PUBLIC NOTICE
BY THE
UNITED STATES NUCLEAR REGULATORY COMMISSION'S
ADVISORY COMMITTEE ON NUCLEAR WASTE

MAY 20, 1997

The contents of this transcript of the proceedings of the United States Nuclear Regulatory Commission's Advisory Committee on Nuclear Waste on MAY 20, 1997, as reported herein, is a record of the discussions recorded at the meeting held on the above date.

This transcript has not been reviewed, corrected and edited and it may contain inaccuracies.

92nd MEETING
ADVISORY COMMITTEE ON NUCLEAR WASTE (ACNW)

+ + + + +

TUESDAY
MAY 20, 1997

+ + + + +

ROCKVILLE, MARYLAND

The Advisory Committee met at the Nuclear Regulatory Commission, Two White Flint North, Room T2B3, 11545 Rockville Pike, at 8:30 a.m., Paul W. Pomeroy, Chairman, presiding.

COMMITTEE MEMBERS:

PAUL W. POMEROY
B. JOHN GARRICK
WILLIAM J. HINZE
GEORGE M. HORNBERGER

CHAIRMAN
VICE CHAIRMAN
MEMBER
MEMBER

ACNW STAFF PRESENT:

JOHN T. LARKINS
MICHELE KELTON
RICHARD K. MAJOR
HOWARD J. LARSON
LYNN DEERING
ANDREW C. CAMPBELL
RICHARD P. SAVIO
MICHAEL MARKLEY
CAROL A. HARRIS
SAM DURAISWAMY
THERON BROWN

Exec. Director
Tech. Secretary

ACNW CONSULTANT PRESENT:

MARTIN J. STEINDLER

ALSO PRESENT:

MARK THAGGARD
KEITH McCONNELL
NORM EISENBERG
MIKE BELL
JIM KENNEDY

P R O C E E D I N G S

8:36 a.m.

CHAIRMAN POMEROY: The meeting will now come to order. This is the first day of the 92nd meeting of the Advisory Committee on Nuclear Waste.

During today's meeting the committee will first discuss the Generic Methodology for Decommissioning Performance Assessment; secondly, prepare for and meet with the Commissioners from 2 to 3:30 this afternoon, is the time for that meeting, in the Commissioner's Conference Room; and thirdly, begin to prepare ACNW reports to the Commission.

Mr. Howard Larson, third to my right, is the designated Federal Official for today's initial session. This meeting is being conducted in accordance with the provisions of the Federal Advisory Committee Act.

We have received no written statements from members of the public regarding today's session. Should anyone wish to address the committee, please make your wishes known to one of the committee staff.

It is requested that each speaker use one of the microphones, identify himself or herself, and

(202) 234-4433

(202) 234-4433

1 speak with sufficient clarity and volume so that he
2 or she can be readily heard.

3 Before proceeding with the first agenda
4 item, I'd like to cover some brief items of current
5 interest. To us, the most important item of
6 interest is the fact that this is Dr. Hinze's last
7 meeting with the committee as a member of the
8 committee. Dr. Hinze will continue to serve as a
9 consultant to the committee and will attend our
10 meeting in San Antonio in July and our Las Vegas
11 meeting in September.

12 I'd like to take the time to read into the
13 record a letter from the members of the committee to
14 Dr. Hinze.

15 MEMBER HINZE: In public?

16 CHAIRMAN POMEROY: There will be other
17 opportunities to provide comments, but we would like
18 to have this officially in the record. And this is
19 a letter to Dr. William J. Hinze from the other
20 three members of the Committee.

21 "Dear Bill: As you leave the Advisory
22 Committee in Nuclear Waste we want to express our
23 most sincere appreciation and gratitude. Your
24 experience and the expertise in the geosciences has
25 been immensely valuable to us. Your dedication,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 intellectual curiosity, and hard work has helped us
2 meet many challenging deadlines.

3 "Over the past eight years you have helped
4 resolve numerous issues involving the geosciences.
5 Your technical insights have improved the regulatory
6 process and your understanding of high quality
7 science has had a major impact on the Nuclear
8 Regulatory Commission's high and low level waste
9 programs.

10 "Your advice has guided us in formulating
11 committee comments and recommendations on numerous,
12 complex, technical matters, including the
13 Commission's direction-setting issues, time of
14 compliance for high level and low level waste
15 disposal, coupled processes, and NRC's high level
16 waste pre-licensing program, igneous activity and
17 high level waste disposal, unsaturated zone
18 hydrology for Yucca Mountain -- this is a long
19 sentence, isn't it -- groundwater age dating
20 techniques, natural resources in the vicinity of
21 Yucca Mountain, the effects of climate change on
22 waste disposal, and geologic dating methods in
23 natural analogs."

24 There should be a verb at the end of all
25 that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 "You were our leader in reviewing the high
2 level waste research program and key technical
3 issues. Your distinguished service, hard work, and
4 outstanding technical leadership has helped us
5 immensely in our mission of providing valuable and
6 timely advice to the NRC on many highly complex,
7 technical issues.

8 "Your collegiality and enthusiasm for
9 science, as well as your diplomacy in dealing with
10 many challenging issues, sometimes on short time
11 schedules, is deeply appreciated.

12 "Above all, it has been a pleasure and a
13 privilege to serve with you over the years. Working
14 with you has enriched us all. You have brought out
15 the best in all of us, and that is of course, true
16 leadership. We wish you the best in your future
17 endeavors, and look forward to a continuing
18 association with you."

19 Sincerely, the members of the committee.
20 Thank you, Bill.

21 MEMBER HINZE: Thank you, Paul, and I
22 thank the past and present members of the committee
23 for their collegial support. I couldn't understand
24 why I was tired but after hearing you read that
25 letter, I understand why I am.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 CHAIRMAN POMEROY: I was tired. Thank
2 you, Bill. More opportunity for that later.

3 The second item of interest, a lawsuit
4 just heard in a U.S. court, could delay the opening
5 of the Waste Isolation Pilot Plant for two to five
6 years if it's successful. The Attorney Generals of
7 New Mexico and Texas, along with citizen's groups
8 and private citizens, claim the Environmental
9 Protection Agency's present compliance criteria for
10 WIPP are insufficient to protect public health and
11 the environment.

12 A third item of interest, as everybody
13 knows, I believe, the tunnel boring machine broke
14 through the south portal at Yucca Mountain on April
15 25th, 1997, at 11:05 a.m. And now I understand the
16 argument is continuing about the east-west tunnel.

17 Let me turn now to the first item on our
18 agenda which we have scheduled through 10 o'clock
19 today. And Dr. Garrick is our lead member for this
20 item. John?

21 VICE CHAIRMAN GARRICK: Thanks, Paul.
22 This is a subject of course, of continuing and of
23 long-time interest to the committee. As a matter of
24 fact, this is a subject of interest to both of the
25 Advisory Committees. And as I looked at the past

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 record concerning it, there seems to be a couple
2 points that were emphasized.

3 One has to do with the desire to take a
4 systems approach with respect to decommissioning.
5 And of course, the other and the one that we're
6 going to get an update on today, is the use of
7 performance assessment and how in fact, it will be
8 employed in decommissioning.

9 So I think that we will look at today as a
10 matter of getting an update on the approach taken by
11 the staff in the application of performance
12 assessment to decommissioning. And we have Mark
13 Thaggard here to provide us with that update, and if
14 there are other people he will introduce them.
15 Mark?

16 MR. THAGGARD: Good morning. Can everyone
17 hear me? I'm going to begin the presentation today.
18 I do have Dr. Eisenberg here from my office, along
19 with Dr. McConnell, kind of backup support.

20 Dr. Garrick has already introduced me. My
21 name is Mark Thaggard; I'm from the Division of
22 Waste Management. This presentation is in response
23 to an earlier request by the committee to find out
24 how the Division is using its performance assessment
25 capabilities and PA tools used in the low level

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 waste area to support the decommissioning program.

2 What I'd like to go over today is, first
3 of all I'd like to give you some background
4 information on performance assessment. The purpose
5 of this background information is to show some of
6 the commonalities in performance assessment, whether
7 it's done for high level waste, low level waste, or
8 for decommissioning.

9 In addition, I want to show how
10 performance assessment has evolved within the
11 Division, to provide a comparison between the
12 regulatory framework between low level waste and
13 decommissioning. Our understanding of the
14 difference in the regulatory framework provides some
15 insights in some of the differences in the proposed
16 approach for performance assessment in low level
17 waste versus decommissioning.

18 Then I'd like to briefly go over the
19 proposed low level waste performance assessment
20 approach in the draft branch technical position.
21 This was previously presented to the committee so
22 I'm only going to lightly touch on it today.

23 Then I'd like to provide an overview of
24 the decommissioning performance approach, and this
25 is going to be the main focus of my presentation.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 And then I will conclude by briefly talking about
2 some of the computer codes that we're using in
3 performance assessment, and some other related
4 ongoing activities.

5 Some common elements in performance
6 assessment, whether it's done for high level waste,
7 low level waste, or decommissioning, includes: a
8 description of the natural and engineered system; an
9 understanding of likely and unlikely events; a
10 description of processes for waste transport; an
11 estimation of potential release and human exposure;
12 and some type of evaluation of uncertainties in the
13 results.

14 Three components in a performance
15 assessment analysis include: trained and
16 experienced analysts; quantification tools; and
17 data. Some of the trained and experienced analysts
18 and quantification tools that were used in the low
19 level waste program are now being used to support
20 the decommissioning program.

21 The performance assessment analysis should
22 be driven by the characteristics of the waste
23 disposal system -- and I've given some examples here
24 -- and the characteristics of the compliance
25 framework; that is, the regulatory framework.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 Performance assessments was first
2 developed to support high level waste programs back
3 in the mid-1970s. It provided some insights into
4 the repository, and also helped with the formulation
5 of 10 CFR Part 60. Demonstration of staff
6 capabilities in implementing the performance
7 assessment identified key research needs and showed
8 the need for integration among the disciplines.

9 We are still using performance assessment
10 in the high level waste program, and some of the
11 approaches, staff capabilities and PA tools used in
12 the high level waste program has been adapted for
13 use in the low level waste program, and now we are
14 adapting them for the decommissioning program.

15 Performance assessment is used in the
16 Division to support decommissioning to carry out
17 NEPA analysis. It's used in the low level waste
18 area to develop guidance and provide technical
19 support to States, and in the high level waste
20 program to assess the viability of the proposed
21 repository, and also to analyze site-specific
22 regulation.

23 And as I stated before, one of the
24 characteristics of a performance assessment analysis
25 is that it should be driven by the compliance

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 framework. Understanding differences in the
2 regulatory framework between low level waste and
3 decommissioning provides some insights into some of
4 the differences in the proposed performance
5 assessment approach between the two programs.

6 In low level waste, the regulation has
7 four performance objectives: a dose standard for
8 protecting the general public; provisions for
9 protecting inadvertent intruders through waste
10 classification and intruder barriers; requirements
11 for protection of individuals during operation; and
12 requirements for long-term stability.

13 The proposed rule in decommissioning, on
14 the other hand, really only has provisions for dose
15 standards as the primary performance objective. And
16 there are two situations: one is for an
17 unrestricted release and the other is for restricted
18 release. The reason I point this out, because
19 you're going to need to understand this a little bit
20 as we start going through the framework.

21 When we look at the situation of the
22 restricted release there are two situations that
23 have to be analyzed in the performance assessment
24 analysis. One case involves looking at the dose to
25 somebody offsite, because there's a 25 millirem

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 standard, assuming that institutional controls are
2 effective in keeping somebody from moving onto the
3 site.

4 The second case involves looking at the
5 impact to somebody onsite, assuming that the
6 institutional controls fail at some point.

7 Several key points to consider when
8 comparing performance assessment for low level waste
9 and decommissioning are that decommissioning sites
10 are not sited for waste disposal, so some of the
11 pathways that may be less important in the low level
12 waste performance assessment may become very
13 important in decommissioning.

14 Also, there's no waste classification or
15 intruder barrier requirements, and so this aspect of
16 somebody getting onto the site becomes a real
17 important aspect of a decommissioning performance
18 assessment analysis. In low level waste this is
19 largely taken care of by the waste classification
20 and intruder barrier requirements within the
21 regulation.

22 There's also a proposed 1000-year
23 timeframe in regulation so if a licensee is
24 proposing barriers such as covers, their performance
25 may be important in terms of demonstrating

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 compliance.

2 There are also some key differences in the
3 source terms that you typically have between low
4 level waste and decommissioning. At most
5 decommissioning sites you have a small number of
6 radionuclides that you're dealing with, and you
7 usually don't have waste containers to contend with.

8 But on the other hand, you may have to
9 deal with hazardous chemicals if you're looking at
10 -- if you're dealing with NEPA. There also may be
11 the possibility that you have existing groundwater
12 contamination at the site, so you may be -- in the
13 performance assessment analysis you may be analyzing
14 the release of contaminants to the groundwater.

15 In addition, you may be modeling transport
16 of existing contamination, which is something you
17 wouldn't have to deal with in low level waste.

18 Now, what I wanted to was, I want to
19 briefly go over the proposed performance assessment
20 approach that's recommended in the draft branch
21 technical position for low level waste performance
22 assessment. And this will allow you to see some of
23 the similarities and some of the differences in the
24 proposed approach that we're recommending for
25 decommissioning.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 And as I indicated before, since this has
2 already been presented to the committee, I'm going
3 to go over this kind of briefly.

4 The main point is that it is an iterative
5 approach. You begin by analyzing the data, develop
6 the conceptual models and your parameter
7 distributions, formulate your mathematical models
8 and select computer codes to implement the
9 mathematical models, carry out the analysis, do some
10 sensitivity analysis, and then you ask the question,
11 do you meet the dose objective? If you meet the
12 dose objective then you're basically finished.

13 On the other hand, if it turns out that
14 you do not meet the dose objective based upon the
15 analysis, the sensitivity analysis will have helped
16 identify the key parameters and assumptions that's
17 driving the models.

18 So you can possibly go out and collect
19 data to update your parameter distributions or
20 change your conceptual models, reformulate your
21 mathematical models, select new computer codes if
22 need be, and run through and do your consequence
23 analysis again. And you may go through this several
24 times and for that reason it's an iterative
25 approach.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN POMEROY: Mark, before you go on
2 with your next slide, maybe this is the right place
3 to begin to ask this question. We're really talking
4 about two things here: the low level waste
5 performance assessment approach that was developed
6 for low level waste --

7 MR. THAGGARD: That's correct.

8 CHAIRMAN POMEROY: -- versus the one that
9 is being developed at this point in time for
10 decommissioning.

11 MR. THAGGARD: That's correct.

12 CHAIRMAN POMEROY: If I understand you
13 correctly you're saying that there are pieces of the
14 low level waste PA program as it was developed, that
15 are being used in decommissioning?

16 MR. THAGGARD: That's correct. Where we
17 can carry over we've done that, but I'm trying to
18 highlight that there are some reasons that there are
19 differences in the approaches. One of the reasons
20 is that there are some differences in the
21 regulations.

22 CHAIRMAN POMEROY: One of the things that
23 I wanted to ask was, is there -- and perhaps you're
24 not the person to answer this but one of your two
25 compatriots are I'm sure -- are there any plans to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 continue with the development of a low level waste
2 performance assessment package that might be useful,
3 for example, for us in the future, or for the States
4 -- in their development work?

5 MR. THAGGARD: Well, Keith can answer
6 that.

7 CHAIRMAN POMEROY: Good morning, Keith.

8 DR. McCONNELL: Good morning. Keith
9 McConnell, NRC staff. We basically are continuing
10 with the low level waste BTP. It should go out for
11 public comment today or tomorrow, I would expect --
12 be signed out. Beyond that, there is some minor
13 assistance to the States when they call in, but
14 that's about it in the low level waste program area
15 at this point.

16 CHAIRMAN POMEROY: So we're anticipating
17 that anybody that needs a low level waste
18 performance assessment package will develop that or
19 will find it in the external community?

20 DR. McCONNELL: We would hope that they
21 would look at the BTP as kind of a guidance document
22 for them to develop their own program, and for an
23 implementor to develop their own programs. But I
24 think that's basically it.

25 CHAIRMAN POMEROY: You know what I'm

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 looking for here today. How much of the low level
2 waste performance assessment development is useful?
3 Mark has pointed out that there are models and so
4 forth that are taken. Is this basically a new
5 initiative, or does this have a significant
6 component that's drawn from the low level waste
7 performance assessment?

8 DR. McCONNELL: I'll let Mark speak to the
9 specifics, but in general I think a large part of
10 the low level waste effort is being harvested into
11 this decommissioning PA strategy and guidance. And
12 we've also used a low level waste test case and some
13 of the supporting work as a basis for some of our
14 analysis in high level waste.

15 So I think it's a fairly well integrated
16 effort where we're using some of the techniques
17 developed in high level to apply to low level and
18 decommissioning and vice versa. So I think it's
19 pretty well integrated and we're trying to be as
20 efficient as we can.

21 MR. THAGGARD: Yes, one of the things, to
22 answer your question, is yes to both of them. It's
23 somewhat new but we're also using what we can that's
24 already been developed. The people that are
25 developing this are Sandia National Laboratory.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 They were, obviously, very instrumental in
2 developing the performance assessment methodology
3 for low level waste. Some of the same people --
4 some of the same staff members are involved so
5 there's some continuity from that standpoint.

6 CHAIRMAN POMEROY. Okay. We may want to
7 return to that later, but let's go on.

8 MR. THAGGARD: Okay. Now what I want to
9 get into is the proposed approach that we're
10 recommending for decommissioning. As I indicated,
11 this is going to be the main focal point of my
12 presentation. What I'd like to do is, I'd like to
13 go through this flow chart one time fairly quickly,
14 and then come back and touch on some of the
15 individual elements of it.

16 The approach begins with the assimilation
17 of existing data and information, which leads to
18 defining scenarios and pathways, developing a system
19 conceptualization, doing an analysis, and the
20 question this time is: can the site be released?
21 If, based on the analysis the site can be released,
22 then you need to determine whether or not the ALARA
23 requirements have been met. If so, then you can
24 basically terminate the license.

25 If on the other hand, you determine that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the site cannot be released based upon the analysis,
2 then you need to go through and define a set of
3 options that would allow the site to be released.
4 And also options that would need to be considered
5 under the NEPA requirements.

6 Once you've defined the various options
7 that possibly could allow the site to be released,
8 you analyze these options in terms of the costs to
9 implement the option, the time it takes to carry out
10 the option, and the probability of being able to
11 release the site.

12 Based on that information, you select a
13 preferred option, then you collect data to verify
14 that your assumptions about the probabilities are
15 correct. You may also need to do some remediation,
16 and then collect data, update your assumption,
17 parameter values, pathways, and go back, redevelop
18 your conceptualization of the system, do your
19 analysis, and ask the question again: can the site
20 be released?

21 And of course if it can't be, you have to
22 go back in here and redefine your options. If it
23 can, then you go down here, determine whether or not
24 you met the ALAR requirement, and terminate the
25 license. So again, it's an iterative process.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 When you get over here, when you select
2 your preferred option, if none of the options would
3 allow the site to be released then there's a
4 provision that the license will have to be
5 maintained.

6 And now what I'd like to do is, I'd like
7 to walk you through some of the elements. In the
8 first step we are talking about the assimilation of
9 existing data and information, and the key point
10 here is that we're only talking about existing
11 information. No new data is collected at this step.

12 And some of the examples of the type of
13 information that may be available when we get into
14 these sites; at some sites there's only information
15 on the source term; at other sites there's extensive
16 amount of site characterization data that's already
17 been collected. But the key point about step number
18 1 is that you use the existing information; no new
19 data is collected.

20 In step number 2 you define your scenario,
21 which is basically the future state of the system.
22 This can either be generic or site-specific. We've
23 been working with the Office of Research to try and
24 come up with generic scenarios that should be used
25 in these analyses, or identify what type of guidance

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 is needed to select site-specific scenarios. The
2 main point is that the doses should go down, even if
3 the scenarios are changed as you iterate through the
4 process.

5 The pathways are basically the source to
6 human receptors. And these can change based on
7 site-specific information. What I mean by that is,
8 an example is that if we recommend as a generic
9 scenario, that everybody looks at the residential
10 farmer scenario, at a specific site there may be
11 some information that indicates that the groundwater
12 is not usable.

13 Well, for that particular site, based on
14 that information, you would turn off the groundwater
15 pathway in your analysis. You would still use the
16 residential farmer scenario because it would be the
17 defined generic scenario, but based on the site-
18 specific information you would turn off the -- you
19 wouldn't consider the groundwater being used.

20 In step number 3 you develop your system
21 conceptualization to be based on a specific scenario
22 and set of pathways. You define your process and
23 parameters to use in the analysis, and your media
24 selection should be based on your system
25 conceptualization. Some of the information about

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 the parameter uncertainty I'm going to get to in a
2 minute.

3 In step 4 you do the consequence analysis.
4 This is basically where you calculate the dose from
5 all the pathways and scenarios. Under the approach
6 that's recommended, you can use the bounding
7 conservative deterministic analysis, or prudently
8 conservative deterministic analysis, or
9 probabilistic analysis.

10 In step number 5 is where you get to the
11 question, can the site be released? The first time
12 through the process the question is, can the site be
13 released for unrestricted release? According to the
14 regulation, that needs to be looked at, so the first
15 time through that's the question.

16 Subsequent times through the process the
17 question becomes, can the site be released? So you
18 may be asking, can the site be released for
19 unrestricted use or can it be released with
20 restrictions?

21 In step number 6 you need to determine
22 whether or not the ALARA requirements are met for
23 unrestricted release without remediation. This will
24 probably involve some type of cost benefit analysis
25 to determine whether or not additional contamination

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 need to be removed.

2 For the unrestricted release following
3 remediation or for restricted release, the goal and
4 intent of ALARA should be met when you identify your
5 various options and consider the costs associated
6 with implementing those various options.

7 And now I'd like to go through steps 8
8 through 10. At this point you've done your analysis
9 and you've determined that the site cannot be
10 released. In step 8 you define various options, and
11 these could include collecting data that would allow
12 you to be able to release the site for unrestricted
13 release.

14 Maybe your initial analysis was too
15 conservative and there might be some data you can go
16 out and collect that would allow you to be able to
17 demonstrate that the site could be released for
18 restricted use.

19 Another option might be to remediate the
20 site and then release it for unrestricted use.
21 Another option might be to remediate a part of the
22 site and put restrictions on the other part of the
23 site. Another option might be to collect data and
24 then remediate. Another option might be just to
25 place restrictions on the site. And then the no

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 action option needs to be looked at for NEPA.

2 VICE CHAIRMAN GARRICK: Excuse me, Mark.
3 What about the option of just improving your model?
4 Maybe the model is just too simple.

5 MR. THAGGARD: Well, that would probably
6 be similar to collect data. These are just
7 examples, but yes, that could certainly be one of
8 them.

9 VICE CHAIRMAN GARRICK: Because I can
10 imagine situations -- well, matter of fact,
11 experience indicates that very often the recycling
12 is more of a turning up the microscope on the model
13 than is actually collecting data or what have
14 you. But that is an option -- that is an acceptable
15 alternative?

16 MR. THAGGARD: That's correct. But
17 similarly, if you're going to change your model, you
18 will have to have some justification --

19 VICE CHAIRMAN GARRICK: Sure.

20 MR. THAGGARD: -- or some data, something
21 to justify that. But yes -- I mean, these are just
22 examples, but the main point is that in step 8 you
23 would identify the various options.

24 In step 9 you analyze these options in
25 terms of the cost to implement each option and the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 time to carry out the implementation, and some
2 probability that you will be able to release the
3 site by carrying out that particular option.

4 Step 10 is just a selection, or the
5 preferred option. Now, one of the main points I
6 want to make to you is that this process is designed
7 to optimize your selection over a preferred option.
8 A lot of these sites, we don't have a lot of money
9 to deal with, so we don't want to -- the main idea
10 is, we don't want to drive somebody into bankruptcy,
11 especially without even knowing what is an
12 appropriate means of remediating the site. So
13 there's consideration of cost and time involved in
14 this.

15 CHAIRMAN POMEROY: Mark, help me out with
16 the logic a little bit here.

17 MR. THAGGARD: Okay.

18 CHAIRMAN POMEROY: As I understand it,
19 you're dealing -- you're using the concept of a
20 critical group here, and an average member of the
21 critical group. Forget about the average member for
22 a moment.

23 MR. THAGGARD: That's correct.

24 CHAIRMAN POMEROY: In this case, if you're
25 talking about unrestricted or restricted release,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 you're really talking about some person -- some
2 hypothetical person or persons being on the site, is
3 that not correct?

4 MR. THAGGARD: Well, if the -- we deal
5 with restricted use of the site then there are
6 provisions that you need to have institutionalized
7 controls. But presumably, those institutional
8 controls could fail, and for that reason there are
9 two dose standards for somebody under that scenario,
10 and you need to assess that as part of the
11 performance assessment.

12 CHAIRMAN POMEROY: Right, but if, in the
13 case of, if you're contemplated an unrestricted use
14 you're looking at the question of some person being
15 on -- physically located on --

16 MR. THAGGARD: That's correct.

17 CHAIRMAN POMEROY: -- the site.

18 MR. THAGGARD: That's correct.

19 CHAIRMAN POMEROY: So it's certainly a
20 different kind of definition of a critical group;
21 somebody will almost certainly be there and
22 receiving whatever maximum dose that there is on the
23 site.

24 MR. THAGGARD: That's correct, and we've
25 been working closely with Research to try and figure

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 out how to define these average members of the
2 critical group. It's not a trivial task.

3 CHAIRMAN POMEROY: No, we found that
4 certainly to be true in our work on high level
5 waste. I'm just curious though, I'm a little lost
6 why it's so difficult here, if we're thinking of
7 unrestricted use, you just put somebody right on the
8 site and expose them to whatever maximum dose there
9 is available on the site. Is there something wrong
10 with that thinking, Norm?

11 DR. EISENBERG: I'm sorry, say that again?

12 CHAIRMAN POMEROY: Well, aren't you
13 dealing with a question of, in a case of
14 unrestricted use, you're going to put the member of
15 the critical group on the site and expose them to
16 the maximum dose on the site? It's almost a
17 deterministic -- do you need a critical group for
18 that, is I guess what I'm saying?

19 MR. THAGGARD: Well, you've got to define
20 what that person does. See, that's the problem.
21 You've got to -- I mean, is that a residential
22 farmer? Is that the critical group, is that the
23 member? Or is it somebody using the site as an
24 industrial use? So you've got to put some
25 definition to that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 You're right in terms of location. I
2 mean, obviously location of it is on the site, but
3 in terms of defining what that person does or what
4 that person -- I mean, you know, that's the
5 difficult part of it, and you need that in order to
6 do the assessment. I don't know if that gets at the
7 heart of your question.

8 CHAIRMAN POMEROY: Well, it helps me,
9 certainly. Why don't we go on? Maybe I can frame
10 it better later.

11 MR. THAGGARD: Okay. This just provides
12 an example of what the output from the analysis
13 could look like. On one axis you've got time,
14 another you've got cost, and then the probability of
15 being able to release the site. And these things
16 that are defined as activity sets are basically the
17 various options. This is just an example what the
18 output could look like. We haven't gone through the
19 process yet.

20 MEMBER HINZE: Mark, you have a time
21 threshold. What's your cost threshold? Can you
22 give me any more definitive way of evaluating the
23 cost threshold?

24 MR. THAGGARD: Well, there are no cost
25 thresholds within the regulation.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER HINZE: That's what I see on your
2 diagram here.

3 MR. THAGGARD: Yes. Now, the reason the
4 cost is on there is because, what I'm saying is,
5 obviously cost is a consideration. I mean, it may
6 cost you \$200 million to clean up the site and carry
7 all this stuff off the site, versus \$50 million to
8 leave it on site. And so you've got to weigh that
9 in your consideration.

10 Especially if there's only \$75 million
11 available within the company, then to require that
12 they carry out \$200 million option, you know, you've
13 got to -- the cost is there so that the decision-
14 maker can consider it, but there's no set thresholds
15 as to what that could be. It's just another piece
16 of information for the decision-maker.

17 I mean, it will have to be something that
18 will have to be included in an EIS anyway, as part
19 of the NEPA requirement. You need to look at the
20 cost, so it will just be another piece of
21 information for the decision-maker. But there are
22 no set thresholds within the regulation for cost.

23 MEMBER HINZE: It's an evaluation of each
24 independent site and the owners of the site and the
25 operators?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 MR. THAGGARD: That's correct. Just to
2 highlight some of the similarities between the
3 proposed approach for the low level waste and
4 decommissioning, as I indicated, both are iterative
5 approaches where the performance assessment is used
6 to identify data needs. Both approaches account for
7 uncertainties, either through the use of bounding
8 deterministic or probabilistic analysis.

9 And both approaches are designed to
10 present a defensible assessment of long-term
11 performance. That is, the intent is not to try and
12 calculate a real dose.

13 MEMBER HORNBERGER: Mark, I don't
14 understand the last bullet.

15 MR. THAGGARD: Okay.

16 MEMBER HORNBERGER: If the intent is not
17 to calculate doses -- real doses -- what is the
18 intent?

19 MR. THAGGARD: Well I mean, it's not a
20 dose that somebody -- we anticipate -- is really
21 going to get. Because there's a lot of assumptions
22 that's being made into this. We can't go out and
23 verify that -- if we come up with a dose of 25
24 millirem, you know, there's no way for us to assess
25 whether somebody in the future is going to get that,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 and in all likelihood, they're not.

2 It's just some information so that the
3 decision-maker can have some gauge as to the likely
4 impact, but it's not a -- I mean, we don't know for
5 example, who's going to be at the site, we have no
6 -- I mean, all this conjecture about the scenario,
7 it's all conjecture.

8 We can assume that it's going to be a
9 residential farmers; it may actually be an
10 industrial use at the site 1000 years from now. And
11 so if we estimate the dose for a residential farmer,
12 somebody is using the site for industrial use would
13 get a much less dose. But we would use maybe the
14 residential farmer because it helps bound -- put
15 some caps on the potential impact that somebody
16 could get.

17 DR. McCONNELL: Yes, it's more of an
18 estimation of a dose, not a prediction that some
19 residential farmer will receive a specific dose at
20 year 999 in the future.

21 MR. THAGGARD: And I'd like to talk about
22 some of the computer codes that are available for us
23 to use in performance assessment analysis. The
24 first one listed here is a code called DandD. It's
25 a code that's being developed by Sandia National

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 Laboratory for the Office of Research. It's a
2 screening code and possibly could be used to
3 implement steps 1 through 4 of the diagr .

4 The DandD code is a deterministic code but
5 it's got somewhat of a probabilistic basis to it in
6 that the default parameters in that code are
7 designed so that there's only a five percent chance
8 of getting a higher dose if you place one of the
9 default parameters with a site-specific parameter.

10 Another code that's commonly used is
11 RESRAD code. As I indicated before, assessing the
12 impact of somebody getting on the site is a key
13 component in the decommissioning performance
14 assessment analysis. That's what the RESRAD code is
15 designed to look at. It can be used even in a
16 deterministic or probabilistic analysis.

17 Another code is the NEFTRAN code. This
18 code was originally developed to support the high
19 level waste performance assessment work. It can be
20 used to analyze the release from a source area
21 transport through the vadose zone and transport
22 through the saturated zone.

23 The NEFTRAN code is also a -- was an
24 integral part of the performance assessment code
25 used in the low level waste test case analysis.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 And another code I mention here is the
2 MEPAS code which was developed by Pacific Northwest
3 Laboratory. It can be used to analyze impacts from
4 both radiological and hazardous chemicals.

5 The code that we're hoping to use in the
6 future for most of this work is a code that's under
7 development right now by Sandia National
8 Laboratories, called SEDSS. At some point we would
9 like to maybe give you all a demonstration of it.

10 Some of the attributes of SEDSS are that
11 it automatically feeds the output from one module
12 into the next, so therefore, setting up the inputs
13 for the various computer codes is somewhat
14 transparent to the analyst. It was originally
15 designed to help in site characterization, risk
16 assessment, and remedial design. SEDSS has been
17 supported by EPA, DOE, and the NRC.

18 Its main focus right now is in terms of
19 the risk assessment. One of the other key
20 attributes of SEDSS is that it documents the implied
21 and explicit assumptions that are made in the
22 analysis.

23 And I'd like to go with some of the other
24 activities that are being worked on right now. The
25 decommissioning rule as I indicated, is a proposed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 rule. It is currently with the Commission. The
2 Office of Research is working on developing guidance
3 on implementing the rule. We've been trying to work
4 with them on that.

5 We are in the process of testing out the
6 methodology on a real SDMP site, and we hope to
7 finalize the methodology sometime next year.
8 There's continual work being done on the SEDSS code.
9 We should get a UNIX version of this code sometime
10 this month, and a Windows version sometime next
11 year.

12 That basically concludes my presentation.
13 Be happy to try and answer any questions that you
14 have.

15 VICE CHAIRMAN GARRICK: Thanks, Mark. I'm
16 sure we have a few. I guess I'd like to start with
17 a vaguely familiar man on my left here. Consultant,
18 Dr. Steindler, do you have some questions?

19 DR. STEINDLER: Yes. You did indicate
20 that there was a time threshold. What is it and why
21 is it?

22 MR. THAGGARD: You mean in the proposed
23 regulation?

24 DR. STEINDLER: No, no, in your little
25 diagram that apparently comes from Sandia.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 MR. THAGGARD: Oh, that time is not a
2 threshold. What it is, is it's a -- you're
3 estimating the cost it would take to implement a
4 particular option, and also the time it would take
5 to implement it. For example, if it takes ten years
6 to build a cover and some other engineering features
7 at the site, well, we may not want to select that
8 particular option.

9 On the other hand, it may only take a year
10 to dig up all this stuff and cart it offsite. So
11 the time listed on that diagram is the time it would
12 take to carry out the particular option. And again,
13 this is just another piece of information for the
14 decision-maker so that, you know, he can weigh the
15 cost, the time it would take to implement the
16 option, and the probability of being able to release
17 the site. He has those three information.

18 DR. STEINDLER: In your step 9 where you
19 analyze the options in terms of cost, time, and
20 likelihood of site release, I fail to see the role
21 of risk in whatever decision process comes out of
22 that step. What am I missing?

23 MR. THAGGARD: Well, there's an element of
24 risk in terms of the probability of being able to
25 release the site.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. STEINDLER: I'm sorry, I'm not talking
2 about that risk; that's the risk of success --

3 MR. THAGGARD: Yes.

4 DR. STEINDLER: -- or the risk of failure.
5 I'm talking about the kind of risk that is generated
6 by a 25 millirem number, for example.

7 MR. THAGGARD: Well, you get a measure of
8 risk when you calculate the consequence analysis in
9 step 4. I mean, you're going to get a dose right
10 there, and if you want to convert that to a risk you
11 can certainly do that. But that's where you're
12 actually calculating the impacts.

13 DR. STEINDLER: I'm not making myself
14 clear. You've already passed step 4 and you've
15 identified the fact that you can't release the site.

16 MR. THAGGARD: That's correct.

17 DR. STEINDLER: And so your next two steps
18 are, you try to define as best you can, the site
19 characteristics and what kind of options that
20 presents to you, and now you, having enumerated
21 those options in step 8, you begin to try and
22 analyze them.

23 The absence of discussion of the risk
24 factor to the residential farmer or however you
25 structure your scenario, is puzzling. I mean, isn't

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 that -- I mean, it seems to me that that ought to be
2 a non-trivial issue.

MR. THAGGARD: Well, as I indicated,
4 you're going to select a preferred option. When you
5 select the preferred option you've got to go back
6 and reanalyze it.

7 DR. STEINDLER: The preference process
8 doesn't seem to include --

9 MR. THAGGARD: Well it does -- that's
10 correct, it doesn't. But it does include the
11 probability of being able to release the site, which
12 is the main goal of the regulation -- is being able
13 to release the site. I mean, that's the main focus
14 of decommissioning.

15 I mean, I understand where you're coming
16 from. I mean, you're going to get one option here
17 that you're going to run back through and do an
18 analysis on, and so presumably you will have some
19 measure of what the impacts are going to be to
20 people based on implementing that particular option.
21 You won't have it for all the options that you
22 didn't select; you're correct about that.

23 DR. STEINDLER: That's the point. You
24 listed four or five separate codes. How would one
25 choose between them, and have any of those been

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 validated in the real world so that their
2 applicability to an unanalyzed site is obvious?
3 Four codes.

4 MR. THAGGARD: I can't really speak on the
5 degree of verification that's been done on these
6 codes, to be honest with you. I'm not that familiar
7 enough with them to be able to answer that. But
8 obviously, the selection of the code is going to
9 depend upon what type of analysis you're doing.

10 If you're going to analyze impacts to
11 somebody onsite, if your intent is like to analyze
12 whether or not the site can be released for
13 unrestricted release and the possibility, as Dr.
14 Pomeroy indicates, somebody getting on the site,
15 then one code you possibly will consider using is
16 the RESRAD code, because that code is specifically
17 designed to analyze somebody getting on the site.

18 On the other hand, if you're concerned
19 about the potential impact to somebody offsite,
20 assuming that you're going to have some restrictions
21 on the site, then you will probably want to use a
22 code like NEFTRAN, because you can analyze the
23 transport, at least through the groundwater pathway,
24 offsite.

25 So the code selection is going to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 dictated to some extent by what you're trying to
2 analyze. You can also use the DandD screening code
3 as an initial code to just assess what the impacts
4 would be from releasing the site for restricted use.
5 So the code selection, I think to a large extent, is
6 going to be basically geared toward what you're
7 trying to do.

8 I don't know. Maybe --

9 DR. STEINDLER: I've got one other point
10 -- I understand what you're saying. You spoke of
11 ALARA as though it were in fact, a goal of some
12 sort. The ground rule that I thought we all were
13 operating under was that ALARA is a process. Where
14 have we diverged?

15 MR. THAGGARD: Well, it's specifically
16 that in the rule as a requirement; that you've got
17 to demonstrate that you meet ALARA.

18 DR. STEINDLER: Okay, that's a process.

19 MR. THAGGARD: That's correct. Maybe I'm
20 missing --

21 DR. STEINDLER: What's the goal -- I
22 thought those were your words. Let me see if I can
23 find them someplace in here. Yes, on your, almost
24 last slide there -- on slide 19 you indicated that
25 the goal and intent of ALARA is already

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 accomplished.

2 MR. THAGGARD: Oh.

3 DR. STEINDLER: Does that imply a
4 numerical standard of some sort --

5 MR. THAGGARD: No, no, that just --

6 DR. STEINDLER: -- with you --

7 MR. THAGGARD: No, it's just that the --
8 the intent there is just to state that the
9 requirement for ALARA -- maybe that would have been
10 a better choice of words -- the requirement for
11 ALARA should be met by going through the process of
12 looking at the various options and the costs
13 associated with those. That would be a better --

14 DR. STEINDLER: That's what you meant?

15 MR. THAGGARD: Yes.

16 VICE CHAIRMAN GARRICK: George?

17 MEMBER HORNBERGER: Mark, I was wondering
18 if you could tell me a little more -- on slide 16
19 when you were talking about the conceptualization,
20 defining process and parameters, and you have a note
21 in there that it includes explicit treatment of
22 parameter uncertainty, and then you have three
23 subheadings: bounding, prudently conservative, and
24 probabilistic data distribution.

25 MR. THAGGARD: Yes --

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER HORNBERGER: Are all three of those
2 used?

3 MR. THAGGARD: No, no, the idea there is
4 you can use any one of those. As I tried to allude
5 to on the next overhead, is in doing step number 4
6 where you actually do the dose analysis, you can
7 either use a deterministic analysis or you can use a
8 probabilistic analysis.

9 If you use the deterministic analysis that
10 can either be through the use of a bounding type
11 analysis or prudently conservative analysis, or you
12 can use the probabilistic analysis. So you can use
13 one of those, but the ideal is not to use all three.

14 MEMBER HORNBERGER: And typically, how do
15 you decide which approach to use?

16 MR. THAGGARD: Well, to a large extent
17 it's decided based on again, the site. I mean, if
18 you can get away with doing a bounding or prudently
19 conservative analysis, ideally you would do that.
20 But in some cases you may do that and determine that
21 you're being overly conservative and so you may need
22 to use some other means to try and account for
23 uncertainty.

24 But there are no set guidelines as to
25 which one you would select. If you use the DandD

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 screening code as the first cut to check to see
2 whether or not the site can be released for
3 unrestricted use, you're probably using a prudently
4 conservative analysis, because it's got that built-
5 in set of default parameters that are designed to be
6 conservative.

7 On the other hand, there may be a site
8 where you really have some fairly good idea that
9 this site is okay. You might be able to just make
10 some real grossly conservative assumptions, do some
11 quick analysis, and be done with it. So again, it's
12 going to be really up to the analyst to make that
13 decision.

14 MEMBER HORNBERGER: They see this almost
15 as a sequential process. If you use the screening
16 analysis and everything is hunky-dory --

17 MR. THAGGARD: That's correct.

18 MEMBER HORNBERGER: -- then it's okay.

19 MR. THAGGARD: That's correct. And to the
20 extent that you can get away with it, you want to do
21 that, because as I indicated, most of these sites
22 you're not dealing with companies that have a lot of
23 money available to clean up these sites. And so if
24 you can make a decision based on somewhat simple
25 analysis and be done with it, you want to do that.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MEMBER HORNBERGER: On that line, could
2 you give me some quick picture of the diversity of
3 sites that you envision applying this method to?

4 MR. THAGGARD: Well, the way the
5 methodology is set up right now is, we've tried to
6 make it as a continuum from all decommissioning
7 sites, so that you may have some sites where you
8 have just building contamination, you're using the
9 same logic to analyzing those sites as opposed to
10 some sites where you've got massive amounts of
11 contaminated dirt, sludge ponds, contaminated
12 buildings, groundwater contamination.

13 So you have the whole spectrum of
14 decommissioning sites out there, and we've tried to
15 make this approach consistent so that -- well, we
16 tried to make the approach so that you can use a
17 consistent logic in analyzing that whole spectrum.
18 And so we've tried to work with some of the work
19 that's being done in Research in terms of
20 development of the DandD screening code. We've
21 tried to embody that logic into this framework.

22 DR. LARSON: Mark, I think this is Dr.
23 Hornberger's first general presentation on the SDMP
24 program, so when he asked that question I don't know
25 if he really understands that there are actual sites

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 and what their nature is. I think that would help
2 him understand what you're trying to --

3 MR. THAGGARD: Oh, okay. I apologize.
4 Basically, in terms of decommissioning, you've got a
5 real broad spectrum of different sites out there. I
6 mean, as I indicated, some sites you have just
7 building contamination, other sites you've got a
8 whole range of multiple contamination sources out
9 there.

10 At other sites you may have contaminated
11 slag, you've got contaminated dirt, you've got
12 contaminated groundwater. I mean, it's a real
13 mixture of what we may be facing. And that's one of
14 the reasons that we've tried to design this
15 methodology to be somewhat flexible.

16 A lot of the questions that you're asking
17 I think, are things that the analysts -- and that's
18 why you've got to have experience in training
19 analysts doing these analysis -- a lot of it's
20 going to be based on their intuition as to what's
21 the appropriate approach to follow.

22 MR. BELL: Mark -- this is Michael Bell.
23 I'm the Acting Chief of the Performance Assessment
24 High Level Waste Integration Branch. And I guess I
25 found Mark's response just somewhat repetitive of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 what he had already said, and he didn't get into
2 enough specifics.

3 The spectrum of SDMP sites ranges from
4 things like fuel cycle facilities, fuel fabrication,
5 plants where they have large volumes of, say low and
6 rich uranium in a sludge pond that needs to be
7 cleaned up. They may have had onsite burials of low
8 and rich material.

9 The other end of the gamut is there are
10 contaminated ammunition artillery ranges at defense
11 sites where you essentially have depleted uranium in
12 the soil. Well, we have ore processors where, you
13 know, they were recovering some rare earth minerals
14 and the ore they were using had natural uranium in
15 it, and so you've got slags with low concentrations
16 of natural uranium.

17 I'd say the common denominator here is,
18 most of these difficult sites, the ones where you're
19 going to need the SDMP methodology, have large
20 volumes of low levels of contamination, so it makes
21 it very difficult to, you know, and very expensive
22 to essentially, remove all contamination, take it
23 away.

24 There are situations where the
25 radioactivity in many cases, is going to have to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 stabilized on the site and you're going to have to
2 look at the option of, if this material is left in
3 place then what are the impacts on the environment
4 and the future residents?

5 VICE CHAIRMAN GARRICK: Thanks, Mike.
6 Bill?

7 MEMBER HINZE: Mark, I'd like to go back
8 to my cost question again.

9 MR. THAGGARD: Okay.

10 MEMBER HINZE: I'd like to go back to your
11 decision point number 9 in the decision framework.
12 Presumably, the analyze options in terms of cost,
13 time, and likelihood of site release. These are
14 criteria that are used in the decision making of the
15 option that is going to be used, is that correct?

16 MR. THAGGARD: That's correct.

17 MEMBER HINZE: Are there any other
18 criteria that are used by the analysts?

19 MR. THAGGARD: Well, there will probably
20 be some other consideration used by the decision-
21 maker. The decision-maker may not necessarily be
22 the analyst. But there may be some other NEPA
23 consideration that need to be thought about like
24 environmental justice, for example.

25 You know, if you want to leave this stuff

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 onsite, this framework doesn't consider things like
2 environmental justice. You may have some minority
3 groups, low-income people living near the site and
4 so you may not want to leave it there because of
5 that reason. So there's some other things in NEPA
6 that you would need to -- that you will have to
7 think about in terms of selecting the preferred
8 option.

9 MEMBER HINZE: You might want to include
10 some caveat to provide for those. My next question
11 is, what is the weighting given to these and who
12 provides that weighting? Through these criteria.

13 MR. THAGGARD: Well, right now I think
14 they're equally weighted. We really haven't thought
15 that through. I mean, as I indicated, this
16 methodology has not been tested yet and that's one
17 of the reasons that we're testing it now.

18 MEMBER HINZE: Well, what do you envision?
19 Do you envision that these will receive equal
20 weight? Well, that's not a fair question perhaps.

21 MR. THAGGARD: I really can't say right
22 now. I mean, we hadn't really thought about it, to
23 be honest with you.

24 MEMBER HINZE: As a person looking at this
25 for the first time, I find your third criteria to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE. N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 less than satisfactory. This likelihood of site
2 release sounds like it's -- the perception is that
3 it's a rigged setup. I would suggest to you that
4 you consider some other nomenclature rather than
5 likelihood of site release, because it sounds like
6 it's being set up.

7 I would suggest to you that the site
8 status or the site conditions, or some other
9 criterion be used rather than likelihood. I know
10 what you mean by that, but I think it gives a wrong
11 perception to the person that approaches this for
12 the first time.

13 And I really think that there is a need to
14 help all of us out in terms of deciding how these
15 are weighted. Because it seems to me that what you
16 could have is a very uneven weighting from site to
17 site, by the analyst or the decision maker. As a
18 result, there would be the subjective nature reigns
19 when we're trying to make this as quantitative as
20 possible.

21 Let me ask you, in terms of your
22 experience with this, what are the percentages of
23 the decisions regarding these options that have been
24 made to-date? Are most of these -- do most of these
25 fit under, the site can be released, yes, and fall

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 off the page? Or, you know, do 90 percent of those,
2 of the sites fall off the page and don't have to go
3 into the righthand portion of your flow diagram?

4 MR. THAGGARD: Well, I think -- well, we
5 really don't have any experience with this yet. I
6 mean, as I indicated, this is draft methodology and
7 that's one of the reasons we're testing it out. But
8 in terms of decommissioning sites, I would say the
9 vast majority of the decommissioning sites -- not
10 the complex SDMP sites as Mike alluded to, but just
11 decommissioning sites in general -- the vast
12 majority of decommissioning sites should appear to
13 go down the left side of this diagram.

14 MEMBER HINZE: Do you have any feeling
15 about what will be the experience in the -- for
16 example, collect data versus no action options?

17 MR. THAGGARD: I don't think the no action
18 is going to be much of an option. It's put in there
19 because we've got to consider it under NEPA. I
20 can't really say whether or not there's going to be
21 a greater percentage of the site -- choosing to
22 collect data versus choosing to just put
23 restrictions on the site, for example.

24 I can't differentiate as to which of those
25 various options are going to pop out as a greater

NEAL P. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 percentage. I don't really have any feel for that.
2 If I had to guess it would probably be, collect
3 data. You know, if you can get away with collecting
4 additional data you probably want to do that.

5 Let me just point out one thing about your
6 comment about the likelihood. The thinking that
7 went into that is that, in terms of the data
8 collection, as a perfect example, is that you're
9 relying somewhat on professional judgment on trying
10 to come up this likelihood of success.

11 But the thinking was, if you're going to
12 go out and collect data, you probably have some
13 feeling in your mind, at least the person -- the
14 expert in that area -- as to whether or not they're
15 going to be able to collect data that's going to
16 give them a certain range of values. And based on
17 that range of values you have some feel as to
18 whether or not it's going to improve your analysis.

19 And so that's kind of the logic that went
20 into the --

21 MEMBER HINZE: Yes, I appreciate that, but
22 I think there are factors that you are going to
23 consider, there are criteria you are going to
24 consider in terms of that likelihood of site
25 release. And perhaps those criteria, in trying to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 specify those, I realize you want the flexibility
2 here, but you may want to consider the factors that
3 lead to that decision regarding the likelihood.
4 That's all that I'm saying.

5 DR. EISENBERG: Mark, isn't it true that a
6 minimum requirement for release of the site is that
7 you meet the regulatory standard?

8 MR. THAGGARD: That's correct.

9 DR. EISENBERG: So part of this is this
10 consideration of the dose impact of following one of
11 these options, and the likelihood is the idea that
12 if you did do a particular option, whether it's
13 getting more data or some remediation action, that
14 you would be able to then find compliance with the
15 regulation.

16 MR. KENNEDY: That's what I wanted to
17 address. I'm Jim Kennedy from the Staff. Mark and
18 I have been working together on the shield alloy
19 site for about two years now, and one of the things
20 I want to point out is, there are two things going
21 on here in that chart and in the whole SDMP process
22 involving performance assessment.

23 And one is NEPA and the other is
24 compliance with our regulations for protecting
25 public health and safety. I don't want to give a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 primer on NEPA, but NEPA is very different from our
2 regulations which are designed solely to protect
3 public health and safety. NEPA has no firm
4 criteria; you're simply to look at all of the
5 environmental impacts; you're to look at a range of
6 alternatives for decommissioning a site which would
7 include offsite disposal say, in Utah; would include
8 onsite disposal with restricted release; it might
9 include recycling.

10 And there are no firm criteria. In other
11 words, the environmental impacts include, as Mark
12 said, environmental justice, impact on cultural
13 resources, impacts on schools and local traffic, in
14 addition to health and safety impacts from
15 radiological contamination.

16 You know what -- they might be with a
17 onsite alternative versus offsite. But there are no
18 firm criteria whereby you can say, well, if the
19 environmental justice impact is this, then that's
20 inadequate. What a decision-maker does, what we do,
21 is take all of the impacts and look at them in a
22 combined fashion and weight them against the costs
23 of the various alternatives.

24 Like for example, in the case of shield
25 alloy, the cost of onsite disposal is around \$3 to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 \$8 million, and the cost of offsite disposal is some
2 \$140 million. So that cost differential is looked
3 at in terms of what the environmental impacts would
4 be for onsite disposal versus offsite disposal, if
5 that makes any sense.

6 Now, as Norm was saying, which is very
7 important, the other step beyond that is that any
8 option that's chosen has to meet the requirements in
9 10 CFR Part 40 for protection of public health and
10 safety, and all of the criteria that are contained
11 in our regulations for decommissioning are the
12 criteria that we use to evaluate whether health and
13 safety is protected from radiological hazards.

14 But within this framework here, decision
15 framework that he's showing, both things are going
16 on. You know, we're looking at cost in terms of
17 NEPA. The cost is really not a factor for us in
18 terms of our regulations. You know, either it meets
19 it or it doesn't, and if a licensee doesn't have the
20 money to adequately decommissioning a site and meet
21 the regulations, then the site may go on Superfund.

22 I hope that helps, but both are going on
23 up here.

24 MEMBER HINZE: That's helps. Thanks very
25 much. My interpretation of what you're saying, is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 the likelihood of site releases are garbage -- is a
2 catch-all kind of criteria.

3 MR. KENNEDY: Another way of saying it
4 might be likelihood of -- you know, any alternative
5 that we look at in NEPA has to be a feasible
6 alternative, and if it's not feasible to release the
7 site in accordance with our regulations, then it
8 gets thrown out.

9 MEMBER HINZE: I'm very sympathetic to
10 what you're saying. I'm going to suggest to you
11 again, though, that the likelihood of site release
12 may be conveying the wrong impression.

13 VICE CHAIRMAN GARRICK: Okay. Paul, do
14 you have any further questions?

15 CHAIRMAN POMEROY: I have a number of
16 questions but I think I'll limit them to just a
17 couple here. One is that as we know -- because you
18 presented to us, Mark, some time ago the work on
19 shield alloy -- there are presumably other
20 evaluations of SDMP sites going on at the present
21 time, is that correct?

22 MR. THAGGARD: That's correct.

23 CHAIRMAN POMEROY: And can you give me
24 some idea of -- according to your time schedule here
25 and the near term activities, you plan to test this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 methodology on an SDMP site, and you plan to do that
2 by the summer of '98. So there are a number of SDMP
3 sites, I presume, starting from shield alloy and
4 going through the summer of '98, that are going to
5 be evaluated under some set of existing criteria.
6 Do they tend to be the simple cases, in general?
7 Shield alloy didn't sound particularly simple to me.

8 MR. THAGGARD: Well, I've done a lot of
9 the work; I would agree it wasn't particularly
10 simple. But the problem we have is that, we're
11 trying to develop a methodology. At the same time
12 we have casework that's got to be done --

13 CHAIRMAN POMEROY: That's right, yes.

14 MR. THAGGARD: And so we -- ideally, this
15 would have been developed, I don't know, ten years
16 ago, and we would be implementing it on all the
17 sites. So we're in somewhat of a catch-up mode in
18 trying to develop this for future work, but at the
19 same time we've got existing casework that's going
20 on, and so there's really no set criteria or
21 procedures for doing those, and so again, it's going
22 to kind of fall back on the analyst to use their
23 best judgment as to the appropriate methods to carry
24 out the analysis.

25 DR. McCONNELL: Dr. Pomeroy?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 CHAIRMAN POMEROY: Yes.

2 DR. McCONNELL: Basically, we're working
3 on three sites now, and that's the shield alloy
4 site, the Parks Township site, and the Sequoyah
5 Fuels site. We're applying this methodology on the
6 Sequoyah Fuels site, and we hope to then, if we get
7 further into some of the other of the 14 SDMP sites
8 that we'd be looking at, apply it I think, after
9 it's finalized, to those sites.

10 CHAIRMAN POMEROY: Fine. That gives me an
11 idea of the numbers involved. You're perhaps not
12 the right person to ask this, but somebody at the
13 table is, probably.

14 If indeed, the NRC takes over
15 responsibility for regulating the Department of
16 Energy, is this kind of framework -- if it becomes
17 acceptable to the Commission -- going to be the kind
18 of decision framework that could be used, or will be
19 used to attach some of the DOE decommissioning
20 activities?

21 MR. THAGGARD: Well, I don't see why it
22 couldn't be used in DOE. Again, maybe somebody else
23 could answer that, but --

24 CHAIRMAN POMEROY: I guess my question is,
25 is anybody thinking or working on that subject?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

(202) 234-4433

1 DR. McCONNELL: Well, we are I think, both
2 for decommissioning and also low level waste. We
3 would expect that the BTP would provide a framework
4 should external regulation of DOE low level waste
5 facilities become the reality. And the same would
6 go for, I think, the decommissioning. We would hope
7 this framework is flexible enough that it would work
8 for those sites also.

9 CHAIRMAN POMEROY: Great. Thank you.

10 VICE CHAIRMAN GARRICK: Thanks, Paul.
11 Marty?

12 DR. STEINDLER: Yes. Before this
13 framework -- which is a reasonably logical set of
14 steps -- was written down on a sheet of paper,
15 obviously some other scheme was used by the
16 experienced folks in the business. Was that scheme
17 drastically different from what has now been
18 codified on the slide? I view this thing as a
19 fairly logical way to get from 1 to 14, or whatever
20 -- 1 to 7. And all of those steps look like they're
21 necessary.

22 MR. THAGGARD: Well, I would say that they
23 -- it's fairly similar to what's being used. I
24 mean, obviously, as Jim alluded to, we're using the
25 NEPA process in terms of looking at the shield alloy

1 sites. For that particular site we did look at
2 various options. We analyzed all of them, though,
3 so we did an analysis on all of them.

4 There was certainly some consideration of
5 costs, and this underlining thought process about
6 the likelihood of being able to link the sites. So
7 I would say, although we didn't have this laid out,
8 this has probably been somewhat our thought process.
9 It just hasn't been structured --

10 DR. STEINDLER: This is basically a
11 codification of what you've been doing anyway?

12 MR. THAGGARD: That's correct.

13 DR. McCONNELL: With the addition, Mark,
14 isn't it true, of the unrestricted versus restricted
15 release and the use of institutional controls, which
16 is somewhat new with the new proposed
17 decommissioning standard?

18 MR. THAGGARD: Well, we considered both of
19 those in the shield alloy site. We had some inkling
20 that that was going to be in the regulation.

21 VICE CHAIRMAN GARRICK: Mark, what can you
22 say briefly, about the lessons learned from other
23 experience in DandD activities? And I'm thinking
24 particularly of the reactor experience. There's
25 been a substantial amount of activity in the last

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 five years in this whole arena as it relates to
2 reactors. Has that been a major factor in the
3 formulation of the underpin of the rule and the
4 guidance for the rule?

5 MR. THAGGARD: Well, I can't really speak
6 on the rule, to be honest with you. If we had some
7 people here from Research I think they would
8 probably be better able to talk about what went into
9 the thought process in terms of coming up with the
10 rule.

11 One of the things that we're hoping to do
12 is at some point give you a full briefing on a
13 decommissioning program and we could certainly go
14 into more discussions about the rule and have some
15 of those people here. But I'm certainly not the
16 person to answer that question.

17 VICE CHAIRMAN GARRICK: Who's worrying
18 about the test reactor and research reactor DandD?
19 Is that another group? Better licensed.

20 DR. EISENBERG: That's NRR.

21 VICE CHAIRMAN GARRICK: So my question
22 would apply there, too. There's a lot of activity I
23 would assume, going on there. Does that experience
24 -- have you found that experience to be relevant to
25 your work?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

WASHINGTON, D.C. 20005-3701

(202) 224-4433

(202) 237-4433

1 MR. THAGGARD: Well --

2 DR. EISENBERG: Mark, if I can jump in? I
3 would tend to think that there are such sizable
4 differences in the nature of the facilities and the
5 nature of the problems that exist at them, that a
6 lot of that would not be very relevant. But I think
7 your point is well taken. We should take a look at
8 their experience to make sure we haven't missed
9 anything; that we could learn from it.

10 But I mean, after all, most reactors are
11 kept pretty clean. The radioactivity is very well
12 contained. A lot of these fuel cycle facility
13 sites, it's spread all over, it's contaminated the
14 soil; it's a different kind of problem.

15 VICE CHAIRMAN GARRICK: Yes, I've heard a
16 couple of presentations on recent reactor
17 decontamination projects. And I guess the thing
18 that sticks in my mind is that in both -- in the
19 several cases that I've heard there was a
20 considerable amount of elaboration on the fact that
21 they believe they have covered every kind of waste
22 handling problem that can be imagined in the course
23 of decontaminating a nuclear power plant in terms of
24 the types of radionuclides involved, the types of
25 materials involved -- everything from resins to

1 hardware to transuranic waste and so on.

2 It's true. It's a different problem in
3 terms of magnitude, but the question is just that,
4 given that there's been a lot of activity in that
5 arena, it sounds like a rich and robust source of
6 information.

7 DR. EISENBERG: I think the point is well
8 taken. Although I would wonder how many reactor
9 site have depleted uranium nitrate in ponds, things
10 like that.

11 VICE CHAIRMAN GARRICK: Yes, there's other
12 fuel cycle facilities, though, that are also under
13 some DandD activity, even in the DOE arena, that do
14 have that kind of nasty stuff. But yes, the
15 facilities like Sequoyah Fuels, certainly have their
16 own unique set of problems, and I'm quite familiar
17 with those.

18 All right. Any other questions? Thanks,
19 Mark. Paul?

20 CHAIRMAN POMEROY: Thank you, John. Right
21 on schedule; that bodes well for the future. Mark,
22 I'd just like to say thank you on behalf of the
23 whole committee also, and you mentioned that
24 possibly, a briefing on the decommissioning program
25 in the future. We would very much like to pursue

(202) 234-4433

1 that with you and hope that we could arrange
2 something like that in the future. So thank you
3 again.

4 The next item on our agenda is a 15-minute
5 break. After that break the committee will be
6 involved, essentially, until 4 o'clock this
7 afternoon in preparing for its Commission briefing
8 and participating in its Commission briefing. We
9 won't require any transcript of that or our meeting
10 at the end of the day, so we're finished with the
11 transcript, and we'll reconvene in 15 minutes, at 10
12 minutes after 10.

13 (Whereupon, the 92nd Meeting of the
14 Advisory Committee on Nuclear Waste was concluded at
15 10:02 a.m.)

C E R T I F I C A T E

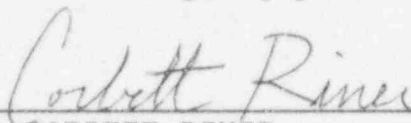

This is to certify that the attached
proceedings before the United States Nuclear
Regulatory Commission in the matter of:

Name of Proceeding: 92ND ACNW

Docket Number: N/A

Place of Proceeding: ROCKVILLE, MARYLAND

were held as herein appears, and that this is the original
transcript thereof for the file of the United States Nuclear
Regulatory Commission taken by me and, thereafter reduced to
typewriting by me or under the direction of the court
reporting company, and that the transcript is a true and
accurate record of the foregoing proceedings.

United States
Nuclear Regulatory Commission

STATUS OF PERFORMANCE ASSESSMENT IN SUPPORT OF DECOMMISSIONING

Presented to:

**Advisory Committee on Nuclear Waste
Rockville, Maryland
May 20, 1997**

By:

**Mark Thaggard, Sr. Systems Performance Analyst (Hydrology)
Division of Waste Management
Nuclear Material Safety and Safeguards
301-415-6718, mxt3@nrc.gov**

*United States
Nuclear Regulatory Commission*

OUTLINE

- ☐ **Background Information (features common to PA and evolution of PA methodology)**
- ☐ **Comparison LLW/Decommissioning Regulatory Framework**
- ☐ **Brief Overview of LLW PA Approach**
- ☐ **Overview of Decommissioning PA Approach**
- ☐ **Codes Used in Decommissioning PA**
- ☐ **Related Near-term Activities**

*United States
Nuclear Regulatory Commission*

COMMON ELEMENTS TO PA

- ☐ **Description of natural and engineered system**
- ☐ **Understanding of likely and unlikely events**
- ☐ **Description of processes for waste transport through the geosphere and into the biosphere**
- ☐ **Estimation of potential release and human exposure**
- ☐ **Evaluation of uncertainties in results**

*United States
Nuclear Regulatory Commission*

COMPONENTS OF PERFORMANCE ASSESSMENT

- ☐ **Trained and experienced analysts**
- ☐ **Quantification Tools**
 - **Models**
 - **Computer codes**
 - **Computer Infrastructure**
- ☐ **Data**
 - **General**
 - **Site specific (mostly from licensee)**

*United States
Nuclear Regulatory Commission*

CHARACTERISTICS DRIVE ANALYSES

☐ **Characteristics of waste disposal system**

Depth

Hazard

Uncertainty

Waste Composition

Engineered Components

Transport Characteristics

☐ **Characteristics of compliance framework**

Time Frame

Performance Measure (e.g. dose)

Institutional Controls

*United States
Nuclear Regulatory Commission*

EVOLUTION OF PA AS A PROGRAMMATIC TOOL

- ☐ **Method development for HLW (1976-80)**
 - Provided insights into repository system
 - Helped to formulate 10 CFR 60

- ☐ **Demonstration of capability (1985-92)**
 - Indicated needed research and development
 - Showed need for integration among disciplines

- ☐ **Application to HLW (1992-now)**

- ☐ **HLW tools and methods adapted for other waste applications**
 - LLW PA Working Group (1990-now)
 - LLW PA BTP and Test Case Development (1993-96)
 - Decommissioning Applications (1995-now)
 - Guidance for residual radioactivity rule (in progress)

*United States
Nuclear Regulatory Commission*

PERFORMANCE ASSESSMENT SUPPORTS DWM MISSION

Decommissioning:

NEPA analyses to evaluate adequacy of proposed remediation and decommissioning of SDMP sites

LLW:

Methods, guidance, and technical support for state regulatory authorities; development of NRC review capability

HLW:

Performance assessment of the proposed Yucca Mountain repository

United States
Nuclear Regulatory Commission

LLW/DECOMMISSIONING REGULATORY FRAMEWORKS

☐ **LLW**

- Protection of the general public (25 mrem/yr)
- Protection of inadvertent intruder
- Protection of individuals during operations
- Long-term stability

☐ **Decommissioning (proposed)**

- Unrestricted release
 - 25 mrem/yr to average member of critical group (AMCG)
 - ALARA
- Restricted release
 - 25 mrem/yr to AMCG w/institutional controls
 - 100 or 500 mrem/yr to AMCG w/o institutional controls
 - ALARA

*United States
Nuclear Regulatory Commission*

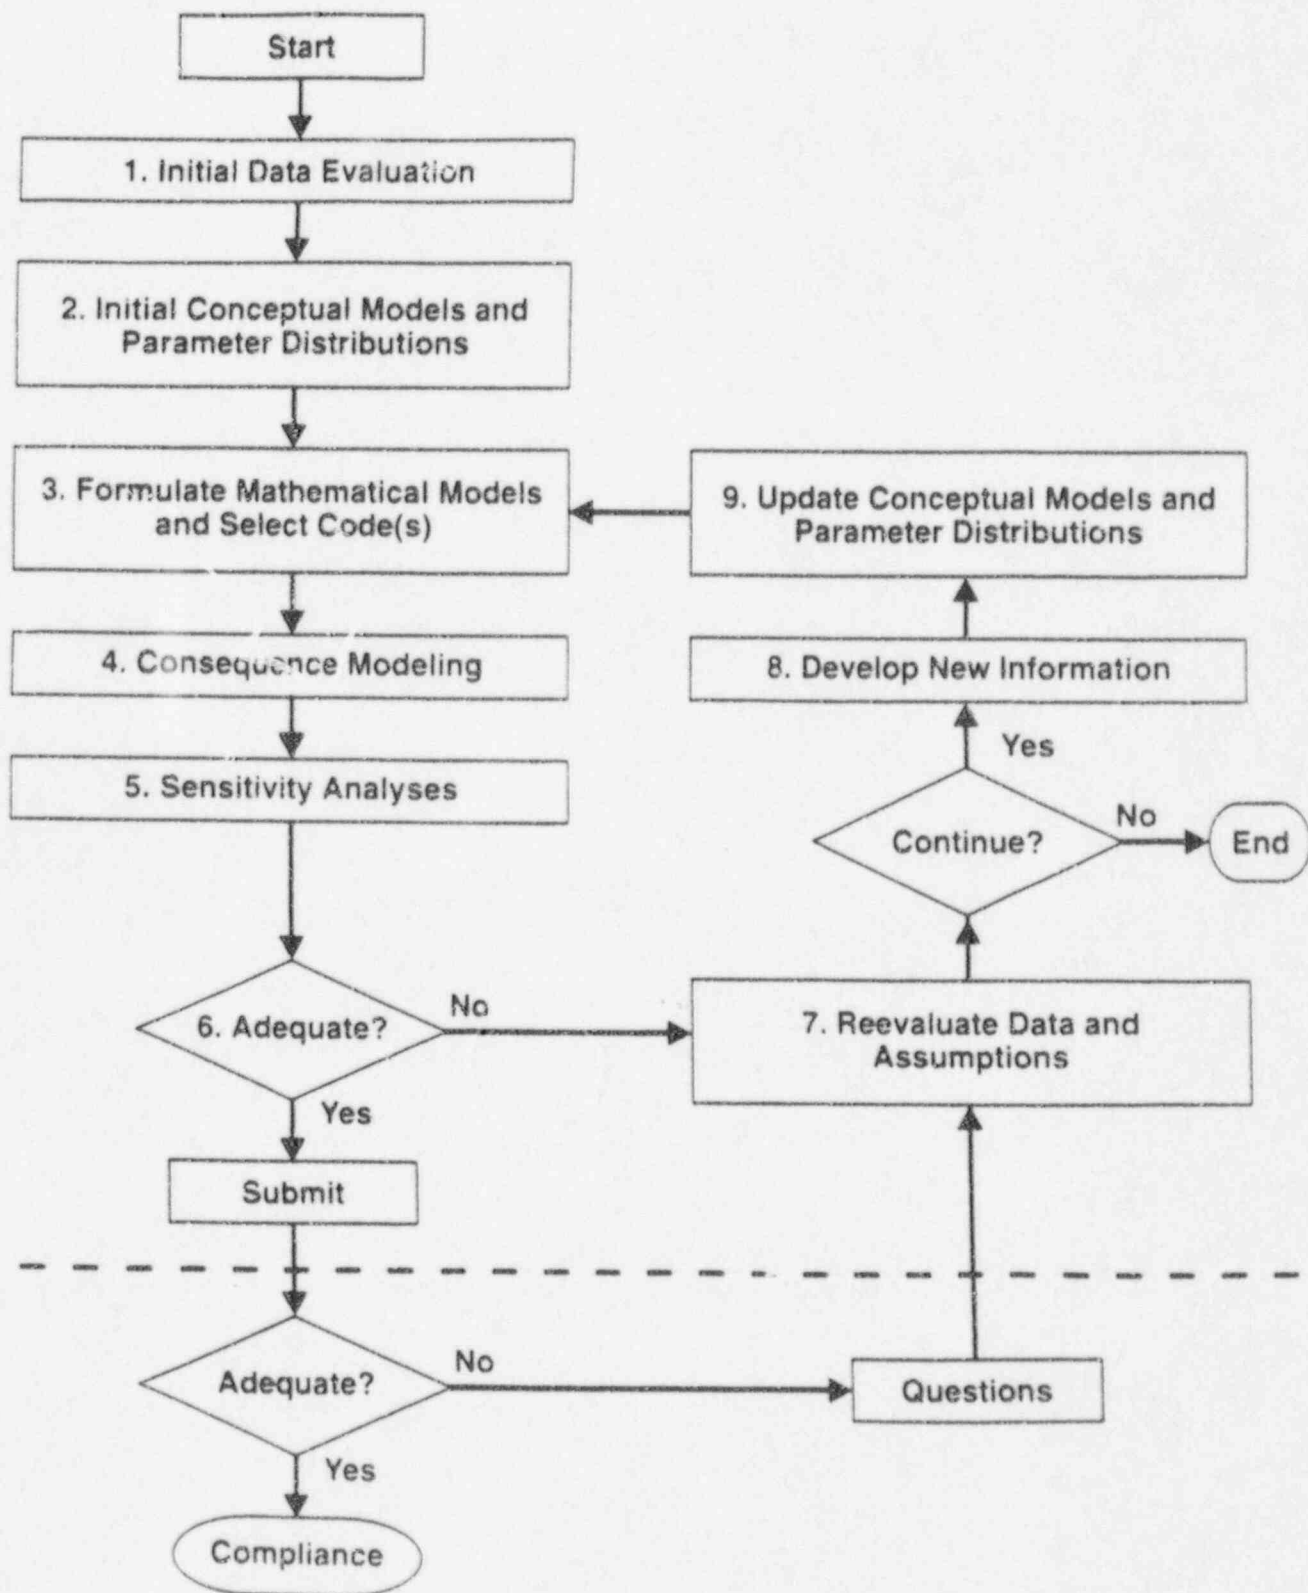

KEY COMPARISON BETWEEN LLW/DECOMMISSIONING PA

- ☐ **Decommissioning sites are not sited with waste disposal in mind**
 - Pathways that are less important in LLW PA, may be important in Decommissioning PA (e.g., Air and SW)
- ☐ **No waste classification or intruder barrier requirements in decommissioning**
 - Inadvertent intruder is a key aspect of Decommissioning PA
- ☐ **There is a 1000-year time frame for decommissioning PA**
 - Barrier performance may be key to demonstrating compliance
- ☐ **Decommissioning PA have different source terms than LLW PA**
 - Decommissioning sites have small no. of radionuclides, may have hazardous contaminants, and have no waste containers
 - Decommissioning sites may have existing ground-water contamination

United States
Nuclear Regulatory Commission

Proposed LLW PA Approach

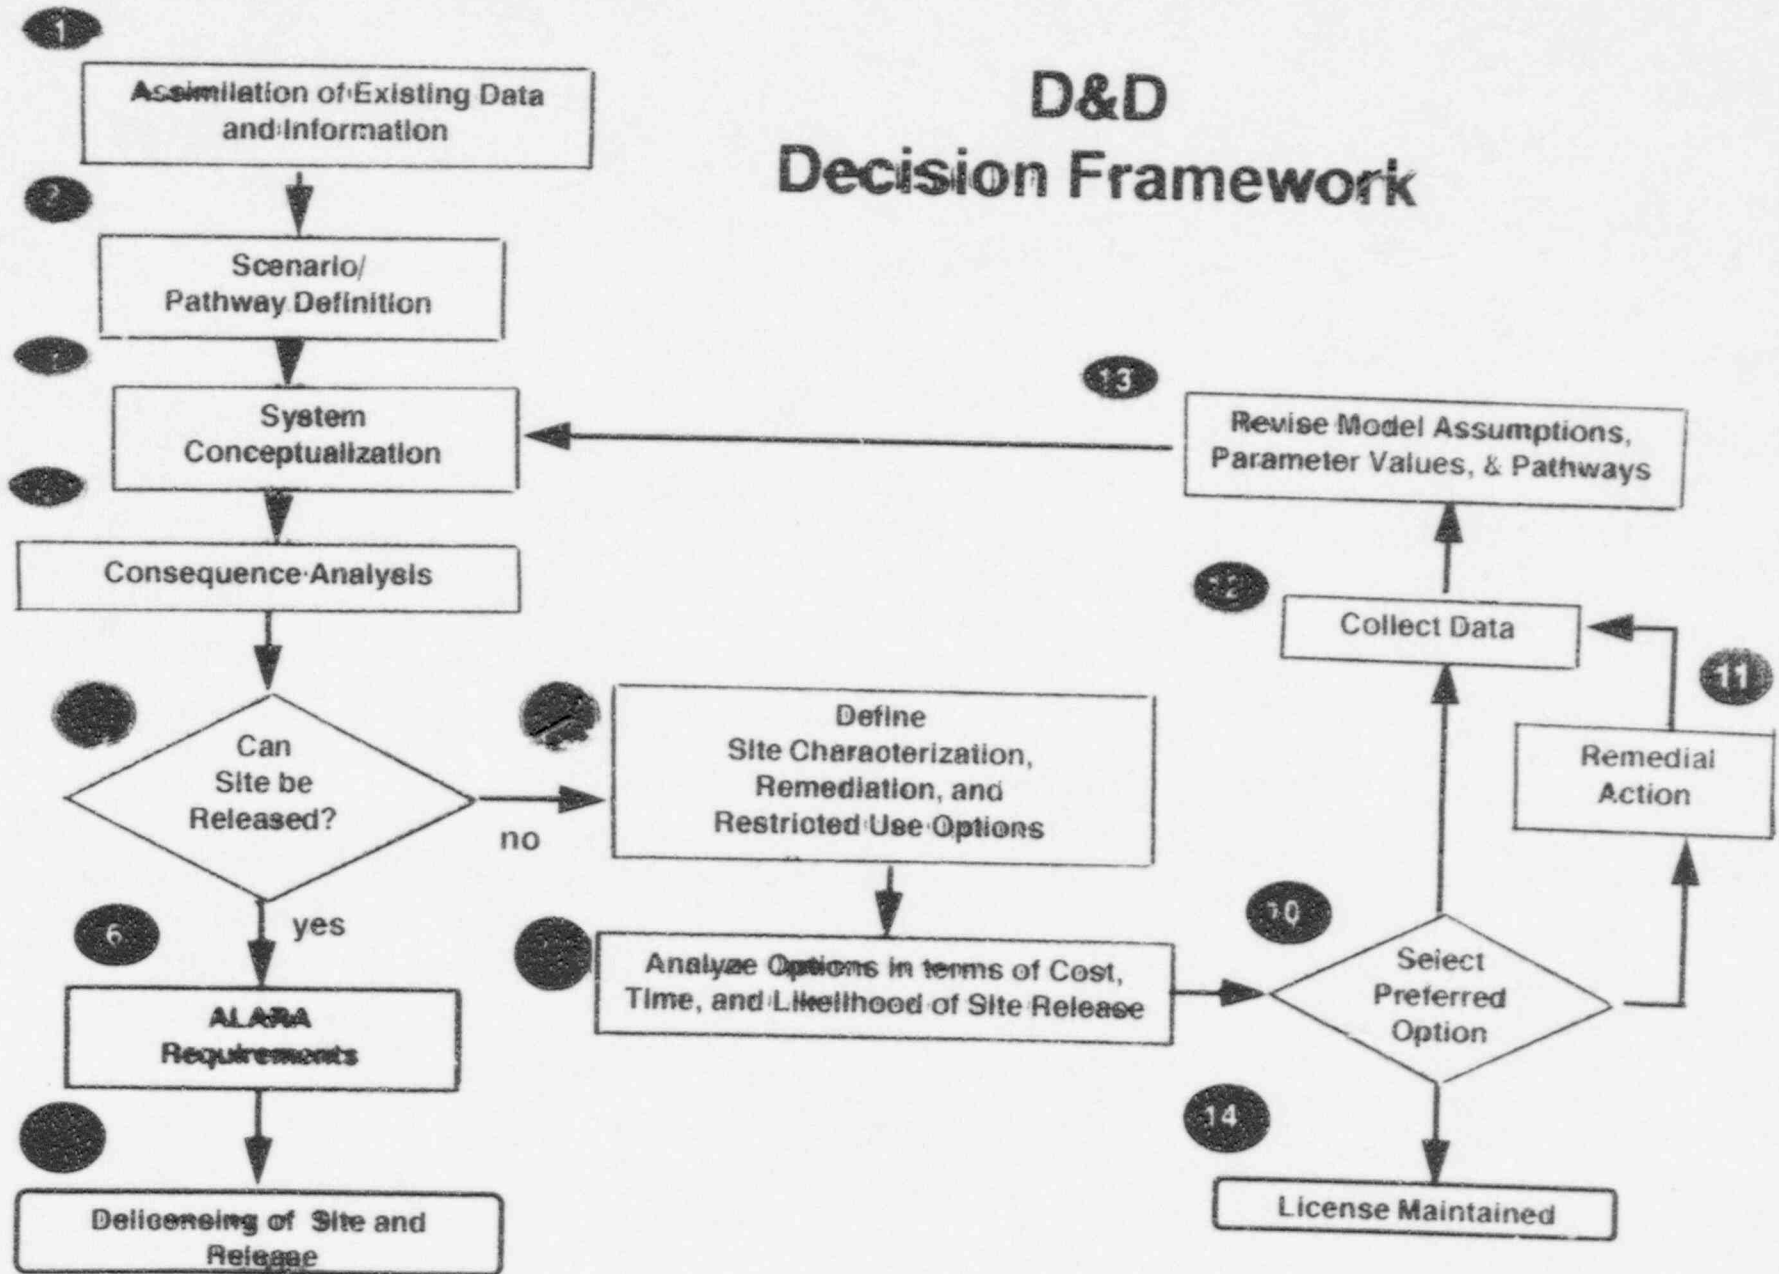

*United States
Nuclear Regulatory Commission*

Proposed Approach for Decommissioning PA

D&D Decision Framework

*United States
Nuclear Regulatory Commission*

1. Assimilation of Existing Data and Information

☐ Key Points

- Existing Information Only
- No New Data Collection at this step

☐ Examples of Existing Information

- Bounded Estimate of Residual Contamination
- Extensive Site Characterization Data

*United States
Nuclear Regulatory Commission*

2. Scenario and Pathway Definition

- ☐ **Scenario - Future State of the System**
 - could be generic or site specific
 - doses are expected to decrease if scenarios are changed based on site-specific data

- ☐ **Pathways - Source to Human Receptor**
 - subject to change with site-specific information for either generic or site-specific scenarios

*United States
Nuclear Regulatory Commission*

3. System Conceptualization

- ☐ **Developed for a specific scenario and set of pathways**
- ☐ **Defines process and parameters used to assess migration and exposure**
 - **Includes explicit treatment of parameter uncertainty**
 - bounding
 - prudently conservative
 - probabilistic data distributions
 - **Must be defensible with current information**
- ☐ **Define codes for modeling contaminant migration and exposure**

*United States
Nuclear Regulatory Commission*

4. Consequence Analysis

- ☐ **Calculation of Doses from all Pathways and Scenarios**
- ☐ **Deterministic or Probabilistic depending on parameter definition**

*United States
Nuclear Regulatory Commission*

5. Can the Site be Released?

- ☐ **First Iteration - Does the Site Meet the Unrestricted Dose Criteria?**
- ☐ **Subsequent Iterations - Does the Site Meet the Criteria Associated with the Chosen Option?**
 - **Unrestricted release following Data Collection and/or Remediation**
 - **Restricted release potentially following Data Collection and/or Remediation**

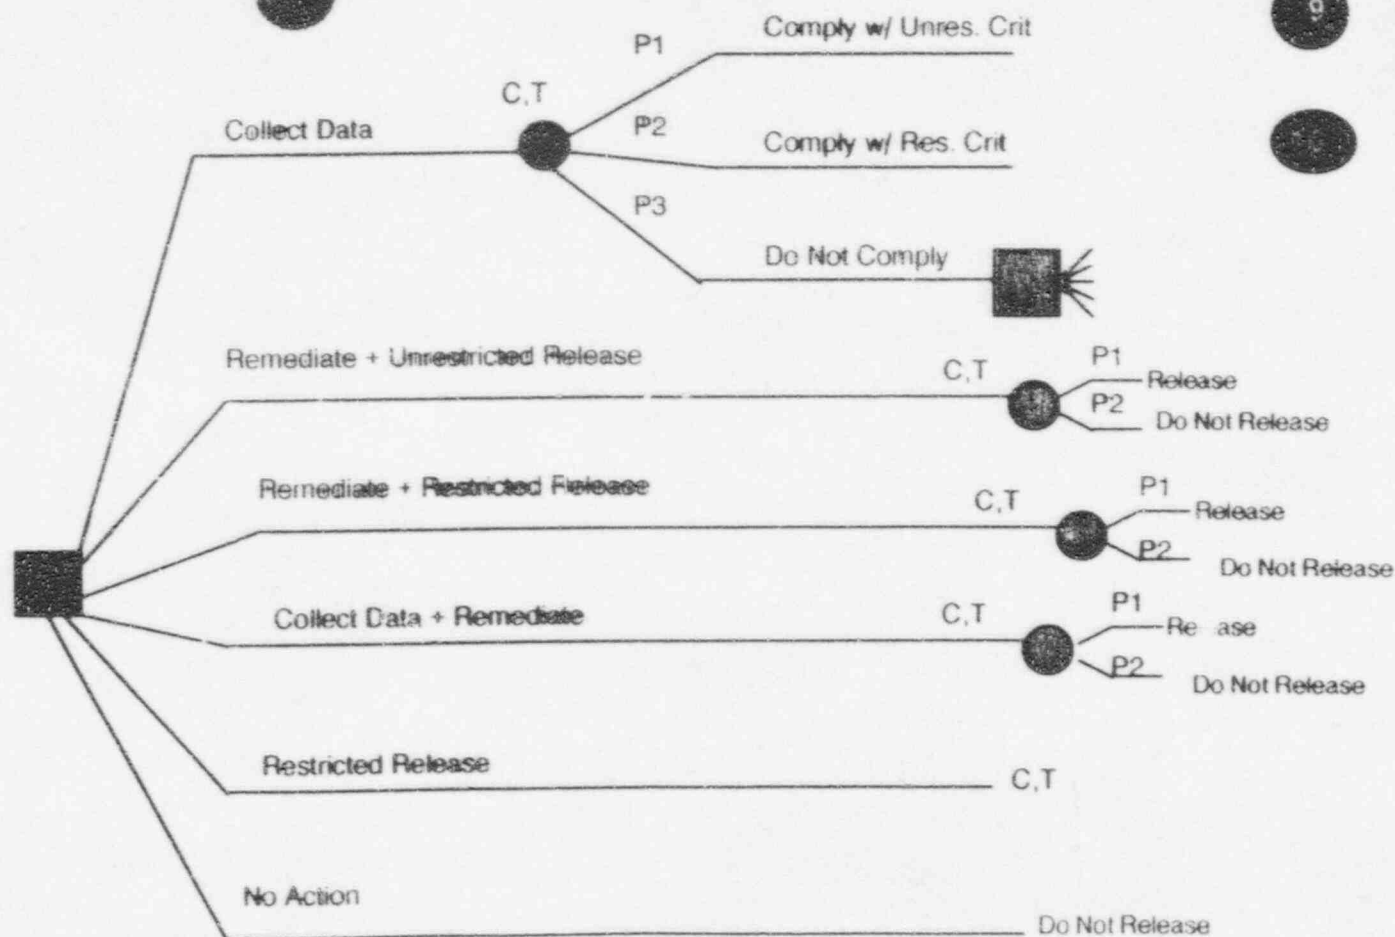

*United States
Nuclear Regulatory Commission*

6. ALARA Requirements

- ☐ **For Unrestricted Release without Remediation**
 - **Cost/Benefit Analysis based only on removal of residual contamination**

- ☐ **For Unrestricted Release following Remediation or for Restricted Release**
 - **Goal and Intent of ALARA already accomplished**

Generic Decision Tree Example

8

Define Options

9

Analyze Options

Make Decision

Decision Node

Uncertainty Node

Decision Matrix

*United States
Nuclear Regulatory Commission*

**SIMILARITIES BETWEEN PROPOSED APPROACH FOR
LLW PA AND DECOMMISSIONING PA**

- ☐ Both are iterative approaches
 - PA is used to identify data needs

- ☐ Both approaches account for uncertainties
 - Bounding deterministic or probabilistic analyses

- ☐ Both approaches are designed to present a defensible assessment of long-term performance
 - Calculated doses are not intended to represent predicted real doses

*United States
Nuclear Regulatory Commission*

Codes Used in Decommissioning PA Analyses

- ☐ **Current**
 - **DandD**
 - Screening code (*steps 1-4*)
 - **RESRAD**
 - On-site assessment (*inadvertent intruder*)
 - **NEFTRAN**
 - Off-site transport
 - **MEPAS**
 - Off-site assessment (radiological/hazardous)
- ☐ **Future**
 - **SEDSS** (Sandia Environmental Decision Support System)

*United States
Nuclear Regulatory Commission*

Attributes of SEDSS

- ☐ **Automatic computer based tool**
- ☐ **Guides site characterization, risk assessment, and remedial design selection**
- ☐ **Documents decision process**

*United States
Nuclear Regulatory Commission*

Near-term Activities

- ☐ **Decommissioning rule (with the Commission)**
- ☐ **Development of guidance on implementing the rule (one-year after issuance of rule)**
- ☐ **Testing the methodology on a SDMP site (completed by Summer 98)**
- ☐ **Finalize PA methodology (by Fall 98)**
- ☐ **Continue development of SEDSS (Unix version 6/97)**
