes that the appropriate level of resources will be applied based on the level of effort estimates provided in this plan. No dates are shown on the schedule since the start date is uncertain. Detailed assumptions and schedules are discussed in Section III.

A summary of the anticipated man-days for each of the major activities of developing and implementing the databases is shown in Exhibit I-8.

To assist the NRC in budgeting for the database projects, we applied some costing assumptions based on survey data to the man-days and developed an estimate of the cost. A summary of the cost estimates is shown in Exhibit I-9. Detailed cost estimates for each of the major tasks are provided in Section III. These estimates are only an approximation of the anticipated total cost to develop each of the databases. Costs could vary as a result of estimating standards, procurement delays, technical difficulties

The data entities are also linked between databases through these core entities. Links between databases were established when it was determined that data was required simultaneously about entities in separate databases. However, if it was determined that an entity was merely "referenced" (e.g., identifying number or name) a formal link was not established. Such a reference would be embedded in the database requiring the reference.

A detailed description of the modeling process and the results are provided in the Data Model, dated June 1985.

B. EVALUATION CRITERIA AND METHODOLOGY

Six development priority criteria were identified to assess each of the databases. These criteria are:

- Man-days required to:
 - Develop and implement the databases and update applications,
 - Convert existing data, and
 - Develop user applications;
- Productivity gains estimated to be derived from implementing each database;
- Number of application subject areas supported by each database;
- Sequence of databases to maximize the development of health and safety application subject areas;
- Organizational usage of each database; and
- Record volume of each database.

Regulatory reporting requirements for each of the entities in the databases was considered as a criterion. However, since data about most entities needs to be reported, regulatory reporting requirements had little impact on priority evaluation. Therefore, regulatory reporting requirements were not used as a criterion.

The objective of the analysis was to determine through quantitative methods the overall merit of developing one database before another. Each of the criteria were determined to be of equal weight. No individual criteria was identified as being of greater importance than another. For example, it is difficult to determine whether a database requiring a relatively low number of man-days to be developed is of greater importance than a database which has

relatively high organizational usage. Similarly, a database which is estimated to provide high productivity gains to one user organization may not be of wide interest as indicated by the number of application subject areas it supports. Consequently, the databases must be evaluated on all of the criteria.

Each database was assigned a rank on each of the six criteria. Some databases received the same rank on some of the criteria since the databases were evaluated identically on that criterion. The ranks were then totaled to determine a relative priority for development. Qualitative factors which could impact this relative priority are discussed in Section II-D.

General and special purpose entities were evaluated as part of the analysis. However, since these entities do not form a logical database, they were excluded from the ranking of the databases. The development priority of these entities is addressed in our development strategy recommendations.

Each of these criteria and the results of the evaluation of each of the databases is discussed on the following pages.

1. MAN-DAYS

One of the development criteria is the number of man-days required to fully implement a database including data conversion, development of update applications and key user applications. Total man-days includes both contractor and NRC users and RM/D staff. Generally, a database which can be operational in a short period of time is preferred. Exhibit II-3 summarizes the man-days for each of the databases and shows the ranks of the databases in ascending order of man-days. The supporting analysis is described in detail on the following pages. Costing assumptions are applied to the man-days in Section III.

a. Scope

The man-day estimates are for the design, development, and implementation of:

- Logical databases;
- Associated update applications (e.g., basic add, change and delete capabilities);
- Data conversion; and
- Initial user applications (i.e., database query, report generation and analysis).

b. General Assumptions

(1) Software/Hardware

All of our estimates assume that the following will be available and in place at the start of the development:

- Fourth generation languages,
- Prototyping tools,
- Database Management System (DBMS),
- Microcomputers linked to mainframes,
- Information Planner software, and
- Data Designer software.

(2) Contractor Expertise

We based all of our estimates on the assumption that all database and database update application development will be performed by a contractor(s). Our estimates assume that the contractor is experienced in:

- Data modeling;
- Using DBMS software; and
- Prototyping tools.

*Note: Not ranked. Entities do not form a logical database.

(3) NRC Level of Effort

(a) Users

We estimate that the effort required by NRC user staff will be equal to the effort of contractor analysts. User responsibilities will include the following tasks:

- Provide knowledge of detailed user requirements and objectives to analysts;
- Validate analyst's conceptual designs of the logical databases and applications;
- Identify sources of information contained in existing data files to be converted and loaded into the new databases;
- Validate converted data within the new databases once loaded;
- Assist during system testing by providing test data and verifying test results;
- Participate in organized training sessions initially as trainees and later as trainers;
- Develop and implement user applications;
- Continue to operate existing systems until they are phased out;
- Participate in scheduled reviews of work performed; and
- Recommend changes or enhancements as necessary.

(b) RM/D Staff

We estimate that the effort required by NRC RM/D staff will be equal to twice the effort of the contractor management. Half of this effort will be for direct labor on the project and the other half will be for indirect labor (e.g., data administration, systems programming) and management time.

c. Database Development

The following discussion describes the database development process and presents the estimated man-days required to develop each of the databases.

(1) Description

The design and development of a database involves the following steps:

- Specification of Database Requirements;
- Logical Design; and
- Physical Development.

Specification of database requirements lays the detailed foundation upon which the database will be developed. This step includes systems analysis, user requirements and conceptual design. The primary emphasis will be the development of a logical database with a complete list of entities and their attributes.

The first step in the logical design process involves updating "Information Planner" and "Data Designer" to include all attributes. During this step, the attributes are normalized and keys are identified. At this point NRC users must agree that the new database is ready for physical design. Physical design involves:

- Systems Technical Specifications;
- Technical Support Development;
- Database Specifications;
- Database Building;
- Implementation Planning; and
- Conversion Planning.

While dependent on the specific DBMS to be selected by NRC, these tasks include:

- Developing technical database performance considerations;
- Specifying the mechanisms to be used in database and application development;
- Determining physical storage and access paths;
- Loading the data dictionary; and
- Planning for both database implementation and conversion from existing systems.

(2) Estimating Standards

Exhibit II-4 shows our estimate of the man-days to develop each of the databases. The following summarizes the estimating standards used based on our experience. These standards are general since a detailed requirements

analysis was not in the scope of the Data Requirements Task. This discussion will assist the reader in understanding the level of detail contained in the man-day estimates.

- Attributes - (Column E) On average, there will be 100 attributes (data elements) per entity. For the 101 entities described in the Data Dictionary, the total number of attributes will be approximately 10,100 (101 x 100). Database Design, Inc. reports that this is consistent with the number of attributes found in an electric utility in Wisconsin and appears to be reasonable. We estimate that it will take an average of ten days per entity to identify its attributes.
- Relationships - (Columns B and C) "Internal relationship" indicates the number of times the entities within a database are linked. "External relationship" indicates the number of times the database is linked to other databases. Relationships are used to identify keys. We estimate that it will take an average of 1/2 day per relationship to identify keys. (Column F)
- Complexity Factor - (Column D) Each database was examined to determine the degree of complexity. A complexity factor indicates how complex a database is based on the number of types of each of the entities in the database (e.g., there are several types of licenses), number of attributes, need for multiple data maintenance responsibility, and volume of transactions. Based on our judgement of the relative complexity of the databases, databases of average complexity were assigned a complexity factor of 100%. Databases which appeared to be very complex (Finance/Accounting, License, Procurement, Radioactive Material and Personnel) were assigned a complexity factor of 150 to 300%.
- Level of Effort - (Columns E-H) The effort for the logical design of the database will be equal to 1.5 times the effort spent on identification of database requirements. The effort for physical development of a database will be equal to twice the logical design effort.
- Contractor Labor - (Columns J-M) Based on our experience we estimate management time to be 15%

of the total Analyst and Programmer time. The allocation of man-days to Analysts and Programmers is shown in the key to the Exhibit.

 THESE ESTIMATES ARE ONLY AN APPROXIMATION.
 VARIATIONS COULD RESULT FROM PROCUREMENT
 DELAYS, TECHNICAL DIFFICULTIES, ISSUE
 RESOLUTION OR OTHER FACTORS. ESTIMATES
 COULD BE HIGHER OR LOWER BY 25%.

Total	(I) = E + F + G + H		

d. Update Application Development

(1) Description

The process for designing and developing the update applications (the applications used to add, change, or delete information in the database) is similar to the design and development of database. The time required to design and develop these applications, however, will be considerably less.

(2) Estimating Standards

Exhibit II-5 shows our estimate of the man-days to develop update applications for each of the databases. The same basic methodology with regard to relationships and complexity factors used in estimating database development was used in estimating update application man-days.

The effort estimated for performing system requirements (Column N) is 5 days per entity based on the assumption that the analyst can identify and code edits for an average of 20 attributes per day. The effort for the logical design of the update application (Column O) will be equal to 1/2 of the effort spent on requirements or 2.5 days per entity. The effort for the physical development (Column P) will be equal to twice the effort spent on logical design or approximately 5 days per entity.

The standards used for computing Contractor Labor (Columns R-U) are the same as those used for database development. The computations are shown in the key to the exhibit.

 THESE ESTIMATES ARE ONLY AN APPROXIMATION
 VARIATIONS COULD OCCUR FROM PROCEDURE
 DELAYS, TECHNICAL DIFFICULTIES, ISSUE
 RESOLUTION OR OTHER FACTORS. ESTIMATES
 COULD BE HIGHER OR LOWER BY 25%.

e. Implementation

(1) Description

Following the design and development of both the database and the update applications, the implementation process will begin. The initialization of the new database and procedures and the termination of old systems will involve the following steps:

- System testing;
- Preparing systems documentation;
- Preparing user documentation;
- Planning for user training;
- Installing user procedures and controls;
- Conducting user training.
- Parallel running and verification with existing systems;
- Phasing out of old systems (if any); and
- Conducting a post-implementation review;

Implementation excludes data conversion which is discussed in part f. on the following pages.

(2) Estimating Standards

Exhibit II-6 shows our estimate of the man-days to implement both the databases and the update applications. The same basic methodology was used in computing man-days with regard to relationships and complexity factors. The effort for database implementation (Column V) will be equal to approximately 20% of the effort required for database physical development. The effort required for implementation of each update application (Column W) will be equal to twice the update application's physical development effort.

The standards used for computing Contractor Labor (Columns Y-AA) are the same as those used for database development. The computations are shown in the key to the exhibit.

f. Data Conversion

(1) Description

The data conversion estimates are based on the following assumptions:

- Adequate system documentation is available for existing systems whose data are converted and loaded to the new databases; and
- Data to be converted currently resides in an automated system.

The data conversion task excludes actual parallel running and verification with existing systems which is accomplished during implementation, discussed previously in part e.

(2) Estimating Standards

We reviewed the Federal government's standard algorithm for staff-day resource requirements for data file conversion.* However, the information required to implement the algorithm is not available (e.g., number of files to be converted, percentage of documentation available, degree of file complexity). Therefore, we developed an estimate based on our prior experience.

Exhibit II-7 shows our estimate for performing data conversion. The effort estimated to analyze existing data files and determine the source(s) of the data to be converted (Column AC) is 5 days for each of the existing systems containing that data. The effort required to identify and map the location in the logical database where the data will reside (Column AD) is equal to 25% of the time required to determine data source(s). The effort for logical design of the conversion programs (Column AE) will be 25% of the total time needed for analyzing data sources and data mapping together. Physical development of the conversion programs (Column AF) will be twice the time required to perform the logical design. These estimates assume that although all sources will be analyzed to determine contents, only 50% of the sources will actually be used in mapping and physical development.

The standards used for computing Contractor Labor (Columns AH-AJ) are the same as those used for database development. The computations are shown in the key to the exhibit.

Federal Conversion Support Center Conversion Cost Model (Version 2), Report No. OSD/FCSC-82-001, Pgs. 40-41.

g. User Application Development

(1) Description

During the database development task, the design and development of the user applications will begin. User applications will consist of queries, reports, decision support tools, and other types of programs. The process for designing and developing the user applications is similar to the design and development of the database update applications.

(2) Estimating Standards

Exhibit II-8 shows our estimate of the man-days to develop user applications for each of the databases. For purposes of this estimate, we assumed that, on average, there will be five user applications for each database. We estimate that development time for a user application will be roughly equal to the time required to develop an update application, including fourth generation language user training.

The standards used for computing Contractor Labor (Columns AM-AO) are the same as those used for database development. The computations are shown in the key to the exhibit.

2. PRODUCTIVITY GAINS

An estimate of the anticipated gains in employee productivity from implementing a database is another criterion for development priority. Generally, databases with high anticipated gains relative to other databases should be developed first.

The major benefits which the NRC will derive from converting to a database environment will be significant improvements in the quality and integrity of the data, in addition to improved access to the data. Because of this improved integrity and access, the NRC over time will experience gains in employee productivity.

However, in a non-production environment, productivity gains are difficult to measure with any reliability. There are indicators, however, which can be used to compare how each of the databases might improve productivity.

Two measures were identified in the Enterprise Model, dated May 1985:

- Data redundancy, and
- Unmet needs.

These measures indicated the overall inefficiency of the current systems operating environment during the first quarter of 1985.

Reduction in data redundancy

Data redundancy is defined as a data entity that appears in more than one database. From a productivity perspective, elimination (or minimization) of data redundancy would reduce data collection, input, processing, and system maintenance time and typically, is a major benefit in converting to a shared database environment.

Satisfaction of unmet needs

An unmet need is defined as a data entity that is required by an organization but is currently not received in an automated format. Generally, an unmet need indicates that an organization must manually consolidate information from a variety of sources (e.g., manual files), and typically represents a time-consuming, expensive method of obtaining information. Satisfaction of these needs will generally reduce costly manual consolidation efforts.

The sum of these two measures for a database indicates the degree to which the database will improve the overall productivity of the users of the data. It is anticipated that users will be able to concentrate their efforts on analyzing data rather than sorting inconsistent data or gathering required data.

Exhibit II-10 shows the ranking of the databases based on the sum of the redundancy factor and the unmet needs factor. The factor for each database is the sum of the factors for each of the individual entities in the database shown in Exhibit II-11.

It should be noted, however, that there will be a lag in realizing productivity gains. Users will need to learn to use the new databases while phasing out use of the old systems.

3. APPLICATION SUBJECT AREAS

An understanding of the number and type of major application subject areas which would be serviced by a database provides additional information for database priority. An application subject area is a group of applications concerning one subject. Generally, it is preferable to develop databases which serve many application subject areas first.

To determine which databases potentially serve the greatest number of major application subject areas, we performed the following analysis:

- Grouped the current systems (within the scope of our study) into defined application subject areas;
- Using the Enterprise Model, identified which entities are used by each system;
- Identified the logical databases which contain these entities;
- Counted the number of application subject areas served by each of the databases; and
- Ranked the logical databases in descending order of number of application subject areas served.

Exhibit II-12 summarizes our analysis. Some databases received the same rank since the databases served the same number of application subject areas. Exhibit II-13 shows the details of the number of application subject areas served. A description of each of these application subject areas is shown in Appendix B. However, this listing of application subject areas may not be complete. Within the scope of our work, we examined 81 major systems. Many systems were not examined, including microcomputer based systems. Therefore, this listing should be viewed as only an approximation of the probable number of major application subject areas of interest to NRC.

A listing of the entities for each of the application subject areas is presented in Appendix E.

4. SEQUENCING REQUIREMENTS

Databases which serve the same application subject areas should be developed as closely together as possible. In this manner, a complete application subject area can be implemented in a shorter period of time.

We analyzed groupings of databases to determine which sequence would maximize the number of health and safety oriented application subject areas. The results of our analysis is shown in Exhibit II-14. The databases are ranked according to the sequence which maximizes the number of health and safety oriented application subject areas. Our detailed analysis is shown in Exhibit II-15.

To derive the sequence of databases, we performed the following steps:

- Selected an application subject area(s) which uses a small number of databases (i.e., Plant Status Reporting, Nuclear Facilities Reporting);
- Placed the databases serving that application subject area(s) at the beginning of the sequence (i.e., Events, Site, Radioactive Materials);
- Selected an application subject area(s) which can be completed next in sequence using the least incremental number of databases (i.e., Events Reporting and Analysis);
- Placed the databases serving that application subject area next in the database sequence (i.e., Hardware, Research);
- Repeated this process until all databases were sequenced.

The sequencing of databases under this analysis does not consider the relative importance of each of the application subject areas to the NRC users. Our approach to sequencing is quantitative since it focuses on maximizing the number of application subject areas.

It should also be noted that although an application subject area may not be completed until all databases serving that application subject area are implemented, the major user applications for each of the databases will be developed as the databases are implemented.

*Note: Duplicate rankings assigned to logical databases with identical values in the ranking criterion.
 **Note: Not Ranked. Entities do not form a logical database.

5. ORGANIZATIONAL USAGE

Another criterion for determining database development sequence is the organizational demand for the databases. In general, databases which are used by a high proportion of users should be developed before databases which are used by few organizations.

For the Enterprise Model, we asked each organization in the NRC to indicate which of the data entities are required by their organization.

Usage is defined as the number of times the entities in a given database could be used by all organizations. For each database, usage is calculated as the sum of:

$$\begin{array}{l} \text{Organization (1..n) Requiring Entity (1..n)} \\ \quad \times \\ \text{Number of Staff in the Organization.} \end{array}$$

Although we know that each staff member in an organization does not use every entity required by the organization, this method is a useful approximation for estimating usage. This method weights organizational usage by organization size. Organizational staffing levels were obtained from the FTE Permanent Full-Time Report. The logical databases are ranked in descending order of demand in Exhibit II-16. Exhibit II-17 shows the usage by entity for each of the databases.

For some databases, the potential database usage shown exceeds the number of NRC personnel. This occurs because the potential database usage is equal to the sum of the maximum potential usage of individual entities in the database.

6. RECORD VOLUME

The estimated record volume of a logical database is a measure of the need to automate the database. Generally, the higher the volume, the greater the need to automate the database. Volume is defined as the total number of occurrences of an entity (e.g., 2500 events). The total record volume for a database is the sum of the volumes of each of the individual entities in the database. Record volumes were obtained from the Data Entity Dictionary. Where ranges were provided we used the midpoint of the range as the record volume.

The logical databases are ranked in descending order of record volume in Exhibit II-18. Exhibit II-19 shows the record volume for each entity in each database. The logical databases "Radioactive Materials" and "Events" are ranked high due to the volumes associated with the entities "Shipment" and "Exposure".

C. DATABASE SCORES AND CLASSIFICATIONS

Exhibit II-20 summarizes the scoring of each of the databases based on the six quantitative criteria discussed on the previous pages.

The total score for each database is the sum of the individual ranks on each of the criteria. Priority classifications of A, B or C were assigned to each of the databases where A is the highest priority. Priority classification parameters were established at one standard deviation above and below the mean.

An evaluation of qualitative factors discussed below may justify some modifications to the priority order determined as a result of quantitative analysis. Generally, if modifications are required, the changes should only be made within a classification. That is, if it is determined that a class B database should receive a higher priority, the change in the order of development should only be made among the class B databases (except for a special reason as judged by senior management).

Our assessment of modifications to this sequence is presented in our recommendations in Section III.

D. QUALITATIVE FACTORS

In addition to determining development priority based on quantitative measures, qualitative factors should also be considered.

1. Enterprise Model Issues

During the development of the Enterprise Model, issues were identified which may have an impact on the priority for developing databases within the CDN. Each issue is restated below and its potential impact on development priority assessed. These issues and assessments are presented so that NRC can apply qualitative judgement to the quantitative analysis of development priorities shown in this report. At this time, development priorities in this report are based strictly on quantitative measures.

- Few new reactors are being licensed.

A reduction in license applications may place greater attention on maintenance of existing plants. Generic and backfit issues could, therefore, receive a higher development priority since some of these issues address health and safety considerations with respect to plant maintenance.

- NRC is sustaining significant budget cutbacks.

68
 15

This indicates a need to conserve resources by sharing data.

- FOIA requests could potentially increase.

The FOIA volume would still be small relative to other types of data. Development priority would not be significantly affected.

- At some point in time there may be a standard reactor design.

If a standard design is adopted, the impact would be in the long term (beyond five years) and would not effect current CDN activities.

- There could be a decrease in elapsed reactor licensing time.

This could indicate a need for faster data access, but will not impact development priority.

- NRC needs to improve consistency with industry practices.

This indicates a need to establish data maintenance responsibility with appropriate NRC offices. Priority is not affected.

- Storage of increasing amounts of high level waste must be addressed.

There is no immediate impact on development priority. However, resolution of this issue could result in the need to create a new database.

- The number of resident inspectors may increase.

If there is a significant increase, inspection data may receive a higher priority to accommodate increased volumes and usage.

- The number of agreement states could potentially increase.

Even with an increase in the number of agreement states, the volume of data would still remain relatively low. Development priority would not be affected.

- The impact of ex parte on data access must be taken into account.

Ex parte rules could result in the need to create separate databases or stringent data access (security) procedures. Further investigation is required to determine what data is affected by ex parte.

- A change in regulations could impact data requirements.

The impact of a change in regulations must be reviewed on a case-by-case basis. For example, changes to 10 CFR Part 35 (medical) or 10 CFR Part 39 (well-logger) could change volumes and/or types of data reported relative to material licenses, thereby impacting license data priority.

- There may be a need to share data with organizations outside of NRC.

This indicates a potential need to provide access to NRC data. It is unlikely that development priority would be affected.

- The number of allegations is likely to increase.

Apparently the volume of allegations increases as new reactors go online. As the number of new reactors planned to go operational in the next few years is relatively high, the volume of Allegations is expected to increase. Because of the sensitive nature of allegations data, the development priority is likely to increase.

- NRC may consolidate its offices into one building.

Consolidation would impact the telecommunications network, not data priority.

- Goals assigned to an office may change.

A change in an office's existing goal would shift responsibility for maintaining data or the need to access data. There would be no impact on priority.

- NRC may adopt a chargeback methodology.

A chargeback procedure would probably create a new function within the existing financial reporting system. Development priority, from a data viewpoint, would not be affected.

2. Management Considerations

Listed below are implementation considerations identified during the Data Requirements task of the CDN planning process. These considerations are presented so that NRC management can assess the relative importance of each on the development priority or development strategy of the various CDN databases. At this time, development priority is based strictly on quantitative measures explained elsewhere in this report.

- Status of current systems

The status of current systems could impact the approach to developing databases. Those systems that are relatively new could lower the priority of development for certain CDN databases because these systems have typically been implemented using advanced hardware/software to make them "user friendly". Candidate databases that appear to be currently supported by recently developed systems (names of the systems are in parenthesis) include:

-Finance/Accounting (IFMIS)

-Allegations (AMS)

-License (OLTS, LMS)

In addition, there are other databases supported by systems that are operated external to the NRC. The priority for developing these databases in a CDN environment could also decrease if the need to share this data is relatively low and development effort relatively high. Candidate entities falling into this category appear to be:

-Radioactive Materials (NMMSS)

-Events (REIRS, LERS)

- Level of detail

The required level of detail regarding some entities could impact data volumes, and therefore priority.

Entities that require further refinement as to the required level of detail include:

-Component

-Test

Data Dependency

The CDN Data Model, issued June 1985, identified the overall CDN database structure and the relationships within and between databases. This overall structure was developed in order to minimize future data redundancy while optimizing the number of user applications accessing that data.

In the initial stages of development of the databases only a few applications can be supported; as the number of databases implemented grows, the number of applications supported increases at an accelerated rate.

In many cases a specific application may process data in more than one database. The database development sequence will therefore determine the order of fully supported user applications as well as the extent to which particular applications are supported throughout the development cycle. Depending on which databases are needed and when they are developed, all of the required data for a specific application may not yet have been developed. Consistent with established database development methodology, interim design solutions may be required, including building temporary code tables, "skeleton" structures of other required databases, or concurrent database development (resulting in a change in database development priority). While excessive use of interim solutions is not recommended, this approach can be implemented in order to make available key applications to meet user needs while preserving the integrity of the database structure set forth in the Data Model. One of the benefits of using DBMS technology is that it more readily allows for such design solutions than traditional technology.

Our analysis of information contained in the Enterprise Model and Data Model indicates that there is insufficient information available to recommend a database sequence that eliminates or minimizes this data dependency constraint. Only a detailed knowledge of each application (in terms of data elements) and all of the databases where those data elements reside could provide the information needed to make this determination. However, it would be impractical to perform such an analysis in a timeframe consistent with the CDN plan.

One alternative solution to address this issue is to prioritize applications and then to sequence the databases to support those application priorities (resulting in a change in database priority). We

anticipate, however, that it will be difficult to prioritize the applications and that if it is possible to prioritize them, it might result in a tendency to violate the integrity of the Data Model by creating redundant data elements. Finally, we anticipate that this data dependency constraint will still occur and still require interim design solutions.

- Data availability

Information on some entities may currently not exist within NRC in a manual or automated form. Where data does not currently exist, the development priority of an entity could be lowered. Further investigation is required to determine if there are any entities which fall into this category.

- Data conversion

In converting to the new databases, existing data should be converted automatically where possible. This determination should be made on a case-by-case basis.

- Data maintenance

Responsibility for maintaining (add/change/delete functions) data must be established. Responsible offices should take the lead in resolving any level of detail, data availability, or data conversion issues. Responsible offices will be the key to maintaining the integrity, quality and timeliness of data creation and updates.

- Development resources

Any constraints with respect to budgeted funds must be considered in establishing database priority or schedules.

- User acceptance

Initial database implementations should have short timeframes and widespread usage to increase user familiarity and acceptance of the CDN concept. This is a new technology that NRC has not developed or used before. A database environment will require new roles for users and RM/D.

- Complexity

Initial database implementations should have a low complexity to reduce implementation risk while experience is gained with new software tools.

- User level of effort

Development timeframes should consider the impact on user level of effort required during database design and implementation in order to minimize user staffing requirements.

The potential impact on development priority of each of these qualitative factors is summarized in Exhibit II-21.

* * * * *

Our development strategy recommendations, the development schedule based on the quantitative evaluation, and budget estimates are presented in the remainder of this report.

III. DEVELOPMENT STRATEGY

In this section we present our detailed strategy recommendations and cost and schedule estimates. The information is organized as follows:

- Development strategy recommendations;
- Schedule for developing the databases based on quantitative factors; and
- An estimate of the cost for implementing the plan to be used for budget planning.

A. DEVELOPMENT STRATEGY RECOMMENDATIONS

We recommend that the NRC develop the CDN databases in three phases:

- PHASE I--FINALIZE DATABASE PRIORITIES AND DEVELOPMENT TOOLS
- PHASE II--DEVELOP AN INFRASTRUCTURE FOR DEVELOPMENT
- PHASE III--IMPLEMENT DATABASES

Below we summarize the key activities that should be included in each phase. Exhibit III-1 illustrates the overall schedule. Detail costs and schedules for Phase III can be found in Sections III B and III C on the following pages.

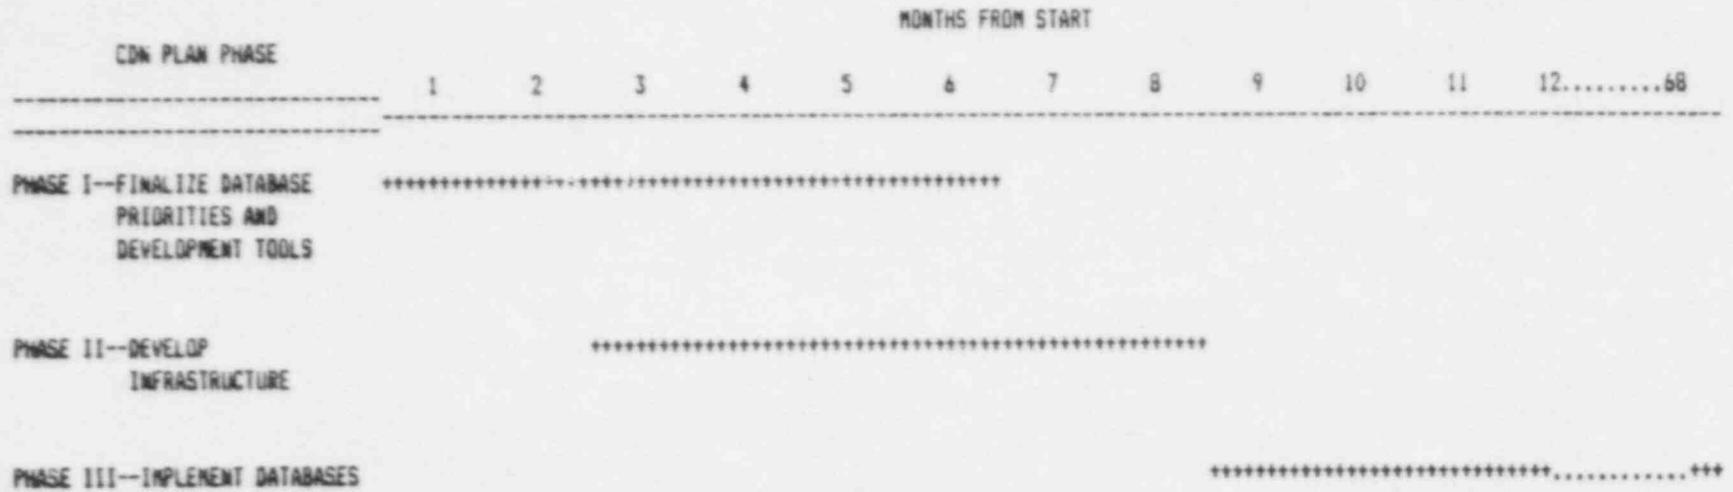

PHASE I--FINALIZE DATABASE PRIORITIES AND DEVELOPMENT TOOLS

The purpose of this phase is to make final assessments on the priority of database development as well as the tools to be used in developing the databases. Modifications to the preliminary strategic data plan should be made as required.

I-1 Evaluate qualitative factors.

RM/D should evaluate the qualitative factors discussed in Section II, consult with the CDN liaisons to obtain the perspective of each of the offices, and make recommendations on any changes in development priorities to the ADP Steering Group. Each of the qualitative factors can affect the relative priority of development for the databases (currently, priority is established on a quantitative basis). The ADP Steering Group should make a decision on whether or not the development priority should

EXHIBIT III-1
 OVERALL CON DATABASE DEVELOPMENT SCHEDULE

be modified based on RM/D's recommendations. If priorities are changed, the detail schedules for Phase III should also be updated.

I-2 Finalize the approach for general/special entities.

Currently, the entities that are included in the general and special purpose categories are not priority ranked, because these categories are not considered to be logical databases. Each entity should be reviewed and a decision made on when to implement the entity. For example, the "Fee" entity could be implemented at the same time as the Finance/Accounting database; the "Training" entity could be implemented at the same time as the Personnel database.

I-3 Conduct a pilot program to test development tools.

A major strategy in the development of the CDN databases will be to use DBMS, fourth generation language, and microcomputer-based development tools. In order to properly utilize these tools in the context of this plan, the NRC should demonstrate and evaluate the development process using these tools prior to beginning full-scale development. These tools should be used to develop prototypes of one or two key entities for:

- Detail user requirements;
- A database and its associated update application; and
- A user (reporting) application.

Each prototype should be assessed and evaluated. Recommendations for improvement in the use of each tool should be made. Key management issues should also be identified and proposed strategies for their resolution documented.

Based on the results of the prototypes, refinements to the preliminary strategic data plan should be made as necessary.

PHASE II--DEVELOP AN INFRASTRUCTURE FOR DEVELOPMENT

The purpose of this phase is to organize various NRC offices into an infrastructure that will accommodate both the development and operation of the CDN.

II-1 Develop database functions within RM/D.

Key database functions should be developed within the RM/D organization to address database administration and data

analysis. These functions will be critical to the development and operation of the CDN by establishing standards and guidelines for software development, use of the data dictionary, and communications between technical, data administration and user personnel.

II-2 Develop a strategy for integrating other tasks of the CDN.

In developing the shared databases the NRC must ensure that other related activities are integrated with the those identified in this plan. Key areas that should be addressed include:

- Telecommunications;
- Hardware (e.g., timesharing and microcomputers);
- Software (both mainframe and microcomputer); and
- Office automation tools.

The NRC needs to plan for the integration of these activities and establish an integration team with responsibility for monitoring the integration.

II-3 Assign Data Maintenance Responsibilities.

Before any development activities can begin, responsibility for maintaining (i.e., creating and updating) data in the various databases must be established. The organizations who are identified as having data maintenance responsibility should be the lead organizations in the design, development and implementation efforts. Appropriate user staff in these organizations should be designated to work with the development team. These individuals should also form the membership of the ADP Working Groups for each of the database projects.

II-4 Expand the Phase I pilot program.

The entity level prototypes developed in Phase I should be expanded to simulate a more complete operation. Expansion can occur by converting current operational data into the prototype system, adding more entities to the prototype, and by increasing the number of users who have access to the prototype. This will provide the NRC with the opportunity to increase its experience with the various development tools and in the actual operation of a database (i.e., both users and technical staff will begin to "climb up" the learning curve before full scale implementation begins in Phase III).

PHASE III--IMPLEMENT DATABASES

The purpose of this phase is to implement the databases identified in this plan. Databases should be implemented sequentially (i.e., one-by-one) in the first one to two years to allow for an orderly progression of development. After the NRC has gained sufficient experience, development should occur in parallel (i.e., multiple, concurrent projects).

B. SCHEDULE

Using the development priorities based on the quantitative analysis in Section II, we developed a schedule for the implementation. This schedule includes:

- Database development and implementation;
- Update application development and implementation;
- Development of basic user applications for reporting and querying the databases; and
- Conversion of data from existing systems.

We assumed that:

- The entire development, implementation and conversion effort for all of the databases needed to be completed in approximately 5 years;
- Funds will be available; and
- NRC users and RM/D staff will be able to commit the level of effort required.

To determine the elapsed schedule for each database project we developed a standard man loading model as depicted in Exhibit III-2. We then applied this model to the estimated development man-days for contractor and NRC personnel to estimate project elapsed time as shown in Exhibit III-3. When reviewing these exhibits, it is important to note the following:

- The model optimizes the utilization of the same personnel on each project, where possible. For example, on a project with 4 analysts on Task 1 (Database Development), these same analysts also work on Tasks 2 (Update Application) and 3 (Implementation);

EXHIBIT III-2

PARAMETERS USED FOR MAN LOADING TO DETERMINE PROJECT ELAPSED SCHEDULE

TASK	TOTAL CONTRACTOR MAN-DAYS	NUMBER OF ANALYSTS	NUMBER OF PROGRAMMERS	NUMBER OF NRC USERS	MODEL FOR COMPUTING ELAPSED WEEKS*
1 DATABASE DEVELOPMENT	< 400	4	4	4	(1) + (2)

Footer: Staffing levels and Project Elapsed Weeks is not presented for Special Purpose and General Purpose Entities. Refer to the Strategic Data Plan for a discussion of the development and implementation of special purpose and general purpose entities.

- The model assumes that any programming activities needed in Task 3 (Implementation) uses programmers in other tasks; these tasks are appropriately loaded with the necessary programmer man-days;
- For relatively small projects (i.e., Allegations, Commission, Operator, and Research), the man loading would probably be slightly less than presented in the model in order to optimize the number of personnel on the project;
- For relatively large projects (i.e., Finance/Accounting, License, and Personnel), the man loading would probably be slightly larger than shown in the model in order to accelerate the schedule; and
- Ideally, data conversion activities should end at about the same time as Task 3 (Implementation). However, the staffing model for Task 4 (Data Conversion) resulted in a significantly early finish in 13 projects and a significantly late finish in 3 projects. Upon further analysis it was determined that there is no single model for Task 4 that will schedule conversion activities properly. Generally this can be attributed to the fact that there is little or no relationship of the conversion activities to the relative size of other project tasks. Therefore, data conversion activities must be assessed on a project-by-project basis. For projects where the model results in an early finish, conversion activities can be started at a later time and/or the man loading can be reduced. For projects where the model results in a late finish, the estimate for conversion should be reevaluated and possibly lowered (e.g., the estimate for conversion of the Organization database could probably be lowered) and/or the man loading could be increased.

The overall Phase III schedule was then prepared using the detail project schedules and is depicted in Exhibit III-4. The general guidelines used to prepare this schedule were:

- Since site data will be frequently referenced by numerous other databases, including the Events database, the Site database was placed first in the order of development;
- The sequence of the remaining databases is based strictly on priority as determined by quantitative factors only. If the sequence is modified based on qualitative factors, the schedule would also need to be modified; and
- For the first year of development, only one project at a time was scheduled; for the second year of development, two projects at a time were scheduled; for the third and subsequent years, three projects were scheduled simultaneously. This project loading pattern was selected to allow the NRC to gradually "climb" the

learning curve at a faster rate in each year up to a maximum practical level of resource commitment.

Exhibit III-5 shows the rapid rate at which user applications can be developed given the acceleration of the development effort in the second year and beyond.

Based on the overall schedule, we then developed an estimated man loading by month by manpower category including specific NRC Offices, RM/D, and Contractor. This loading chart is illustrated in Exhibit III-6. Detailed loading charts are presented in Appendix C. We used supporting details from the proposed data maintenance responsibility matrix in Appendix D to allocate NRC user manpower to specific NRC offices. Several key points should be noted concerning Appendix D:

- The assignment of proposed data maintenance responsibility to specific NRC Offices is preliminary. These assignments are based on information developed during the preparation of the Enterprise Model, Data Dictionary, and Data Model, and are likely to be modified as a result of further analysis conducted with the implementation of our Phase II (Infrastructure) recommendation (See above for more details);
- Where multiple Offices share specific data responsibility, estimated user man-days were allocated on an equal basis; and
- Where the chart indicates an "any", man-days were allocated on an equal basis to all remaining offices not having a specific assignment.

As discussed in our recommendations, modifications to this schedule may be required as a result of priority changes based on qualitative factors.

C. BUDGET ESTIMATES

To assist the NRC in budgeting for the database projects, we applied some costing assumptions to the man-days and developed an estimate of the cost.

We estimate that contractor billing rates will be:

- | | |
|-------------------------|----------|
| • Contractor Management | \$100/hr |
| • Analyst | 60/hr |
| • Programmer | 35/hr |

These estimates are an average of government billing rates for a mix of large and small firms. The actual rates could be higher or lower depending on the contractor selected. We estimate that

^aNote: Based on Phase III Database Implementation Schedule. Does not include Special Purpose or General Purpose Entities.

106

contractor management will expend 15% of the overall contractor effort. We anticipate that the contractor's expenses will be approximately 5% of total labor, net of hardware and computer time.

Costs for software, hardware and telecommunications have not been included in the development costs. However, we have made an estimate of required computer time charges under a timesharing arrangement. The hourly rate used is for a short term arrangement and, consequently, is probably high. A long term negotiated rate may be significantly lower.

All estimates are presented in current dollars. No adjustment has been made for inflation.

A summary of the cost estimates is shown in Exhibit III-7. Detailed cost estimates for each of the major tasks are provided in Exhibit III-8-13. These estimates are only an approximation of the anticipated total cost to develop each of the databases. Costs could vary as a result of estimating standards, procurement delays, technical difficulties (e.g., computer down-time), issue resolution or other factors. Therefore, these estimates could be higher or lower by as much as 25%.

 THESE ESTIMATES ARE ONLY AN APPROXIMATION. :
 VARIATIONS COULD OCCUR FROM PROCUREMENT :
 DELAYS, TECHNICAL DIFFICULTIES, ISSUE :
 RESOLUTION OR OTHER FACTORS. ESTIMATES :
 COULD BE HIGHER OR LOWER BY 25%. :

GLOSSARY OF TERMS

ATTRIBUTE	The smallest unit of data that is meaningful in describing information; synonymous with data element.
CONVERSION	The process through which data stored in unlike structures and formats or on unlike media are converted to a common format and media.
DATA ENTITY	Anything about which data can be stored such as a person, place or thing.
DATABASE	A collection of interrelated data stored together with controlled redundancy to serve one or more applications. The data are stored so that they are independent of the programs which use data.
DATABASE MANAGEMENT SYSTEM (DBMS)	The collection of system software required for using, managing and controlling a database.
DATA MODEL	A precise detailed database design expressing the interrelationship of data entities created completely independent of hardware or software considerations; the logical data structure of an organization.
FOURTH GENERATION LANGUAGE	Software development tools used primarily in the creation of user applications. Fourth generation languages are generally much easier to use than traditional third generation languages such as COBOL or PL/I.

LOGICAL DATABASE

A database as perceived by its users. The logical structure may differ from the physical structure and the way the data are stored and retrieved.

PROTOTYPING

A selective process for refining conversion, development, and implementation methodologies using automated tools before beginning full-scale production.

TIMESHARING

A method of procuring processing time on a computer that is owned and maintained by an outside source.

UPDATE APPLICATION

A program or system of programs designed to add, change or delete data in a database.

USER APPLICATION

A program or system of programs to extract, accumulate or manipulate data in a database without affecting the data itself.

DESCRIPTION OF APPLICATION SUBJECT AREAS

<u>APPLICATION SUBJECT AREA</u>	<u>DESCRIPTION</u>
Allegation Tracking	Tracks and monitors the receipt, disposition, and status of allegations.
Enforcement Action Tracking	Maintains and monitors data concerning inspections, investigations, and associated enforcement actions. Provides current and historical data regarding enforcement actions including escalated enforcement actions.
Events Reporting & Analysis	Tracks and analyzes events.
Exposure Monitoring	Collects and maintains data about personnel located or employed at nuclear sites.
Financial Administration	Records, maintains, and reports General Ledger transactions. Provides budget planning, variance analysis, and reporting.
General Purpose	Collects, maintains, and reports current and historical data of a generalized nature.
Hearing Status	Tracks and maintains data concerning hearing schedules, status, and disposition.
Inspection Control	Provides an overview on the progress of each inspection. Analyzes data for each inspection module.
Inventory Management	Maintains, monitors, and analyzes NRC property and equipment.
Investigation Reporting	Reports data regarding all investigative actions, case status, and expended man-hours.
Issues (Safety Related)	Inventories and analyzes issues requiring responses from the NRC or a licensee. Records and maintains data concerning issue commitments made by the NRC.

APPLICATION SUBJECT AREADESCRIPTION

Licensee Performance Evaluation	Maintains current and historical data regarding enforcement actions, events, or other pertinent data used to evaluate a licensee's operational performance.
Manpower Reporting	Monitors manpower assignments to various NRC projects.
Nuclear Facilities Status Report	Tracks and analyzes the status of case work relating to facilities licensing reviews.
Nuclear Facilities Licensing	Maintains and analyzes fuel facilities and materials licensing case work including export/import requests.
Nuclear Incident Estimating	Provides data concerning the magnitude and dispersion of releases including their estimated radiological impact.
Nuclear Material Tracking	Maintains and monitors data regarding the location, type, status, and disposition of nuclear material including import/export.
Operator Licensing	Tracks the logging of operator applications and licenses. Records and maintains data on operator applicants and license renewals.
Payroll	Maintains and generates employee payroll information, annual leave, and retirement benefits.
Personnel Management	Tracks and analyzes personnel actions, qualifications, training, and requirements.
Personnel Security	Monitors security clearance by NRC employee. Records and maintains data concerning badges, cards, and keys issued.
Plant Status Reporting	Tracks and analyzes data concerning nuclear power plants including operations, daily status, and significant events. Analyzes the status of plants under construction including anticipated fuel loading dates.
Policy Guidance	Tracks policy and planning guidance at the Commission level.

APPLICATION SUBJECT AREADESCRIPTION

Procurement Control	Records, maintains, and controls procurement activities. Monitors and analyzes procurement actions, requests, and NRC providers/suppliers.
Project Control	Monitors the status and responsibility of work assignments, as well as manpower requirements.
Reactor Construction Report	Tracks and permits analysis of reactor unit construction and planned fuel loading dates.
Reactor Licensing	Maintains and analyzes reactor licensing from application to decision including import/export requests. Projects manpower requirements for licensing actions.
Regulatory Reporting	Provides data for scheduling, monitoring, and controlling the development of regulations, guides, and standards.
Research (Project Control)	Tracks and maintains the status of research project data from inception to completion including, objective, scope, personnel, funding, and schedule dates.
Special Purpose	Collects, maintains, and reports current and historical data of a specialized nature.
Staffing	Monitors and projects manpower availability for NRC organizations.
Systems/Component Analysis	Tracks and analyzes reported failures, defects, or non-compliance of components, systems, or packages. Analysis includes performance during events and allows tracking by vendor.
Travel Control	Monitors and analyzes travel and travel related expenditures.

 THESE ESTIMATES ARE ONLY AN APPROXIMATION.
 VARIATIONS COULD OCCUR FROM PROCUREMENT
 DELAYS, LOGISTICAL DIFFICULTIES, ISSUE
 RESOLUTION OR OTHER FACTORS. ESTIMATES
 COULD BE HIGHER OR LOWER BY 25%.

APPENDIX D

DATA RESPONSIBILITY MATRIX

Key to Exhibits:

C - Create

The office(s) responsible for the entry or creation of master records in the database. All offices with the responsibility for creating a record also have the ability to update a record.

U - Update

The office(s) responsible for updating an existing record in the database.

R - Reporting/Access

For offices having a requirement for data concerning an entity, refer to the Enterprise Model. The ability to report or access data may be restricted because the data is stand-alone, sensitive or classified as defined in the Data Dictionary.

<small>13. ABSTRACT (200 words or less)</small> <p>The NRC has initiated a multi-year program to centralize its information processing in a Corporate Data Network (CDN). The new information processing environment will include shared databases, telecommunications, office automation tools, and state-of-the-art software. Touche Ross and Company was contracted with to perform a general data requirements analysis for shared databases and to develop a preliminary plan for implementation of the CDN concept. The <u>Enterprise Model</u> (Vol. 1) provided the NRC with agency-wide information requirements in the form of data entities and organizational demand patterns as the basis for clustering the entities into logical groups. The <u>Data Dictionary</u> (Vol. 2) provided the NRC with definitions and example attributes and properties for each entity. The <u>Data Model</u> (Vol. 3) defined logical databases and entity relationships within and between databases. The <u>Preliminary Strategic Data Plan</u> (Vol. 4) prioritized the development of databases and included a workplan and approach for implementation of the shared database component of the Corporate Data Network.</p>
