OYSTER CREEK NUCLEAR POWER  
PLANT UNIT 1

Supplemental information regarding the quality review of the Oyster Creek plant was prepared by GE and informally submitted to the NRC. As part of the total inspection program GE identifies the non-destructive tests performed on critical systems, the service requirements of certain valves of questionable origin or quality test of the standby gas treatment system, and results of the main steam line isolation valve tests. GE also provides additional information regarding the reasons for the elimination of the demisters from the standby gas treatment system.

No ACES action appears warranted.
