

NUCLEAR REGULATORY COMMISSION

- - -

MEETING BETWEEN THE EMPLOYEE'S LEGAL PROJECT
AND THE NUCLEAR REGULATORY COMMISSION

- - -

King of Prussia, Penna., Tuesday, December 29, 1987

- - -

A Meeting was held between the Employee's
Legal Project and the Nuclear Regulatory Commission
at 631 Park Avenue, at 9:00 A.M., on the above date,
before Norma Carr, Court Reporter - Notary Public.

AREA-WIDE FEDERAL REPORTING, INC.

1315 WALNUT STREET, SUITE 1315

PHILADELPHIA, PA. 19107

(215) KI 5-7003

1 APPEARANCES:

2 JACQUE P. DURR,
Acting Deputy Director, DRS

3 DONALD HAVERKAMP,
4 Project Section Chief

5 JAMES KAUCHER,
6 Project Engineer

7 JAMES WIGGINS,
Section Chief, Region I

8 DAVID RUSCITTO,
9 Resident Inspector, NRC

10 ANTONE C. CERNE,
Senior Resident Inspector, NRC

11 KAMAL MANOLY,
12 Engineering Technical Assistant,
NRR, NRC

13 E. HAROLD GRAY,
14 Senior Reactor Engineer, NRC, Region I

15 SHARON TRACY,
Director, Employees Legal Project

16 DOUGLAS E. RICHARDSON,
17 Researcher, Employee's Legal Project

18 MICHAEL GREENSTEIN,
District Director, U.S. Rept. Nicholas
19 Mavroules

20 MARY BETH GENTLEMAN, ESQ.
Assistant Secretary for Policy
21 Executive Office of Energy Resources
Commonwealth of Massachusetts

DESCRIPTION

PAGE MARKED

A

Proposed agenda. 155

- - -

MR. DURR: Let's open the record. I guess for the benefit of the record I would ask everybody to state their name, their title and address, and who they represent.

I'm Jack Durr. I'm Acting Deputy Director of the Division of Reactor Safety for Region I for the NRC.

MR. HAVERKAMP: Don Haverkamp, Project Section Chief of the Seabrook Plant, NRC.

MR. KAUCHER: James Kaucher. I'm the Project Engineer for Section 3C of which Seabrook is a part.

MR. GREENSTEIN: Mike Greenstein, District Director for United States Representative Nicholas Mavroules. The Congressman represents the 6th Congressional District of Massachusetts. 6 communities within the District lie within the 10-mile EPZ, and that's why we've come here today representing the Congressman.

MR. RICHARDSON: Douglas Richardson. I'm doing research work for the Employee's Legal Project.

MS. TRACY: Sharon Tracy, Director of

1 Employee's Legal Project.

2 MR. GRAY: Harold Gray, Senior Reactor
3 Engineer, Region I, NRC.

4 MR. MANOLY: Kamal Manoly, Engineering
5 Technical Assistant, Division of Engineering and
6 System Technology, Office of Nuclear Reactor
7 Regulation, NRC.

8 MR. CERNE: Tony Cerne, Senior
9 Resident Inspector at Seabrook for Region I, NRC.

10 MR. RUSCITTO: Dave Ruscitto, Resident
11 Inspector for Seabrook for the NRC.

12 MR. WIGGINS: Jim Wiggins. I'm the
13 Project Branch Chief here at Region I for NRC for the
14 Branch at Seabrook. I'll only be here for part of the
15 time. I have other things I need to do.

16 MR. DURR: With that, I guess I would
17 like to restate the purpose of the meeting, and it
18 was at partially your request that we have a post-
19 inspection meeting to deal with the issues of
20 inspection report 86-52 and 87-07, which dealt with
21 the allegations presented by Employee's Legal Project
22 to the NRC back in November of 1986 and April of
23 1987, and the purpose of this meeting is to address
24 some additional questions that came from those 2

1 reports, and this meeting will deal with those issues
2 and those issues only that are in those 2 reports.

3 MS. TRACY: Could I add something to
4 that?

5 MR. DURR: Certainly.

6 MS. TRACY: To that end, I agree with
7 your synopsis of why we're having this meeting. I've
8 put together a proposed agenda which lists those
9 issues which have been deferred until this meeting,
10 and I would like to pass this out to the people here,
11 and also enter it into the record.

12 MR. DURR: At this point in time I
13 would like to take a look at those first. You
14 submitted to us a letter which contained your
15 concerns back in -- what's the date?

16 MR. GRAY: November 12, '87.

17 MS. TRACY: Right.

18 MR. DURR: On November the 12th you
19 sent us a letter with your concerns and the issues
20 that you had questions about that would be discussed
21 at this meeting. So based on that letter that you
22 sent us we had the appropriate people here, and so I
23 would like to work from that letter, if we could,
24 because everybody is familiar with that. This is a

1 new piece of information.

2 MS. TRACY: This isn't new
3 information. This simply amplifies what I put in the
4 letter that I wrote to you, and lists specific issues
5 that we have raised that are mentioned in that
6 letter.

7 Why don't I pass this out? You can
8 all look at it. I think I have enough copies for
9 everyone. There is 3 pages each.

10 I would also like to enter this into
11 the record as my understanding of why we're convening
12 here today.

13 MR. DURR: For this point in time I'm
14 going to lay this aside for now because I see things
15 in here that I do not recognize that were in your
16 letter of November the 12th. We'll come back to this
17 after we've gone through your initial November 12th
18 letter because that was really the thrust of this
19 meeting.

20 MS. TRACY: Could I look at the
21 letter? Is that what you have right there?

22 MR. DURR: We have prepared our
23 responses --

24 MS. TRACY: You're talking about our

1 response to 87-07?

2 MR. DURR: Yes. That was the purpose
3 of the meeting.

4 MS. TRACY: The purpose of the meeting
5 was to deal with procedural questions which have not
6 been addressed in either 86-52 or 87-07.

7 MR. DURR: The purpose of the meeting
8 was to discuss -- and that's why we requested you to
9 send us in your November the 12th letter your
10 concerns that you wanted to discuss, so that we could
11 prepare and have the adequate staff available for
12 this meeting. That's why I'd like to gear it to your
13 November the 12th letter. I assume the November the
14 12th letter contains all of your concerns.

15 MS. TRACY: At the end of the letter,
16 which is our response to your report, I list all the
17 different issues that haven't been dealt with yet.

18 MR. DURR: I understand.

19 We'll deal with your November the
20 12th letter because it should contain all those same
21 things.

22 MS. TRACY: It should.

23 MR. DURR: Very good.

24 MR. GREENSTEIN: Are there any copies

1 of the November 12th letter?

2 MR. DURR: There are, but I don't have
3 one with me right at this point. We can get you one.

4 MS. TRACY: It's the 87-07 response.

5 MR. DURR: Here. I'd like that back.
6 But for the purpose of the meeting, here's a copy.

7 With that, the first page of your
8 letter is an introduction, and the first issue that
9 we noted in there was a statement that says,
10 "Biofouling discussed in both the body of this report
11 and in Appendix A is a contention under litigation
12 before the NRC by the New England Coalition on
13 Nuclear Pollution".

14 That is a new issue. Biofouling has
15 not been discussed in either one of the inspection
16 reports. It is, in fact, under litigation before the
17 Hearing Board, and it was presented by the
18 Interveners. So we will not address that particular
19 subject, other than the fact to say that we have done
20 some preliminary inspections, and to our knowledge
21 biofouling has not been a problem at the Seabrook
22 Plant. But rather than preempt whatever the Hearing
23 Board decisions are relative to biofouling because it
24 is an Intervener contention, we will not discuss that

1 in this particular meeting. It's outside of the
2 scope of the meeting really.

3 MS. TRACY: I just would like to point
4 out that microbiologically induced corrosion,
5 according to NRC documents that I've read, does fall
6 under the category of biofouling.

7 MR. DURR: Not true. They are 2
8 separate issues. Biofouling is one issue, and
9 microbiologically induced corrosion is another issue.

10 MS. TRACY: Is caused by biofouling.

11 MR. RICHARDSON: We have been treating
12 them as related issues.

13 MR. DURR: We understand that you
14 have, but we would like to point out to you that it's
15 inappropriate to treat those 2 as the same thing
16 because they are different sources, different
17 issues.

18 MR. RICHARDSON: They are still
19 related.

20 MR. DURR: I have a technical
21 corrosion expert here, and within the technical
22 community they are 2 separate issues, and the NRC
23 treats them as 2 separate issues.

24 MS. TRACY: Are you the expert?

1 MR. GRAY: Right.

2 MS. TRACY: I am fine with that.

3 MR. DURR: So the biofouling

4 question --

5 MS. TRACY: We will defer.

6 MR. DURR: Because that's under
7 hearing. We would prefer not to discuss that. We
8 will be prepared to discuss MIC.

9 Your first question in your November
10 12th response in Section 1.3 --

11 MS. TRACY: Excuse me, Jacque.

12 MR. DURR: Certainly.

13 MS. TRACY: I am concerned about our
14 time limitations today, and I am also concerned that
15 we do get to the programmatic issues which it was my
16 understanding that we were going to deal with. So I
17 would like at some point to have an assessment of how
18 far we've gotten toward dealing with the issues. At
19 some point, say, in an hour or so we can renegotiate
20 perhaps.

21 MR. DURR: I would like to stay as
22 much focused on your November 12th submittal as we
23 can.

24 MS. TRACY: I'm referring to pages 17,

1 18 and 19.

2 MR. DURR: We will make it to that. I
3 feel confident.

4 MS. TRACY: Because those were the
5 issues that I felt we were down here to talk about
6 today.

7 MR. DURR: I would hope that we leave
8 here with no stone unturned.

9 MS. TRACY: I would be surprised.

10 MR. DURR: Moving on, Section 1.3,
11 paragraph 3, discusses programmatic weaknesses, poor
12 quality assurance/quality control, technical
13 training, et cetera. (A) under that says ongoing
14 problems reflected in current NRC inspection reports
15 up to October, 1987 show that even if programmatic
16 deficiencies were corrected before 1987, the problems
17 caused by those deficiencies are now built into the
18 plant and are continuing to become evident. The
19 programmatic deficiencies themselves are still
20 continuing and are being dismissed as isolated
21 incidents by the NRC.

22 We took that as a statement of
23 opinion on your part. Are there any questions with
24 that?

1 MS. TRACY: These are issues we will
2 deal with later on. These are the programmatic
3 issues.

4 MR. DURR: That is a statement of
5 opinion on the ELP's part. It's not a question. Is
6 that correct?

7 MS. TRACY: I would say it's a
8 statement, yes. There is no question mark at the
9 end.

10 MR. DURR: With 1.3 what are your
11 specific questions that you want answered by the
12 technical staff?

13 MS. TRACY: Well, you have my list
14 right here. I would say that what is listed here --

15 MR. DURR: Let's stay with the
16 November 12th document. We are familiar with that.
17 We have read it. We've all reviewed it. We know
18 what the direction of focus for your comments are,
19 and we are prepared to respond to those. So if you
20 could stay with that, it would make it much easier.

21 MS. TRACY: Okay. Programmatic
22 weaknesses are listed at the end of this report on
23 pages 17, 18, 19 and 20.

24 MR. DURR: We will get back to those.

1 Let's take them sequentially, if we can.

2 MS. TRACY: Sure.

3 MR. DURR: Is there anything under 1.3
4 that you would like to discuss now that the staff is
5 prepared to respond to?

6 MS. TRACY: Do you have anything? You
7 say you assembled your people here today.

8 MR. DURR: Yes.

9 MS. TRACY: Does anyone here have
10 something to say about 1.3?

11 MR. DURR: We've said it all in the
12 inspection reports 86-52 and 87-07. We thought that
13 you had questions concerning these issues.

14 MS. TRACY: Yes. Quality assurance --

15 MR. DURR: That's why you sent this to
16 us. Are there any questions under 1.3 that you would
17 like to have the staff address?

18 MS. TRACY: Programmatic deficiencies
19 related to quality assurance/quality control,
20 document control, design control and training. This
21 is what I wrote up in my proposed agenda for today.
22 If you want to deal with those issues that are
23 mentioned briefly in 1.3, if you want to deal with
24 them now, we can. If you want to wait until we get

1 back to the Appendices where I list those issues in
2 more detail, we can do that too.

3 MR. DURR: I think we're having a
4 communications gap.

5 MS. TRACY: Not unusual.

6 MR. RICHARDSON: I'll start us off, if
7 you would like.

8 MR. DURR: Let me explain what I think
9 we're supposed to be doing here. You have specific
10 concerns.

11 MS. TRACY: Yes.

12 MR. DURR: Inspection reports 86-52
13 and 87-07 both dealt with these areas, and as far as
14 the NRC is concerned, it has been adequately
15 inspected and those issues are closed. We don't
16 intend to do anymore on those issues.

17 However, in your reading of those
18 inspection reports if there was something in there
19 that technically you did not understand or that you
20 would like further clarification on, then I think we
21 are prepared to respond to that.

22 MS. TRACY: I understand.

23 MR. DURR: So using those 2 inspection
24 reports as the basis for your questions, what in

1 there technically did you not understand that you
2 need clarification from the staff on? Because we
3 feel that a technically competent person reading
4 those reports would arrive at the same conclusions.
5 We are essentially the "technical arm" that inspects
6 those things, and we have looked at them and to our
7 satisfaction they have been resolved. So what I need
8 from you then, what specific questions do you have
9 relative to those paragraphs in those reports that
10 you don't understand that you need clarification or
11 amplification on?

12 MS. TRACY: My point is, Jacque, that
13 particularly dealing with Section 1.3 is that there
14 are programmatic weaknesses.

15 MR. DURR: Such as?

16 MS. TRACY: Such as problems with
17 quality assurance --

18 MR. DURR: Specifics, please.

19 MS. TRACY: The specifics are written
20 down in the document that I just passed around that
21 we can either deal with now, or we can deal with when
22 we get to where they're listed at the back of the
23 report.

24 MR. DURR: You should have given us

1 all that information back in 1986, and we addressed
2 all that information in 1986 and 1987.

3 MS. TRACY: That's right.

4 MR. DURR: Specifically, other than a
5 general statement that you feel uncomfortable with
6 quality assurance, what specifically don't you
7 understand?

8 MS. TRACY: I understand that there
9 has been a breakdown in quality assurance/quality
10 control.

11 MR. DURR: We can't substantiate that.

12 MS. TRACY: That's because you have
13 not looked.

14 MR. DURR: That's not a true
15 statement. It's obvious from the 2 inspection
16 reports that we have looked.

17 MS. TRACY: Jacques, you have told me
18 in our past meetings that your job is to deal with
19 technical issues.

20 MR. DURR: It is.

21 MS. TRACY: If I bring you something
22 and say there are specific welds in a specific area
23 which have been done incorrectly, you will go and
24 attempt to look at them and attempt to see if they're

1 all right. If you cannot reach those welds
2 physically, you will look at the documentation. That
3 is a technical problem which you will resolve by
4 looking at the technical information.

5 I have brought you other kinds of
6 information which you have not regarded as being
7 technical information. You, therefore, have not had
8 the techniques necessary to investigate whether these
9 charges are true or not. Those charges which I have
10 generally factored out into falling under QA/QC,
11 document control, design control and poor training
12 have not at any time been addressed to our
13 satisfaction, to resolve them to our satisfaction to
14 say that these were not a problem, particularly with
15 document control.

16 MR. DURR: Let me answer your question
17 before you get too far on. Let me interrupt you just
18 for a minute.

19 MS. TRACY: Yes.

20 MR. DURR: Our job is not to resolve
21 any issues to your satisfaction. They are to resolve
22 them to our satisfaction. That's what our Charter is
23 from Congress. We're the technical experts. I don't
24 know that you have any technical experts on your

1 staff that have any vast experience in quality
2 assurance/quality control, construction of nuclear
3 power plants. We are the technical experts, and it's
4 our Charter.

5 No one individual makes that
6 decision. Our allegation process is such that a
7 panel reviews what the inspection team has done, and
8 they determine that that is an acceptable
9 resolution. So if you expect the NRC to "satisfy"
10 ELP, that's not our Charter. Our Charter is to
11 satisfy ourselves that there is no wrongdoing; that
12 the plant was properly constructed, and that's what
13 we have done.

14 So that's why I wanted to respond to
15 that part because there is a misunderstanding on your
16 part.

17 MS. TRACY: I don't think so, Jacque.
18 Let me say something. It's my understanding that you
19 all are public servants.

20 MR. DURR: That's correct.

21 MS. TRACY: And that ultimately you
22 have to resolve these issues to the satisfaction, not
23 just of yourselves, but of the Congress and of the
24 public.

1 MR. DURR: That's correct.

2 MS. TRACY: So in a sense what you
3 just said is not entirely accurate. You have to
4 satisfy the public to the fact that you are
5 protecting their health and safety, not just
6 yourselves, but the public.

7 I represent, not just the people who
8 worked at the Seabrook Nuclear Plant, but also to
9 some extent the public, and certainly Congressman
10 Mavroules does.

11 MR. DURR: We have been utterly
12 responsive to everyone's concerns. That is to say,
13 we have spent an inordinate amount of manpower in
14 dealing with these issues. We have had focused,
15 directed allegations presented by you which we have
16 looked at specifically, and we have come up with
17 nothing. In all of these inspections we have not
18 found anything that would indicate that there was bad
19 construction or cover-ups or anything of that
20 nature.

21 So at some point the NRC has to say
22 we are spending all these efforts, and we are not
23 getting anything in return for it. We don't find any
24 credibility in your statements because we have looked

1 at your very focused, very specific allegations.
2 Even in the very specific ones we cannot find
3 anything the matter. So at some point in time we
4 have to start saying the credibility of these
5 allegations is such that at some point in time we
6 have to disengage from this.

7 Now, we do not have to satisfy every
8 single individual in the community that that plant is
9 technically safe. We "satisfy" the public through
10 the process, and that's what the licensing and
11 hearing process is all about. That's where the
12 public gets satisfied. If the public has valid
13 concerns or valid contentions, then the process is
14 set up such that they can be heard. Nobody, other
15 than a few people, have taken that route to present
16 their concerns, and those concerns are being
17 addressed in that forum, and they will be. The
18 process is set up so the public can be heard
19 throughout this whole thing.

20 Now, when you come in with
21 allegations, that's a different process, and that
22 process says that we will inspect and satisfy
23 ourselves that there is nothing wrong with the plant,
24 and that's we are doing here. Now, if you have other

1 concerns that you want to run through the other
2 forum, that's where you can be heard. So the NRC, I
3 think, is being very fair in this respect; that we
4 are taking the concerned citizen at your level
5 outside of the formal process, and we are pursuing
6 your concerns.

7 MS. TRACY: That's very generous of
8 you, Jacque.

9 MR. DURR: We only have to pursue them
10 to the extent that we feel that the plant is safe.

11 MS. TRACY: I think Mike has
12 something to say.

13 MR. GREENSTEIN: I would just like to
14 interject. I think that we're getting off on the
15 wrong track, and we're talking about philosophy,
16 rather than dealing with specifics.

17 MR. DURR: That's correct.

18 MR. GREENSTEIN: There are a great
19 many specific allegations that have been raised that
20 the Congressman is aware of and is concerned about.

21 MR. DURR: Certainly.

22 MR. GREENSTEIN: That's the reason why
23 I am here today. I would like some of those specific
24 allegations to be addressed.

1 MR. DURR: They will be, whatever is
2 in this November 12 letter.

3 MR. GREENSTEIN: The Congressman is on
4 record, along with a number of his colleagues, in
5 asking for an independent investigation.

6 MR. DURR: I understand that.

7 MR. GREENSTEIN: The NRC in its wisdom
8 saw fit to reject that request. In that light the
9 Congressman, who believes that evacuation is
10 impossible, is committed to getting answers to all of
11 the allegations that are raised by the ELP. It's
12 important that those allegations be thoroughly
13 addressed, at least to the Congressman's
14 satisfaction.

15 So rather than discuss philosophies
16 here, if we could get down to some specifics. It
17 strikes me that this first statement is an umbrella
18 statement under which there are dozens and dozens of
19 specific allegations that can be raised.

20 What I would ask Sharon and Doug to
21 do is, to start with the first step. Let us identify
22 an allegation. Let's put the allegation on the
23 table, and let the technical expertise of the NRC
24 come into play.

1 MR. DURR: And that's the direction we
2 are trying to head in. That's the point I was trying
3 to make earlier.

4 We have looked at these issues that
5 you have sent us. We have read through them and
6 we're prepared to address them. You just have to
7 understand that at some point the NRC has decided
8 that they have done enough under the quality
9 assurance/quality control aspects, and that you have
10 not given us enough specifics that we can go out and
11 find anything the matter with it. We have our own
12 inspection record that essentially tells us that the
13 quality assurance/quality control program was
14 functional and did exist. Were there isolated cases?
15 Certainly. There always will be. That's human
16 error. You can't design out that. But we feel that
17 that particular issue has been adequately addressed.

18 Now, do you have any specifics in
19 this area that you want to discuss?

20 MS. TRACY: Yes, I do.

21 MR. DURR: Please do.

22 MS. TRACY: All right. Let's start
23 with the issue raised by Scott Kennedy in our April
24 meeting last year -- sorry -- this year. April, 1987

1 it was. He raised the issue that the legs on the
2 pumps that run from the pump to a pipe into the
3 reactor; that the legs -- one leg on each pump was
4 put in an incorrect position according to the
5 design. In discussing with him his reaction to your
6 report, he mentioned that you said what had happened
7 to 4 of those legs -- there are 12 legs altogether
8 involved in this. He would like to know what
9 happened with the other 8 legs. He would like more
10 specific information on how you reached your
11 conclusions that the change in design allows for the
12 safe operation of the plant. He would like to know
13 if the pumps were moved, and he would also like to
14 know if this change in design will result in
15 premature bearing wear for the pumps.

16 MR. DURR: What does that have to do
17 with this first issue, 1.3?

18 MS. TRACY: This is one of the
19 problems with design control.

20 MR. DURR: Design control?

21 MS. TRACY: Yes.

22 MR. DURR: It was a specific
23 allegation concerning the pump, and that really ought
24 to be a separate issue because it's an isolated

1 case. But I think we are prepared to address it.
2 The fact is, I think that was all fairly much
3 discussed in 87-07. Was it not?

4 MR. MANOLY: Yes.

5 MS. TRACY: Jacque, I think we have a
6 problem because 1.3 is very general. As Mike said,
7 it's an umbrella statement. It encompasses many many
8 issues that you have looked at to some extent, and
9 some of which you haven't, and some of it which you
10 have touched on a bit. I think that each issue that
11 I raise which falls in my mind under the broader
12 problems --

13 MR. DURR: It can, sure.

14 MS. TRACY: -- and you will find a
15 technical issue that you may or may not have dealt
16 with. This particular issue falls under what I call
17 problems with design control. It was not built
18 according to the design of the plant, and then I am
19 asking specific questions within that concern.

20 MR. DURR: Sure.

21 MS. TRACY: We have other concerns.
22 We have them here.

23 MR. DURR: You need to understand,
24 Sharon, that's one of the reasons why we feel that

1 there is not any basis for this quality assurance/
2 design control concern. Because in each instance the
3 specific that you have given us, such as the pump, we
4 looked at that. We looked at it in depth. Kamal
5 Manoly looked at it. He's a qualified structural
6 mechanics engineer. He understands the design. He was
7 a designer for an AE. So he knows that area. He has
8 looked at it, and he has determined that there is not
9 a problem there; that it was appropriately
10 dispositioned. So from the quality assurance/design
11 control perspective we found it was not a problem;
12 that it was adequately controlled; that it was
13 controlled within the confines of the procedures that
14 they had there.

15 So, therefore, from a quality
16 assurance aspect or design control we have no concern
17 because it was handled the way it was supposed to
18 be. From the technical -- is the pump okay, and are
19 the supports the way they are supposed to be, we also
20 came out of there and we didn't have a problem
21 because we went back all the way back to Westinghouse
22 to get the information concerning -- and that was
23 off-site. That was the constructor of the --

24 MR. MANOLY: NSSS.

1 MR. DURR: The NSSS vender that built
2 the thing. They designed it. We went all the way
3 back to them and looked at their calculations, and we
4 came away and we didn't have a problem. So what
5 specifically in that pump concern do you think
6 creates a design control question?

7 MR. MANOLY: Did you read the response
8 in the reports?

9 MS. TRACY: Yes.

10 MR. MANOLY: Did you understand what
11 was in there?

12 MS. TRACY: I generally understood
13 what was in there.

14 The person who brought the concern
15 up, do you recall Scott Kennedy?

16 MR. MANOLY: Yes.

17 You are repeating the same thing that
18 was already answered here.

19 MR. DURR: If you remember, I asked
20 him point blank in that interview, was this an
21 allegation. He said no. It was just a concern, and
22 he'd really like to know how it turned out. We said,
23 sure, Scott. We'll look into it. We recognize it's
24 not an allegation. Do you remember that? He

1 specifically said in his transcript that's not an
2 allegation.

3 MS. TRACY: Jacque, you pulled a fast
4 one on poor Scott. He did not know what you meant.
5 He did not understand. There are semantic
6 differences. But we're getting off the track again.
7 Let's deal with some specific questions.

8 MR. DURR: All right. Give me the
9 specific questions.

10 MS. TRACY: I take it you feel, Kamal,
11 that the questions that I just raised have been
12 answered in 87-07?

13 MR. MANOLY: Yes, on page 52 in the
14 report.

15 MR. RICHARDSON: I had some questions
16 about your response to this here. Leaving aside
17 whether we have a programmatic issue here or not,
18 dealing strictly with the technical aspects of it,
19 maybe it's out of place right now, but we may as well
20 get it over with.

21 First off, my understanding of the
22 original question was that one leg on each of the
23 steam generator supports had had to be relocated at
24 its base in order to clear some interfering piping,

1 and that Mr. Kennedy's concern was that because of
2 the way the relocation was done that that leg would
3 drop as the system was heated up. Whereas the other
4 2 legs would rise because of the pipe connecting the
5 reactor coolant pump to, I guess it would be the
6 reactor vessel, because of its expansion. And in his
7 preparation for that he did the sketches that we
8 received at the April meeting.

9 Your answer to the question doesn't
10 make an awful lot of sense in a couple of areas. In
11 your discussion on page 52 of 87-07, just below the
12 center line of the page, you go into some description
13 of the maximum pump flange rise at operating
14 conditions, maximum rise in the columns, and the fact
15 that the pump as installed was level. The pump was
16 installed, we can assume, cold. You described the
17 rise of the pump flange, but you make no reference at
18 all to whether it will remain level when it rises,
19 whether, if it does not remain level, that will or
20 will not put an unacceptable stress on the piping
21 associated with that.

22 Also, it's my understanding that when
23 you're dealing with a rapidly rotating piece of
24 equipment, ideally you want it to remain level in

1 order to prevent an uneven load on bearings and
2 subsequent premature bearing wear. So I am concerned
3 myself with whether you have adequately addressed the
4 question of will the pump remain level when the
5 system is heated.

6 MR. MANOLY: Did you read page 52 of
7 the report?

8 MR. RICHARDSON: Yes.

9 MR. MANOLY: Maximum postulated pump
10 flange rise at operating transient condition is 100
11 mils.

12 MR. RICHARDSON: Yes, but you haven't
13 addressed the question of, is it level.

14 MR. MANOLY: The maximum permitted
15 rise of RCP support column during modification was 40
16 mils.

17 MR. RICHARDSON: Can you explain how
18 that answers the question?

19 MR. MANOLY: That means after heating
20 up, after the pump operates it's not going to exceed
21 the 100 mils that the original design intended to
22 have.

23 MR. RICHARDSON: I'll show you
24 Mr. Kennedy's sketch here. His understanding of the

1 way the modification was done was that 2 legs had
2 been designed to rise from a slope toward the reactor
3 vessel to a vertical position.

4 MR. MANOLY: Uh huh.

5 MR. RICHARDSON: And that because the
6 third leg at its base had been moved toward the
7 reactor that it would then be as installed cold,
8 sloped away from the reactor, and as the piping to
9 the reactor vessel would expand that that slope would
10 increase, and thus the side of the reactor coolant
11 pump which is supported by that leg would drop while
12 the opposite side would rise.

13 MR. MANOLY: The weld was not
14 performed on the pipe end until after the
15 installation of the modification of the leg.

16 MR. RICHARDSON: It doesn't matter.

17 MR. MANOLY: That's what matters to
18 me.

19 MR. RICHARDSON: No. If the system is
20 cold, you're going to have it in its as-installed
21 position, and up through the final weld it's going to
22 be perfectly fine, but as you heat it up, as this
23 pipe expands, the back 2 legs are going to come to a
24 vertical position and they will rise.

1 MR. MANOLY: They are allowed 100 mils
2 to rise.

3 MR. RICHARDSON: Yes. That's not the
4 concern.

5 MR. MANOLY: It is the concern.

6 MR. RICHARDSON: No. I'm not saying
7 that that's unacceptable. The concern is that the
8 third leg, which is installed at an angle heading
9 away from the reactor, as that pipe expands, the top
10 of that leg is going to move farther out of plumb,
11 and this is going to result in the inner side of the
12 reactor coolant pump dropping, as opposed to the
13 other side of the reactor coolant pump rising. So
14 that as the system is heated up -- this wouldn't be
15 expected to show in a cold condition. As the system
16 heats up, that pump is going to cock out of level.

17 MR. MANOLY: When the system heats up,
18 the pipe will take a distorted position or deformed
19 position.

20 MR. RICHARDSON: Yes. He's calculated
21 in for that. His concern was whether that was
22 acceptable.

23 MR. MANOLY: The position of the
24 piping at the pump flange allowed, based on code

1 limits, is 100 mils. Okay. That's what we are
2 saying in the report. When you look at the stress
3 level in the piping in the heated condition, it's not
4 going to be heightened with the allowed code limits
5 of 100 mils.

6 MR. RICHARDSON: Then the 100-mils
7 limit would be acceptable when it is hot as well?

8 MR. MANOLY: Yes.

9 MR. RICHARDSON: Mr. Kennedy
10 calculated that the deflection that would be caused
11 when the pump was heated up is 125 thousandths of an
12 inch, 1/8 of an inch.

13 MR. MANOLY: The numbers that the pump
14 legs were shifted is listed in the second paragraph
15 of the report on all 4 pumps. If you look at the
16 numbers you see 2 inches --

17 MR. RICHARDSON: The numbers don't add
18 up either.

19 MR. MANOLY: These are the true
20 numbers. These are numbers that were changed for the
21 movement of the leg. The highest angle of change was
22 2.33 degrees.

23 MR. RICHARDSON: How does that affect
24 your --

1 MR. MANOLY: I just told you.

2 MR. RICHARDSON: What you are saying
3 is that his numbers here are not correct. Is that
4 right?

5 MR. MANOLY: The numbers that you have
6 in the report are the correct numbers.

7 MR. RICHARDSON: That's a matter of
8 concern to me too. They don't appear to me to work
9 out properly.

10 MR. DURR: Wait a minute. How did you
11 arrive at that conclusion?

12 MR. RICHARDSON: Basic trigonometry.

13 MR. DURR: What are you basing that
14 concern on?

15 MR. RICHARDSON: I am about to explain
16 it to you.

17 MR. DURR: All right.

18 MR. MANOLY: Some of these numbers are
19 pretty close to ours. You have 5 and 1/4 and 5 and
20 3/8.

21 MR. RICHARDSON: Yes. That's why I'm
22 concerned. The numbers are close enough to be
23 accurate for purposes of discussion.

24 His design drawing, how this piece of

1 equipment was supposed to originally have been
2 installed, shows a position as these legs are
3 installed approximately 2 inches off of plumb leaning
4 toward the reactor vessel in a cold condition. Is
5 that accurate?

6 MR. MANOLY: That number is irrelevant
7 here.

8 MR. RICHARDSON: No. It's not
9 irrelevant.

10 MR. MANOLY: It does not pertain to
11 what we are talking about.

12 MR. RICHARDSON: It does indeed.

13 MR. MANOLY: The concern we have is
14 the movement of the legs.

15 MR. RICHARDSON: Yes. That's why the
16 number is relevant.

17 MR. MANOLY: The movement of the base,
18 that's what is important to the issue, because what
19 you do, you change the angle of the face of the pump.

20 MR. RICHARDSON: That's precisely what
21 I'm concerned about.

22 MR. MANOLY: That's the only thing
23 that's changed in here, the leg movement.

24 MR. RICHARDSON: But the question is

1 that the numbers you are using don't appear to me to
2 work out right. Let me explain. For a design figure
3 you've got 2 inches offset at the top of the leg from
4 the bottom.

5 MR. MANOLY: I didn't say that.

6 MR. RICHARDSON: The first question
7 I'm asking is, is this accurate.

8 MR. MANOLY: No, it's not.

9 MR. RICHARDSON: What is the correct
10 figure?

11 MR. MANOLY: That number, he had no
12 way of knowing how much that point moves relative to
13 the vessel.

14 MR. RICHARDSON: I would assume --

15 MR. GRAY: Can we take a break on this
16 question for a second? I'd like to back up to the
17 original question. The original question from
18 Kennedy was, I have a concern about what happened to
19 the pump after I left. You have a concern as to
20 design control. This is an example of design
21 control.

22 MR. RICHARDSON: Yes, it is.

23 - - -

24 (Mr. Wiggins is not present at this time).

- - -

MR. GRAY: The components could not be constructed in accordance with the original drawing. As a result of that, the modification was made. The information from this modification was worked on by Westinghouse, who reviewed the projected changes, and then reviewed the effects of those changes. This is an example where design control is -- or was done properly.

Exactly the details of these numbers and things is a different issue entirely. The fact is that Westinghouse, the NSSS supplier who has the responsibility for the pump, was involved in the description of the problem, the construction in an attempt to install this, and was involved in the resolution of the problem. This is not an example of a design control problem.

MR. DURR: The fact is, it's an example of design control working the way it's supposed to.

MR. MANOLY: The numbers you see in the report are numbers that were recorded after the change was made. That's what the analysis was based on, the modified location of the piping in the

1 as-built condition.

2 MR. RICHARDSON: Aside from the
3 question of whether we have a design control problem
4 here, I'm particularly interested myself in
5 addressing the question I have, which is that I feel
6 that your analysis may have failed to take into
7 account the question that Mr. Kennedy originally
8 raised. What I was trying to do was to discuss it to
9 the point where you can explain to me why your
10 numbers do work because on the surface it doesn't
11 appear that they do. If this is a matter that would
12 best be left to later on in the day, I have no
13 problem with that, but it looks like it's going to
14 take quite awhile to discuss. I do want to go through
15 it completely.

16 MR. DURR: You're extrapolating, and
17 that's not the way the systems works. Mr. Kennedy
18 had a concern which is very clearly stated on page 50
19 of the inspection report. We took that concern
20 verbatim, and we addressed that concern. We assumed
21 that to be an allegation, although he clearly stated
22 it wasn't. We addressed it. We addressed the
23 question that he asked. Do you agree that we
24 addressed the question that he asked?

1 MS. TRACY: He feels --

2 MR. DURR: That only requires a yes or
3 a no.

4 MS. TRACY: He feels that there is
5 some --

6 MR. DURR: Additional question.

7 MR. RICHARDSON: I feel you did not
8 address this question.

9 MS. TRACY: Would you like to know
10 exactly what Mr. Kennedy said?

11 MR. DURR: I know exactly what he
12 said.

13 MS. TRACY: He said that you have
14 given an answer to the question, but not "the"
15 answer. That was what Scott Kennedy told me the
16 other night on the phone when I asked him how he --
17 that answers your question.

18 MR. DURR: We have his question very
19 clearly set forth during the interviews of April the
20 20th, and a qualified engineer -- are you a qualified
21 engineer, sir?

22 MR. RICHARDSON: No.

23 MR. DURR: A qualified engineer, who
24 is experienced in design, stresses, calculations, and

1 knows how to do these things, looked at this. This
2 man is just short of having a Ph.D. in the area that
3 we're talking about. He has a Master's Degree for
4 sure.

5 Now, he is thoroughly competent and
6 qualified to look at this technical issue and
7 determine if it's adequate, and he has done that, and
8 in his professional opinion -- he's a Professional
9 Engineer, Registered Professional Engineer. In his
10 opinion, in his technical judgment this is adequately
11 resolved.

12 Now, once you have an allegation and
13 you address the allegation, we don't want to get into
14 the mode where now you are going to second and third
15 quarter iterate that from that. That's not an
16 allegation. That's your technical concern. If it
17 turns out to be an allegation, we'll try to
18 accommodate that. I want you to understand that you,
19 sitting down with information after the fact and not
20 having any prior knowledge, other than what you have
21 garnered from Mr. Kennedy's discussion and from our
22 inspection reports, really throws into question your
23 ability or your right to make these concerns and
24 these added --

1 MS. TRACY: Excuse me, Jacque. Does
2 Scott Kennedy have the right to come back and ask you
3 that question?

4 MR. DURR: Mr. Kennedy has an
5 allegation which we originally addressed here. If he
6 has additional allegations that he wishes to make to
7 the NRC --

8 MS. TRACY: Regarding this?

9 MR. DURR: We will be happy to
10 entertain them.

11 MS. TRACY: If he has additional
12 questions --

13 MR. DURR: If he has additional
14 questions, we may not answer additional questions
15 because they are just questions. We are not here to
16 educate the public in engineering.

17 We are here to protect the health and
18 the safety of the public, but we do not have the time
19 or the wherewithal to answer every question that the
20 public has. Because what we'd have to do is send
21 them to college to get them enough background --

22 MS. TRACY: I think we're getting off
23 the track again.

24 MR. DURR: Yes.

1 MS. TRACY: I have a procedural
2 suggestion. You have called in certain of your
3 experts to deal with particular issues that were
4 raised in our response to your report. Some of them
5 are under time constraints and have to leave. Mike
6 has some concerns as well, and he is also under a
7 time constraint. What I would like to suggest is,
8 you have come to this meeting and your people have
9 come prepared to deal with specific issues. I think
10 you probably have some, and so forth and so on.

11 MR. DURR: Yes.

12 MS. TRACY: I would suggest that
13 instead of asking me to raise questions which are all
14 listed here in the paper that I passed out, that we
15 deal with the issues that your people came here to
16 address.

17 MR. DURR: Certainly.

18 MS. TRACY: And then we go on, just so
19 that people don't have to sit around and listen to
20 discussions that may not concern them.

21 MR. DURR: That's why I'm trying to
22 get past 1.3.

23 MS. TRACY: Then we can go on to the
24 issues that I came down here to address.

1 MR. GREENSTEIN: I sense that there is
2 an adversary atmosphere in this room that isn't
3 necessary.

4 MR. DURR: That's true. I agree.

5 MR. GREENSTEIN: It's really being
6 destructive of what this meeting is all about.
7 Obviously there is disagreement. Let's accept the
8 fact that there is a disagreement, and let's try to
9 put the questions on the table and have some answers
10 to the questions without any argument. You are being
11 a tad bit legalistic, Jacques, which is also clouding
12 what we're trying to do here.

13 MR. DURR: I understand that. But
14 you've only just arrived. We've been dealing with
15 this since 1984, and specifically with ELP since
16 1986, and we have not had adversarial relationships
17 in the past. But at some point we, the NRC, have to
18 make the point that we cannot go on ad infinitum with
19 this thing, and we will not go on ad infinitum with
20 it.

21 At some point, if you can establish
22 your credibility : giving us the allegation that
23 says this is wrong, and we can go out and find that
24 that is, in fact, wrong, now we've got something to

1 deal with. We've spent over 1000 man hours turning
2 over every rock out there, and we cannot find -- we
3 cannot substantiate anything that you say.

4 MS. TRACY: Can we get down to brass
5 tacks here?

6 MR. DURR: Let's go beyond 1.3, and
7 we'll come back to that.

8 MR. RICHARDSON: Let's not just yet.

9 MR. DURR: Let's get into the
10 technical, and get out of the programmatic stuff.

11 MS. TRACY: But with the agreement
12 that we will deal with the programmatic issues.

13 MR. DURR: We will come back to it.

14 MS. TRACY: All right.

15 MR. MANOLY: Do you have anymore
16 questions?

17 MS. TRACY: Are you under a time
18 constraint, Kamal? Are you going to be around?

19 MR. MANOLY: Yes. I am going back to
20 Washington.

21 We looked at all 4 pumps. He
22 mentioned only one. I looked at 4. The numbers in
23 here are the offsets that were applied to all 4
24 legs. Only one leg that's close to the reactor was

1 moved. So he mentioned one. I look at all 4 of
2 them, and that's an evaluation for all 4 of them.

3 MS. TRACY: And you looked at all 12
4 legs, not just the --

5 MR. MANOLY: What counts is the one
6 that was moved.

7 MR. RICHARDSON: What counts is the
8 one that was moved.

9 MR. MANOLY: Each pump has 4 legs for
10 support. The one that moves, that's the one that
11 counts.

12 MR. RICHARDSON: 4 or 3?

13 MR. MANOLY: 3. I'm sorry.

14 MS. TRACY: So you looked at the leg
15 on each pump that had been moved.

16 MR. MANOLY: Yes. That's what's
17 important because you don't want to have the pipe
18 installed in a rotation exceeding what is allowed by
19 the manufacturer. When they did the relocation of
20 the leg, they monitored the levelness at that
21 process.

22 MR. RICHARDSON: During construction?

23 MR. MANOLY: Yes. They monitored it.

24 MR. RICHARDSON: That wasn't the

1 question --

2 MR. MANOLY: Wait. My concern, I want
3 to see the pipe installed with initial rotation on it
4 exceeding what the NSSS required, and what we found
5 is that the NSSS required a maximum of 40 mils. It
6 did not get there. 100 is the maximum allowed under
7 hot condition. The NSSS said they didn't want it to
8 exceed 40 mils during installation, and to maintain
9 levelness to remain under 40 mils during erection,
10 and they maintained that. That's what's a concern to
11 me.

12 MR. RICHARDSON: Our problem is,
13 however, that Mr. Kennedy's concern was with the pump
14 remaining level when the system is heated, not the
15 construction.

16 MR. MANOLY: No. When the pump is
17 heated, it can tolerate up to 100 mils of rise.

18 MR. RICHARDSON: Okay. Can you
19 translate mils into decimils? We're talking 10
20 thousandths of an inch?

21 MR. MANOLY: .1.

22 MR. DURR: .1 inches.

23 MS. TRACY: So what you're saying is
24 that according to the NSSS requirements that the pump

1 will remain adequately level, both when it's cool and
2 when it's hot.

3 MR. MANOLY: When it's hot, it's
4 supposed to rise, yes.

5 MR. RICHARDSON: It's supposed to
6 rise, but stay level.

7 MS. TRACY: But it will stay level
8 when it's heated, as well as when it's cool. There
9 won't be any tipping.

10 MR. MANOLY: The tipping concern is
11 only important as it induces stress on the piping,
12 and the piping was evaluated in the as-built
13 condition, and the stress limits were within the code
14 limits. That's all we care about. There is no such
15 thing that, well, if it's not level, that's something
16 of concern to whoever. But what you care about is
17 the piping stress.

18 MS. TRACY: Bearing wear. If the pump
19 isn't level whether the bearings in the pump will be
20 worn unevenly as well. That's also a concern if the
21 pump doesn't remain level.

22 MR. MANOLY: I understand what he's
23 saying. But the issue that he raised in the last
24 meeting was about the stress of the piping, and I

1 think we addressed that. We told you what the stress
2 levels were before and after.

3 MR. RICHARDSON: Mr. Kennedy's figures
4 indicate that he calculates that the pipe going to
5 the reactor vessel will rise approximately 125
6 thousandths of an inch.

7 MR. MANOLY: There is no way that he
8 can compute that. You know why? These numbers are
9 arrived to from a computer analysis. The only way he
10 can really know is to look at the model and see what
11 the results are. There is no way, with the geology
12 of the piping and the temperature of the transients
13 it's going to go through that he can estimate how
14 much it's going to rise.

15 MR. DURR: You have to understand that
16 the pump and the piping is moving, but also the
17 reactor vessel itself is moving. You've got relative
18 motion between all of these things. So when you heat
19 up the reactor pressure vessel, it grows also. So
20 everything is moving.

21 MR. RICHARDSON: It would be bowed
22 more or less.

23 The question I had about your figures
24 on the placement of the legs, Mr. Kennedy's sketch

1 shows the pump as originally installed to have legs
2 set at a slight angle off perpendicular, leaning
3 toward the reactor vessel, so that as the pipe
4 expands, the reactor coolant pump will move outward
5 and the legs will come up to perpendicular. Is that
6 the correct intent of the design?

7 MR. MANOLY: The pipe will move, yes.

8 MR. RICHARDSON: His sketch of the
9 as-built condition shows the leg closest to the
10 reactor vessel having been moved in order to clear
11 the --

12 MR. MANOLY: Interference.

13 MR. RICHARDSON: -- the piping behind
14 it. That the bottom leg was moved approximately 5
15 inches toward the reactor vessel.

16 MR. MANOLY: That's a final
17 adjustment. It already had slope in it.

18 MR. RICHARDSON: In which direction
19 was its original slope?

20 MR. MANOLY: You did not really read
21 my report. It moves the amount of 2, 2, 1 1/2, and 1
22 3/4, not 5. That's the final offset.

23 MR. RICHARDSON: The problem is it's
24 in the other direction.

1 MR. MANOLY: What other direction?

2 MR. RICHARDSON: Your original design,
3 if this is correct, would have called for all 3 legs
4 to be slanted toward the reactor vessel at the top.

5 Let's take the figure of 2 inches
6 because that's what he had here as the design. Now,
7 if you move this leg to get to a position where
8 you're 5 1/4 inches toward the reactor vessel from
9 the pump, then you can move that leg a total of
10 closer to 7 inches, not 2.

11 MR. MANOLY: No. That is not
12 correct. The columns are moved by 2, 2, 1 1/2, and 1
13 3/4.

14 MR. RICHARDSON: How do you get from 2
15 inches farther away from the reactor vessel to 5
16 inches closer to the vessel?

17 MR. MANOLY: They already had 3 and
18 some numbers. It was 5 and 3/8, 5 3/8, 4 7/8, and 4
19 15/16. You subtract the 2, 2, 1 1/2, and 1 3/4 from
20 the final numbers. That was the original offset.

21 MR. RICHARDSON: Then your original
22 offset would have to have been with the legs at the
23 bottom, closer to the reactor pressure vessel. That
24 doesn't match his design. That doesn't match the

1 drawing that Mr. Kennedy put in his question to you,
2 which I have to assume was based on design drawings.
3 He appears to be competent enough, knowledgeable
4 enough to have --

5 MR. MANOLY: He was a surveyor.

6 MR. RICHARDSON: Yes. He would have
7 had access to design drawings as necessary.

8 MR. MANOLY: No. He would not have
9 access. The surveyors, all they use is the surveying
10 drawings that was given to him to work with.

11 MR. GREENSTEIN: For the record, can
12 we identify who this Mr. Kennedy is?

13 MR. DURR: Mr. Kennedy was a
14 surveyor. We've got the original transcripts. He
15 was a surveyor working in the reactor building, and
16 he was aware that this occurred. He never saw the
17 end of this evolution. He saw the beginning of it. He
18 knew they had to move the feet, but he did not know
19 what the results were. He moved on to someplace else
20 before they finished it. He was concerned as a
21 concerned citizen. He was interested in finding out
22 what were the final results.

23 MS. TRACY: He was concerned that the
24 way that the legs had been placed -- it was different

1 from the original design -- would place undue stress
2 on the pipe.

3 MR. GREENSTEIN: Is that a fact? Were
4 the legs placed differently than as designed?

5 MS. TRACY: Yes.

6 MR. MANOLY: Yes. The legs were moved,
7 the modification on the legs.

8 MR. DURR: Let's clarify that. There
9 was a design change from the original design. It's
10 not that they were placed differently than they were
11 designed. They were put where they were supposed to
12 be in the final design. It was a design modification
13 or a design change.

14 MS. TRACY: He had raised the issue,
15 perhaps with you, Tony, I'm not sure, when he was at
16 the plant.

17 MR. CERNE: Yes.

18 MS. TRACY: And he had felt that the
19 response didn't really satisfy him. So he went to
20 Representative Hilt, his representative in
21 Massachusetts who raised this issue and brought it to
22 us, and eventually we all got together.

23 What I would like to do is to convey
24 what you have had to say at this meeting and the

1 discussion that will turn up in the transcript to
2 Scott Kennedy because he was the one who asked me to
3 raise this issue again, and perhaps he can even give
4 you a call in Washington or wherever you are, if he
5 wants to talk to you about it further. Would that be
6 okay?

7 MR. MANOLY: Yes.

8 - - -

9 (Ms. Gentleman is now present at the meeting).

10 - - -

11 MR. DURR: We need to add one more
12 person to the record. For the benefit of everyone
13 here and Mary Beth, this is Mary Beth Gentleman.

14 You are from the --

15 MS. GENTLEMAN: Executive Office of
16 Energy Resources, State of Massachusetts.

17 MR. DURR: So she knows who everyone
18 is, we will identify ourselves. I'm Jacque Durr. I'm
19 Acting Deputy Director of Division of Reactor Safety.

20 MR. HAVERKAMP: I'm Don Haverkamp,
21 Project Section Chief for Seabrook.

22 MR. KAUCHER: I'm Jim Kaucher. I'm
23 the Project Engineer in the section of which Seabrook
24 is a part.

1 MR. GREENSTEIN: Mike Greenstein,
2 District Director. I'm here representing U.S.
3 Representative Nicholas Mavroules.

4 MR. RICHARDSON: I'm Douglas
5 Richardson, Researcher for Employee's Legal Project.

6 MS. TRACY: Sharon Tracy, Employee's
7 Legal Project.

8 MR. GRAY: Harold Gray, Region I.

9 MR. MANOLY: Kamal Manoly, NRR,
10 Division of Engineering and System Technology.

11 MR. CERNE: Tony Cerne, Senior
12 Resident Inspector at Seabrook for Region I.

13 MR. RUSCITTO: Dave Ruscitto, Resident
14 Inspector at Seabrook.

15 MR. DURR: With that, we'll start
16 again. Are all the questions now -- are we finished
17 with pumps?

18 MR. CERNE: There is one point that
19 Kamal and I were just discussing. Very simply put,
20 what Scott Kennedy has in the design drawing there is
21 incorrect. Doug's entire problem with this in the
22 way the geometry works out is erroneously based on
23 that incorrect drawing because the offset originally
24 always was --

1 MR. RICHARDSON: The offset would have
2 been then all the way through; that the top of the
3 support columns in a cold position should have been
4 farther from the reactor.

5 MR. CERNE: At least on the leg that
6 was moved.

7 MR. RICHARDSON: Mr. Kennedy's
8 question is not with the leg that was moved per se,
9 but the relation of the leg that was moved to the
10 other 2 legs. Because if the other 2 legs are
11 leaning toward the reactor at the top, and the third
12 leg is leaning away from the reactor at the top, as
13 the system heats up the pump is going to move away
14 from the reactor. We all can agree on that; is that
15 correct? And the 2 legs that are slanted toward the
16 reactor at the top will come up to plumb, and the
17 tops of the legs will rise by a fraction of an inch,
18 and the third leg, which is already slanted away from
19 the reactor to begin with, is going to move to a
20 greater degree of slope, and it's top is going to
21 drop. It was Mr. Kennedy's concern that this would
22 create an out-of-level condition on the pump, rather
23 than having all 3 legs moving parallel which would
24 keep it level. That appears not to have been

1 addressed, at least from the discussion in the 87-07
2 report.

3 MR. DURR: This is a new question.

4 MR. RICHARDSON: No. This is the
5 original question. That's the problem.

6 MS. TRACY: This was definitely Scott
7 Kennedy's original concern.

8 MR. RICHARDSON: I refe you to the
9 second page of the text of the paper that he had put
10 together.

11 MS. TRACY: Just read it.

12 MR. RICHARDSON: In the as-built
13 condition, however -- this is using Mr. Kennedy's
14 information -- in the as-built condition, however,
15 the rear legs of the pump cause a rise of about 0.015
16 inch, while the front leg lowers the pump
17 approximately 0.036 inch, making a total difference
18 of about 0.051 inch.

19 His estimate is that this would tend
20 to make the pump leading to the reactor -- the pipe
21 leading to the reactor deflect approximately 1/8 of
22 an inch. So this was the original concern.

23 MR. DURR: No. This is a quote. The
24 quote from the ELP document attachment D says, "Since

1 this pipe is quite rigid most of the stress would, I
2 believe, fall on the welds of the pump in the
3 reactor. This condition would also cause a slight
4 twist in the cross-over piping".

5 So he's talking about stresses in the
6 piping.

7 MR. RICHARDSON: He's talking about a
8 variety of expected results.

9 MR. DURR: I'm just reading what it
10 says here. It says, "This condition would also cause
11 a slight twist in the cross-over piping".

12 He is talking about stresses in the
13 welds at the pump in the reactor. I'm just reading a
14 quote.

15 MS. TRACY: It's a matter of
16 interpretation, what you choose to pick out as being
17 Scott Kennedy's concern. I spoke with him a number
18 of times about this, and he was concerned, yes, about
19 the stress, bearing wear. He was also very concerned
20 about the fact that the pump would not remain level,
21 thus causing these problems.

22 MR. MANOLY: It says that it can move
23 100 mils. So obviously he was not aware of that.

24 MR. RICHARDSON: Is it permitted to

1 move 100 mils, if it remains in a level position, or
2 is it --

3 MR. MANOLY: It rises.

4 MR. RICHARDSON: Is it permitted to
5 tip?

6 MR. MANOLY: 100 mils. That's a
7 flange. The flange of the pump would rise 100 mils.

8 MR. RICHARDSON: Which flange?

9 MR. MANOLY: Where the pipe is welded.

10 MR. RICHARDSON: Can you show me on
11 this drawing, or do you have another one that would
12 show it?

13 MR. DURR: What? The pump flange?

14 MR. RICHARDSON: Yes.

15 MR. DURR: There is only one flange on
16 that pump that I know of, and that's where the motor
17 mounts to it. It's the top flange.

18 MR. RICHARDSON: Here?

19 MR. MANOLY: Yes.

20 MR. RICHARDSON: The question I'm
21 still trying to get at is, that flange is permitted
22 to rise 100 mils. I have no problem with that. But
23 is it permitted to tip? Is it permitted to go out of
24 level?

1 MR. DURR: That's a new question.

2 MR. RICHARDSON: No. That's the
3 original question.

4 MR. DURR: Based on what we have here
5 that's a new question.

6 Are we prepared to answer that
7 question?

8 MS. TRACY: I think there is some
9 disagreement as to whether it's a new question or
10 simply an augmentation --

11 MR. DURR: To the NRC, that's a new
12 question.

13 MR. MANOLY: Yes.

14 MR. DURR: As far as we're concerned,
15 that's a new question. Whether it's a
16 miscommunication or how it arises, to the NRC that's
17 a new question, and we're not prepared to respond to
18 that question. However --

19 MS. TRACY: In the future perhaps.

20 MR. RICHARDSON: Would you be willing
21 to discuss it in the future?

22 MR. DURR: Yes.

23 MR. CERNE: There is another point to
24 be made here though. I will go back to the record.

1 Mr. Kennedy's drawing is in error. If that's how he
2 perceived it, and that's how you people arrived at
3 calculations which seem to dispute the NRC's
4 findings, that may be the source of the problem.

5 MR. RICHARDSON: That was part of what
6 I was trying to discuss, to find out if his
7 information was, in fact, correct. That's why I've
8 been asking about the plan.

9 MR. MANOLY: Some of the numbers shown
10 in his drawing do not agree with the numbers I got
11 from the documents.

12 MR. RICHARDSON: Which ones? Can you
13 explain them?

14 MR. MANOLY: 5 inches, that is not the
15 movement of the leg. This is the final position from
16 -- it was only moved 2 inches.

17 MR. CERNE: You are assuming that it
18 was 2 inches on the other side, and then it moved 5
19 inches for a total offset of about 7 inches.

20 MR. RICHARDSON: That appears to be
21 his understanding.

22 MR. CERNE: If you take the fact that
23 the pump -- or the leg was already offset 2 inches in
24 the opposite direction, and then it moved to the

1 final position of 5 inches, the difference is only 3
2 inches.

3 MR. RICHARDSON: So the original
4 position then on this leg --

5 MR. CERNE: Was already in that
6 direction.

7 MR. RICHARDSON: -- was already sloped
8 from the reactor vessel at the top. The other legs
9 as well, or just that one?

10 MR. MANOLY: The other legs were not
11 moved. Only the leg that had interference with the
12 piping, that leg was moved.

13 MR. RICHARDSON: What is the position
14 then of the other 2 legs? Are they parallel to the
15 third leg, or are they at an opposite angle?

16 MR. MANOLY: I don't know exactly what
17 the angles are of the 3 legs, but I know those have
18 not been moved. They are consistent with the way
19 they are originally designed.

20 MR. RICHARDSON: Can you tell us --

21 MR. DURR: Wait. Let's keep the
22 question simple. I think the question is, is the
23 pump acceptably level at heat up.

24 MR. RICHARDSON: That was the

1 question.

2 MR. DURR: What you are interested in,
3 is the pump acceptably level after a heat up. Is
4 that correct?

5 MR. RICHARDSON: That, as I understood
6 it, was his concern.

7 MR. DURR: That's the question we'll
8 answer. Is the pump acceptably level after it heats
9 up. And we can answer that question.

10 MR. GREENSTEIN: And it only took us
11 about an hour to get to the first question of the
12 day.

13 MS. TRACY: That brings me back to my
14 suggestion before. I know Don had said that several
15 people had to leave around noon or something.
16 Perhaps we should deal with why those people came, so
17 that they can leave on time.

18 MR. DURR: Let's move on to something
19 a little less knotty than 1.3, and maybe it will move
20 a lot faster.

21 MS. TRACY: Yes, I agree. We'll come
22 back to 1.3.

23 MR. DURR: On 2.1, what is your
24 specific question on 2.1?

1 MR. RICHARDSON: First off, specific
2 case, the case where I believe I saw cold pulling
3 being attempted in condensive piping. The first time
4 I mentioned this it was addressed in the 86-52
5 report, and your response in that report was -- I'm
6 going to paraphrase -- was that I was talking about
7 the main steam or feedwater cold pulling incident
8 that is documented. That's incorrect, first off.

9 MR. DURR: What is incorrect?

10 MR. RICHARDSON: The assertion that
11 that was the instance of cold pulling that I was
12 referring to.

13 MR. DURR: No. We never said that.
14 We said that that was a documented case of cold
15 pulling. I don't think we attributed that to you.

16 MR. RICHARDSON: Let me find it,
17 report 86-52. Cold pulling was discussed in a couple
18 of sections in that report. It's discussed on page
19 91, allegation number 55. The first paragraph cites
20 a list of possible problems, and item F is cold
21 pulling pipe. The third paragraph down, page 91,
22 there is a quote, "On one occasion I saw a crew
23 attempting to force a pipe spool into location by use
24 of a chainfall".

1 In the context of the affidavit I
2 gave you I was referring to piping within the
3 condenser.

4 MR. DURR: We understand.

5 MR. RICHARDSON: Your response on page
6 92, second paragraph from the bottom, it says that
7 cold pulling of pipe is discussed in allegations
8 number 40 and 46. However, one cold pulling incident
9 did occur.

10 MR. DURR: Yes. We didn't attribute
11 that to you. We just said that we recognized that
12 there were other allegations.

13 MR. RICHARDSON: That same quote or
14 another one that I did is cited in one of those which
15 reads --

16 MR. DURR: You have to understand that
17 there were multiple allegations, others in cold
18 pulling, and we lumped them together because it was a
19 common issue. We looked at those and number 40 and
20 46, allegation 40 and 46. There was a specific
21 allegation in number 40 that said one of the main
22 pipes from the reactor to the turbine building did
23 not fit, so workers had to use a comealong to make
24 the connection.

1 MR. RICHARDSON: That was not mine.
2 Cold pulling to align pipes, which is cited as number
3 46, I believe may have been mine.

4 MR. DURR: That may be true, but it
5 was so broad and general we lumped it with number
6 40.

7 MR. RICHARDSON: I gave you a fairly
8 specific location.

9 MR. DURR: In number 46?

10 MR. RICHARDSON: In a discussion in
11 the original affidavit I gave you. I was
12 specifically dealing with piping within the
13 condenser. There were a number of criticisms.

14 MR. DURR: And we went back and looked
15 at that in 87-07, right?

16 MR. RICHARDSON: You did to some
17 extent. That was another area I'm concerned about
18 because in 87-07 you say that that particular
19 incident -- I believe it was a transcription error.
20 You quote me as saying that that particular incident
21 occurred in condenser number H, and that there is no
22 condenser number H.

23 I specifically said condenser number
24 A. If the transcriptionist got that wrong, I'm

1 sorry. But I think you should have at least given me
2 a phone call to ask why the discrepancy. We were
3 working with the general arrangement drawings right
4 there. I believe I pointed out to you where in the
5 condensers we were talking about. It should have
6 been obvious that there was a communication error
7 there, and that should have been checked out, rather
8 than to simply assume that because the
9 transcriptionist put it as condenser H, that I didn't
10 have a valid concern.

11 Furthermore, the pipe in question,
12 the 13-stage steam dump, you cite as being attached
13 to the turbine on the upper end and open ended on the
14 lower end, and therefore, because it was open on the
15 lower end there is no closure weld, and a case of
16 cold pulling could not have occurred. That piping is
17 welded to the condenser wall at the far end, and that
18 weld would function as a closure weld.

19 MR. MANOLY: No, it's not. Closure
20 means closure. It means closed both ends. This --

21 MR. RICHARDSON: You are forcing a
22 pipe --.

23 MR. MANOLY: You are using the wrong
24 terminology here.

1 MR. DURR: Let's slow down. First of
2 all, you are arguing with an expert.

3 MR. RICHARDSON: I'm sorry if I'm
4 arguing with an expert.

5 MR. DURR: What's your credentials for
6 arguing with an expert that he doesn't know what
7 closure means. He knows what closure means.

8 MS. TRACY: It's another semantic
9 difference.

10 MR. MANOLY: No, it's not.

11 MR. DURR: Let me finish. We're
12 talking about induced stresses in piping. I want to
13 know where you have your credentials from induced
14 stresses in piping systems. Where do you have your
15 experience from?

16 MR. RICHARDSON: I saw that pipe being
17 cold pulled in place. It was supposed to be welded
18 to the condenser. What you are doing is fixing the
19 pipe at two locations and --

20 MR. DURR: I am not disputing what
21 you saw. But when he said it does not have, and you
22 said yes, it does, I want to know what the basis for
23 your argument is.

24 MR. RICHARDSON: The basis for my

1 argument is this, apparently the question of cold
2 pulling refers to pipe that is fixed at one end,
3 forced into position at another end, and fixed in
4 place at that end subsequently with the stress still
5 incorporated. Is that correct?

6 MR. MANOLY: Close.

7 MR. RICHARDSON: Would you define it
8 more accurately then, please?

9 MR. MANOLY: Cold pull is when you
10 weld a piping in addition to a pre-prescribed amount
11 that is already accounted for in the design. The
12 design will always allow for a certain amount of
13 closure, offset due to closure of piping. The amount
14 is prescribed depending on the length of the piping
15 from the fixed end, and if you exceed that, that is a
16 cold pull. That only happens during the closure
17 weld, the very final weld on the system. When you
18 are talking about the piping that you are referring
19 to in the condenser, that's a free ended pipe. By
20 definition it has no closure weld.

21 MR. RICHARDSON: It is welded to the
22 condenser shell. Is that correct?

23 MR. MANOLY: The other end is free.

24 MR. CERNE: An inspection was made of

1 that, and it is free ended on one end.

2 MR. RICHARDSON: Which end?

3 MR. CERNE: The down end.

4 MR. MANOLY: The down end is free.

5 MR. RICHARDSON: We are accepting the
6 expansion joint which is attached as a fixed point.
7 Is that correct?

8 MR. MANOLY: It's only welded at one
9 point.

10 MS. TRACY: Here we have a map.

11 MR. GRAY: First, is that the piping
12 that you are talking about?

13 MR. RICHARDSON: Yes, it is.

14 MR. GRAY: That piping is not welded
15 from the end of the condenser wall.

16 MR. RICHARDSON: What's the attachment
17 here?

18 MR. GRAY: That's a pipe support.

19 MR. RICHARDSON: Let me explain to you
20 the situation I saw. This pipe was installed at the
21 upper end. The people who were getting it into place
22 had a chainfall attached to it --

23 MR. DURR: Let me ask you a question
24 -- let me make a statement, more appropriately, I

1 think. You understand that piping is normally put in
2 place using comealongs and chainfalls.

3 MR. RICHARDSON: Yes.

4 MR. DURR: So you are aware, just
5 because there's a comealong or a chainfall on a pipe
6 does not constitute cold pull because some of these
7 spools are very very heavy and they have to have some
8 mechanism to move them into place.

9 MR. RICHARDSON: I wouldn't try to
10 pick up most of them. I agree.

11 MR. DURR: Just because there's a
12 chainfall on there doesn't necessarily constitute cold
13 pulling.

14 MR. RICHARDSON: Let me continue. What
15 the crew was trying to do, what they were discussing
16 was, they were pulling on the chainfall, and the
17 blocking was somewhere over my head and I could hear
18 it cracking, and they were talking about not being
19 able to bring this end of the pipe into its required
20 location. This end was already attached. They were
21 putting a considerable amount of stress on the pipe
22 to bring it up to the location they wanted to and --

23 MR. CERNE: That's not cold pulling.

24 MR. GREENSTEIN: What's the

1 terminology then?

2 MR. RUSCITTO: Cold pull is, you take
3 a pipe and you bend it, and then when you weld it,
4 that induces stresses in this weld, not the one at
5 the pivot. There was never a weld at the end. So it
6 couldn't have been a cold pull.

7 MR. RICHARDSON: I'm not concerned
8 about the pivot.

9 MR. CERNE: You don't have a weld at
10 both ends.

11 MR. RICHARDSON: Okay. Not at both
12 ends, but you have a weld toward that end of the
13 pipe.

14 MR. DURR: The other thing you have to
15 understand is that here again, we went far beyond our
16 normal scope of inspection. The condenser itself is
17 not safety related. The rules and procedures that
18 the NRC imposes on the licensee are not in effect in
19 this particular case because that entire condenser is
20 not safety related, nor is the piping that is
21 attached to it, nor are any of those things that are
22 around it. Even the turbine is not safety related.
23 So you have to understand that, yes, you may have
24 seen cold pull. However, we went out and looked at

1 it, and we feel very strongly from a professional
2 that cold pull in this particular case probably did
3 not exist. Now, maybe it does. That's a moot
4 point.

5 The other thing is that it's open on
6 one end. It's not a closure weld. It doesn't fit
7 the definition of cold pulling. It's non-safety
8 related. It's beyond the NRC's purview to even look
9 at that piping. However, we did, just to satisfy
10 ourselves that there wasn't some other underlying
11 issue going on here that we needed to be aware of.
12 From the NRC's point of view, yes, we are interested
13 in did the licensee control cold pulling, and we
14 looked at that issue. We, the NRC, looked at that
15 issue a long time ago, independent of the
16 allegation. In this particular instance we went back
17 one more time in a non-safety related area beyond the
18 NRC's purview, and we looked at that specific one
19 trying to be responsive to the public's concerns.

20 MS. TRACY: That was very good of
21 you.

22 MR. DURR: We have found that there is
23 no problem there. So I don't know where we are going
24 to go with this discussion. As far as the NRC is

1 concerned it's over with. There's nothing there.

2 MR. RICHARDSON: Can I get one more
3 clarification from you?

4 MR. DURR: Certainly.

5 MR. RICHARDSON: As far as cold pull
6 then, your specific concern is with the integrity of
7 the closure weld, in that if the weld deteriorates,
8 you're going to be opening the pipe?

9 MR. RUSCITTO: No. You're welding the
10 pipe that's under stress, so that stresses induced in
11 that weld exceed the stresses that are allowed for in
12 the design of the weld.

13 MR. RICHARDSON: You're not concerned
14 specifically with the stresses in that weld because
15 it's --

16 MR. MANOLY: Once you have a weld it
17 becomes like the pipe. It's really part of the pipe.
18 Once the weld is finished, it's like part of the
19 pipe.

20 MR. RICHARDSON: Your concern is for
21 the integrity of the pipe itself, rather than the
22 integrity, say, of any attaching welds.

23 MR. MANOLY: Yes. When the 2 ends of
24 the pipe are welded together, it becomes one part.

1 MR. RICHARDSON: A closure weld, and
2 in this case a weld fixing one end of the pipe to a
3 support.

4 MR. MANOLY: No. Supports are
5 different. Don't mix up supports with piping.

6 MR. RICHARDSON: It's a support
7 regardless.

8 MR. MANOLY: No, it's not. When a
9 pipe is welded at a support, that's an anchor.
10 That's a different story. We're talking about closure
11 welds which is 2 ends of a pipe welded together to
12 make a continuous system. The concern would be if I
13 moved the 2 ends. They are like this, and I push them
14 towards each other. I will overstress the piping.
15 If the other end of that piping is closed at anchor
16 point, which is a support, then I'll be going beyond
17 the code limit for the design.

18 MR. RICHARDSON: So your concern for
19 the stress then, are you specifically concerned with
20 stress at that weld, or the stress induced by moving
21 that pipe in any other place?

22 MR. RUSCITTO: That is part of the
23 as-built.

24 MR. RICHARDSON: Are you concerned

1 specifically with the weld, or with stresses induced
2 in the length of the pipe?

3 MR. MANOLY: The weld becomes part of
4 the pipe. It's a continuous system. Then you would
5 want to see the other points on the line where the
6 stress rise would be, as pushing the 2 ends of the
7 pipe to each other.

8 MR. RICHARDSON: So your concern then
9 is primarily with the pipe having wound up in a
10 location it's not supposed to be.

11 MR. DURR: We are concerned about the
12 stresses in the piping system.

13 MR. MANOLY: It will change at every
14 point in the pipe. The highest change would be at
15 the anchor end.

16 MR. DURR: Those are limited by the
17 ASME Piping Code that limits the amount of stress
18 that you can have in that piping, and this
19 contributes to it.

20 MR. RICHARDSON: So if the piping is
21 forced into a position and held in that position by
22 other than a closure weld, say, for example, by a
23 support, is that still considered a case of cold
24 pull?

1 MR. MANOLY: No. That is a different
2 situation.

3 MR. RICHARDSON: Is that a matter for
4 concern?

5 MR. MANOLY: If the support is
6 installed in a location other than its design
7 location, that's part of the as-built program.
8 That's a different program.

9 MR. RICHARDSON: If the pipe is forced
10 into a position other than what it would naturally
11 lie if one end is fixed, is the fact that that pipe
12 has been forced into a different position, and if it
13 is fixed in that position, is that a matter for
14 concern in and of itself? Or is it only a matter for
15 concern if there is a closure weld connecting it at
16 both ends through further piping? Are we concerned
17 with the fact that the pipe is closure welded, or are
18 we concerned with the fact that the pipe may or may
19 not be stressed by nature of its position?

20 MR. MANOLY: You can only induce a
21 stress in a pipe if one of the ends is restrained.
22 If the pipe is free, then you are not inducing stress
23 in it.

24 MR. RICHARDSON: That's the point I'm

1 trying to get to with the condenser piping. It's not
2 a closure weld at the open end of it. We agree that
3 it dumps into the condenser, but it is fixed in
4 location at that end by whatever the item is that's
5 shown on that drawing tying into it. Is that
6 correct?

7 MR. GRAY: Pipe support, yes.

8 MR. RICHARDSON: It is fixed in that
9 location?

10 MR. GRAY: No, it is not fixed. It is
11 supported at that location.

12 MS. TRACY: So it can move.

13 MR. MANOLY: Stress can only be -- the
14 kind you are talking about here would be caused by a
15 seismic restraint or an anchor. A dead-weight
16 support is not going to stress a piping, if you move
17 a dead-weight support.

18 MR. RICHARDSON: And that's a dead-
19 weight support?

20 MR. DURR: I suspect very strongly
21 that's not seismically qualified pipe.

22 MR. GRAY: Could I summarize where we
23 are on this one from my point of view?

24 MS. TRACY: Yes.

1 MR. GRAY: Doug had a concern with
2 potential cold pulling on the stage 13 piping. We
3 went to the field. We reviewed the drawings
4 applicable to that. We went into the condenser. We
5 looked at the piping. We saw how it was in place at
6 this point in time, and we asked ourselves whether or
7 not that it's possible that there could be
8 significant cold pulling of this piping.

9 Our conclusion was that there is not
10 a significant cold pulling on this pipe. Therefore,
11 your allegation is not substantiated. You may have
12 seen them pulling the pipe, forcing the pipe, but at
13 this point it really has no bearing on the as-
14 constructed condition.

15 MR. RICHARDSON: Why is that?

16 MR. RUSCITTO: Even if it was safety
17 related, it would not have an impact on the design.
18 By virtue of its physical design, what you saw could
19 not have induced abnormal stresses on it because of
20 the method that it's fixed.

21 MR. KAUCHER: Abnormal residual
22 stresses.

23 MR. RICHARDSON: Why could it not
24 have, if you've got it fixed at the turbine exhaust

1 and you've got it fixed at the dead-weight support?

2 MR. MANOLY: Because dead-weight
3 supports do not restrain the rotation of piping.

4 MR. CERNE: You don't know what a
5 support does. There are different types of supports.
6 Some do not totally restrain the pipe from moving.
7 There are different types of supports.

8 MR. DURR: They are flexible.

9 MR. RICHARDSON: If this is the case,
10 then the cold pulling question is moot because the
11 pipe support will permit movement in the pipe?

12 MR. CERNE: Exactly.

13 MR. RICHARDSON: Okay. I wish it had
14 been better explained.

15 MR. CERNE: I think that's the point
16 Jacque made to begin with. The point of looking at
17 an allegation is to satisfy the experts, the NRC, and
18 the public that there is no concern. Harold did that
19 when he wrote the report. What we just spent a half
20 hour doing is trying to re-educate you as to how this
21 system is designed and is supposed to work.

22 MR. RICHARDSON: To me, that's a very
23 desirable thing, and I appreciate it when you would
24 take the time to do that.

1 MR. CERNE: I don't think we have the
2 luxury of time to do that, particularly with this
3 amount of effort.

4 MR. DURR: We obviously want to do
5 this. We want to make everybody comfortable. We
6 can't do it with everybody. It's physically
7 impossible to take everybody in the New England area
8 and re-educate them, so to speak.

9 What you have to believe is that
10 there are experts who are highly qualified going out
11 and looking at these things, taking what you are
12 saying seriously. When it comes to allegations, we
13 take them very seriously. We process them through a
14 panel. They are looked at. We select experts in the
15 area to go out and resolve them, and then the panel
16 of upper management looks at what the resolution was,
17 and agrees that's acceptable or unacceptable, whether
18 we need more or less. So it's not just any one
19 individual taking what you've said and going out and
20 sweeping it under the rug, so to speak, but it's a
21 body of people looking at these things and taking
22 each one seriously because we don't know where the
23 big one really is.

24 MS. TRACY: And neither do we, Jacques.

1 MR. DURR: Some of them are
2 innocuous. I understand that.

3 MS. TRACY: Yes. That's why if
4 perhaps your explanations to some of the allegations
5 that have been raised don't entirely satisfy the
6 people who raised the allegations, that's why we come
7 back and talk to you some more about it. I do
8 appreciate the fact that, as Tony said, you're taking
9 time out to explain it in some detail.

10 MR. DURR: Some of these are very very
11 knotty technical problems.

12 MS. TRACY: I know they are.

13 MR. DURR: The fact is, in one or two
14 cases we've gone out and gotten consultants to come
15 in and look at these issues because we felt that we
16 needed just a little bit more depth than what we had
17 available on our staff. So you have to understand
18 that we're taking these very seriously, spending a
19 tremendous amount of time trying to resolve them.

20 MS. TRACY: Definitely I understand
21 that. I think we all do.

22 MR. DURR: Good.

23 Moving right along to 2.2.

24 MS. TRACY: I would say that this

1 issue having to do with the CBA drawings also falls
2 under some of the programmatic concerns that I
3 raised. However, there is some specifics here that I
4 think Doug can probably speak to, having to do with
5 the fact that there were no construction drawings for
6 specific pipes in the CBA system.

7 MR. DURR: Suresh Chaudhary, who
8 followed this one, he's out. He's not well.

9 What's your specific concern here?

10 MR. RICHARDSON: First off, you've got
11 a fair amount of electrical equipment, the operating
12 equipment in the area in the diesel generator
13 building where the air conditioning for the control
14 room is. There is no isolation between the trains
15 for that system as far as physical barrier for fire
16 protection.

17 MR. DURR: I think we've got 2
18 different issues going.

19 MS. TRACY: Let's stick to this one
20 right now; that there were no design drawings.

21 MR. RICHARDSON: You mentioned in one
22 of your reports that construction drawings were
23 issued.

24 MR. DURR: Yes.

1 MR. RICHARDSON: I did the as-builts
2 for the smaller refrigerant lines on the CBA system.
3 I don't recall the unit numbers, but the lines were
4 1/2 and 3/4 diameter, I believe. There were no
5 installation drawings that were done before those.
6 The ones I did were it.

7 MR. DURR: I'm going to operate from
8 my memory, but when we originally looked at that
9 issue, I thought we found that there were drawings
10 issued in 1978 --

11 MR. MANOLY: Yes.

12 MR. DURR: -- on that system that
13 showed that there was an original set of design
14 drawings. We found drawings dated 1978, I think was
15 the date -- we are going from my memory now -- that
16 were issued back then. You did the as-builts, we
17 understand.

18 MR. RICHARDSON: I did the as-builts
19 on a supplemental train. There might be a
20 difference.

21 MR. DURR: I'm not clear on this. I
22 think this was field run piping; was it not?

23 MR. RICHARDSON: Yes.

24 MR. DURR: There is nothing wrong with

1 field run piping. We do that all the time,
2 especially in small bore piping.

3 You have to understand that when you
4 build a nuclear power plant, they generally very
5 specifically locate the big stuff. The 30-inch
6 piping is planned very specifically where it goes
7 through the building, but where you start getting
8 down into smaller diameter piping, that goes in
9 last. It goes wherever there is space available
10 that's leftover, if you will, after you put the
11 highly critical, large, heavy equipment in. So field
12 run piping, field run cable, there is all kinds of
13 what they call field run. An engineer goes out and
14 says we'll go from A to B because there's no
15 interference there, or we may have to go A, B, C
16 because there is interference and we'll go around
17 it. So they field run it, or it's not "designed"
18 back in the AE's office specific location because you
19 have all of these interferences that you can't
20 account for. So field run piping is common, and
21 there's nothing wrong with it. That's a controlled
22 process.

23 MR. RICHARDSON: That concept, I have
24 no problem with.

1 Specifically with this system, the
2 problem I've got with it is that at the areas where
3 this tubing was run into the air conditioning
4 equipment, at one point they underwent a series of
5 revisions and reinstallations. There were things,
6 like expansion joints were installed incorrectly to
7 vender's specifications. There were supports that
8 didn't adequately keep the pipe in place. In some of
9 these areas it went back and forth over several
10 design revisions.

11 I am concerned that there may not
12 have been adequate control in design process to make
13 sure that it was done right. At one point on one of
14 the units I was told by a fitter who was working on
15 it that the system would not operate as it was
16 designed as he was installing it. I have to assume
17 he knew what he was talking about. He was, I
18 believe, a refrigeration mechanic. He did seem to
19 have a pretty good knowledge of what he should and
20 shouldn't be doing.

21 This year you have lost one unit of
22 one of the supplemental trains. I don't know if it's
23 specifically one of the ones I was working on, or the
24 other one. I was working on one of these supplemental

1 trains. Is there any connection between the loss of
2 that unit and any deficiencies to the design of the
3 refrigerant piping?

4 MR. DURR: Are you familiar with the
5 loss of one of these units?

6 MR. RUSCITTO: Yes. I don't see any
7 connection.

8 MR. DURR: As I say, with field run
9 things you are going to end up with changes and
10 alterations because they may have had to move it, and
11 we don't know for what reasons they moved these
12 things. If something else comes along that is more
13 important than that, they're apt to move that --
14 they're subject to move that piece of equipment
15 several times because something preempts it,
16 something more important preempts it. It's easier to
17 move a small diameter piping than it is to re-route
18 another larger, more critical piece of equipment.

19 MR. RUSCITTO: I don't see the tie
20 that you are making though. Could you be more
21 specific? If you could be more specific, maybe I
22 could address the issue. I assume you're referring
23 to the CBA air conditioning units that sit on either
24 side of the diesel generator building and horizontal

1 fan cooling coils, and the refrigerant lines run down
2 to the cooling coils in the control building to the
3 fan cooling units that cool the control room. That's
4 the safety related system we are talking about.

5 MR. RICHARDSON: Yes. That's
6 generally where I'm talking about. Specifically what
7 I'm concerned with is the smaller supplemental unit.

8 MR. RUSCITTO: The AC5 A and B.

9 MR. RICHARDSON: Yes, I believe so.
10 Specifically with regard to the set that's on the
11 right-hand side as you're facing the diesel generator
12 control building wall, the unit that's on the control
13 building side of that wall, I don't recall the
14 equipment designation, but that particular train, the
15 piping within the last couple of feet going into that
16 unit was revised repeatedly. At one point they did
17 have an expansion joint -- flexible coupling, rather
18 in a vertical position. Whereas the manufacturer's
19 specs called for it to be horizontal. That
20 configuration was changed repeatedly. I lost track
21 how many times. I believe it was least 3. That was
22 the area in which the person I was talking to said at
23 one point that it would not function; that it had
24 been designed incorrectly.

1 Also down at the unit associated with
2 that train on the diesel generator side of the wall I
3 found a support when I was doing as-builts that --
4 I'm using the term support in a generic sense -- but
5 there is a supporting structure that was supposed to
6 hold that tubing in place that had no provision for
7 any horizontal restraint, where you could take the
8 pipe and flick it, and it would move several inches
9 back and forth like this (indicating).

10 MR. RUSCITTO: It's not an uncommon
11 design.

12 MR. RICHARDSON: No, but I called it
13 to the attention of, I believe, a field engineer, and
14 it was later modified. It was my understanding that
15 these things are supposed to be QC accepted before
16 they go to as-built; is that correct?

17 MR. DURR: No. QC takes the as-built
18 drawings usually and walks them down. That's the
19 last thing that happens. What usually QC uses for
20 their final acceptance is the as-builts.

21 MR. RICHARDSON: It is certified
22 complete and turned over to as-builders then.

23 MR. CERNE: The Pullman process for
24 piping was a 2-part process. They had a form 10 A or

1 B.

2 MR. RICHARDSON: This is at the time I
3 was working for Pullman, if that helps clarify your
4 question.

5 MR. CERNE: What you did was, you had
6 a QC process which was going on, and also an
7 as-building process that was going on. Normally the
8 QC process would be completed before the as-building
9 process, to answer your question.

10 MR. RICHARDSON: So how did that
11 support get by? How come nobody else flicked it to
12 see if it moved?

13 MR. RUSCITTO: The support design has
14 several facets. One of them includes seismic design.

15 MR. RICHARDSON: Is that system
16 seismically supported?

17 MR. RUSCITTO: Yes. One is seismic.
18 Then there are other supports that may be added once
19 the system is placed in operation due to vibration.
20 These are supports that are not accounted for in the
21 seismic design because you can only find out where
22 the piping vibrates once it's in operation.

23 As a matter of fact, we've had
24 concerns that you may have read in our reports about

1 other areas where we went out and saw equipment
2 vibrating and talked to the licensee, and they said
3 yes, by seismic design it's not required, but it
4 appears to be a good idea to put these additional
5 supports in, and they do that over the life of the
6 plant.

7 Not knowing the specific support, I
8 can't address the specific support, but that could
9 very well be a normal process of someone going out
10 and saying hey, it looks like maybe we could put this
11 in now. They want to be conservative. Throw in
12 another support here. In the final design the
13 as-built reconciliation and the stress reconciliation
14 will make sure that there's no undue stresses
15 applied.

16 MR. CERNE: So what you're implying is
17 that you're talking to the engineer or somebody about
18 this. It was contrary to design. The QC inspector
19 checks if it's in accordance with design. If you
20 asked the question that caused the individual to look
21 at it and change it, we don't know the rationale
22 behind that.

23 MR. RICHARDSON: That basically was
24 what happened. I pointed out that that tubing could

1 be moved easily, and the support was modified to hold
2 it in place horizontally. My original question was,
3 how come that had been allowed to happen in the first
4 place.

5 Concerning the seismic qualification
6 of the supports, at the time we were doing as-builts
7 on that system we had no information that indicated
8 they were supposed to be seismically designed.

9 MR. RUSCITTO: When was that?

10 MR. MANOLY: What year?

11 MR. RICHARDSON: Summer of '82.

12 MR. DURR: I don't understand. You
13 were doing as-built drawings?

14 MR. RICHARDSON: That's correct.

15 MR. RUSCITTO: Supports or piping?

16 MR. RICHARDSON: Piping. We had to
17 indicate locations of supports, of course.

18 MR. RUSCITTO: Why --

19 MR. RICHARDSON: When I was doing the
20 as-building, I was also generating construction
21 isometrics to support that line.

22 MR. DURR: I understand.

23 MR. RICHARDSON: As part of that
24 process we had to enter building materials, come

1 other items, and also support classification. I gave
2 you a copy of a couple of the as-built drawings I did
3 from that.

4 MR. DURR: Yes. I understand.

5 MR. RICHARDSON: If you recall --

6 MR. DURR: But you were working for
7 engineering then, and you were generating drawings
8 that would later go to engineering and be further
9 processed; is that correct?

10 MR. RICHARDSON: I was generating the
11 drawings, as I did the as-builts. I was doing both.

12 MR. DURR: I understand that, but
13 those drawings were further processed by engineering.

14 MR. RICHARDSON: During the course of
15 putting those drawings together we were required to
16 indicate the -- I guess you would call it the class
17 requirements and the supports.

18 MR. RUSCITTO: How would you know
19 that?

20 MR. RICHARDSON: I was told to.

21 MR. RUSCITTO: How would know what the
22 class of support was?

23 MR. RICHARDSON: I asked my
24 supervisor, and he looked it up, and --

1 MR. DURR: He had the information.

2 MR. RICHARDSON: He gave it to me as
3 non-nuclear, non-seismic, non-safety related.

4 MR. DURR: So he made a mistake. Is
5 that what you're saying?

6 MR. RICHARDSON: I am saying his
7 information was bad. He probably got it right
8 according to the book.

9 MR. DURR: This sounds like a new
10 allegation to me.

11 MR. RICHARDSON: I discussed it with
12 you in April. That's why I gave you the copy of that
13 drawing.

14 MR. DURR: But you never said anything
15 about not knowing the seismic qualification of the
16 piping system, and having it denoted, and that your
17 supervisor had bad information. I will go back to
18 the transcripts, but I'm almost sure that's not in
19 there. I don't remember any of that.

20 MS. TRACY: Perhaps it didn't get
21 stated exactly that way.

22 MR. CERNE: Let's clarify where we're
23 at now. Are you saying that those things are
24 non-nuclear-safety, non-seismic right now, or just

1 that in the process of information between you and
2 your supervisor at one point you thought they were
3 non-seismic, but they really were seismic?

4 MR. RICHARDSON: I don't know whether
5 they are right now or not. One of the reports that
6 you people did says that they are. I believe it was
7 the first one. I was surprised by that because the
8 drawings I had from that period indicated that they
9 were not. That's why I brought the drawings down to
10 the meeting in April, and that's why I called it to
11 your attention.

12 MR. CERNE: So what's the current
13 problem?

14 MR. RICHARDSON: It comes under the
15 heading of design control. We had apparently a
16 number of --

17 MR. CERNE: Are you a designer?

18 MR. RICHARDSON: No.

19 MR. CERNE: Was your supervisor a
20 designer?

21 MR. RICHARDSON: No. But why did we
22 have bad information?

23 MR. DURR: I'm not sure we've
24 established yet that you had bad information. You

1 suspect that your supervisor had bad information.

2 MR. CERNE: It's quite possible that
3 at one point they were non-seismic, and they got
4 changed to seismic.

5 MR. RICHARDSON: I've considered that
6 possibility.

7 MR. CERNE: What are we chasing at
8 here that's wrong with the plant as-built?

9 MR. DURR: Today. What's our
10 problem?

11 MR. CERNE: That's what we're after,
12 is the plant going to operate as designed.

13 MR. RICHARDSON: My question would be,
14 if these supports were originally designed to
15 non-seismic quality specifications, if they were, has
16 the situation been corrected.

17 MR. CERNE: Our documents say it is
18 seismic.

19 MR. RICHARDSON: Your report says it
20 is.

21 MR. CERNE: And you have information
22 that is different?

23 MR. RICHARDSON: At the time we were
24 as-building them, the information we had said that

1 they weren't. If that information was also what the
2 construction people had, then how can we be sure that
3 they were, in fact, seismically qualified designed
4 and built?

5 MR. RUSCITTO: So really your question
6 is that the CBA system as presently designed should
7 be seismic, but may not be constructed that way. Am
8 I paraphrasing you correctly?

9 MR. RICHARDSON: I believe that would
10 be a close approximation.

11 MR. RUSCITTO: So then we can answer
12 the question that we've either looked at that, or we
13 haven't. We may not have looked at it, if you've
14 never raised that as an issue.

15 MR. RICHARDSON: I thought I had
16 raised that in April. That's why I brought in copies
17 of those drawings.

18 MS. TRACY: Could I ask a question?

19 MR. RICHARDSON: I assume it was
20 supposed to be seismic, and the information we had
21 indicated that it wasn't. And if that information
22 had also gone to the construction people, then is
23 there assurance that it was, in fact, constructed to
24 seismic standards.

1 MS. TRACY: When you check a system,
2 when you say you can check whether or not this is
3 seismically built, do you go and look at the
4 documents, or do you go and look at the actual system
5 itself?

6 MR. RUSCITTO: It depends on what you
7 want to find out.

8 MR. CERNE: What often happens, and we
9 found this in our own inspections, that you can't
10 always tell from the isometric drawings how the
11 supports are designed. You have to go to the
12 specific support drawings because sometimes there are
13 detailing errors in the isometrics which might draw
14 the class break of a non-nuclear safety versus an
15 ASME line in the wrong place, and yet when you say
16 there's an error here and you go into the non-nuclear
17 safety and go to the specific support drawing, you
18 find it's an ASME support designed and built support.

19 MS. TRACY: So after you go to that
20 support drawing and it says it's ASME and seismically
21 proper and so forth, do you ever go and look at the
22 actual thing?

23 MR. RUSCITTO: Oh, yes.

24 MS. TRACY: To make sure that it

1 matches up with the drawings that you're looking at?

2 MR. RUSCITTO: Yes. As a matter of
3 fact, that's part of one of the things our NDE van
4 examination does, which came out to the cite on
5 several occasions, and I've accompanied them. They
6 go around with specific pipe support drawings and
7 evaluate the quality of the welds, the thickness of
8 the welds.

9 MR. RICHARDSON: Where did we say that
10 it was seismically qualified?

11 MR. RICHARDSON: I believe it was in
12 86-52.

13 MR. DURR: Number 54.

14 MR. CERNE: There is another gate
15 there that you meet. If you're non-nuclear safety,
16 non-seismic, it doesn't require QC/QA. If it's
17 either ASME, which is your safety grade of piping, or
18 non-nuclear safety, but it has seismic design because
19 it possibly could affect something safety related, QC
20 is applied to that.

21 So not only are we looking over the
22 shoulder of how it's built, we're also looking over
23 whether the QC process worked, in looking over the
24 shoulder of the people who decide that.

1 MS. TRACY: Do you look to make sure
2 that the QC is used appropriately as well?

3 MR. CERNE: It would only evidence
4 itself if there was something wrong. If you don't
5 find anything wrong with the way it's built, then the
6 QC process worked because that's the intent of the QC
7 process. The QC is not an entity in itself. QC is a
8 means of assuring that the plant is built correctly.
9 If the plant is built correctly, then QC worked.

10 MS. TRACY: However, if QC did not
11 work, you won't be able to know either that, or
12 whether the plant was built properly. If there is a
13 failure of QC, you won't know that there was a
14 failure of QC because there is nothing to "QC" QC,
15 except you guys.

16 MR. CERNE: That's not correct.
17 There's levels of QC. There's QC inspection, QC
18 surveillance, QA, audit. That's all part of the
19 defense in depth of the QC process. They call us the
20 fourth level of inspection, looking over the
21 shoulder. We do a sampling process, but when we do a
22 sample of different areas and can't find anything
23 wrong in the final construction, that gives us our
24 assurance that their QC process is working. That's

1 the way the system works.

2 MR. RUSCITTO: If you have a question
3 now that the CBA system may or may not be installed
4 properly, if it hasn't been addressed before, you can
5 either raise it as a new allegation, or a concern
6 which is not an allegation.

7 MR. RICHARDSON: What exactly is the
8 difference between the two?

9 MR. RUSCITTO: Because an allegation
10 says that you believe that there is something wrong.

11 MR. DURR: The process.

12 MR. RUSCITTO: A concern or question
13 says, hey, I'm a concerned citizen. I don't know if
14 there's anything wrong, but I don't understand.
15 Would you mind explaining it to me? If you have a
16 concern, we can say that we'll do our best to explain
17 it to you. We don't have any obligation to do it, if
18 we have other constraints.

19 MR. CERNE: It may sound like
20 semantics to you, but an allegation is a statement of
21 wrongdoing. I know that is wrong; not I suspect
22 something is wrong, and would you please, the NRC, go
23 look at it for me.

24 MR. MANOLY: The pump support, that

1 was a concern, and we looked at it because we were
2 interested in it.

3 MS. TRACY: You treated it as an
4 allegation.

5 MR. MANOLY: I did whatever I thought
6 I needed to do to assure myself that it was not a
7 concern.

8 MR. RUSCITTO: A concern is a basis
9 for inspection. Concerns by everyday people in the
10 plant, concerns by citizens can often lead us in an
11 area where inspection can give us valuable insights
12 into the quality. In some cases the concerns that
13 you guys generated caused us to do inspection over
14 and above what would be required because of an
15 allegation because we wanted to insure ourselves that
16 there was no problem. Regardless of whether the
17 allegation was justified, we go off on tangents.

18 MR. DURR: I think there was a point
19 made that needs to be emphasized, and that is that an
20 allegation is an individual who has first-hand
21 knowledge that something is wrong, and presents that
22 to us in that form. I know something is wrong, and
23 therefore, you need to look at point B. That's an
24 allegation.

1 The things that you're talking about
2 here today are really concerns. You're saying I
3 think this, or I suspect that, or I'm not sure about
4 this. That's not an allegation. That's just a
5 question on your part because you don't understand
6 the process; that you haven't been privy to the whole
7 picture. We're trying to respond to some of those
8 things, but those are not "allegations".

9 But if you look me in the eye and
10 said, my supervisor had bad information, and he got
11 it out of this book, that's an allegation, and I can
12 do something with that.

13 MS. TRACY: Do you want to on this
14 particular thing?

15 MR. DURR: Is he making an
16 allegation? Because if he is, we will treat that
17 accordingly.

18 MS. TRACY: Do you want to make that
19 an allegation?

20 MR. DURR: Do you have first-hand
21 knowledge that there is wrongdoing there?

22 MR. RICHARDSON: No. What I do have
23 is first-hand knowledge that I was told that the
24 system --

1 MR. DURR: You have a question.

2 MR. RUSCITTO: You being told the
3 incorrect information may not have any effect on the
4 safety of the nuclear power plant.

5 MR. CERNE: If there was incorrect
6 information and if it wasn't changed subsequent to
7 that.

8 MR. RICHARDSON: Stated as a concern,
9 I would say that I am concerned that the correct
10 information may not have been applied when the plant
11 was built.

12 As an allegation, what I would say is
13 that I was given information concerning the seismic
14 requirements for that system that does not match your
15 statement that it is seismic as reported. I gave you
16 copies of drawings at the April meeting. I don't
17 have them with me now.

18 MR. TRACY: Do you still have those?

19 MR. DURR: I don't know. I've got 2
20 boxes full of things. But once we write an
21 inspection report we throw all that stuff away.

22 MR. RICHARDSON: Okay. I can send you
23 new copies.

24 MR. DURR: Send us new copies, and

1 we'll do something with it. Once we get those copies
2 and it's clear to us that there's a discrepancy,
3 we'll take some kind of further action with it. If
4 those drawings support your statement -- if they say
5 -- what you're essentially is, your drawings
6 essentially say non-seismic?

7 MR. RICHARDSON: Non-seismic,
8 non-nuclear, non-safety. Those are the drawings I
9 gave you in April. The reason I gave you them --

10 MR. DURR: And you're sure that they
11 were part of the air handling system that is supposed
12 to be safety related.

13 MR. RICHARDSON: That, I don't know.
14 You have to tell me what part of it is supposed to be
15 safety related. I can tell you what part they are.

16 MR. DURR: We'll take your drawings
17 and we'll decide if we have an allegation. We may
18 not have an allegation.

19 MR. RICHARDSON: That was the small
20 bore, 1/2 and 3/4 inch refrigerant lines in the
21 supplemental --

22 MR. DURR: When are you going to send
23 those to us, Doug?

24 MR. RICHARDSON: I'll be able to send

1 them to you sometime this week.

2 MR. DURR: All right.

3 MR. RICHARDSON: Can you give me a
4 mailing address?

5 MS. TRACY: I've got it.

6 MR. CERNE: They list the supports as
7 NNS.

8 MR. RICHARDSON: I don't recall
9 exactly what they're listed as. They were a very
10 unspecified thing at the time.

11 MR. CERNE: I am unclear then what
12 makes it non-seismic, non-safety, if it's not in
13 writing.

14 MR. RICHARDSON: I wish I had a copy
15 of them with me. There was space on the drawing title
16 blocks that was used to designate the type of support
17 requirement that the system was built to use. There
18 were 3 or 4 categories that would be applied as
19 appropriate, and this one, I was told, was to be
20 designated as non-nuclear, non-seismic, non-safety.

21 MR. DURR: But that's written right on
22 the drawing?

23 MR. RICHARDSON: Yes, it is. The
24 majority of those drawings I have are designated as

1 partial as-builts. I believe a few are 100 percent
2 as-builts. Even the partial ones did reflect the
3 information that they had available at the time. The
4 reason I'm concerned is that that information
5 apparently is in conflict with what you say in 86-52.

6 MR. DURR: We will take this under
7 advisement as a concern now. Once we receive the
8 drawings and we determine that there is a
9 discrepancy, we may change this thing to an
10 allegation.

11 MS. TRACY: He doesn't have the
12 drawings with him.

13 MS. DURR: He doesn't sound too
14 positive at this moment that there is a problem.

15 MR. TRACY: It's too bad you tossed
16 the other ones he gave you or we would have them
17 right here.

18 MR. DURR: I didn't say I tossed them.
19 I said that I usually throw all those things away. I
20 don't know whether I still have them or not.

21 MR. RICHARDSON: I can tell you as an
22 absolute that I was told to --

23 MR. TRACY: Let's move on.

24 MR. DURR: On 2.3, what's your

1 concern?

2 MS. TRACY: My feeling is that we can
3 entirely skip 2.3 since it's simply a refutation of
4 what you all said, and it has nothing to do with the
5 safety of the plant. It has to do with Doug
6 Richardson's qualifications to talk about what he's
7 been talking about.

8 So let's go on to 2.4.

9 MR. RICHARDSON: I would like to
10 discuss a couple of things.

11 MS. TRACY: How about if we skip it
12 for now because our time -- Mike has to leave soon,
13 and I'd rather deal with some of the more meaty
14 issues.

15 MR. RICHARDSON: Your evaluation in
16 2.3 here does not match --

17 MR. DURR: 2.3? I thought we skipped
18 that.

19 MR. RICHARDSON: I would just like to
20 note that it does not match the discussion of the
21 UE&C as-built program in the 8407 report.

22 MS. TRACY: Which we mentioned in
23 here.

24 MR. CERNE: In terms of --

1 MR. RICHARDSON: As-builders having
2 responsibility as to qualifications.

3 MR. CERNE: They have to be qualified,
4 but not as inspectors.

5 MR. RICHARDSON: I was qualified level
6 2R.

7 MR. DURR: That doesn't mean you had
8 to be. That just means you were.

9 MR. RICHARDSON: I was required --

10 MR. CERNE: But that doesn't mean you
11 were an inspector. All QC inspectors were qualified
12 ANSI N45.2.6. As-builders were qualified to other
13 criteria which may have included some of the criteria
14 used to qualify QC people, but that doesn't mean that
15 you were an inspector because an inspector is making
16 judgments based on the criteria and training. You
17 were documenting things and not making those
18 judgments.

19 MR. RICHARDSON: We were responsible
20 for identifying non-conformance as well.

21 MR. CERNE: Everybody in the plant
22 was.

23 MS. TRACY: Excuse me. I would really
24 rather not deal with this particular issue.

1 MR. DURR: Fine. 2.4, here we go.

2 MS. TRACY: -- as to who was or was
3 not qualified to do what or what not.

4 MR. CERNE: What is the status of that
5 though?

6 MR. RICHARDSON: We would like to
7 discuss it later, if there is time.

8 MS. TRACY: Why don't we leave those
9 for discussion later, if there is time.

10 MS. GENTLEMAN: May I ask one question
11 on our prior discussion?

12 MR. DURR: Certainly.

13 MS. GENTLEMAN: Regarding the comment
14 that where a plant meets seismic qualifications for
15 the piping system and satisfies seismic criteria
16 as-built, but later on when it operates as you
17 mentioned vibrations appear, you indicated that you
18 could ask the licensee to add a support to deal with
19 the vibration that shows up during operation. Is
20 that correct?

21 MR. RUSCITTO: I would say we would
22 ask the licensee to do an evaluation whether a
23 support was required based on a visual observation
24 vibration. You can't really stand there and watch a

1 pipe vibrate and determine whether it's an adequate
2 vibration or not because different piping systems
3 have vibration specs. From a professional point of
4 view, you can have a good feel for whether a
5 vibration is excessive. They may go down there and
6 measure it, and even though it looks excessive, if
7 it's within the scope of the code that's applicable,
8 it may not be required. But in some cases, yes, it
9 may be.

10 MS. GENTLEMAN: If their report or
11 study indicates that a support is needed, does the
12 NRC have the authority to order a support added?

13 MR. CERNE: The determination of
14 whether it's needed is based on engineering analysis
15 which we may spot-check. We're not making them put
16 in the support. Part of the testing program, they
17 instrument all the piping and take vibration
18 measurements. If they design something and they say
19 this is an anomaly, it's not acting exactly, if
20 something is not acting exactly the way it was
21 designed for whatever reason, their testing and the
22 instrumentation tells them that it's beyond spec in
23 vibration, they would then analyze that and determine
24 whether, even though it's beyond criteria, it's still

1 acceptable for some other reason, or no, we're going
2 to address it by putting something into it to fix
3 it.

4 MS. GENTLEMAN: Let's suppose the
5 answer is the second; that it needs to be addressed.

6 MR. CERNE: They determine that.

7 MS. GENTLEMAN: The licensee
8 determines that it needs to be addressed. What if
9 the licensee determines that it needs to be
10 addressed, but it cannot address it?

11 MR. DURR: Cannot, or will not?

12 MS. GENTLEMAN: Let's say cannot for
13 financial reasons.

14 MR. DURR: We've never run into that
15 case. That's a case that I am afraid we have never
16 had to deal with, where a licensee was financially
17 incapable of dealing with a need. We have never run
18 across that, not in my experience. I don't know if
19 anybody else on staff has.

20 MR. CERNE: Once they generate a piece
21 of paper to identify the problem for resolution, it
22 has to get resolved. There is no way of saying well,
23 we'll just leave this thing hanging out there. It
24 has to be resolved. If we disagree, if we in our

1 review disagree with their resolution, there's
2 mechanisms for the NRC to take action, including
3 orders to make them do things. But like Jacque said,
4 we've never reached that point.

5 MS. GENTLEMAN: Okay.

6 MR. DURR: 2.4?

7 MS. TRACY: I think 2.4 raises a
8 number of questions. This deals with the apparently
9 irreparable cracks leaking groundwater in a variety
10 of buildings. 2.4.3.1 talks about the containment
11 itself where there was no water seepage seen,
12 although there are cracks in the containment concrete
13 which you have said are to be expected, and I believe
14 in the past you have told me that you go out and map
15 them and so forth.

16 I guess the question we raised in
17 this particular part was, if there's a steel liner
18 inside the containment wall, how would you be able to
19 see if there was seepage within the containment wall
20 because it wouldn't seep through the steel liner.

21 MR. DURR: What you have to understand
22 is, there are multiple structures throughout the
23 United States and the world in water. They are built
24 in water. A good example is a dam. It's built in

1 water. All concrete is porous and water permeates
2 through. So concrete and water is not bad. We
3 recognize that. The world knows that.

4 If I have a concrete structure and
5 it's in water, but there is no flow, so now I have a
6 steel liner on one side and I've got water coming in,
7 but it can't go anywhere, and I have no flow, that's
8 not bad. Once you establish the basic environment it
9 protects the steel. There is no corrosion of the
10 reinforcing steel. It's not detrimental to the
11 concrete structure. Ergo, it's not a problem.

12 MS. TRACY: How is it that you know
13 that there is no corrosion of the reinforcement
14 steel?

15 MR. DURR: Because the environment
16 created by concrete itself protects the reinforcing
17 steel. The chemistry of concrete itself creates a
18 very basic pH.

19 MS. TRACY: Literally.

20 MR. DURR: Literally. And we know
21 that that protects the steel in a watery environment.

22 MS. TRACY: Therefore, it's only when
23 that base material leaches out, that you reach a
24 point.

1 MR. DURR: Yes.

2 MS. TRACY: What you're saying is that
3 that material will not leach out because there is no
4 flow.

5 MR. DURR: No where for it to go.
6 There is no flow of water around the containment.

7 MS. TRACY: That addresses the
8 question about the containment possibly having
9 problems. However, what about the leaks in the
10 equipment vault, the primary auxilliary building, the
11 waste process building, and the electric cable tray
12 tunnel where there is flow?

13 MR. DURR: As we explained in the
14 report, we have taken water samples both inside and
15 outside the walls and looked at chemistries, because
16 here again, that same concrete is protected because
17 of the high basic pH that it sees that the steel is
18 in, and the concrete provides that. So if we don't
19 see a big change in the water chemistry from outside
20 and inside, then we know that that steel is still
21 protected.

22 MS. TRACY: Right now.

23 MR. DURR: Yes.

24 MS. TRACY: Is this why you have said

1 that it's not a safety problem right now?

2 MR. DURR: Yes.

3 MS. TRACY: Meaning that if the base
4 leaches out, and when you do your pH tests it shows
5 that there has been a problem that way, or might even
6 show that there's some rust happening, your water
7 tests could show that, and then you would consider it
8 to be to a safety problem.

9 MR. DURR: But you have to understand
10 that there are a lot of buildings, skyscrapers and
11 everything else, that are below the water table that
12 are constantly seeing water. To my knowledge -- I'm
13 not an expert in concrete. Maybe Tony can add
14 something. Suresh is not here. This is his area. I
15 don't know of any concrete structures failing because
16 of water leaching the silicates out of the concrete
17 and --

18 MS. TRACY: However, if there was a
19 previous report where it was mentioned that there
20 could be -- for one thing, the water-proof membrane
21 has apparently failed.

22 For another thing, the report
23 mentioned that this corrosion of the reinforcement
24 bar could be a problem in the future. So apparently

1 whoever wrote that report -- I don't know if that was
2 you.

3 MR. DURR: We're watching it. We're
4 monitoring it.

5 MR. MANOLY: All supports of bridges
6 are under water.

7 MS. TRACY: Yes, that's true.

8 Another concern that I had based on
9 both 87-07 and 86-52 was the fact that there are new
10 leaks; that there is not a problem that's been
11 contained; that leaks are increasing, and I
12 understood that this was perhaps due to the fact that
13 they have discontinued their dewatering program
14 because construction is complete.

15 MR. DURR: One of the things you need
16 to remember is -- I don't need to tell you because
17 you were there -- but you had an inordinate amount of
18 rain during that period that we were up there looking
19 at that. The water table is probably much above its
20 normal level.

21 MS. TRACY: Right.

22 MR. DURR: So that would account for
23 the new seepage that you're seeing. When we talk
24 about leaks, we are talking about a puddle on the

1 floor. We're not talking about something that's a
2 torrent coming in.

3 MS. TRACY: I didn't imagine a
4 torrent, Jacque.

5 MR. DURR: It's like a leaky
6 basement. We're talking about very small amounts of
7 water permeating through the concrete, and during
8 that period they not only stopped the dewatering, but
9 you had heavy rains in that area during that period.

10 MS. TRACY: I understand that.

11 One question I have about these leaks
12 and the new leaks as well is, is the plant perhaps
13 settling and that's why these things are occurring?

14 MR. DURR: I'm glad you asked that
15 question.

16 MS. TRACY: I'm sure you are. It
17 sounds like you have a dandy answer.

18 MR. DURR: No. This is where we told
19 you that we had consultants in. We weren't so much
20 concerned about the cracks because there was water
21 seeping through. We were concerned about the cracks
22 because some of them had the indications that they
23 could have been settlement cracks. We've had
24 consultants from Brookhaven National Laboratory come

1 in and do an independent evaluation and assessment of
2 those cracks in the waste process building and the
3 other areas, and they say not to worry. That plant
4 is built on solid rock. There is nowhere it can
5 settle unless New England is sinking into the ocean.

6 MS. TRACY: That could be a problem.

7 MR. DURR: We very well established
8 that. We had a meeting with UE&C in Philadelphia
9 because that's where their home address is,
10 concerning just these cracks and settlement, and they
11 went back and did a review, plus our people from NRR,
12 and the consultants have looked at this and it's
13 still under review.

14 MS. TRACY: NRR?

15 MR. DURR: Yes, Nuclear Reactor
16 Regulation. His office in Washington, the licensing
17 people.

18 MR. RICHARDSON: Have you identified
19 the cause for why you've still got leaks developing?

20 MR. DURR: The reason that you have
21 leaks developing is just as you stated, that the
22 waterproof membrane has obviously been ruptured, and
23 there is nothing you can do about that. That's
24 there.

1 MS. TRACY: So it seems as if you have
2 sort of a multi-barrier situation here. You have your
3 waterproof membrane, you have your concrete, and you
4 have your rebar inside, and probably other things
5 too, like in containment you have your steel
6 membrane. It seems that if there was a waterproof
7 membrane put in there, it was put in for a good
8 reason.

9 MR. DURR: True.

10 MR. RUSCITTO: There is no waterproof
11 membrane. I think Jacque is talking about that in a
12 general sense as a barrier to water. There is no
13 physical piece of plastic or rubber that is installed
14 throughout the wall.

15 MS. TRACY: Are you sure?

16 MR. CERNE: It's on the outside next
17 to the ground level.

18 MR. RUSCITTO: It's waterproofing.

19 MR. CERNE: Let's get back to what the
20 situation is now. If you're saying that the
21 waterproof membrane as designed shouldn't have
22 failed, I'll give that. The point is, you analyze
23 what you're seeing right now, water coming through
24 the cracks.

1 Are the cracks' structural nature
2 that they would detrimentally affect the building as
3 it's designed? Our answer to that so far has been no,
4 although it's still under review by people in NRR.

5 The second question, is the water
6 affecting the rebar detrimentally, and the answer to
7 that is no.

8 MS. TRACY: So far. And you are
9 monitoring it on a regular basis.

10 MR. DURR: That's correct.

11 MR. CERNE: And we have open items to
12 track that.

13 You want to get back into the process
14 of the way things happened, and we want to look at
15 the result. Is the plant built correctly as it now
16 stands? That's why when we look at some of these
17 concerns from the back end, we are looking at their
18 impact at this point in time.

19 MS. TRACY: I understand that. Just
20 as you understand that I attempt to look at the whole
21 process because I'm dealing with people who have been
22 involved in the ongoing process. So sometimes I
23 raise issues that may seem as if they're process
24 issues, but they actually come down to being things

1 that you're dealing with on a very concrete basis,
2 shall we say.

3 MR. GREENSTEIN: Are you saying that
4 there are new cracks developing?

5 MS. TRACY: Yes.

6 MR. CERNE: No, not new cracks.
7 Because the water table may have risen, either by
8 stopping the dewatering process around the plant
9 which is normally only there --

10 MR. GREENSTEIN: There's leakage.

11 MS. TRACY: It's new leaks.

12 MR. CERNE: There's new leakage. It's
13 exposing existing cracks. That goes back to the
14 basis that concrete does crack, and these cracks have
15 not evidenced themselves as structural cracks. There
16 are no settling cracks, no shear cracks. These are
17 cracks that don't affect the structural integrity of
18 the concrete of the building.

19 MR. GREENSTEIN: And the increased
20 water table is just exposing them for the first time.

21 MR. DURR: That's right.

22 MR. CERNE: And depending on where the
23 water table is in the future, may either expose them
24 again, or not expose them.

1 MR. GREENSTEIN: You're saying this
2 problem is under review now. Is there a timeframe on
3 this review? Is it an open-ended review?

4 MR. CERNE: It's an open-ended review
5 because we've asked the question, whether this would
6 affect anything -- we have to always ask the question
7 for any of our open items, which these constitute 2
8 open items, whether they would affect the delay of
9 the issuance of a low power license, if it's issued,
10 and our technical experts have come back and said no.

11 MR. GREENSTEIN: So at this point in
12 time it's not a problem.

13 MR. CERNE: That's right.

14 And it's not a problem for the future
15 as they see it right now because they're willing to
16 give a low power license, aside from other issues
17 that are currently under litigation. On these
18 specific issues this would not delay issuance of the
19 license because it does not have impact on the health
20 and safety of the public.

21 MR. DURR: I think this is a good
22 example of where a concern was raised by an allegor
23 which, during all the review of that concern, we have
24 expanded the scope. Because from a professional

1 aspect of it we looked at it, and we didn't see much
2 problem with the water seepage, but we did see crack
3 patterns that caused us concern about the settlement
4 question, shear cracks, structural damage, these
5 kinds of things, which go far beyond what ELP
6 originally asked.

7 The fact is, we have a structure that
8 we are looking at now, even in more depth than the
9 ones that you were talking about, for totally
10 different reasons, because we went back and took
11 these other looks. These are the ones that we made
12 and resolved in reports.

13 MS. TRACY: Are you actually saying we
14 are cooperating?

15 MR. DURR: We are cooperating? Yes,
16 we are.

17 MS. TRACY: I have a couple of other
18 issues on this particular item. One is the problem
19 with repairing the cracks, in other words, stopping
20 the water from leaking.

21 MR. DURR: They attempt to do that.
22 But as every homeowner has tried to stop the water in
23 their basement, sometimes you're successful, and
24 sometimes you're not.

1 MS. TRACY: Thus far, it's not been
2 successful; is that correct?

3 MR. RUSCITTO: That's correct. In
4 some areas it has not been successful.

5 MR. CERNE: In some areas the natural
6 process stops the leak.

7 MR. DURR: It heals itself.

8 MR. CERNE: The leaking of the
9 sulfates and whatever is in the concrete actually
10 plugged up the hole, the effervescent.

11 In other cases they've attempted
12 repair, and it's worked. In other cases they've
13 attempted repair, and it hasn't worked.

14 Again, back to the bottom line.
15 Assume it doesn't work, and it's not going to work
16 for the 40-year life of the plant. What is the
17 impact?

18 MS. TRACY: Yes.

19 MR. CERNE: That's what the unresolved
20 items are.

21 MR. DURR: I guess your original
22 question, and this is day-to-day, I think, if I'm not
23 mistaken, but the original question was that they
24 used a material other than what he thought should

1 have been used.

2 I think from an engineering
3 perspective it doesn't make any difference which one
4 of the crack sealers that you use. Once the
5 hydraulic pressure becomes more than what that sealer
6 can withstand, it's going to leak again. That's the
7 question that he's concerned with. He thought they
8 ought to use brand X, and we used brand Y.

9 MS. TRACY: No. He was concerned
10 because he felt that the particular brand that they
11 were using would not work. He wasn't recommending a
12 brand himself. He was saying the repair material
13 that he believed them to be using was not working,
14 which apparently is, at least in some instances, the
15 case.

16 MR. DURR: In some cases it works, and
17 in some cases it doesn't. Here again, it's a
18 function of whatever the hydraulic pressure is on the
19 other side, it's going to overcome whatever you put
20 in there. If the elevation head gets high enough, it
21 will seep through whatever you put in.

22 MS. TRACY: It seems almost -- I
23 hesitate to use lack of structural integrity, the
24 problem with these cracks. Seabrook sits on an

1 earthquake fault. Do you think that these cracks
2 would be --

3 MR. CERNE: That was part of the
4 design review. When we say structural integrity of
5 the building, it's not meaning structural integrity
6 only now. It's structural integrity of the building
7 as designed capable of withstanding an intensity
8 level 3 earthquake.

9 MS. TRACY: Because you are mentioning
10 that you checked out whether these cracks could be a
11 problem of settling, and the fact that it's sitting
12 right on bedrock, and I would presume if there were
13 an earthquake, which there are from time to time,
14 that that would sort of change the situation.

15 MR. CERNE: It would, if designed for
16 modified locality intensity level 8 earthquake.
17 These cracks have no bearing upon that design. They
18 are not structural in nature to the extent that they
19 affect the design of the plant to withstand the
20 highest earthquake that it was designed for.

21 MR. DURR: Most people don't
22 understand it, but all concrete cracks.

23 MS. TRACY: I understand that,
24 Jacque. We've had this conversation many times. All

1 concrete cracks. All concrete is porous. Yes, I do
2 understand that. I believe you.

3 MR. DURR: If you don't believe that,
4 just look at my patio.

5 MS. TRACY: Maybe it's how you mixed
6 your concrete.

7 MR. DURR: Could be.

8 MS. TRACY: So these tests to check
9 the pH of the water coming through the wall, these
10 are ongoing, the utility is engaged in ongoing tests,
11 and will continue to do so --

12 MR. DURR: Until we are satisfied, or
13 until they are satisfied and we agree.

14 MS. TRACY: Because it seems to me
15 that as time goes on the likelihood of the
16 reinforcement bar rusting heightens as the base
17 leaches out. It seems you could test it for a couple
18 of years and things would be dandy, and the utility
19 could say well, it's fine. No need to test anymore.
20 That decision to stop testing could occur right when
21 you might need it the most. So right now, it's
22 considered to be an ongoing program.

23 MR. DURR: That's correct.

24 MR. RICHARDSON: Did you say that

1 water from outside the walls is being monitored as
2 well?

3 MR. DURR: We used that as a base
4 reference. I don't know whether we're testing the
5 water outside now because I don't think it's
6 changed. But I think the program that they have does
7 definitely monitor the water coming through the
8 wall. I don't know what the specifics of that test
9 program was. That was Suresh's area.

10 MR. CERNE: That was one of the issues
11 that was also turned over to the NRR for review. One
12 of the two unresolved items talks about water
13 chemistry contro .

14 MS. TRACY: Do you all have any other
15 comments on this section?

16 MR. DURR: Not that I'm aware of.

17 Let's go on to the next one, 2.5.
18 You have no comments on that. That was Cadweld
19 splices.

20 2.6?

21 MS. TRACY: I assume this is Harold's?

22 MR. GRAY: That's right.

23 MR. DURR: What are your questions
24 concerning the fire protection system?

1 MS. TRACY: This deals with the
2 problem that was first mentioned regarding the fire
3 protection system, what was first raised by Raymond
4 Lavoy as being as being sediment, but which was
5 defined by you all as being microbiologically induced
6 corrosion. And having read, probably not as much as
7 you have, on the issue of biofouling in
8 microbiologically induced corrosion, it seemed that
9 certain ongoing problems, current problems at the
10 plant were also caused by MIC. So that is our
11 belief. I would like to know -- you might have
12 something to say about that.

13 MR. CERNE: Yes. I think the ongoing
14 problems that occurred at the plant, which have not
15 arisen from allegations, but from licensee identified
16 items which needed correction, and we were informed
17 about them through the proper channels, have given us
18 an opportunity to look in the service water system,
19 and to visibly inspect the heat exchangers, to
20 visibly inspect the strainers, to have chemical
21 samples taken on the wall where corrosion was
22 exhibited to check for MIC. And the answer is that
23 biofouling is not a problem at Seabrook. MIC is
24 certainly not a problem in the service water system.

1 So the premise of your statement is exactly opposite,
2 borne out opposite by our ability to independently
3 inspect the system because it was open for other
4 problems.

5 MS. TRACY: What caused the pitting
6 and corrosion on the heat exchanger tubing?

7 MR. RUSCITTO: One was the general
8 seawater copper nickel tubing corrosion which is
9 typical of heat exchangers, and the other one was
10 caused by cavitation which can also be seen in any
11 fluid system. These are typical engineering problems
12 that are found throughout the industry and have
13 various solutions.

14 MS. TRACY: You're saying it's
15 electrolyte corrosion?

16 MR. RUSCITTO: Cavitation is the
17 formation and subsequent collapse of vapor bubbles in
18 a fluid stream due to pressure changes. It causes
19 shockwaves when the bubble collapses. We're talking
20 about it on a very small scale now. It will cause a
21 vibration and erosion of the pipe.

22 MR. DURR: Probably the best
23 description of cavitation I can give you is, do you
24 live close to the water?

1 MR. GREENSTEIN: Yes.

2 MR. DURR: Do you ride on boats?

3 MR. GREENSTEIN: Yes.

4 MR. DURR: Do you see the bubbles stir
5 up when the turbine starts the propeller?

6 MR. GREENSTEIN: Yes.

7 MR. DURR: That's cavitation. Because
8 the propeller changes the pressure of the water and
9 you form bubbles, and those bubbles, when they
10 impinge and collapse, they erode away material.

11 MR. RICHARDSON: I have another
12 question for you. In one of your recent reports you
13 indicated that a check valve on the primary component
14 cooling system had developed a pin-hole leak. Have
15 you assigned a cause for that yet?

16 MR. RUSCITTO: Yes. That was not a
17 corrosion problem. That was just a casting flaw
18 within the body of the check valve. It was not a
19 corrosion-related problem. It's a fresh-water
20 system.

21 MR. DURR: We seem like we're getting
22 kind of far afield here. This thing was the fire
23 protection system. Do we have anymore questions on
24 the fire protection?

1 MS. TRACY: We go beyond the fire
2 protection system.

3 MR. DURR: We do?

4 MS. TRACY: Yes.

5 MR. DURR: In 86-52?

6 MR. RUSCITTO: All we're saying is,
7 there is no MIC, and there is no biofouling.

8 MR. CERNE: This isn't an allegation.
9 It's a statement on your part that is attempting to
10 tie an earlier allegation, which was resolved by
11 Mr. Gray, into things that the NRC has identified in
12 our own inspection reports, and drawing some premise
13 that they're related. We're unequivocally saying
14 that we've looked at that in advance and they're
15 unrelated.

16 MR. GREENSTEIN: Your conclusion that
17 there is no MIC or biofouling, what is the foundation
18 for the conclusion?

19 MR. CERNE: We've looked inside the
20 service water system which is in question, in which
21 MIC was not discovered -- it's totally divorced from
22 the fire protection system. It was opened up for
23 other reasons, some valve problems. At the time it
24 was opened up we had the opportunity to look at the

1 heat exchange. We had the opportunity to look inside
2 the pipe. We had the opportunity to look at the
3 strainers to see the amount of debris that had
4 accumulated.

5 It was an extremely clean system,
6 probably because you got a long tunnel that
7 chlorinates. Biofouling was not a problem. Chemical
8 swab samples were taken on the piping. That chemical
9 swab sampling and analysis will tell you the amount
10 of bacterial contamination on the pipe wall, and it
11 was way below the level at which you would see
12 microbiologically induced corrosion.

13 MR. GREENSTEIN: Who did the
14 analysis?

15 MR. CERNE: The licensee and an
16 independent contractor. And we reviewed the results.

17 MS. TRACY: Who was the contractor?

18 MR. DURR: I guess to put this in
19 focus, the original issue was sedimentation in the
20 fire protection system. And from that evolved -- the
21 only way we got into microbiologically induced
22 corrosion was the fact that that was in conjunction.
23 The licensee was replacing some piping at the time
24 that the allegor saw other piping that had concrete

1 lining in it, and he assumed that these 2 were
2 connected, and they were not connected.

3 MS. TRACY: No. He saw -- your latest
4 explanation was that he did see sediment. You are
5 allowing them that. But that he saw sediment in
6 pipes which had been removed from the fire pump house
7 outside the pump house for cleaning.

8 MR. DURR: No. They were concrete
9 lined.

10 MS. TRACY: No.

11 MR. DURR: They were cleaning outside,
12 and there was pipe outside the pump house that was
13 concrete lined that was also exposed.

14 MS. TRACY: Yes, Jacque, but what
15 Raymond Lavoy saw was not concrete lined pipe. He saw
16 pipe with sediment in it, and that pipe with sediment
17 in it was not the pipe that was in the ground outside
18 the fire pump house. It was apparently, according to
19 your explanation, pipe that had been removed from the
20 fire pump house for cleaning outside the fire pump
21 house. So he did see pipe with sediment and MIC in
22 it.

23 MR. CERNE: It's granted. Again, at
24 the risk of being adversarial here, let's bring us

1 back to the present. The fire protection piping and
2 the MIC which was admitted to occur, and which was
3 cleaned up by the licensee, has been addressed by
4 Mr. Gray in NRC inspection reports.

5 What you appear to be presenting here
6 is some transition using our own reports to try to
7 tie that with MIC in the service water system or
8 biofouling in the service water system, which we have
9 said does not exist because we've looked for it.

10 MR. GREENSTEIN: Getting back to the
11 original point about the fire protection system,
12 there was some MIC and sediment which has been
13 removed. Was there any discussion as to how the
14 sediment got there in the first place?

15 MR. CERNE: The MIC?

16 MR. GREENSTEIN: Yes.

17 MR. CERNE: Yes, and basically what
18 you had is, you had a certain -- fire protection
19 piping was first filled with water from the site
20 which had some organic mechanism -- organic material
21 in it, and as it sat stagnant for several years, or
22 over the course of construction the MIC process
23 developed.

24 MR. GREENSTEIN: And the pipe was

1 removed?

2 MR. GRAY: The majority of it was
3 cleaned.

4 MR. GREENSTEIN: Is it a likelihood
5 that this problem is likely to redevelop?

6 MR. CERNE: No. We've fixed it. Part
7 of the corrective action was to put -- the first
8 consideration was for its ozonater, which if you
9 flood the water with oxygen, you'll kill the
10 bacteria, and then the licensee decided to treat it
11 with ultraviolet light which also inhibits corrosion
12 of the bacteria in the future. So for future systems
13 where this could occur, like fire protection, the new
14 system that they have in place will prevent it from
15 recurring. Of course, their water chemistry, we'll
16 continue to check it.

17 MR. GRAY: And another thing, they are
18 using now Seabrook drinking water for the fire
19 protection system, not pump to groundwater.

20 MS. TRACY: They were using
21 groundwater that was pumped right out.

22 MR. CERNE: Yes. That was part of the
23 source of the organic material.

24 MS. TRACY: They weren't using well

1 water back then?

2 MR. GRAY: That was a part of the
3 cause of the original problem, the pump groundwater
4 had more organics in it --

5 MS. TRACY: So now they're using
6 treated water.

7 MR. GRAY: -- sufficient organics to
8 cause this problem under conditions of long-term
9 stagnation.

10 MR. GREENSTEIN: You're saying they
11 installed ozonaters?

12 MR. CERNE: No. Ultraviolet light.
13 Ozonaters would have been one option. They
14 established the ultraviolet light option.

15 MS. TRACY: Is that an ongoing
16 program, the ultraviolet light?

17 MR. CERNE: Yes.

18 MS. TRACY: What do they do? Beam it
19 on the water before it goes into the pipes?

20 MR. CERNE: I'm not exactly sure how
21 the process works, but basically it's at the water
22 treatment facility that they actually treat it with
23 UV. So the water coming into the plant systems -- of
24 course, some of the more critical systems in terms of

1 reactor coolant water and secondary and tertiary
2 systems are demineralized water anyway.

3 MR. RICHARDSON: How is that done?

4 MR. CERNE: The demineralizing
5 process?

6 MR. RUSCITTO: It comes through a
7 demineralizing plant that uses demineralizers.

8 MR. DURR: Have you ever seen the
9 little bottles that you get for your iron at home to
10 take the hardness out of the water that has little
11 pellets in it?

12 MR. RUSCITTO: That's a demineralizer.

13 MR. DURR: It's the same kind of
14 thing.

15 MR. RUSCITTO: It's ion exchange.

16 MR. DURR: It's an ion exchange
17 process. That's what the little brown beads in the
18 bottle are.

19 MR. RUSCITTO: A demineralizer is a
20 big, huge tankfull of that.

21 MR. RICHARDSON: All right. We're not
22 exposing it to great degrees of heat then?

23 MR. DURR: No.

24 MS. TRACY: I have a question

1 regarding the fire protection system and why MIC grew
2 there. Weren't they doing chlorination for a number
3 of years before 1986?

4 MR. CERNE: Not in the fire protection
5 system. Chlorination is in the service water system.

6 MR. RICHARDSON: Your report cites
7 chlorination.

8 MR. GRAY: There is also chlorination
9 in the fire protection system.

10 MR. RUSCITTO: In the pottable water
11 system. That's a different kind of chlorination.

12 MR. CERNE: Not for the biofouling
13 process.

14 MS. TRACY: It's not part of the
15 biofouling treatment prevention?

16 MR. RICHARDSON: The reason I'm
17 curious about that is, that in -- I believe it's
18 discussed in both 86-52 and 87-07 -- there is a
19 statement to the effect that the chlorination was
20 instituted in 1983, and that the piping was
21 disassembled in 1986. Why is there a difference of 3
22 years between when the chlorination process was
23 started? The way the report reads it suggests that
24 it was in relation to the fire protection

1 microbiological problem. If that is the case, why
2 was the piping dismantled 3 years after the
3 chlorination program was started?

4 MR. DURR: The question, I guess, is,
5 where are you going with this. What difference does
6 it make?

7 MR. RICHARDSON: Basically your report
8 suggests that a treatment program was started in
9 1983, and that the piping was dismantled and cleaned
10 in 1986.

11 MR. DURR: So?

12 MR. RICHARDSON: What I'm asking is,
13 was the problem discovered after the chlorination
14 program was started?

15 MR. DURR: I guess the question is,
16 when did they first discover that they had a MIC
17 problem.

18 MR. RICHARDSON: That's part of the
19 question, yes.

20 MR. DURR: Do we know that?

21 MR. GRAY: I don't recall the answer
22 to that.

23 MR. DURR: Is that in a report?

24 MS. TRACY: No.

1 MR. CERNE: I think we have that in
2 one of our resident reports.

3 MS. TRACY: I think that a corrolary
4 to the question, or what I was leading to is -- and
5 also when you answered about whether they're
6 chlorinating that in the fire protection system -- I
7 had understood that chlorination was taking place as
8 part of the chlorination program to do away with
9 biofouling, and that it was being done in the fire
10 protection system too, which would mean that it
11 wasn't working, if it had been going on for 3 years.

12 MR. RUSCITTO: The chlorination in the
13 fire protection system is related to the chlorination
14 of the pottable water system for drinking. Just like
15 any other city water supply, it has a chlorine
16 residual.

17 MR. CERNE: To answer Doug's question,
18 and I'm going from memory, but as I recall, the
19 resident report that first addressed it, because we
20 knew about the problem as soon as the licensee did,
21 was at least a couple of years after 1983.

22 MS. TRACY: So 1985?

23 MR. CERNE: To my memory, yes.

24 MR. RICHARDSON: That chlorination

1 program then is not intended to address
2 microbiological corrosion?

3 MR. CERNE: Not for the fire
4 protection. It's intended to address biofouling in
5 the service water system because there's massively
6 more amounts of chlorine because it's not pottable
7 water.

8 MR. GRAY: We may have a conflict. As
9 I recall, I believe I saw a chlorination system
10 installed in the fire pump house system, and that it
11 had some intention to act on this MIC problem which
12 had occurred in the fire pump house.

13 MR. CERNE: It doesn't jive with the
14 dates we are talking about. It could have been used
15 post-discovery of MIC to try to fix the problem.

16 MR. GRAY: As I understand it at this
17 point, as I recall it, chlorination was installed in
18 the fire pump house water system after the discovery
19 of the MIC as a part of the corrective action to
20 prevent it from recurring.

21 MR. CERNE: I have no problem with
22 that statement. What I'm saying is, if they stay
23 chlorination was installed in 1983, I don't have any
24 facts that would argue that. I'm just saying that if

1 that were true, that was not to combat MIC because
2 they didn't discover MIC in 1983.

3 MS. TRACY: And at that time they were
4 using groundwater. They weren't using drinking
5 water, which is slightly chlorinated anyway. So it
6 seems like there was no chlorination program going on
7 to prevent, to combat or prevent MIC in the fire
8 protection system until after the problem was
9 discovered.

10 MR. CERNE: Based on our own confusion
11 from memory here, we would have to go back and get
12 the specific dates. From what I recall, MIC was not
13 discovered in my mind until like a 1985 timeframe.
14 So if your dates indicate something happened earlier,
15 I don't believe that was related to MIC.

16 Let me read the section which Harold
17 has documented. "Chlorination of the fire system
18 water which was initiated in October, 1983 was noted
19 to be in progress. This chlorination was initiated
20 as a measure to prevent microbiologically induced
21 corrosion in the unlined portions of the fire
22 protection system piping".

23 I won't dispute what Harold has
24 researched, more than I have researched. What I'm

1 saying is, they didn't discover MIC prior to 1983.
2 They may have had a system in place in part to
3 prevent it, but they didn't identify it as a problem
4 to be on circa 1985 timeframe.

5 MS. TRACY: My point is that if there
6 was chlorination going on to prevent it, and after
7 the program had been going on for 2 years they found
8 it to be a fairly serious problem, it seems as if
9 that program wasn't really effective against MIC,
10 which is why you are doing UV light now, right?

11 MR. CERNE: Yes.

12 MR. DURR: Also, you have to
13 understand they changed the source of water.

14 MS. TRACY: Right, from groundwater to
15 drinking water.

16 MR. RICHARDSON: When did they change
17 the water source?

18 MR. DURR: I don't know.

19 Do we know that?

20 MR. CERNE: What are we getting to,
21 the bottom line? I'm still failing to see --

22 MR. RICHARDSON: The bottom line is
23 this, according to this report, the paragraph that
24 you just read, the chlorination program was

1 instituted in 1983. It specifically states that it
2 was to prevent a MIC problem. Now, in 1986 we have
3 fire protection piping being dismantled and cleaned
4 of microbiologically induced corrosion deposits.

5 MR. DURR: True.

6 MR. RICHARDSON: The timing there, the
7 fact that the piping was dismantled and cleaned 3
8 years after the chlorination program was instituted,
9 appears to suggest that the chlorination program was
10 not effective.

11 MR. RUSCITTO: Wait a second. I don't
12 know that we know that the fire protection system was
13 in operation in 1983 when the chlorination was
14 installed. Just because the chlorination was
15 installed doesn't mean the system was operating and
16 being chlorinated.

17 MS. TRACY: Let's take a break.

18 MR. DURR: At 12:00 o'clock I'd like
19 to break.

20 But what you have to understand is,
21 you have a lot of unknowns, and we don't have the
22 answers to them either. The unknown is, we don't
23 know when the MIC occurred. The MIC could have
24 occurred before 1983, and they finally discovered it

1 in 1986. So we don't know that. There's a lot of
2 unknowns.

3 I guess the point is, the bottom
4 line, that the piping has been removed and cleaned,
5 they've changed the water source, they've introduced
6 new methods for killing bacteria, and we've tested
7 the system, and everything works fine. So what's the
8 problem?

9 MS. TRACY: I think that one of the
10 reasons why we threw in these other systems, aside
11 from not being completely up on the technological
12 aspects of things, was it appeared that the
13 chlorination program for the fire protection system
14 was not working.

15 MR. RUSCITTO: I don't think you can
16 draw that conclusion based on the fact that we don't
17 know that the fire protection system was operating in
18 1983.

19 MS. TRACY: Right. I agree with you
20 that we have raised more questions --

21 MR. CERNE: You're stilling trying to
22 jump over the service water system, and that's not an
23 allegation. That's some premise you have put
24 together based on an allegation which has been

1 already investigated, and our own reports which
2 identify inspection issues --

3 MR. DURR: Let's solve one problem.
4 Is your problem with the fire protection system? Do
5 you have a problem with the fire protection system?

6 MS. TRACY: I'm not sure today.

7 MR. DURR: We've looked at it. We've
8 tested it. We've watched them test it. We were
9 physically there when they ran water through it and
10 performed the test. The authorized nuclear inspector
11 for the insurance company was there. We watched him
12 do his thing. We know the system works.

13 MS. TRACY: Who was that inspector, by
14 the way? Do you recall?

15 MR. DURR: I don't know.

16 Do you know, Harold?

17 Harold was with him.

18 MR. GRAY: The company's name is
19 there.

20 MR. CERNE: Kemper Insurance Company?

21 MR. GRAY: No. This is different.
22 This is a company who insures the buildings against
23 fire loss, as opposed to the authorized nuclear
24 inspector. It's a different ballgame altogether.

1 MS. TRACY: Is it a different company
2 entirely?

3 MR. GRAY: I gave you the company name
4 in the report.

5 MS. TRACY: I think you did.

6 MR. DURR: Hartford, or something like
7 that.

8 MS. TRACY: Yes.

9 MR. CERNE: Do you have a problem with
10 the fire protection, or are you trying to flow it
11 over to the service water system?

12 MS. TRACY: Yes.

13 MR. DURR: Because right now we don't
14 have a problem with the fire protection system. Is
15 there a question you need to ask on the fire
16 protection system?

17 MS. TRACY: I think that at this time
18 you have answered my questions about the fire
19 protection system.

20 MR. DURR: Now, are there peripheral
21 issues that you think that you want to discuss
22 concerning this issue?

23 MS. TRACY: My feeling is at this
24 point we have discussed the peripheral issues that I

1 wanted to discuss.

2 MR. RICHARDSON: I would like to ask
3 one question. If the chlorination process in the
4 fire protection system may not have worked,
5 suggesting it as a possibility because it was
6 dismantled and cleaned in 1986, 3 years after the
7 chlorination procedure was instituted, are there
8 other procedures, other than chlorinization, to treat
9 service water, and if not, is it possible that a
10 chlorinization process may not work in that system as
11 well?

12 MR. CERNE: First of all, you're
13 talking about much different doses. There are other
14 processes, like thermal backflushing of the system.
15 Where you bring in water, you throw heat out.

16 Secondly, you're talking about salt
17 water versus pottable water.

18 Thirdly, you're talking about an
19 ocean supply which is 3 and a half miles out.

20 The systems that could be
21 detrimentally affected by, for example, the
22 biofouling, having strainers in the system, and the
23 microbiologically induced corrosion, you're talking
24 about inspection processes which look for it.

1 And I guess finally I would just say
2 that the reason we haven't suspected it to date is
3 that we've checked for it in our most recent
4 inspections, and it hasn't existed. It doesn't exist
5 right now.

6 MR. DURR: Is your question relative
7 to the fire protection system?

8 MR. CERNE: No. The service water
9 system --

10 MR. DURR: Let him answer.

11 Is your question relative to the fire
12 protection system and the chlorination? Given the
13 fact that it may not have worked, how are we
14 convinced that we don't have a problem? Is that the
15 question in fire protection?

16 MR. RICHARDSON: That basically is the
17 question.

18 MS. DURR: Correct me if I'm wrong,
19 Harold, but on a periodic basis the fire protection
20 system is tested?

21 MR. GRAY: That's correct.

22 MR. DURR: Flow tested. We run water
23 through it. We make sure that it works, and that's
24 on a periodic basis.

1 Now, I can get my fire protection
2 engineer in here, and he'll probably give us a whole
3 lot more details, if he's in today. But those
4 systems, they do fire drills. We witness the fire
5 drills. We witness them hooking up the hoses and all
6 those kind of things.

7 So from a fire protection program
8 aspect we have a separate group, a separate gang that
9 goes out and looks at fire protection. We do indepth
10 inspections in fire protection for all power plants,
11 including Seabrook. So I really feel comfortable
12 that I don't think we have a problem here. If MIC
13 re-occurs, I think it will be detected, and
14 appropriate steps would be taken to fix it because we
15 have an inspection program that goes back and looks
16 at the fire protection system.

17 MR. RICHARDSON: Are you also covering
18 the other freshwater supply systems as well?

19 MR. DURR: What freshwater supply
20 systems?

21 MR. RICHARDSON: Primary component,
22 secondary component --

23 MR. DURR: Those are closed-route
24 cooling water systems.

1 MR. RUSCITTO: You're talking about a
2 very heavily chromated system. I am not aware of MIC
3 occurring in a system like that.

4 MR. RICHARDSON: What are you
5 chromating?

6 MR. RUSCITTO: Potassium chromate is
7 put in the system --

8 MR. DURR: It's a corrosion inhibitor.

9 MR. RUSCITTO: -- to inhibit corrosion
10 of those systems.

11 MR. DURR: It's like the stuff you put
12 in your radiator. It's not ethylene glycol to
13 prevent it from freezing, but there's also a
14 corrosion inhibitor that's in your radiator.

15 MR. RICHARDSON: It's inhibited as a
16 biocide, or just as a corrosion inhibitor?

17 MR. DURR: It's a corrosion inhibitor.

18 MR. CERNE: They're closed systems,
19 and they're supplied from chemically controlled
20 environments. They're not hooked into the pottable
21 water supply, like fire protection.

22 At the expense of being rude, I'll
23 say that even though Jacque is talking about fire
24 protection piping, because that's the allegation that

1 was raised, we don't have an allegation before us
2 that talks about MIC in the service water system.

3 You have raised, in my mind, some
4 contentions which try to bridge a gap between MIC in
5 the fire protection system which everybody agreed
6 occurred, to the potential for it occurring in the
7 service water system, and our inspections have looked
8 at and documented the fact that that is currently not
9 a problem. That's where we stand. We have no
10 allegation that we're pursuing in the service water
11 system with respect to MIC.

12 MR. RUSCITTO: I think that anything
13 else is pure supposition on anyone's part, and we're
14 just as interested as you about future possibility of
15 MIC. But to give it anymore effort, I think would be
16 inappropriate.

17 MR. DURR: That whole question is
18 under the Hearing Board. I don't think we need to
19 pursue it any further. That will be addressed later
20 to everybody's satisfaction, I would hope.

21 At this point in time I think it's
22 appropriate that we take a break for lunch. It's
23 12:00 o'clock. Let's say, we reconvene at 1:00.
24 With that, I close the record.

1

- - -

2

(Whereupon a recess was taken at this time.)

3

- - -

4

(The meeting resumes at 1:00 o'clock).

5

- - -

6

7

MR. DURR: Did we finish with section 2.6? Were there any additional questions?

8

9

MS. TRACY: I think for the moment we've finished with that.

10

11

12

13

14

15

16

17

I would like to, once again, refer to this proposed agenda that I brought which refers to the end part of this report and see if we can deal with some of these issues. I would like to get this entered into the record as my understanding of what this meeting was to concern, and then look at some of the specifics in here. So is it all right with you to enter this into the record?

18

19

20

21

22

23

24

MR. DURR: I don't have a problem with entering it into the record. I am reluctant to divert from what we were discussing in sequence here for fear that something will remain undone. If we pursue it in an orderly fashion, we'll get through all of them because it's not our intent to go from beginning to end here to answer your question.

1 MS. TRACY: My feeling is that our
2 time is fairly limited now. We have about 1 3/4 hours
3 left, and there are some fairly overriding concerns
4 that are at the end here which are organized in a
5 fashion in this agenda. What I would like to suggest
6 is that we touch on some of these, and then if we
7 have time, go back. I would rather deal with these
8 then find ourselves in an hour and 3/4 not to have
9 dealt with these at all, if that's all right.

10 We could perhaps call this Exhibit
11 A.

12 MR. DURR: However you would like to
13 include it in the record.

14 (Whereupon the proposed agenda was
15 marked as Exhibit A).

16 MR. DURR: What specific part of this
17 agenda would you like to address?

18 MS. TRACY: First, let me say that it
19 was my understanding this meeting was to deal with
20 procedural issues that had not necessarily been fully
21 addressed in 86-52 or 87-07. In order to conserve
22 our time, and since we have those issues listed,
23 perhaps we could concentrate on a couple that are of
24 particular concern. Essentially what this does is,

1 it lists the overriding concern, and then it lists
2 the different allegations that have been made to our
3 project that support these concerns. So under
4 quality assurance/quality control I would like to
5 look specifically at F, I, J, O, Q and S.

6 MR. DURR: F, I, J, O and S?

7 MS. TRACY: Q and S. Under document
8 control --

9 MR. DURR: Let's do them sequentially,
10 and then we'll get them done. What is your specific
11 question for 2(F)? I haven't had time to read them
12 all, but from what I have glanced at they all were
13 discussed in either 86-52 or 87-07 in some form or
14 fashion; is that correct?

15 MS. TRACY: They were acknowledged.
16 They were not necessarily discussed in the sense that
17 these are not specific technical issues that you can
18 go and look at the particular weld, and for that
19 reason you did not discuss them in any kind of
20 detail.

21 MR. DURR: That's correct.

22 MS. TRACY: However, it's our feeling
23 that these procedural problems, what you call
24 procedural problems in 87-07 are issues which point

1 to overriding safety concerns about the plant.

2 MR. DURR: How?

3 MS. TRACY: In that they point to the
4 fact that, for instance, quality assurance/quality
5 control had some serious problems. If quality
6 assurance/quality control had some serious problems,
7 then the safety of the equipment inspected, the
8 systems inspected is also questionable.

9 The same thing with, for instance,
10 document control. You all make a lot of your
11 judgments based on the utility's documents. If there
12 is a problem with the documents, an unrecognized
13 problem with the documents, then the information that
14 you base your inspections on is also questionable.

15 MR. DURR: To answer that question, to
16 respond to that, you have to understand that the NRC
17 did, in fact, look at the licensee's documents. They
18 also did hands-on inspections. We did as-built
19 inspections, not only after the plant was built, but
20 we did hands-on inspections while the plant was being
21 built. So throughout the construction of the plant
22 there was essentially nearly a continuum of audits
23 being performed, not only on the hardware and the
24 installation and the implementation of the

1 procedures, but the quality assurance aspects of the
2 plant itself, and the implementation of the
3 licensee's quality assurance program.

4 One of the main underpinnings of the
5 NRC's inspection program was that by rule we require
6 the licensee to have their own quality
7 assurance/quality control program. We require them
8 to put the people in place and to have a viable
9 program, and we audit to insure that that quality
10 assurance program is viable and functions.

11 Now, are you saying, were there
12 isolated cases wherein people didn't follow
13 procedures? More than likely. Here again, that's
14 the human element, and you can't make that an
15 absolute. No one can make anything like that
16 absolute.

17 MS. TRACY: But we are not saying
18 there's been isolated cases.

19 MR. DURR: We haven't seen anything to
20 indicate that that's true. Witness the fact that if
21 there were serious breakdowns in quality
22 assurance/quality control, they would have manifested
23 themselves somewhere in the hardware because that's
24 the ultimate concern. Those programs are in place to

1 insure that the hardware, the physical plant itself
2 is built according to the design and the intent. So
3 if there were series breakdowns within that program,
4 which I'm not sure that at this point in time anybody
5 would ever be able to prove or disapprove, then what
6 we have to look for is where did that manifest itself
7 as a deficiency in the plant.

8 With all the allegations that ELP has
9 given us and other allegations, we have not been able
10 to ascertain that it has manifested itself in a
11 deficiency within the plant, and that's what's
12 important. Because whether the QA/QC program did or
13 did not function appropriately back during the
14 construction of the plant, I don't think anybody can
15 determine that today. That's history.

16 So what we have to be concerned with
17 is, how did that show up in the plant as a
18 deficiency. And not only through our construction
19 program, but through our construction inspection
20 program, our as-built programs, our independent
21 design audits, and the focused allegations that you
22 have given us, we have not been able to show that
23 quality assurance was deficient in any of those
24 instances. Ergo, we have to assume that that still is

1 true; that quality assurance/quality control did not
2 suffer from significant breakdowns because we don't
3 have anything to prove counter.

4 MS. TRACY: You may feel you need to
5 assume that. However, having talked to a number of
6 quality assurance engineers, who all had serious
7 criticisms of the program, who were told that they
8 were -- forced might be too strong of a word -- were
9 pressured in a serious way to pass on equipment and
10 items that they did not feel comfortable about, and
11 that that was a continuing procedure that they were
12 subject to, and that if they were too careful in
13 their checking of quality assurance, that they would
14 face firing, that is a concern which reflects on the
15 safety of the plant. Because they are talking about,
16 not just isolated instances, but about an ongoing
17 situation that they had to deal with.

18 MR. DURR: If that's the case, then
19 they need to give us a specific where that pressure
20 resulted in a deficiency in the plant that they
21 bought off or were forced to buy off on, and they
22 know it's deficient, and we can go out and inspect
23 that and confirm that, and we can verify that very
24 aspect. If those individuals have knowledge of just

1 that condition, we can inspect that. All they have
2 to do is give it to us, and we can verify that, and
3 then we can make that case.

4 But as to date no one has been able
5 to give us a specific that resulted in an equipment
6 deficiency that we can go out and inspect and verify
7 that yea and verily the quality assurance/quality
8 control program did not function. We don't have
9 anything, and that's what we keep asking for you to
10 give us. If you have that kind of knowledge, we need
11 that very specific information because that will
12 prove your case.

13 MS. TRACY: It seems that we're caught
14 in a 'Catch 22' because these people no longer work
15 at the plant. They don't have access to the kinds of
16 records that they need to exactly pinpoint their
17 concerns.

18 Another part of that 'Catch 22' is if
19 they were to exactly pinpoint their inspection
20 sheets, then they themselves are pinpointed, and
21 they're absolutely positive that they would be
22 blacklisted. Many of them still work in the nuclear
23 industry. So it is, as I say, a 'Catch 22' type
24 situation in many cases. They don't have access to

1 the proof that you need to even investigate it
2 because it's proprietary information at the plant.
3 They didn't leave with the documents.

4 MR. DURR: I understand that, but the
5 individual having that kind of knowledge would be
6 able to point out some specifics, or at least give us
7 an area to look in. For instance, if he just says
8 pipe supports in a certain area, we can go look at
9 pipe supports in a certain area. We've looked at
10 hundreds, literally hundreds of pipe supports, and we
11 couldn't find anything wrong.

12 MS. TRACY: What you're saying is that
13 it's irrelevant to you whether or not quality
14 assurance works.

15 MR. DURR: It's not irrelevant. No,
16 it's not.

17 MS. TRACY: Because what is relevant
18 to you is the results of quality assurance/quality
19 control. If this person says I was forced to pass on
20 X number of welds that I was not sure about --

21 MR. DURR: I understand.

22 MS. TRACY: -- and they weren't sure.
23 And you say okay, show me exactly those welds. Now,
24 this might have been in the course of 3 days of work

1 and they had worked there for months. You go and
2 look at those welds, and you say well, there's no
3 problem with these welds, then it's resolved to your
4 satisfaction.

5 That does not deal with the issue
6 that quality assurance did not work. As a procedure
7 it did not work because people felt pressured to the
8 point where they went along with what the utility
9 wanted, rather than reporting problems.

10 Another example, perhaps an example
11 of that is, I'm sure you're aware of the case of
12 James Pedavano, who falsified documentation on
13 apparently thousands of welds, was arrested,
14 convicted, and has subsequently said that he was a
15 scapegoat, and it's my belief he probably did it to
16 more of an extreme degree than other inspectors, but
17 he said that he was a scapegoat; that what he did was
18 common practice. That has been substantiated by
19 other QA people who I've spoken with who said, it's
20 too bad about James. He was a little extreme, but
21 what he did was not unusual. To me it would seem
22 that would be a matter of concern.

23 MR. DURR: It is a matter of concern,
24 and we looked at that. But based on the fact that we

1 can't find anything wrong, even before the
2 allegations came in, we've gone back and looked at
3 our inspection record, independent of all that. We
4 don't find any underlying problems there, other than
5 the ones that were identified, addressed and
6 resolved.

7 Granted, there were problems back
8 there. Our inspection reports reflect that. It also
9 reflects the fact that we followed those things to
10 resolution. So we aren't just saying that we can't
11 find anything wrong. Ergo, we're not worried about
12 it. That's not true. I don't think that's a proper
13 characterization of it. We are always concerned.

14 What I'm saying now is, whether it
15 did or didn't work back then becomes moot when you go
16 look at the final as-built condition of the plant.
17 We have thoroughly looked at the hardware. We have
18 thoroughly reviewed the start-up and testing
19 process. We had somebody up there almost
20 continuously through that start-up testing program
21 and the pre-operational tests. All of those things
22 are designed to make sure that that plant is safe to
23 operate. So far we don't find anything to indicate
24 otherwise.

1 Now, granted there is underlying
2 concern in the community about the safety of the
3 plant, and we appreciate that.

4 MS. TRACY: It's not just the
5 community, Jacque. It's people that work there who
6 built it.

7 MR. DURR: You have to understand that
8 we can't convict them until we have some evidence.
9 We don't have any evidence, concrete evidence that's
10 going to convince anybody that that plant is unsafe.
11 I cannot make hollow allegations about the safety of
12 that plant. I have to have something substantial to
13 prove my point. That's what we are asking for, and
14 so far it's not forthcoming. Everything that we have
15 chased, we already knew about it, and we were already
16 pursuing it. The licensee had properly documented it
17 and had identified it himself and was pursuing it.
18 We have multiple indications of where people saw
19 things that they thought were wrong, and they have
20 been at that point in time wrong, and they were
21 pursued within the program.

22 MS. TRACY: Let's talk about some of
23 these specific issues.

24 MR. DURR: Okay. Which one?

1 MR. GRAY: Do you want to try "I"?

2 MS. TRACY: Let's deal with F for just
3 a second.

4 MR. DURR: Okay.

5 MS. TRACY: When construction
6 procedures were violated, procedures were rewritten
7 to allow the violations to stand. Procedures were
8 implemented to eliminate inspection tests.

9 Was that a common way of dealing with
10 problems when construction procedures were violated?

11 MR. DURR: In F, here we don't have
12 any specifics, do we, just this statement? We have
13 this statement as it stands by itself. We don't have
14 any specifics to point where things were changed
15 improperly to circumvent some problem. We don't have
16 anything of that nature. So all we're going on is
17 this statement. This is the alleger's
18 characterization of what he thought he saw.

19 Do they revise procedures? Yes. Are
20 procedures rewritten because there may be a design
21 problem or some other underlying problem? Yes, and
22 there is mechanisms for them to do that, but it has
23 to be reviewed and engineeringly acceptable to do
24 that. They just can't arbitrarily go out and say

1 gosh, I can't do this. I'll rewrite the whole
2 procedure to go around it.

3 That's all a controlled process. That
4 all comes under that umbrella of quality assurance.
5 We require them to have procedures that allow them to
6 make these changes in a controlled manner.

7 MS. TRACY: Let deal with "I".

8 MR. GREENSTEIN: Can I ask a question?

9 MR. DURR: Sure.

10 MR. GREENSTEIN: During the 21,000
11 hours that the NRC was doing inspections, did NRC
12 personnel ever witness any violation of construction
13 procedures?

14 MR. DURR: Oh, yes.

15 MR. GREENSTEIN: Was it endemic?

16 MR. CERNE: Endemic in the sense that
17 the causal analysis had root in some generic problem,
18 no. But it has to be reviewed for that reason.
19 There may be a cause that goes beyond the individual
20 guy who just failed to follow procedures. Maybe there
21 was a training problem, maybe the instructions were
22 written unclearly, maybe really what they were asking
23 him to do was too rigorous, and code allowed looser
24 things to be done. That's what Jacque was referring

1 to. Sometimes you can change procedures, and still
2 meet the construction codes.

3 All those things are reviewed, and
4 when we do write a violation for failure to follow
5 procedures, which is a violation of 10 CFR 50
6 Appendix B, we request the licensee, not only to
7 address corrective action for a specific violation,
8 but also how they will correct it to prevent it from
9 occurring again.

10 MR. DURR: Where it has implications
11 of spilling over into other areas, we also ask them
12 to address that particular aspect. So they just
13 don't solve John Doe not putting in something
14 properly, but look at the broader aspects of why did
15 that occur, and what other areas could have been
16 impacted by that same deficiency.

17 MS. TRACY: Doug, did you have
18 something you were going to say about that?

19 MR. RICHARDSON: Yes.

20 I remember back in 1986 I told you
21 that the B31.1 as-built program had been dropped
22 because it was getting too costly to implement, at
23 least that was my understanding. It seems to tie in
24 with a number of problems that Pullman-Higgins had at

1 that time. The conditions that were going on at that
2 time appear to have been continuing for sometime
3 after that. In the 84-07 construction assessment
4 team report it is also mentioned that that -- I
5 believe it was the piping support as-built program
6 was dropped. This was conducted by United Engineers
7 at that time; is that correct?

8 MR. CERNE: Well, Pullman at that time
9 was still doing the pipe supports.

10 MR. RICHARDSON: Pullman was doing QC,
11 I believe, and United, if I remember correctly, was
12 doing the as-built work.

13 MR. DURR: Can we find the specific
14 point in the report?

15 MR. RICHARDSON: Yes. It takes a
16 little bit of discussion to get to.

17 Basically United's piping support
18 as-built program had been identifying deficiencies in
19 approximately 75 percent of the supports they looked
20 at. The reason that the as-built program was dropped
21 was claimed to be because they were overly
22 restrictive in their identification of welding
23 deficiencies. But the deficiencies that they were
24 identifying extended far beyond simply weld

1 deficiencies.

2 MR. DURR: Is this the B31.1
3 as-built?

4 MR. RICHARDSON: I don't know if this
5 is B311 or safety. I believe at the time the CAT team
6 was looking at safety equipment, but I am not
7 completely sure. We can find that out easily enough
8 by going through the report.

9 At the time I was working for Pullman
10 I was told not to write non-conformance reports in
11 such a way as to indicate that Pullman craft people
12 were to blame; that basically that they had done
13 faulty work. It appears from the discussion in the
14 reports up and through dealing with that era that
15 Pullman was under a lot of pressure at the time for
16 the quality of their work. They got a 3 in the SALP
17 in '82, and a 3 in the SALP in '81, and the '80 SALP
18 was said to have been pretty bad. At the end of '82
19 there was a massive reorganization of Pullman's
20 responsibilities; is that correct?

21 MR. CERNE: I think it was a little
22 bit later area, but you are correct. There were
23 several recurrent SALP's where piping and pipe
24 supports was a problem, a problem in the sense that

1 that we gave them a category 3.

2 MR. RICHARDSON: Some of the stuff
3 that shows up, for example, in the '82 CAT, you have
4 engineers who are dispositioning NCR's, particularly
5 the ones that were dispositioned accept as is. Your
6 inspectors reviewed something over 100 NCR's. The
7 wording of that report indicates that not some of the
8 ones that were accepted as is, but enough of a
9 majority of the ones that were marked accept as is,
10 that they simply said those marked accept as is were
11 not adequately reviewed, and that the engineers who
12 did those reviews were not qualified to do that.

13 If this is the case, how can you be
14 sure that they were reviewed adequately all the way
15 along the line?

16 MR. DURR: We said that in our
17 inspection report 86-52?

18 MR. RICHARDSON: I'm sorry. 82-06.

19 MR. DURR: That's outside the scope of
20 this. This is 86-52 and 87-07.

21 MR. RICHARDSON: That inspection was
22 done at the time period approximately that I was
23 working at Pullman. I told you about problems that I
24 thought existed in Pullman's as-built program that

1 appear to be related.

2 MR. DURR: I don't follow you.

3 MR. GRAY: 82-06 was done during the
4 time that everybody was laid off at the site.

5 MR. RICHARDSON: No. That was 84-07.

6 MR. CERNE: 82-06 was the team you led
7 up there, Jacque, the original CAT.

8 I feel that you are taking our
9 inspection reports and saying that we're smart enough
10 to identify items, but we're not smart enough to
11 resolve the resolution of the problems we
12 identified.

13 We identified that there were
14 problems with Pullman-Higgins. We awarded category 3
15 ratings because areas needed correction. Those areas
16 were re-reviewed, and there were some recurrent
17 problems. Jacque's report, the recurrering or
18 repetitive resident reports, the specialist's reports
19 all contributed to those findings that led to those
20 SALP ratings. So if you say were there problems at
21 that time, without getting specific, yes, there were.
22 Otherwise, they wouldn't have gotten category 3
23 ratings. I guess what Jacque is saying and what I'm
24 saying is, what does that have to do with this issue

1 that is the subject of the ELP allegations at this
2 point?

3 MR. RICHARDSON: According to your
4 reports, then and on to about '84 apparently there
5 was in this area inadequate review of the NCR's as to
6 whether the accept as is dispositions were really
7 valid. In the 1984 CAT there is an extensive
8 discussion of failures by the United as-built crew to
9 identify and properly record non-conformances.

10 MR. DURR: I'm curious. What is the
11 point that you are trying to make?

12 MR. RICHARDSON: Given that you've got
13 failures over this long period of time to adequately
14 maintain a quality assurance program, how can you say
15 that the quality assurance program demonstrates that
16 the plant is safe, when you've got non-conformances
17 that weren't evaluated properly, non-conformances
18 that weren't answered, that weren't properly
19 reported?

20 MR. DURR: Let me answer your
21 question. First of all, when you say quality
22 assurance/quality control, there were a multitude of
23 contractors on that site, Pullman-Higgins being
24 one --

1 MR. RICHARDSON: But a very important
2 one.

3 MR. DURR: -- which we singled out as
4 being a recalcitrant performer. The NRC identified
5 them as a poor performer, and we applied pressure to
6 the licensee to get that act straightened up, so to
7 speak. Is that correct?

8 MR. RICHARDSON: That's my
9 understanding.

10 MR. DURR: Now, you have to understand
11 that Pullman-Higgins -- but there was also a civil
12 structural contractor on site, there were people
13 putting in the HVAC, there's the electrical
14 contractor. You have to understand, all those
15 aspects, nobody has ever attacked that. So to have a
16 total breakdown of the quality assurance program you
17 have to have all these people making mistakes, and
18 that wasn't the case. That's not what I'm hearing.

19 What I'm hearing is, you have a
20 specific problem with the Pullman-Higgins quality
21 assurance/quality control program which we
22 identified, and which we forced the issue to get the
23 licensee to straighten it out. So now, what's the
24 problem?

1 MR. RICHARDSON: Part of the problem
2 is that Pullman's deficiencies were identified for a
3 period ranging for several years and were not
4 corrected.

5 MR. DURR: That's right. But we
6 finally fixed that problem. That's all acknowledged
7 in another report.

8 MR. CERNE: There is another factor
9 here that bears directly on the point you're trying
10 to make. You're quoting from our SALP's, and our
11 SALP's clearly identify in the write-ups, if you will
12 research them, that the problems that were identified
13 with Pullman-Higgins were primarily process control
14 problems which did not necessarily result in
15 deficient hardware.

16 MR. RICHARDSON: Then how do you
17 account for 75 percent of the supports that the
18 United as-built team were inspecting showing up with
19 deficiencies after they've been through Pullman's
20 QA? And this is in 1984. Your problems were
21 supposed to have been corrected.

22 MR. CERNE: We've reviewed that
23 process -- it's a long story that has nothing to do
24 with the ELP allegations. But the as-built

1 inspectors were using different criteria than would
2 be used by QC inspectors in determining what was
3 acceptable and what wasn't acceptable.

4 MR. RICHARDSON: Why would they be
5 using different criteria? Aren't we all supposed to
6 be working toward the same standards?

7 MR. MANOLY: What deficiencies are you
8 referring to? You said 75 percent. In what area?

9 MR. RICHARDSON: Let me find the
10 report. It's your 84-07 construction assessment team
11 report.

12 MR. CERNE: The as-built inspection
13 criteria are different. The whole process of
14 as-building is to document, like you were doing,
15 dimensions and things that can be done for stress
16 reconciliation of the piping program.

17 The QC inspection is totally
18 different, like we were talking about before. A QC
19 inspector makes a judgment based on criteria which he
20 has to be trained for. There is a big difference
21 between as-built inspection -- it's not even
22 inspection-- the as-building process, and the QC
23 inspection program.

24 MR. RICHARDSON: We were trained

1 through probably the same criteria. I had a Level 1
2 certification --

3 MR. DURR: You're making statements
4 that I don't think that you can adequately support,
5 Doug. Were you ever a quality assurance/quality
6 control inspector?

7 MS. TRACY: I think that's fairly
8 irrelevant in the issues that we are discussing here.

9 MR. DURR: No. He's making assertions
10 here and casting dispersions about a program, and I'm
11 trying to figure it out.

12 What's your technical qualifications
13 that allow you to do this?

14 MS. TRACY: We've been through this
15 before.

16 MR. RICHARDSON: The information that
17 we generated was used in preparing --

18 MR. DURR: The last time we talked
19 about this, I asked you what your job title was, and
20 you didn't even know what your job title was.

21 MS. TRACY: We're getting off the
22 track.

23 MR. DURR: No. He keeps bearing down
24 on this point, trying to make these assertions that

1 are not relevant to what we have in here.

2 I just want to establish the fact
3 that you are making questions, not allegations. I
4 can understand your not understanding some of these
5 things and having problems assimilating all this.

6 MR. RICHARDSON: Let's read you a line
7 here from the report.

8 MS. DURR: Wait a minute. Is this
9 relevant?

10 MR. RICHARDSON: It may answer your
11 question as to whether I'm qualified to talk about
12 this stuff.

13 This is section 3, page 9 of your
14 84-07 CAT report. The second paragraph starts off,
15 in addition to the fact that ANSI certified
16 inspectors (UE&C as-builders).

17 MR. DURR: So what?

18 MR. RICHARDSON: So was I certified,
19 or was I not?

20 MR. CERNE: You were certified as an
21 as-builder, not as an inspector. All the QC/QA
22 inspectors at Seabrook were certified to ANSI N45.2.6
23 requirements. They had to be to conduct inspections.

24 MR. RICHARDSON: This is true. The

1 assumption I am making is that I was certified
2 adequately to perform the work I was doing.

3 MR. CERNE: Which was not ANSI
4 N45.2.6.

5 MR. RICHARDSON: According to the
6 paperwork I have --

7 MR. TRACY: I would really like to
8 deal with some of the substantive problems.

9 MR. DURR: Me too. But he keeps
10 bringing the subject back to this.

11 MS. TRACY: And you keep worrying at
12 it endlessly too, Jacque. It's a dialogue going on
13 here.

14 MR. DURR: I understand that.

15 MR. CERNE: I don't understand what's
16 going on when people are going back through our
17 inspection reports. If you wanted to have an
18 independent agency come and look at our inspection
19 reports, yes, they'll find several problems. That's
20 us doing our job, finding the problems and seeing
21 that they are getting corrected.

22 Now, if somebody goes back to support
23 ELP allegations and raises issues that have been
24 identified, corrected, and put to bed in our

1 inspection reports, and rehashes them in support of
2 some item that has no factual basis, it seems to be
3 stretching.

4 MS. TRACY: I think that you are
5 incorrect when you say they have no factual basis,
6 Tony. I think that that's an assumption on your
7 part.

8 MR. CERNE: The factual basis I'm
9 talking about is what Jacque needs for us to verify
10 that there are problems or aren't problems in the
11 plant. You're telling us things we already know.
12 That's not an allegation. You're reading from our
13 report and telling us what? We didn't do our job
14 properly? You want to go to the Office of
15 Congressional Affairs?

16 MR. DURR: Time.

17 That's what I was trying to set clear
18 at the opening of the meeting, and Mike thought that
19 it was adversarial. But I was really trying to
20 establish the protocol, the method, the procedure,
21 parliamentary procedure, if you will, by which we have
22 to bound this thing. Otherwise, we end up off the
23 track all the time. That's why I said it was
24 confined to 87-07 and 86-52 issues. That's why I

1 wanted to address the ones that we requested in the
2 letter that we sent you, to please tell us up front
3 what you wanted to discuss. So we would have the
4 appropriate people here, and we would be prepared to
5 intelligently discuss it.

6 MS. TRACY: Well, why don't we forge
7 forward then, Jacques?

8 MR. DURR: I keep trying to, but Doug
9 keeps wanting to go back to this other issue.

10 MR. RICHARDSON: I have a specific
11 question. You've got quite a performance problem
12 with Pullman.

13 MR. DURR: We don't dispute that.

14 MR. RICHARDSON: What was the
15 appropriateness of deleting any inspection program
16 whatsoever, when you've got as-builders catching that
17 portion of mistakes?

18 MR. DURR: That's a question. That's
19 not an allegation.

20 MR. RICHARDSON: I never said it was
21 an allegation.

22 MR. DURR: Okay. And the question
23 that you ask is, they deleted the B31.1 program. Is
24 that correct? Is that what you want to know, why

1 they deleted that? All I'm telling you is, that from
2 the NRC's perspective that's a non-safety related
3 program. It had no impact on the safety of that
4 plant, none whatsoever, or we wouldn't have let them
5 do it. That is the answer to your question.

6 MR. RICHARDSON: Fine. I disagree with
7 the answer. The reason I disagree is that the as-built
8 programs have been catching a hell of a lot of
9 mistakes, and when you have a piping contractor with
10 that kind of conformance problem --

11 MR. DURR: You have to understand.
12 What impact does it have on the safety of the plant,
13 the nuclear safety of the plant? I'm not talking
14 about occupational hazard. I'm talking about nuclear
15 safety.

16 MR. RICHARDSON: As you noted, it's in
17 everybody's best interest to insure that the
18 non-nuclear portions of the plant are fully
19 functional and fully capable in order to prevent
20 having to use the safety systems.

21 MR. DURR: We agree.

22 MR. RICHARDSON: That's the reason on
23 that particular section.

24 On the other one, if you've got a

1 problem with documenting and analyzing --

2 MR. DURR: You're burning up her
3 time. She wants to go on. I'm prepared to move on.
4 It's up to you how you want to spend the time.

5 MR. RICHARDSON: I would like to know
6 if it appears inappropriate to be reducing inspection
7 efforts on the part of the contractors --

8 MR. DURR: So noted that you made that
9 statement. Moving on.

10 MR. RICHARDSON: Very well.

11 MR. DURR: Sharon, what would you like
12 to talk about next?

13 MS. TRACY: I believe "I", the Dravo
14 shop welds in the turbine building were detective and
15 uncorrected.

16 Did you want to say something about
17 that, Harold?

18 MR. GRAY: Yes. We have to draw back
19 to another report. The 84-12 report on page 40 to
20 about 43 discusses that question in depth, and leaves
21 it as an unresolved item, pending them to radiograph
22 the weld. This weld was not a radiographic quality
23 weld to start with. The weld was later radiographed,
24 found to have a small indication, which was not

1 related to the original allegation, which was not
2 contained on the inside surface of the weld, which
3 the allegation pointed to. This defect was repaired
4 and re-radiographed, found acceptable, and it was
5 cleared in a later report. So that "I" is not true.

6 MS. TRACY: How many welds were we
7 dealing with there?

8 MR. GRAY: The alleged gave us a
9 specific single weld that he saw was a problem.

10 MS. TRACY: So you only dealt with
11 that one weld?

12 MR. GRAY: That's correct.

13 MS. TRACY: When he spoke to me about
14 it he seemed to indicate that there were -- there is
15 apparently a lot of Dravo piping, and he felt that
16 the welds in general in that Dravo piping --

17 MR. GRAY: He didn't tell us that in
18 1984.

19 MS. TRACY: So you only looked at that
20 one?

21 MR. GRAY: That's correct.

22 MR. DURR: He was interviewed directly
23 in 1984.

24 MR. CERNE: When you say Dravo shop

1 welds in the turbine building, again, you're talking
2 about non-safety related welds. Dravo, just like the
3 piping contractor on site, built their piping to
4 specific standards. The safety-related piping was
5 build to ASME standards. The non-safety piping was
6 built to B31.1 standards. The turbine building piping
7 is all non-safety piping.

8 MR. RICHARDSON: Did Dravo also do
9 safety piping?

10 MR. CERNE: Yes, but to different
11 standards, including QA at the shop. The QA at the
12 Dravo shop was only applied to the ASME piping, or --
13 yes, the ASME piping, not the B31.1 piping.

14 MR. RICHARDSON: There's no
15 requirement for 100 percent radiographic inspection?

16 MR. CERNE: 100 percent radiographic
17 inspection only takes place in ASME class 1 and 2
18 piping anyway. ASME class 3 only gets surface
19 examination.

20 MS. TRACY: So this is ASME class 3?

21 MR. RICHARDSON: No. B31.1.

22 MS. TRACY: It's even lower than class
23 3.

24 MR. CERNE: No QA was applied. It

1 wasn't required because, as Jacque pointed out, there
2 is no safety consequence to the weld blowing away,
3 for example.

4 MS. TRACY: I find it odd that when I
5 spoke with this person, he mentioned pleural welds,
6 and that there was only one that he mentioned to you
7 and that you dealt with. I would kind of like to
8 check back on that with him.

9 MR. DURR: It's interesting to note
10 that this is an allegation that we already looked
11 at. We already knew about this. We already inspected
12 this one before back in 1984 when he made his
13 original concern known to us.

14 MS. TRACY: You might find it
15 interesting, Jacque, I don't know. I just know what
16 people come to me with, and he said that he was not
17 really satisfied with how it had been dealt with. He
18 spoke with him with April too.

19 Okay J -- or was there more you
20 wanted to say?

21 MR. GRAY: Excuse me. I did explain
22 to him that in April.

23 MS. TRACY: Did you?

24 MR. GRAY: Yes.

1 MS. TRACY: Was that on the record?

2 MR. GRAY: I think it was on the
3 record.

4 MS. TRACY: I think that you all were
5 speaking to each other off the record after the
6 meeting.

7 MR. DURR: J. What's the question?
8 This is, as Mike's characterized earlier, an umbrella
9 allegation.

10 MS. TRACY: Yes, it certainly is.

11 MR. DURR: The welds were bad, but we
12 don't have any specifics. To counter that, we have
13 physically gone out and done independent radiography,
14 using our own equipment, our own technicians, our own
15 sources. We have independently done our own
16 radiographs, and done magnetic particle liquid
17 penetrant tests, and we have not found any welds that
18 required repair.

19 MS. GENTLEMAN: Regarding the Padavano
20 lines, maybe you can straighten me out on this
21 issue. The NRC did a sample of his welds; is that
22 correct?

23 MR. DURR: I cannot address that.

24 Maybe you can. I can't.

1 MS. GENTLEMAN: About 136 welds.

2 MR. CERNE: There were a total
3 approximately of -- I'm going approximately from
4 memory. This is documented, not only in our follow-
5 up inspection reports, but also by an Office of
6 Investigation report which looked into the wrongdoing
7 aspects of the issue, the qualifications aspects.
8 There were about 2400 welds in question, not that he
9 had falsified 2400 welds.

10 What the licensee did was, because
11 even one of his welds was in question, they said that
12 the integrity of this individual cannot be counted
13 on. We're going to look at every single weld that
14 this individual did a surface examination on.
15 They're not radiographed welds. They were just
16 surface examinations which cut it down to a lower
17 class of piping.

18 Out of the 2400 only 800
19 approximately were safety related. The licensee said
20 despite that fact, we'll go back and try to redo the
21 examination on all 2400. Some of them were
22 inaccessible. By inaccessible, it's almost like a
23 misnomer because when you get into a weld, you may
24 have to do a repair in process, and then build the

1 weld back out, and now the PT surface examination
2 that was done is inaccessible. But if that weld got
3 radiographed anyway, for example, a class 2 line,
4 then you're looking at the volumetric section of the
5 weld anyway.

6 MS. GENTLEMAN: Isn't inaccessibility
7 also occurring where a weld is encased in concrete
8 and not accessible for that reason?

9 MR. CERNE: Yes, but I can think of
10 very few welds that were encased in concrete. Some
11 were buried underground, but it's not standard
12 practice to encase piping welds in concrete. I can't
13 even think of any, off the top of my head. Because
14 the important ones have to be accessible for ongoing
15 evaluation throughout the life of the plant.

16 MR. RICHARDSON: I have a question on
17 that. Between unit 1 and unit 2 approximately in the
18 area between the containment and unit 1 PAB diesel
19 generator building there was a trenched-out area
20 running north/south on the site that had a rack of
21 what appeared to be about 8 or 10-inch stainless pipe
22 maybe 4 or 6 wide, 3 or 4 deep, and I believe that
23 was encased in concrete.

24 MR. CERNE: You're talking about cable

1 conduit. It's not stainless. It's galvanized steel
2 cable conduit. That's encased in concrete.

3 MS. TRACY: Go on about Padavano.

4 MS. GENTLEMAN: My final question
5 would be -- maybe you can direct me to a document
6 that would be helpful. Of the 136 welds or
7 thereabouts that the NRC took a look at itself, my
8 understanding is that none of those welds are the
9 welds that Mr. Padavano actually pleaded to. Is that
10 correct?

11 MR. CERNE: No.

12 MS. GENTLEMAN: All of the welds that
13 he pleaded were inspected by the NRC?

14 MR. CERNE: No. There is a cross
15 there. When the licensee reported this problem and
16 said this is what we're going to do about it, they
17 launched into correction action which is to inspect
18 their welds, or as many of the 2400 as they could get
19 to.

20 The ones they couldn't get to, they
21 had to disposition either by engineering evaluation
22 or some other technique. A lot of the ones that were
23 non-safety related, if they weren't accessible, they
24 just said they're non-safety related, they're crane

1 hooks or something that's not part of the permanent
2 plant.

3 The safety related ones, we -- and I
4 can refer you to the inspection reports -- we looked
5 over their shoulder in this entire process and
6 watched them do their corrective action. Then we
7 came back with our van and did independent inspection
8 on some of the welds that they had redone and said
9 was no problem.

10 In other words, not all of the ones
11 that Padavano did were faulty. Some were ones they
12 said -- and one percent sticks in my mind. Maybe one
13 percent of the ones had to be redone. We did a
14 sample on the ones that had to be redone to assure
15 that the final weld was a proper repairing process.

16 In the ones they dispositioned to say
17 that we don't have to do anything with it, we did a
18 sample of those. So we took a sample and our sample
19 -- 136, if you got that out of some report, I'll
20 believe you. I don't remember the exact number. We
21 took a sample, like we do in all our inspections, on
22 any category where the licensee made some rationale
23 decision as to why they did it the way they were
24 doing it. We judged that decision as it was being

1 made, and then we brought our van in and did a
2 sampling to assure ourselves that it was a good
3 decision. All of that is documented.

4 MS. GENTLEMAN: Within those samples
5 did you test the welds that he pleaded to?

6 MR. CERNE: Yes. That was part of the
7 sampling.

8 MS. GENTLEMAN: The specific welds
9 that he pleaded to.

10 MR. CERNE: Pleased to? All o' the
11 2400 we sampled --

12 MR. RUSCITTO: Are you talking about a
13 legal -- where he admitted under oath --

14 MS. GENTLEMAN: Yes.

15 MR. RUSCITTO: I'm not sure we know
16 what those welds are. We made no distinction as to
17 the ones he admitted to. We looked at every weld he
18 ever did, whether he admitted to falsifying it or
19 not.

20 MS. GENTLEMAN: The welds that he
21 pleaded to in court that he had falsified, you are
22 not sure if you re-inspected those or not?

23 MR. CERNE: We don't know of any --

24 MS. GENTLEMAN: You may have, if you

1 caught them in the sample, but then again, you may
2 not have?

3 MR. DURR: That's correct. I think
4 that's true.

5 MR. CERNE: I don't understand the tie
6 between what you're leading to --

7 MR. DURR: Let's break it up into a
8 set theory here. There's 2400 in the set.

9 MS. GENTLEMAN: There's 2400 in the
10 set, but there's a sub-set of welds that an inspector
11 indicated --

12 MR. DURR: Under oath that he --

13 MS. GENTLEMAN: Under oath.

14 MR. DURR: That he didn't inspect
15 them; that he had falsified.

16 MS. GENTLEMAN: My simple question is,
17 did you check them.

18 MR. DURR: Specifically did we look
19 for those welds? I think the answer is no. We took
20 sub-sets of 2400 and did some of each sub-set, the
21 ones that they said were okay, the ones that they
22 said were done by Padavano, and the ones that they
23 said that they didn't have to do. We looked at
24 sub-sets of all of those or a sampling of each one of

1 those. We didn't take a slice and say these are the
2 ones that Padavano said were bad, and we'll go look
3 at those again. We looked at the whole population.
4 We didn't want to focus in. We wanted to make sure
5 the whole set was good.

6 MR. CERNE: When you say he pleaded to
7 11, I don't think that the legal part of that where
8 the Department of Justice got involved and is
9 pleading to certain contentions, it was maybe a
10 generic pleading to 11. I will admit I did it 11
11 times. But there wasn't in that process, here's weld
12 54-X75.

13 MS. GENTLEMAN: Oh, yes, there was.

14 MS. TRACY: Yes. It was very
15 specific.

16 MR. DURR: Aside from that, the
17 responsibility to go back and correct it was the
18 licensee's. What we went back and looked at was his
19 program to make sure that everything was okay. We
20 looked at the programmatic aspect of it, and we
21 sampled the sub-sets.

22 MS. GENTLEMAN: I understand, as best
23 I can, your sample approach. My question is more, a
24 simple citizen in the world knows that a quality

1 control inspector identified welds whose documents he
2 falsified, and my question is simply, have you looked
3 at those. I guess your answer is that maybe you did,
4 and maybe you didn't.

5 MR. KAUCHER: All the welds were
6 looked at, but not specifically by the NRC.

7 MR. DURR: The NRC did not
8 specifically look at the 11 or however many it was,
9 unless they were in that sub-set that we looked at.

10 MR. CERNE: But the licensee's look at
11 it is no different than the program they used to look
12 at all welds. In other words, when they re-looked at
13 the weld, it was no different than any other weld we
14 may have picked as a sample for other reasons.

15 MS. GENTLEMAN: Thank you.

16 MR. RUSCITTO: The fact that he
17 falsified the records on the weld doesn't mean that
18 it was an improper weld. It just means that there
19 was no assurance.

20 MS. GENTLEMAN: What percentage of the
21 800 safety related welds that the licensee looked at
22 failed? Can you direct me to a document with that
23 number?

24 MR. CERNE: I think the failure rate

1 is documented, and I want to say in the neighborhood
2 of one percent. Failed in the sense that a repair
3 had to be done to the weld. In other words, the
4 examination process yielded something that said
5 something needed to be corrected.

6 MR. RICHARDSON: I have a question for
7 you. One of your earlier CAT reports gets into an
8 area on weld examination that was done. It cites a
9 sample of 29 welds that were radiographed, and of
10 those, I believe 6 of them came up with reportable
11 deficiencies. My understanding was that these had
12 passed Pullman's QA. Is this a common occurrence?

13 MR. DURR: What do you mean common?
14 Relative to what? Other nuclear power plants?

15 MR. RICHARDSON: No.

16 Do you have a significant portion of
17 your inspections where you go back and x-ray welds
18 that have already been bought off by QA? Do you have
19 any significant amount of cases where you find
20 deficiencies weren't identified by the contractor?

21 MR. CERNE: The 29 you're talking
22 about was not an NRC identified case for Pullman
23 welds. The licensee shows above the code requirements
24 to review all radiographs on the site, either done by

1 Dravo or Pullman or done by anybody, and in the
2 process of doing that review in some cases they
3 identified some problems.

4 Now, not in all cases -- 29 might be
5 a number you have documented, and I'll believe you if
6 you say you read it. Not in all cases are we talking
7 about problems where the weld was bad. It may have
8 been a problem with the radiograph. In some cases it
9 required re-shooting of the radiograph. In other
10 cases it could be dispositioned by a code
11 interpretation or other engineering evaluations.

12 MR. DURR: Do you have an example?
13 No. Don't dig it out now. After the meeting bring
14 it to me, and I will take a look at it because the
15 NDE van comes under my branch, and I can probably
16 tell you what the answer is, if I see it.

17 MR. RICHARDSON: I believe it --

18 MR. DURR: But in an effort to speed
19 things along, so that Sharon can get her salient
20 points covered, see me after the meeting, and I will
21 discuss it with you.

22 MS. TRACY: It seems, given the
23 restrictions on dealing with things that are too
24 general, that we've perhaps covered the major points

1 I wanted to address in the quality assurance/quality
2 control section, since I would imagine that Q, welds
3 were improperly certified and quality assurance was
4 poor according to a third QA engineer, would be too
5 general for you to deal with. And also, there was a
6 lack of weld safety, and people were harassed, if
7 they raised safety problems. Am I correct?

8 MR. DURR: Sorry? They're too broad?

9 MS. TRACY: For you, yes.

10 MR. DURR: I don't think they're too
11 broad. I think we addressed all these things in
12 86-52.

13 MS. TRACY: Let's go on to 3, the
14 document control section. The problem with pipe and
15 pipe supports being assembled using the wrong
16 materials after the identification numbers were
17 ground out and rescribed, that was something that was
18 brought up in some of the statements that I gave you
19 in April, and it was not really addressed in your
20 87-07 report. We feel that this also points to a
21 problem with controlled documentation.

22 MR. DURR: I don't understand how that
23 has anything to do with document control.

24 MS. TRACY: This is the way I imagine

1 it works, Jacques. You have your design, and your
2 design has the equipment laid out with the numbers
3 for the different pieces that belong in various
4 locations, and if the incorrect equipment is used,
5 then your documents do not reflect the real
6 situation. In other words, the numbers on the
7 equipment might appear to match the documents --

8 MR. DURR: I understand where you're
9 coming from.

10 MS. TRACY: -- but they don't because
11 they been ground out and rescribed.

12 MR. DURR: But the root cause is not a
13 document control problem. The root cause in this
14 particular case is a material control problem.

15 MS. TRACY: Okay. Let's call it a
16 material control problem.

17 MR. DURR: And that ultimately results
18 possibly in document control -- not document control,
19 but inaccuracies in the documentation.

20 But to me a document control problem
21 is one wherein the formal document control system,
22 and there is such an entity that controls procedures,
23 drawings and specifications and those things to make
24 sure that the appropriate document is at the right

1 place in the right revision, that's the document
2 control system. So when you say this is a document
3 control problem, from my perspective it's a material
4 control problem. It ultimately results in
5 inaccuracies in the documentation, but that's not a
6 "document control problem".

7 MS. TRACY: But it is a problem.

8 MR. DURR: I understand where you're
9 coming from, yes.

10 MS. TRACY: It wasn't really addressed
11 in 87-07 either.

12 MR. DURR: What about 86-52?

13 MS. TRACY: No. It wasn't even raised
14 in 86-52.

15 MR. DURR: When did you give us this?

16 MS. TRACY: I gave this to you in
17 April.

18 MR. DURR: Is this one of the issues
19 that we sent you a letter and said these are kind of
20 general, and we need some more information? There
21 were some of those things that you gave us in April,
22 and we said yeah, we can do something with these
23 because they're specific enough. And then I sent you
24 a letter and said that on these, I've got some

1 questions for you.

2 MS. TRACY: Right, and I answered some
3 of those questions, and some of them I didn't.

4 MR. DURR: Those we have not done
5 anything with, to my knowledge. If it was not in
6 87-07 or 86-52, we haven't done anything with it.
7 Those were awaiting responses from ELP, and those
8 will be turned over the residents, I think, and that
9 will be addressed in a subsequent inspection report.
10 Yes, there's some of these things that we didn't talk
11 about in 87-07, and that's why we sent you a letter.
12 We felt that we really couldn't do anything with them
13 at that particular time.

14 MS. TRACY: Again we're caught in this
15 'Catch 22' situation where the person who made this
16 allegation does not have access to the documents he
17 needs in order to be specific enough for you to act
18 on the exact equipment. If he were to wander through
19 the plant in the locations where he was working, he
20 would be able to point the equipment out to you, if
21 he had access to the documents.

22 MR. RUSCITTO: But even so, I am not
23 sure we understand the statement of the problem.
24 What was wrong with what they did? If equipment was

1 changed under a proper design control procedure, then
2 maybe what he saw wasn't even a problem.

3 MS. TRACY: It was not that way. The
4 way it was explained to me was, this crew was working
5 on some pipes in the turbine building. They needed a
6 piece of pipe. They went out to the yard to find the
7 pipe. They were looking for a specific number. They
8 could not find it. They found another pipe that
9 approximated what they needed. They cut it off to
10 the size that they needed. They ground out the
11 number that was on it, and scribed in the number that
12 they were looking for, with no documentation.

13 MR. DURR: In the turbine building?

14 MS. TRACY: No.

15 MR. DURR: That may not be safety
16 related piping.

17 MS. TRACY: I think I'm wrong about
18 that. I can dig out exactly where he was working.

19 MR. RUSCITTO: What you are describing
20 is not necessarily wrong.

21 MR. CERNE: We need more details.

22 MR. DURR: We can't decide that now.

23 MS. TRACY: I think that I should
24 maybe need to talk to you to find out exactly what

1 more details you need in order for me to get
2 information.

3 MR. CERNE: I think Jacque asked the
4 questions. We can go on from that basis.

5 MR. DURR: That may be in those
6 questions. Let us take a look at that.

7 MS. TRACY: You'll check back on that.

8 MR. DURR: We'll be in touch with you.

9 MS. TRACY: I'm curious that you say
10 it might not necessarily be a problem. I would
11 assume --

12 MR. RUSCITTO: As long as there's
13 traceability of the switch or the re-tag. If it's an
14 equivalent substitution, it's a perfectly valid
15 change that occurs all the time. As a matter of
16 fact, that's what we would want them to do, would be
17 to re-number the part to what the design shows.

18 MS. DURR: There's a couple of numbers
19 that you have to be concerned with. Some are system
20 identification numbers, pipeline numbers, but the
21 number from the material document control that you're
22 concerned about is the heat numbers. If they change
23 the heat number, now they've changed the
24 identification of the kind of material and its

1 allowable stresses and those kinds of things. If
2 it's ASME stuff, it has a code data tag on it. That
3 code data tag has to remain intact. If the code data
4 tag isn't on there, they can't put the piece of pipe
5 in the system.

6 MR. CERNE: If it was safety related
7 piping, that's one of the QC inspection points they
8 would be looking for.

9 MS. TRACY: The tag.

10 MR. DURR: They look for those tags.
11 Those are unique tags. If you take one of those tags
12 off, you either have to save the tag, or you have to
13 take a stencil of it or something. Those have to all
14 be accounted for. So if it was ASME code piping,
15 that kind of a scenario is pretty hard to envision
16 without controls on it because even if you put it in,
17 you can't verify what it is after it's in there, and
18 they're going to make you take it back out again.

19 MR. RUSCITTO: But if they are just
20 changing line numbers, it's just like changing the
21 license plate on your car versus changing the serial
22 number on the engine block. You can change the
23 license plate on the car, but you can't falsify what
24 engine is put in there.

1 MS. TRACY: I understand the
2 distinction. I'm glad you explained that. Also,
3 this explanation will make it easier for me to get
4 more details that would be relevant to your dealing
5 with the problem.

6 MR. RICHARDSON: I would like to ask a
7 question about something that I hadn't thought of
8 until recently. One of the emergency feedwater lines
9 -- this is in the area of the emergency feedwater
10 pump house -- was supposed to make a 90-degree bend
11 with, I believe, a weldolet attached to the bend.
12 When I did as-builts on the line, the stamped
13 identification on the fitting was ground out. The
14 whole fitting was ground, as a matter of fact, and
15 the identification was scribed into the piece by
16 hand.

17 The reason I'm concerned about it is
18 that a weldolet or an elbowlet, I believe, according
19 to the catalog cuts I've got, is supposed to have the
20 particular break through its taper in order to give
21 you the concentrated internal pipe, the thicker
22 section at a particular point in the internal wall.
23 This one didn't have that configuration. It was a
24 straight taper all the way out. Have we got a piece

1 that shouldn't be there? Is that an improper piece
2 to be in that location if the welder was called
3 for?

4 MR. DURR: That's a question.

5 MR. RICHARDSON: I can give you a more
6 specific location. It's a general question now.

7 MR. DURR: It's hard for us to answer
8 that question without going out and doing some
9 inspection on it.

10 MR. RICHARDSON: The reason I'm
11 concerned is because the outside contour of the piece
12 doesn't appear to match the product catalog that I've
13 got. The entire surface is ground, and the
14 identifying information is hand-scribed in.

15 MR. DURR: My question is, is this an
16 allegation? Are you alleging that there is a bad
17 piece in that line out there, or are you just
18 concerned and have a question? If it's an
19 allegation, we will go out and do inspections and
20 make sure that's not true. Do you have first-hand
21 information that that's a concern? If you are just
22 asking a question, if this is a question, we will not
23 be able to respond to you.

24 MR. RICHARDSON: I can tell you first

1 hand that the contour of that particular fitting
2 doesn't match the catalog cuts that we were issued at
3 the time, and that the information on it is
4 hand-scribed, as opposed to the factory stamping that
5 could be expected to be there.

6 MR. DURR: You never answered my
7 question.

8 MS. TRACY: It's an allegation,
9 Jacque.

10 MR. DURR: We will treat that as an
11 allegation, and we will do something with it.

12 MS. TRACY: Thank you. Very good.

13 MR. RUSCITTO: But we need more
14 information.

15 MR. DURR: But we need to know exactly
16 where this alleged piece of pipe is.

17 MR. RICHARDSON: The emergency
18 feedwater pump house on the floor that would be at
19 approximately elevation -- what, 25 feet, 28 feet?

20 MR. RUSCITTO: Yes.

21 MR. RICHARDSON: That approximate
22 range. A few steps up from ground level.

23 MR. DURR: And it's on an elbow?

24 MR. RICHARDSON: It's on an elbow

1 where the pipe --

2 MR. RUSCITTO: Do you know what size
3 pipe?

4 MR. RICHARDSON: I believe it's 8 or
5 10 inch.

6 MR. RUSCITTO: Do you know if it's
7 suction piping in the emergency feedwater pump?

8 MR. RICHARDSON: Yes, I believe it is.
9 There are 2 lines directly over each other that come
10 through from the yard, go through the stairwell, and
11 pass through the east wall of the emergency feedwater
12 pump house, go north along the inside of the east
13 wall, and then go west along the inside of the north
14 wall, and then the 2 of them go south in different
15 directions to go to the pumps.

16 MR. RUSCITTO: Okay.

17 MR. RICHARDSON: And it is on the
18 elbow on one of those lines -- I don't know which --
19 where it comes off the wall and goes south to the
20 pump.

21 MR. RUSCITTO: Okay. That's good and
22 specific.

23 What size is the tap?

24 MR. RICHARDSON: I'm not sure. I

1 guess a 1 to possibly 2-inch range.

2 MR. RUSCITTO: We'll take a look at
3 it, but just to tell you off the cuff, that piping
4 probably isn't even there anymore because that whole
5 line was re-designed after -- for totally unrelated
6 reasons, for testing during the start of the test
7 program. EFW research lines were totally changed.
8 So based on what you're telling me, I think we're
9 going to find that that's not even there anymore.
10 But we will take a look at it. That's certainly easy
11 enough to do.

12 MR. DURR: Next?

13 MS. TRACY: Still under document
14 control, the fact that blueprints were not updated,
15 workers in the document control department were
16 untrained, did not know how to read blueprints, and
17 put incorrect numbers on blueprints. There is some
18 documentation of these problems in your own reports,
19 but this information came from someone who worked in
20 the blueprint room.

21 MR. DURR: This was looked at in
22 86-52. I'm almost certain of that. Am I not
23 correct?

24 MS. TRACY: It might have been a

1 slightly different issue.

2 MR. DURR: It sounds familiar.

3 MS. TRACY: I brought this to you in
4 April, and 86-52 was done prior to April.

5 MR. RICHARDSON: I had discussed
6 document control in 86-52, but this --

7 MS. TRACY: This is from a different
8 person, put it that way, someone who worked with
9 blueprints. And it has not been dealt with
10 specifically, although I did give you this
11 information in April.

12 MR. CERNE: Was this related to
13 piping?

14 MS. TRACY: I would say that this is
15 related --

16 MR. DURR: This falls under the same
17 general heading as tracking of blueprints is an
18 impossibility, and drawing revision control was
19 ineffective. The allegor was doing as-built
20 inspection on the fire protection system.

21 Is this the one that you made?

22 MR. RICHARDSON: Not entirely. Drawing
23 revision control was ineffective is me. Tracking of
24 blueprints an impossibility isn't.

1 MR. DURR: But this one we're talking
2 about here, blueprints were not updated, and workers
3 in the document control department were untrained, is
4 that your allegation?

5 MS. TRACY: No, it's not.

6 MR. RICHARDSON: I think what you've
7 done is combined 2 of them.

8 MR. DURR: We did. They all say the
9 same thing.

10 MR. RICHARDSON: That's not all mine.

11 MR. DURR: I understand. All I am
12 saying is, these are all similar issues.

13 MS. TRACY: They are similar, but this
14 particular issue that we're looking at, letter C, was
15 in a statement that was submitted to you in April.

16 MR. DURR: I understand, but how is
17 that different from what we looked at in number 32
18 and 57, those allegations?

19 MS. TRACY: I'm looking at the exact
20 affidavit right now because I think --

21 MR. DURR: It sounds like the same
22 thing.

23 MR. RICHARDSON: What was the
24 allegation number in 86-52?

1 MR. DURR: 32.

2 MS. TRACY: This was Perrini, the
3 document control department of Perrini, and in the
4 permanent materials department keeping track of
5 materials. Whoever it was that asked if this had to
6 do with piping, I don't know if that answers your
7 question.

8 MR. DURR: I think if we had that same
9 allegation when we did 86-52, it would have gone
10 under 32 and 57 where we went back and looked at
11 drawing control.

12 MS. TRACY: In the document control
13 department. So this was for Perrini, and the
14 document control department person in charge was so
15 and so. He was fired after an investigation.

16 MR. DURR: Because to support those
17 other 2 allegations we essentially recounted all the
18 inspections that we've done of document control, the
19 fact, we've done as-builts using independent as-built
20 inspections of equipment, and the fact that we have
21 also done drawing revision control inspections. And
22 in those cases we didn't find any significant
23 breakdowns in the document control process. I don't
24 know what else you can do with that.

1 MS. TRACY: I don't know either,
2 Jacque. I think that we have a disagreement of
3 opinion here.

4 MR. DURR: What's that?

5 MS. TRACY: I think that there are
6 quite a number of people who said that there were
7 problems in that area, and you are looking at it from
8 a different perspective than they were.

9 MR. DURR: That's correct.

10 MS. TRACY: And, therefore, reached
11 different conclusions.

12 MR. DURR: Here again, it goes back to
13 what's there today. Does that plant meet the design
14 drawings? And everytime we go out and inspect it, we
15 find that it does meet the design drawings.
16 Everytime we look in a specific area we find that it
17 meets what it's supposed to meet. That's the bottom
18 line.

19 If these things occurred, and here
20 again, it's speculation whether they did or they
21 didn't, it's hearsay, it's their word against the
22 system. All I'm saying is that we can't find any
23 instances where this resulted in hardware
24 deficiencies in the field. That's what we are

1 interested in.

2 MR. RUSCITTO: Also, all drawings are
3 not either safety related -- not all drawings have
4 the same controls put on them, or some drawings are
5 updated, and some are not, depending on what their
6 purpose is. Lacking some more specifics on which --
7 even the category of drawings, we might be able to do
8 something more with it. To say safety related piping
9 instrumentation drawings, yes, but vendor fabrication
10 drawings may not even be part of the official design
11 process, although the drawings were available on site
12 and were used for a certain period of time.

13 MR. CERNE: Particularly in the area
14 of civil structural, the process of issuing an
15 engineering change authorization, which is a document
16 which changes the design, not in all cases there was
17 an explicit decision made on the ECA as to whether
18 the affected drawing had to be changed or not. When
19 it didn't have to be changed, then that ECA would
20 become part of the design for that what you call
21 blueprint. We call it design drawing. So if you
22 just looked at the design drawing, you wouldn't get a
23 complete picture of what it's supposed to look like
24 out in the plant. You would have to pull out all the

1 ECA's that went along with it. That process of
2 keeping track of those ECA's was done on a computer
3 controlled system which has been inspectioned many
4 times by the NRC.

5 MS. TRACY: D and E sort of reflect
6 the same kind of problem which is the destruction or
7 theft of documents and blueprints and so forth.

8 MR. DURR: That D is blueprints were
9 destroyed in the blueprint room. I believe that.
10 Obsolete revisions should have been destroyed in the
11 blueprint room. Are they alleging that good drawings
12 were destroyed in the blueprint room, ones that were
13 supposed to go to the field that never got there? Is
14 that what they're alleging? All I have here is that
15 they destroyed blueprints. That's like they destroyed
16 money at the mint. Yes, they do.

17 MS. TRACY: The specific allegation
18 was that the people who were working in the blueprint
19 room were getting rather high on controlled
20 substances, and when blueprints came in that they
21 were supposed to make revisions on, occasionally they
22 would say forget it and throw them in the shredder,
23 if that's what it is you have.

24 MR. DURR: That is a possibility.

1 That may be true or untrue. I don't know. What we
2 do know is that there are checks and balances for
3 that kind of thing. There have been instances at
4 other nuclear power plants where people have been
5 found -- they were supposed to be delivering
6 blueprints and were trashing them in the trash can
7 instead. That always gets found because QA does
8 audits of those things to make sure that the stick
9 files are kept up to date, and that the people have
10 the appropriate drawings in the field. So any one
11 individual trying to -- it's like the mailman that
12 doesn't deliver the mail. Sooner or later they find
13 out.

14 MS. TRACY: It might take 40 years,
15 but --

16 MR. DURR: It doesn't take 40 years in
17 a nuclear power plant because we're a lot faster than
18 that. We have found those cases, but there's checks
19 and balances that compensate for that.

20 MS. TRACY: The next item, E, is that
21 there was massive destruction and theft of documents
22 during the 1984 reduction in force according to a
23 former United Engineers and Constructors manager. I
24 put that in here, although you did, I admit, deal

1 with this in report 86-52, simply because it
2 substantiated our contention that document control is
3 ample as a problem.

4 MR. GREENSTEIN: Was that a
5 significant incident? There was destruction of
6 documents; is that correct?

7 MR. DURR: I don't remember the
8 details on that. I didn't do that one.

9 MR. CERNE: No. There was a massive
10 -- in 1984 when they shut down for a period of time,
11 there was a massive layoff. We didn't have any
12 evidence of massive destruction and theft of
13 documents. If people got laid off and they cleaned
14 out their desks, those should not have been any
15 drawings that were other than informational drawings
16 because the controlled stick files and the official
17 drawings were all kept in locked cabinets and locked
18 rooms and so forth.

19 MR. GREENSTEIN: You can't agree with
20 that statement?

21 MR. CERNE: I can agree that probably
22 several documents were taken off site and destroyed.
23 We didn't have any evidence that while they were
24 going through this process that there was any formal

1 design or records or documents that were stolen or
2 destroyed. The licensee would have had to report
3 that.

4 MR. GREENSTEIN: You believe that you
5 have a complete blueprint record then; is that
6 correct?

7 MR. RUSCITTO: We don't have any
8 indication that the official design drawings are
9 deficient in quantity or accuracy at this point.

10 MR. DURR: What, I guess, needs to be
11 pointed out here, and I don't know what the
12 statistics are, periodically we get allegations that
13 are fruitful, that lead us right to the source and
14 they are just exactly as characterized. And those
15 are easy and we can deal with those and correct it
16 very quickly.

17 But a lot of these allegations are
18 like myths. There is enough substance to them.
19 Somebody did see something, but they saw it out of
20 context, or it's been taken out of context, and when
21 we go to investigate, we found that, yes -- a good
22 example is an individual saw a pump that was
23 deficient down in one of the lower levels of the
24 plant. When I went to look at it, yes, the pump was

1 deficient. Yes, the licensee had identified it.
2 Yes, there was a design change in process. Yes, the
3 engineer knew all about and was just ready to discuss
4 it with me. So there was some substance to what the
5 individual had, but he had it out of context. He saw
6 the front part of it, but he never saw the fix.
7 That's what a lot of these turn out to be. They saw
8 the problem, but they never saw the fix. They left
9 or were moved somewhere else and they only saw that
10 little piece of the picture.

11 MS. TRACY: But, Jacque, I have an
12 obligation to bring to you many of these issues.

13 MR. DURR: We appreciate it.

14 MS. TRACY: I have no way of checking
15 myself to see how valid they are, and I have an
16 obligation to bring them to you.

17 MR. DURR: We expect you to bring them
18 to us.

19 MS. TRACY: This is life.

20 MR. DURR: Have we ever discouraged
21 you from bringing us these allegations?

22 MS. TRACY: No, but you do
23 occasionally make little comments about how --

24 MR. DURR: Only because --

1 MS. TRACY: We don't know anything --

2 MR. DURR: No. What I'm trying to
3 point out to you, it's like going to the doctor and
4 he said take 2 of these, and you go home and say I'm
5 not going to take any of them. You don't take the
6 advise once we give it. You bring us the allegation.
7 We go out and do the best job that is possible, and
8 then when we bring them back here, you are not
9 comfortable or you feel uncomfortable and
10 dissatisfied. That's the disconnect that I'm trying
11 to correct. When you bring these to the doctor and
12 he looks at them and says this is okay, then
13 somewhere you have to believe the doctor.

14 MS. TRACY: Well, maybe some day I
15 will, Jacque.

16 MR. DURR: Good.

17 MR. GRAY: Could I add to this E
18 here?

19 MR. DURR: Sure.

20 MR. GRAY: I was on the CAT team
21 inspection that occurred shortly after the big
22 layoff. There were approximately 10 or 12 people in
23 the CAT team. No one came back with an issue that
24 documents were missing. There were items that they

1 were inspecting during the course of that
2 inspection. That was a 4-week inspection. I spent a
3 fair amount of time looking at the ECA's, RFI's and
4 drawings, and did not find a single case of a missing
5 document, ECA or drawing.

6 MR. DURR: The 2-week CAT in '82, when
7 I was up there with a construction team, and Jane
8 Grant was on that, she spent 2 weeks, the woman
9 engineer spent 2 weeks looking at the document
10 control system and she came up with 1 or 2
11 violations, but they were minor things, very minor,
12 not to indicate that the entire system was breaking
13 down, but isolated cases that were obvious that they
14 needed to get the latest documents reviewed. There
15 was nothing to indicate that the whole system was
16 coming unraveled.

17 MR. RUSCITTO: We use this document
18 control system and the change document tracking
19 system. We've been using it for years and years and
20 years, and we never have a problem coming up with a
21 drawing. It's not like there's one master drawing
22 that gets lost. Drawings can be lost and originals
23 can be destroyed, but there is always a copy where
24 you can go back and reproduce it and replace it.

1 There are controlled drawings which
2 have to be updated by the document control system,
3 and there are also drawings called information only.
4 Anyone who needs one goes into the document tracking
5 system, pulls the drawing out. It gets stamped
6 information only, meaning it's current for the time
7 that you got it, but if someone makes a design change
8 next week, they're not going to track you down and
9 update your drawing. When you're done with whatever
10 you were doing, you might throw the drawing away.
11 That could be construed as disposing of drawings or
12 whatever.

13 There's an awful lot of documents
14 floating around, and it's really in the licensee's
15 best interest to make sure that information-only
16 drawings have a very short life, and people aren't
17 using them when they should be using controlled
18 drawings. And as a result information-only drawings
19 are supposed to be trashed as soon as you're done
20 with them.

21 MS. TRACY: I believe that this
22 allegation revolved around the time when
23 Pullman-Higgins was leaving the site and there were
24 apparently some fairly bitter feelings on the part of

1 some of the people who were leaving, at least this
2 was the impression that I was given by the person --
3 or the people who told me this. So it seemed that
4 almost just revenge or something like that that there
5 were documents being destroyed. But you all seemed
6 to have had the documents that you needed to have
7 access to subsequent to that.

8 MR. CERNE: Particularly in the
9 Pullman-Higgins. That's why I asked if it was piping
10 because the piping was as-built and stress
11 reconciled. So any errors that would have been in
12 the plant as a result of some drawing control
13 problems would have evidenced themselves during the
14 as-built process, particularly with piping. There
15 were controls in the other disciplines, but
16 particularly in piping it would be very hard to have
17 a mistake get all the way through the system.

18 MR. DURR: And source design
19 documents, I mean the "original" design documents,
20 those are not in the field available to any one
21 individual to destroy. Those are back in the
22 corporate office someplace. So anything, other than
23 those kind of documents, most of that stuff is
24 replaceable.

1 MR. GREENSTEIN: You can't recall a
2 single instance of where you went looking for a
3 document and it could not be found?

4 MR. CERNE: No. There have been cases
5 of document control errors. We've written them up on
6 violations. We're talking about 26,000 inspection
7 hours over the course of this plant.

8 Using your term again, there has not
9 been anything endemic. And if you tie it
10 specifically to the layoff in '84, this CAT team that
11 Harold participated on, which was consultants and
12 people from Washington, spent time there right after
13 the layoff. It was like April, May --

14 MR. GRAY: We started there the week
15 after the layoff, and then it extended. It was a
16 2-week inspection, followed by a week back in the
17 office, followed by 2 more weeks at the site. We were
18 there almost 2 months.

19 MR. CERNE: I think Harold was looking
20 at design control.

21 MR. GRAY: I was design control and
22 ECA and RFI review.

23 MR. CERNE: That's the best time you
24 could have investigated this question. We weren't

1 doing it for that reason. He was doing the normal CAT
2 inspection function.

3 MR. GREENSTEIN: There was nothing
4 missing?

5 MR. GRAY: No. That area was still
6 staffed with a few people.

7 MS. GENTLEMAN: Just for the record
8 though, statements have been made several times, and
9 just now by you, that the as-built process and so
10 forth would have uncovered any underlying
11 discrepancies in the drawings. It's my understanding
12 from having read the NRC's inspection report
13 regarding Skylar Mitchell's allegations on as-built
14 drawings that were, in fact, discrepancies, although
15 not in your view significant discrepancies between
16 the way the plant looks and the way drawings looked.

17 MR. CERNE: When you talk about
18 discrepancies, all systems that are as-built have
19 criteria within which you build it. Some are
20 acceptable.

21 MS. GENTLEMAN: I understand that --

22 MR. CERNE: When I say discrepancy, I
23 say beyond the criteria that was -- the Skylar
24 Mitchell allegations were investigated and closed.

1 One of the gentlemen that worked on that is in this
2 room right now. None of the discrepancies were
3 beyond the design tolerance, and that doesn't make a
4 discrepancy. That's the point. None of the issues
5 he raised were discrepancies because they were within
6 design tolerances placing the pipe in that particular
7 location.

8 MR. MANOLY: There wasn't a whole lot
9 in the Skylar Mitchell allegation as far as getting
10 anywhere close to a design difference. It was a
11 trivial dimensional difference within the tolerance.

12 MR. DURR: You look perplexed.

13 MS. GENTLEMAN: I am not perplexed. I
14 don't want to debate the Skylar Mitchell issues
15 today.

16 MR. CERNE: They are closed.

17 MR. DURR: But the point being, and I
18 guess something that the world needs to understand,
19 and probably does, but subconsciously, and that is,
20 there are no absolutes. That is to say that when we
21 put 10 feet 6 inches on a drawing, it's physically
22 impossible to make the piece 10 feet 6 inches
23 exactly. It's 10 feet 6 inches, plus or minus
24 something. The plus or minus something is what

1 they're talking about. In the design specifications
2 the plus or minuses, recognizing that there are no
3 absolutes, the plus or minuses cover the
4 discrepancies or the differences that you'll find
5 between what's in the plant and what the
6 specification called for. It falls within that plus
7 or minus value. Skylar Mitchell's problem ----

8 MS. GENTLEMAN: I'm talking about the
9 difference between the drawing and the plant, not
10 between the plant and the spec.

11 MR. DURR: But the drawing is part of
12 that. The drawing is the thing that models all of
13 that. And recognizing that even when you put it on
14 the drawing, 10 feet 6 inches exactly, it may come
15 out 10 feet 6 inches and 1/2, or 10 feet 6 inches and
16 3/4 or more or less. The specification, the design,
17 recognizes there are no absolutes. So it sets
18 tolerances within which they can live because the
19 ultimate goal is to make sure that when they install
20 that piping it fits the structural design analysis.

21 MS. GENTLEMAN: I am understanding
22 that the design has tolerances attached to it. I'm
23 just talking about the difference between as-built
24 drawing measurements and the physical measurements.

1 MR. MANOLY: You might be correct.

2 MS. GENTLEMAN: I'm not debating
3 whether or not those are beyond or not beyond
4 tolerances. All I am picking up is, on the fact
5 issue, that some of the drawings are not as precise
6 as you are alleging they are. Your own inspection
7 report pointed out --

8 MR. MANOLY: I believe there were 4
9 measurements in the report that we said that did not
10 agree with what was shown in the drawing. However,
11 those numbers were all within the accepted
12 tolerances.

13 MS. GENTLEMAN: Fine. That's not the
14 issue. The first point is a simple issue that I'm
15 raising now.

16 I would also note that Skylar
17 Mitchell's work was based on 300 feet of pipe, and to
18 find 4 on 300 feet of pipe --

19 MR. MANOLY: No. The 4 that we are
20 talking about here were based on samples I did and
21 was not Skylar's. It was part of Skylar's other
22 stuff. When I did my inspection, I looked at Skylar's
23 and other things. I went through the other things
24 that were not brought up so I could get a good sample

1 of what the drawings looked like. The 4 I found were
2 really trivial numbers that you can't even get
3 excited about. It was ridiculous.

4 MR. RUSCITTO: Isn't it correct that
5 there is also a tolerance in measurement on
6 as-builts --

7 MR. MANOLY: Yes.

8 MR. RUSCITTO: It's correct to say
9 that an as-built drawing correctly reflects the
10 plant, even though there may be a discrepancy between
11 what is measured in the plant and what is given on
12 the drawing, if what is measured in the plant is
13 within the tolerance accepted to the as-built
14 standards. So you can have a drawing that is as-built
15 as 6 and 3/4 inches, and if you go out and measure it
16 in the plant and it's 6 and 1/2 inches, if that is
17 within the accepted as-building tolerance, that is
18 not considered a discrepancy.

19 MR. DURR: They won't change the
20 drawing.

21 MR. RUSCITTO: It's not worth changing
22 the drawing for 1/4 of an inch because the standard
23 says that when you as-build, you know you're going to
24 be within -- I'm just using a rough number -- plus or

1 minus a half an inch.

2 MS. GENTLEMAN: It depends on what you
3 measure.

4 MR. MANOLY: There is tolerance on
5 measurement of drawings that's accepted for
6 installation. That's much larger. The new guidelines
7 coming out would be that even if the deviations
8 exceed the measurement, but are within the accepted
9 tolerance, the drawing does not have to reflect
10 that.

11 MS. GENTLEMAN: Good.

12 MR. MANOLY: Because they are
13 meaningless. They don't serve any purpose. They
14 just waste time.

15 MR. CERNE: The bottom line is, is the
16 plant built well in accordance with design.

17 MS. GENTLEMAN: I think that's
18 everyone's bottom line.

19 MR. DURR: Did that answer your
20 question?

21 MS. GENTLEMAN: Yes.

22 MR. DURR: Anything else?

23 MS. TRACY: Yes.

24 MR. DURR: Go ahead.

1 MS. TRACY: I would like to leap ahead
2 to page 3 here, under additional issues. Two issues
3 raised since April, 1987, number 1, a crack in the
4 core barrel, and number 2, falsification by a vender
5 of certification required from the manufacturer.

6 I was wondering what kind of progress
7 has been made on these 2 issues. It seems to me that
8 an 18-inch crack in the core barrel would be
9 something you would leap on with all 4 feet, and I
10 was wondering if you had come to any conclusions with
11 that one yet.

12 MR. DURR: This is not part of the
13 87-07, is it, or 86-52?

14 MS. TRACY: It is written into 87-07
15 in response to the letter that I wrote to you, yes.
16 It is contained in the material.

17 MR. DURR: No. I'm saying we didn't
18 inspect this during 87-07; is that correct?

19 MR. RICHARDSON: That's correct. It
20 was brought to the NRC's attention after that
21 inspection.

22 MS. TRACY: And it is included in the
23 response that I sent you. So it is within the
24 purview of this.

1 MR. DURR: I understand, but it's not
2 part of 87-07. We have never gone out and done a
3 formal inspection on that.

4 MS. TRACY: You haven't?

5 MR. CERNE: We've done some inspection
6 on that.

7 MR. DURR: We've done something on
8 that. There's been something done on it, but it was
9 not part of 87-07.

10 MS. TRACY: We've been communicating
11 about it since June. So I figured that you all must
12 have done something.

13 MR. CERNE: I did.

14 MR. DURR: We talked to the guy,
15 didn't we?

16 MR. RUSCITTO: Yes.

17 MR. DURR: The supervisor that was on
18 site that went out with the guy was still on site
19 when we were up there, and you talked to him.

20 MR. RUSCITTO: As soon as we got the
21 allegation I went to the supervisor that he brought
22 out with him to look at the crack on the core barrel,
23 and we discussed the issue. And basically from the
24 NRC's point of view there was no crack. I am not

1 saying that only based on this discussion because I
2 personally inspected the core barrel when it was
3 being installed, and there was no crack in the core
4 barrel as described.

5 The way the supervisor described it
6 as a shimmer, which on polished low alloy steels you
7 get reflections of light, that it could have been
8 misconstrued. But when you went out with the allegor,
9 the allegor was unable to point and identify anything
10 other than a glimmer of light on the piece of metal.
11 The allegor at that time walked away satisfied that
12 there was no problem. Now, he came back to you later
13 on indicating that he still wasn't satisfied.

14 MS. TRACY: He came back to the
15 utility later on.

16 MR. CERNE: There was a third
17 inspection. He went to the EAR program as he was
18 leaving the site, and besides Dave's inspection,
19 besides the inspection done by the particular
20 supervisor of the individual, an EAR individual went
21 out with the gentleman again looking for the crack in
22 the core barrel, and it could not be found. If you
23 looked at the coloration of the core barrel, either
24 sitting in place or moving around on a crane as it's

1 going into the vessel --

2 MR. RUSCITTO: With the bright lights
3 of the containment it's conceivable he might have
4 thought he saw something.

5 MS. TRACY: Yet it was dismissed as
6 something that had been scored and that had been
7 dealt with at one point in their documents --

8 MR. RUSCITTO: I can say unequivocally
9 that his description of that is not accurate to what
10 the core barrel was when I inspected it.

11 MS. TRACY: Did you read the document
12 that was generated?

13 MR. RUSCITTO: Yes.

14 MS. TRACY: And there was nothing
15 about scoring at all?

16 MR. RUSCITTO: Yes, in his affidavit
17 there was. In the affidavits of the people who went
18 out and inspected it, both in his presence and
19 afterwards independently, no one was able to identify
20 either a crack in the zigzag shape which he
21 described, or the stop holes that he said he thought
22 had been drilled in to prevent the crack from
23 spreading. There just has been no substantiation of
24 that issue, and from the NRC's point of view we don't

1 feel that there's anything to pursue that.

2 MR. CERNE: You're right. If we
3 thought there was a crack in the core barrel, we
4 certainly would pursue it.

5 MR. RUSCITTO: You bet.

6 MS. TRACY: It would have been really
7 considerate of you to have gotten back to me, so --

8 MR. CERNE: We have given you the
9 courtesy of incomplete documented inspection
10 findings.

11 MR. RUSCITTO: We don't normally give
12 preliminary inspection findings out.

13 MS. TRACY: So you are going to put
14 this in a report?

15 MR. RUSCITTO: It will be in a future
16 inspection report.

17 MS. TRACY: Okay. Because I had
18 written to Bill Kane a number of times about this,
19 and never heard anything back about it. So I
20 appreciate you're giving me a preliminary.

21 MR. HAVERKAMP: I believe we did
22 respond to that matter. In one of the letters that
23 we sent you this year we also included references in
24 the letter that when you gave us information about

1 the crack in the core barrel, we said that we
2 believed we had enough information to pursue the
3 matter. We did not need anymore information. At
4 that point, as far as our interaction with you is
5 concerned, we had no more questions to ask.

6 MR. RICHARDSON: I think her question
7 or her concern was that we had not been apprised of
8 what your evaluation was.

9 MR. RUSCITTO: That will be included
10 in a future inspection report.

11 MS. TRACY: Do you know when, or do
12 you have any idea?

13 MR. CERNE: No.

14 MR. DURR: I think, for the record,
15 that action that you took was early this Spring.

16 MR. RUSCITTO: It was immediately
17 after we got the allegation because the supervisor
18 was leaving the site --

19 MR. HAVERKAMP: July or August.

20 MR. RUSCITTO: We were able to get to
21 him before he left.

22 MR. CERNE: With some of the issues
23 that are here and how we are going to package this in
24 an inspection report, instead of scattering and

1 shotgunning it today, that's sort of an
2 administrative decision. But to date, these are the
3 inspection findings that we have on this issue.

4 MS. TRACY: You are not going to
5 really go into it any further. I'm just curious
6 because I know that you've put out a couple of
7 inspection reports since you apparently looked into
8 it, and I was just wondering when I would have
9 something to send to this guy, who feels like he sort
10 of put himself out on a limb to bring it up.

11 MR. RUSCITTO: I can't commit --

12 MR. CERNE: That will be an
13 administrative and a management decision.

14 MR. RUSCITTO: Management is trying to
15 make a decision on how to best deal with the
16 remaining issues that have not been put to bed.
17 That's the best I can tell you.

18 MS. TRACY: Management?

19 MR. RUSCITTO: NRC management.

20 MR. DURR: Us. The buck stops here.

21 MR. CERNE: Without belaboring the
22 point, it's consistent with our philosophy to satisfy
23 ourselves that there is not a problem.

24 MS. TRACY: I am sure. I would

1 definitely believe that you would be concerned about
2 this and want to satisfy yourselves.

3 MR. RUSCITTO: I think if there was
4 any indication; that we felt that there was a defect
5 in the core barrel, it would be grounds for
6 significant re-inspection.

7 MS. TRACY: I will get back to him and
8 let him know what the conclusions were.

9 The other item was the falsification
10 by a vender of certification required from the
11 manufacturer. Were you able to look into that?

12 MR. CERNE: That's one, as a matter of
13 fact, when we were going through trying to package
14 your items, where it stood in your November 12th
15 letter 1 through 12, where it stood in the stuff you
16 gave Jacque, A through M, where it stood in previous
17 inspection reports, and to tell you the truth, we
18 couldn't find anything on it.

19 MS. TRACY: You couldn't find it?

20 MR. CERNE: Which issue is it? Can you
21 identify A through M?

22 - - -

23 (Whereupon a short break was taken at this time.)

24 - - -

1 (Ms. Gentleman, Mr. Greenstein, and Mr. Haverkamp
2 excused themselves from the meeting and are not
3 present at this time).

4 - - -

5 MR. DURR: Let's reopen the record.
6 We're back to you, Sharon.

7 MS. TRACY: Tony had asked me, and I
8 understand your question to be, where was this issue
9 raised. And where it was raised was in my answer to
10 some of the questions that Jacque had asked me.
11 Perhaps it was Bill Kane.

12 MR. CERNE: Could you point that out?

13 MR. DURR: In the transcript?

14 MS. TRACY: In the cover letter. In
15 the cover letter to my response to some of those
16 questions there were two issues raised. One was the
17 issue of the crack in the core barrel, and the other
18 was the issue of falsification by a vender of
19 certification required from the manufacturer. Do you
20 see that there?

21 MR. CERNE: Yes.

22 - - -

23 (Mr. Haverkamp is now present at the meeting).

24 - - -

1 MR. CERNE: To answer your question,
2 we haven't done anything with that, and Mass. Gas and
3 Electric is not a safety related supplier. It has to
4 do with turbine building work, and it would be a
5 management decision as to whether we do anything with
6 it at all, given the fact that the vender you are
7 mentioning here is not a safety related supplier.

8 MR. HAVERKAMP: Before we talk anymore
9 specifically on the record, I guess I would like to
10 get a discussion off the record, if I could --

11 MR. RUSCITTO: We are already on the
12 record.

13 MR. HAVERKAMP: I know, but you
14 haven't identified yet the vender. Is that right?

15 MR. CERNE: No. Before you walked in
16 Sharon identified the reason I couldn't find it in
17 the attachment things she put it in the cover letter
18 to the response to Jacques's report. So I was looking
19 for it in the information you gave Jacques on April
20 20th and couldn't find it.

21 MS. TRACY: I see.

22 MR. CERNE: So that's where my
23 question mark drew a blank. Now you've pointed it
24 out to me, and this is the first time I'm looking at

1 it in terms of what we would do, if anything, to tell
2 you right now, just like we did on the core barrel,
3 the status. We haven't done anything with that yet.
4 It will be a management decision whether we do
5 anything with it, given that that, as I know it, is a
6 non-safety related supplier. So the vender
7 application would not require QA.

8 MS. TRACY: And if you need further
9 information, you will contact me.

10 MR. HAVERKAMP: Yes. We would like to
11 discuss this separately because I don't want to get
12 too much information on this record as to what the
13 specifics of the matter are. We will continue the
14 discussion later.

15 MS. TRACY: Okay.

16 Now, there is some issues you wanted
17 to talk about, Don, but are not related to what is
18 right in front of us. Do we want to wait until
19 later?

20 MR. HAVERKAMP: Have we covered all of
21 the issues that you considered important to discuss
22 that were on your agenda?

23 MR. GRAY: I would like to say
24 something about D, 6(D).

1 MS. TRACY: Okay.

2 MR. GRAY: Previously there was a
3 question of 100 bad welds. That was in 1984. It was
4 not on the service water system. It was on piping in
5 the radioactive pipe tunnel. The allegor, when
6 interviewed by our Office of Investigation, said that
7 he did not consider those to be 100 bad welds. He
8 only didn't like them. But he was not of the opinion
9 that they were truly bad welds.

10 What I'm really asking, is D talking
11 about that 100 welds which were not in the service
12 water system, or are you making a claim that there
13 are 100 bad welds in the service water system. I
14 suspect that your answer is going to be that you are
15 not.

16 MS. TRACY: I suspect that your answer
17 is correct; that there was some confusion there.

18 MR. RICHARDSON: One thing that might
19 help clarify that is that that allegor had also
20 discussed with us some welds that -- my understanding
21 of the area he was referring to was service water
22 piping in the yard -- that were also questionable.
23 His specific concern was that the pipe that was being
24 welded had not been adequately pre-heated, and they

1 had problems with condensation gathering in the lower
2 area of the pipe, and this was producing some
3 porosity in the welds. I don't know whether he had
4 also found other problems as well, but I believe
5 perhaps what we've got here is an inadvertent
6 combination of the two. Where we would have a
7 question concerning the service water system, I
8 believe what we would be dealing with is the effect
9 of these welds that he had told us about.

10 MR. GRAY: That's the 3 bad welds that
11 he talked about in the April 20th interview.

12 MR. RICHARDSON: I believe they were
13 discussed in the April 20th interview.

14 MR. GRAY: And we've answered those in
15 the 87-07.

16 MS. TRACY: Yes. You did address that
17 in the 87-07, that's true. You are correct. There
18 is an incorrect mixing of issues.

19 MR. GRAY: 6(D) is no longer a problem
20 from our point of view.

21 MR. RICHARDSON: From our point of
22 view one of your recent reports indicates that there
23 is beginning to be identified a little bit of flaking
24 around some of the repair joints. I believe what was

1 cited specifically was around in the area near the
2 service water valve number D-15. It was one of the
3 most recent reports.

4 Basically our concern, I guess, was
5 whether the effect of the welds that the alleged
6 perceives to be questionable on the integrity of the
7 system would be -- whether the quality of those welds
8 would be affected by the microbiological
9 contamination problem in light of the continuation of
10 flaking.

11 MR. RUSCITTO: I think you've got
12 apples and oranges here. You're talking about weld
13 problems. What you're referring to in our inspection
14 report is liner problems. The fact that that liner
15 is having a problem where the welds are, makes sense
16 because that's the place where the liner was
17 repaired.

18 MR. RICHARDSON: Yes.

19 MR. RUSCITTO: But the flaking
20 problems and any problems that are hypothesized on
21 welds are 2 separate issues. The answer to your
22 question is, no, we don't see that as a problem.

23 Number 2, we've already said that we
24 don't believe that we have a MIC problem in service

1 water anyway. So even assuming there were problem
2 welds, which you have no indication of, we don't see
3 any reason to worry about MIC there at this point.

4 MR. RICHARDSON: Okay. I guess our
5 concern was that if the concrete lining is flaking,
6 does this expose the steel in the pipe.

7 MR. RUSCITTO: Yes. That is of
8 concern to the NRC, but not because of MIC.

9 MP. CERNE: And not because of the
10 weld problem. The pipe is designed to have a cement
11 lining to prevent that from happening. It has
12 nothing to do with any allegation.

13 MR. RICHARDSON: You're aware of it
14 and keeping an eye on it?

15 MR. RUSCITTO: Oh, yes. Unrelated to
16 MIC though.

17 MR. DURR: Is there anything else that
18 you would like to discuss relative to the agenda or
19 the items that are in your November 12th letter?

20 MS. TRACY: I think that generally we
21 have gotten answers to your -- or I would know how
22 you would respond to each item now.

23 So if you would like, we can go back
24 to the process we were going through before we

1 diverted to this.

2 MR. DURR: If you have questions in
3 there, yes.

4 MR. HAVERKAMP: I would suggest that
5 we go back where we left off and at least walk
6 through the issues, and see if there is any
7 additional questions you have.

8 MS. TRACY: Right.

9 MR. DURR: We are just beginning
10 2.1.4. This was the electrical conduit fire. I
11 would like to respond to A of that, because there is
12 difficulty in identifying the location of the conduit
13 there is no guarantee that the appropriate system was
14 examined.

15 Based on the drawing you gave me, and
16 then the subsequent drawing which was made part of
17 the report, and the actual building drawing, I think
18 it's very clear that we have the correct corridor
19 which the allegor was describing because of the lead
20 window that he was talking about, and the door and
21 all those things, and the computer. All of that fits
22 very well. So it's narrowed down to that corridor.
23 I think that's the upside down photograph in the
24 report, my secretary did to me.

1 Needless to say, if you look at that
2 corridor, it's very obvious that there are only a
3 couple of conduits that even remotely resemble the
4 things that he was talking about. So I feel very
5 confident that we are in the right location, and I
6 feel even more confident because of his 20 feet down
7 the corridor that that narrows it down to that single
8 transformer in that lighting distribution panel. So
9 I feel very comfortable that there is no question in
10 my mind that we've got the right location, and the
11 tests that we performed would indicate -- not only
12 did I make them do electrical insulation resistance
13 tests, but I made them take the covers off so I could
14 look inside the conduit where the alleged fire took
15 place. And there was obviously no fire damage in
16 that area.

17 Now, it may have occurred and they
18 replaced it or fixed it, but right now I don't think
19 there is any question that the electrical aspects of
20 that are safe, and there's nothing to be concerned
21 with.

22 MS. TRACY: The issue you raise about
23 them perhaps having replaced it is one that I hadn't
24 considered before.

1 MR. DURR: Assuming the alleged was
2 telling the truth and there was fire in that area,
3 and that was really the only place it could be, then
4 if there was, in fact, a fire, it's been repaired.

5 MS. TRACY: That would explain why you
6 couldn't find any evidence of the fire.

7 MR. DURR: There is no evidence today
8 that there was any damage to the cabling and the
9 wiring.

10 MS. TRACY: Because I'm positive that
11 he's telling the truth.

12 MR. DURR: I don't have any reason to
13 doubt him.

14 MR. RICHARDSON: If any repair work
15 had been done, would it be documented?

16 MR. DURR: I don't know that because
17 that's non-safety related stuff. It's a lighting
18 transformer. It provides no safety function. Very
19 little equipment in that building is safety related.
20 I think that's a correct statement. There are only
21 one or two components in that building that are
22 safety related at all.

23 Anything else on 2.1.4?

24 MS. TRACY: No.

1 MR. DURR: 2.1.5, this is the
2 emergency feedwater system.

3 MR. RICHARDSON: The first time that
4 question was discussed it was in 86-52. Some of the
5 aspects of the concern I raised did not appear to
6 have been addressed, specifically with regard to the
7 emergency feedwater pumps. I was concerned that they
8 were both in one room with no barrier between them to
9 prevent fire from damaging both units.

10 MR. DURR: That particular aspect was
11 written up in the safety evaluation report. It was
12 reviewed by the licensing arm of the NRC. They use
13 the standard review plan which is a document that
14 says look at A, B, C, D, and tell the reviewer
15 exactly what to look at. Then if there are any
16 deviations from that, we have to resolve them. That
17 took place. That is documented. It's put out in a
18 new reg, and I forget the number of it. But anyway,
19 that design aspect of the fact that both pumps were
20 in the same room was looked at and accepted. So a
21 technical expert has reviewed it and accepted it.

22 MR. RICHARDSON: As my understanding
23 goes -- correct me if I'm wrong -- but that was
24 accepted on the basis of the start-up feedwater pump

1 being available to perform emergency feedwater
2 function?

3 MR. RUSCITTO: Not exclusively.

4 MR. DURR: Not exclusively, but that
5 was a consideration. It was a consideration, but not
6 the sole consideration.

7 MR. RUSCITTO: There is no requirement
8 that emergency feedwater pumps be in separate
9 buildings. I don't know of any nuclear power plants
10 that have emergency feed pumps in separate buildings.

11 MR. CERNE: There are other --

12 MR. RICHARDSON: Is there a
13 requirement for a fire barrier between them?

14 MR. CERNE: No. They are allowed to
15 be in the same fire zone if it's a low --

16 MR. RICHARDSON: Low fuel.

17 MR. CERNE: Low fire hazard area.
18 There are separation constraints, and it is tied
19 somewhat to the start-up feed pump, but not
20 exclusively. That is in accordance with design. That
21 design has been reviewed by our experts in
22 Washington, and it's been built in accordance with
23 that design.

24 MR. RICHARDSON: I'm aware that you've

1 approved the set-up as it is, but I'm still concerned
2 in that the start-up feed water pump apparently is
3 not constructed to seismic standards.

4 MR. DURR: Let's address that
5 question. You have to understand that the emergency
6 feedwater pumps are the primary source of emergency
7 feedwater.

8 MR. RICHARDSON: Yes.

9 MR. DURR: And they are seismically
10 qualified, and they are capable of performing.

11 With that issue solved, we don't even
12 take credit for the start-up feedwater pump. So why
13 does it become an issue?

14 MR. RUSCITTO: If it's a matter of
15 your personal technical opinion, that's different
16 than not meeting established criteria. I think
17 that's the point here.

18 MR. RICHARDSON: It could be. I'm not
19 comfortable with it. It doesn't appear to be the
20 best possible set-up.

21 MR. DURR: You can't come up with a
22 scenario under the design criteria where that's
23 unacceptable. That's what you have to come up with.
24 That's the case you have to make. Would the design

1 criteria present a scenario where that doesn't work?
2 Do you see what I'm saying?

3 MR. RICHARDSON: Yes.

4 MR. DURR: Because the first thing I
5 have to do is, I have to lose my main feedwater
6 pumps, and then I have to be on emergency feedwater,
7 and now I've come up with a scenario where I end up
8 losing both of my emergency feedwater pumps, and we
9 can't do that under a "credible" accident scenario.
10 That's the criteria that we're working from. That's
11 the rationale that was driving all of this. You have
12 to come up with why can't it work. Then once you can
13 do that, then it may need redesign.

14 MR. RICHARDSON: Okay.

15 MR. DURR: Next? Is that it with that
16 issue? Any other questions?

17 MS. TRACY: No.

18 MR. DURR: Moving on to 2.16. No
19 present comment. Okay.

20 The same way with 2.17.

21 MS. TRACY: 2.17 was dealt with.

22 MR. DURR: Under 2.4. I understand.
23 2.18, we're back to cold pulling.

24 MS. TRACY: Cold pulling. We already

1 dealt with the issue of the 13 stage.

2 MR. RICHARDSON: I'm concerned about
3 your analysis of the cold pulling problem that was
4 presented to you. You have discussed the one
5 instance of cold pulling that was documented at the
6 plant. A number of the people that we've talked to
7 have said the same thing, and judging from their
8 descriptions they don't appear to be talking about
9 that same incident.

10 Now, the analysis that you appear to
11 be relying on to say that cold pulling was not a
12 problem, appears to address only the use of what was
13 called the Dearman clamp; that 70 sub-systems were
14 analyzed to see if the stresses put on them by the
15 Dearman clamp would be excessive. The problem is
16 that most of the people that have contacted us about
17 cold pulling haven't been talking about that clamp.
18 They've been talking about comealongs and chainfalls
19 and the like, and you haven't got a 1 1/4 inch -- you
20 haven't got a positive stop at 1 1/4 inch of travel.

21 MR. DURR: I'm going to probably open
22 my mouth and put my foot in it, but let me try to
23 address that. This is really Kamal's area. But the
24 70 analyzed cold pulling scenarios done by the

1 licensee did not involve the Dearman clamp. Those
2 were 2 separate issues. The Dearman clamp was one
3 thing, and the 70 analyzed cold pulling situations
4 were another. They were totally separate issues.
5 They were talked about in the same breath because
6 somebody, and I think it was David Day, made some
7 remark concerning using Dearman clamps and squeezing
8 pipes out of round and all of those kinds of things.

9 That was one issue that we addressed,
10 but the separate issue was that the thing that
11 umbrellas all of those cold pulling instances, if
12 they did occur, was the fact that the analysis that
13 the licensee did shows very conclusively that you
14 would have had to cold pull excessive amounts before
15 you would exceed what is allowable. Is that a good
16 characterization?

17 MR. MANOLY: Yes.

18 You brought up, I think, 3 different
19 examples of what you characterized as cold pull. One
20 is the CBS piping --

21 MR. RICHARDSON: That's not one of
22 mine.

23 MR. DURR: No. That was David Day from
24 40 feet up.

1 MR. MANOLY: If you read what we wrote
2 here on that particular piping, and the flanges were
3 -- I believe in that piping that the weld was done
4 after the --

5 MR. DURR: The weld that he was
6 talking about was done, and then the flanges were
7 made up. So there's no way that that could have been
8 a cool pull situation. If it would have been cold
9 pulling, it would have jumped, and they didn't have
10 any problem with that.

11 MR. RICHARDSON: I can't really say
12 anything about that because that's not something I
13 know personally.

14 MR. DURR: That brings up a very good
15 point. In the service water piping where there was
16 alleged cold pulling they went back and took bolts
17 out of a lot of this piping, and they didn't have any
18 instances of the piping jumping around.

19 MR. MANOLY: 30 valves.

20 MR. DURR: That's a good indication.
21 Had they had excessive cold pulling in those systems,
22 they would have had trouble getting the bolts back in
23 those things, and that wasn't the case.

24 MR. RICHARDSON: Is the area in which

1 he was talking about cold pulling close enough to the
2 valves that any stresses that were being incorporated
3 would have made themselves known when the valve was
4 disassembled?

5 MR. DURR: The valve was not that far
6 from the flange. It's in the picture.

7 MR. MANOLY: It's very close to the
8 tank.

9 MR. GRAY: It's close for reassembly.

10 MR. DURR: I remember taking the
11 pictures. That's my photography. This picture here,
12 see the valve? That's a CBS line.

13 MR. RICHARDSON: The service water one
14 is a different one.

15 MR. DURR: Yes. The service water
16 one, that's a big 30-inch line or something like
17 that.

18 MR. RICHARDSON: Okay.

19 MR. DURR: We have pictures of that
20 one too.

21 MR. RICHARDSON: I remember there was
22 some question in Mr. Day's opinion as to whether you
23 had looked at the area that he had told you about on
24 that. I'm not exactly sure. I don't think I should

1 be asking questions about it.

2 MR. DURR: This picture here is in
3 inspection report 84-- whatever it was -- 06 or 07.

4 MS. TRACY: 84-12.

5 MR. DURR: This is the same picture
6 that was in the other report, and he said, see that
7 picture. That's the area I was talking about. We
8 not only looked then, but we looked at it in this
9 report also. The bolts were removed, and that plate
10 didn't jump.

11 MR. MANOLY: In '85.

12 MR. RICHARDSON: Okay, if that's what
13 he said.

14 The reason I was concerned about your
15 analysis, or I guess the utility's analysis of cold
16 pulling, is that perhaps in the way the inspection
17 reports have been written, where you've handled the
18 subjects as far as our concerns, the appearance was
19 that you were relying on an analysis that was based
20 strictly on the use of the Dearman clamp.

21 MR. DURR: No.

22 MR. RICHARDSON: If that's not the
23 case, I would appreciate a clarification.

24 More specifically, there is a report

1 that was done by, I guess, a consultant group to the
2 plant in 1982. It was done basically to INPO
3 guidelines, and it's in the Local Public Document
4 Room under a cover letter by you that refers to it as
5 INPO report. But there is a citation in that report
6 that there were a number of non-conformance reports
7 written in early 1982 that dealt with cold pulling.
8 The specific area in which the report was discussing
9 those was in a concern as to a lack of trending of
10 problems to identify recurring deficiencies.

11 Given that this is criticized in that
12 area in that report, and given that your report
13 appeared to be relying on analysis of stress induced
14 by Dearman clamps, my concern there was whether the
15 utility had adequately investigated the problem and
16 the use of other equipment. Have you reviewed the
17 INPO report?

18 MR. DURR: Have I personally? No.
19 Let me respond to it. You guys correct me if I'm
20 wrong, but I think I understand the question.

21 It goes back to the fact that UR&C
22 imposed originally a very strict, unreasonably tight
23 cold pulling tolerance on the piping systems. This
24 made it almost impossible for the people in the field

1 to make a fit-up where they didn't violate it.
2 Therefore, it generated an enormous amount of
3 non-conformance reports because QC was doing their
4 job writing up cold pull when they found it. So this
5 only supports our argument that QC was doing their
6 thing.

7 Subsequent to that, much later, they
8 recognized that those cold pulling tolerances were
9 unrealistic, and they generated a more realistic set
10 of cold pull tolerances. But during that period
11 where they had these unrealistically small cold pull
12 tolerances QC was writing them up like they were
13 supposed to. They were doing their job. This
14 generated an enormous amount of reports.

15 Now, I suspect that this is what INPO
16 is talking about. They've got all of these
17 non-conformance reports, and nobody is trending them.
18 It's QA doing their job which, I guess INPO's concern
19 would be, is putting an unnecessary load on QC, and
20 somebody ought to look at the root cause and fix
21 whatever the root cause was. Am I in the ballpark?

22 MR. MANOLY: Yes.

23 MR. DURR: So that's the way I
24 understand the story. I think that's what we say in

1 87-07, is essentially that they unnecessarily
2 restricted themselves, and under today's 20/20
3 hindsight they should have had a much more liberal
4 tolerance on cool pull, and that would have done away
5 with a lot of those non-conformance reports.

6 MR. RICHARDSON: How does that square
7 with the information you put in 86-52 where the
8 people who were identifying cold pulling pipe were
9 unaware of the prohibition against it where --

10 MR. DURR: Wait a minute. That
11 statement didn't make any sense. You may want to
12 rephrase that. You said that the people that were
13 identifying cold pulling were unaware of it. If they
14 were identifying it, they must have been aware of it.

15 MR. RICHARDSON: There's a difference
16 between the people identifying the problem and the
17 people who were actually doing the installation work.

18 MR. DURR: Who do you mean by the
19 people actually doing the installation work?

20 MR. RICHARDSON: Let me see if I can
21 find this thing.

22 MR. CERNE: While he's doing that let
23 me clarify one point. The Dearman Clamp issue was
24 related to the 70 systems in the common thing,

1 50.55(e). When the licensee identified under
2 50.55(e) that they had exceeded the tolerance on the
3 Dearman Clamps, they went back and analyzed the 70
4 systems that could have been affected, and did an
5 engineering analysis of each one, taking the worst
6 case situation that the plant could have applied to
7 that pipe and dispositioning it as not being
8 detrimental to the stresses in the pipe.

9 What you said was also correct
10 though. The thing they did in tracing the ELP
11 allegation was separate from that, as was your
12 investigation. So there were 2 separate
13 investigations, but their investigation of these 70
14 systems was related to the 50.55(e) which was related
15 to the use of the Dearman clamp.

16 MR. MANOLY: It has two functions.
17 One is to -- mainly it's to bring together the 2 ends
18 of the pipe. The allegation was that the Dearman
19 clamp would change the cross section of the pipe on
20 one end. That's one issue.

21 The other issue is that when the
22 clamp brings the 2 ends together that have to get
23 welded, that it might have brought it more than the
24 tolerance of 1/8 of an inch. And the maximum that

1 the pipe can handle is 1 1/4 inch. They took the 1
2 1/4 and applied it to those 70 systems, and tried to
3 determine how acceptable these systems are. That's
4 what our report addressed here.

5 MR. RICHARDSON: How do you come with
6 out of 70 sub-systems, you've got a total 88 on the
7 graph --

8 MR. MANOLY: That system involves many
9 piping systems. The piping system is not just one
10 row of pipe.

11 MR. RICHARDSON: Any one of those
12 could have been broken down into a number of
13 components.

14 MR. MANOLY: Yes.

15 MR. RICHARDSON: The citation I'm
16 talking about is partially on page 74.

17 MR. DURR: Of which report?

18 MR. RICHARDSON: Of 86-52.

19 It doesn't specify who identified
20 that particular incident, but in the discussion it
21 mentions some degree of unawareness by the piping
22 contractor, and again, it doesn't specify the exact
23 nature of the cold pulling prohibition.

24 MR. CERNE: That was one of the things

1 we cited with the problem with Pullman-Higgins in one
2 of our SALP reports.

3 MR. RICHARDSON: Is that the
4 construction practices --

5 MR. CERNE: Yes, contrary to specs,
6 acknowledged specs. That was one of the reasons it
7 contributed to their 3. The resolution of the
8 50.55(e) and the Dearman clamp issue has, again going
9 back to our basics, resulted in a plant that is built
10 properly.

11 MR. RICHARDSON: The problem with the
12 Dearman clamp analysis that I have is that it doesn't
13 take into account any possibility that anyone was
14 using any other equipment. The other people that
15 we've talked to, they say comealongs, they say
16 chainfalls. I saw a chainfall being used in the
17 turbine building.

18 MR. CERNE: They analyze safety
19 related systems because we're not concerned with
20 non-safety systems.

21 MR. RICHARDSON: Wait a minute. If
22 that's indicative of the same practices that were
23 used in the safety system --

24 MR. RUSCITTO: It isn't because --

1 MR. CERNE: When you talk about
2 turbine building work and non-safety work, you can't
3 naturally draw a conclusion over on the safety side
4 because there is no QA involved there. There is no
5 independent look at whether people are violating
6 procedures or not.

7 MR. RICHARDSON: Was the cold pulling
8 prohibition in effect for both the B31.1 and the ASME
9 systems?

10 MR. CERNE: Yes.

11 MR. RICHARDSON: So if I've seen
12 somebody trying to force a pipe into place with a
13 chainfall on a B31.1 line system, is it inconceivable
14 then that given that you've got a contractor that is
15 not fully familiar with the specs, that the same
16 thing could not have occurred in the safety systems?

17 MR. CERNE: It's not inconceivable,
18 but based on our evaluation of the QA program we
19 believe that the QA would have caught that because
20 that was one of the things they were looking for in
21 fit-up. They had to do fit-up inspections for every
22 weld.

23 MR. DURR: You have to understand that
24 the difference here is that there is a quality

1 assurance/quality control program over the safety
2 related, and there is none or very little over the
3 non-safety related. So that if those practices were
4 being employed in the non-safety related, that's one
5 issue. But if it's being employed in the safety
6 related, you have the factor of quality
7 control/quality assurance that's preempting all of
8 that, as evidenced by all the non-conformance reports
9 that were written against cold pulling.

10 MR. MANOLY: Closure welds on safety
11 systems are witnessed at the hold point at the fit-up
12 and --

13 MR. RICHARDSON: Do you check at that
14 point to be sure, or do they --

15 MR. MANOLY: That's what hold point
16 means; that the QC would be there. It is not a
17 requirement on non-safety closure welds.

18 MR. CERNE: They have to be there for
19 the fit-up and tack process.

20 MR. MANOLY: We state in our report
21 that the requirement for a cold pull was addressed as
22 early as 1978 because I saw a revision of that
23 procedure, X9, Pullman-Higgins. The requirement for
24 cold pull was established since 1978.

1 MR. RICHARDSON: Whose personnel were
2 responsible for witnessing a closure, the fit-up at
3 the closure weld? Was that the piping contractors?

4 MR. CERNE: Pullman-Higgins level 1
5 QC inspectors, as audited by Yankee level 2
6 surveillance inspectors and by Yankee Framingham
7 auditors.

8 MR. RICHARDSON: And the auditors
9 only --

10 MR. CERNE: Surveillance does a
11 sample, and the QC inspectors do --

12 MR. RICHARDSON: I was working for
13 Pullman at the time, and I was trained at about the
14 time just before this incident occurred and --

15 MR. DURR: I think I know where your
16 question is going.

17 Let me go back to a point that I
18 wanted to make before. Within the construction group
19 there are selected people who have to know that cold
20 pulling is a requirement -- or that the constraints on
21 cold pulling are a requirement, and that's the
22 engineers, the superintendents, the foremen, and the
23 people that are supervising the work in quality
24 control. Now, have any of the alleged fallen into

1 that group? Because those are the people who are
2 responsible for implementing those specifications and
3 drawings and procedures. It's the supervisory group
4 that has to know.

5 So for us to make a determination
6 that nobody knew about it, you have to look at that
7 population. Just because a pipe fitter didn't know
8 there was a prohibition against cold pulling, he's
9 working under the supervision of a foreman at GF, or
10 a foreman or a superintendent, and the fact is,
11 that's the guy that blew the whistle on cold pulling
12 in the feedwater piping. It was a superintendent.
13 It's those people that are responsible for the
14 implementation.

15 So if it's not that population that
16 you're talking about, it's conceivable that there are
17 people out there who didn't understand the
18 restrictions on cold pulling. Until you start
19 talking about that population, it doesn't have any
20 meaning to us. Those are the people I really need to
21 know.

22 MR. RICHARDSON: So the evaluation
23 that's cited in here was done strictly for the
24 effects of the Dearman clamp; is that correct?

1 MR. GRAY: That's incorrect.

2 MR. MANOLY: No, that's not correct.

3 We said that the maximum movement of the 2 ends of
4 pipe that would be welded would be 1 1/4 inch. That's
5 why we evaluated 70 systems with a maximum of 1 1/4
6 inch movement.

7 MR. RICHARDSON: But you didn't
8 consider any movement beyond that?

9 MR. MANOLY: Because the Dearman clamp
10 cannot be closer than -- you can't use it if it's
11 more than 1 1/4 inch.

12 MR. DURR: Now you've got me curious.
13 This table indicates that the maximum cold pull in
14 inches exceeds the 1 1/4 by this much. That's your
15 question, right, why these numbers go beyond 1 1/4
16 inch?

17 MR. RICHARDSON: No. Look at it the
18 other way.

19 MR. MANOLY: The number of systems.

20 MR. RICHARDSON: The number of
21 systems.

22 MR. DURR: I understand that, but your
23 question was, it only addressed the inch and 1/4.
24 What I am saying is, this indicates that you could go

1 well beyond an inch and 1/4 in a lot of systems, and
2 it wouldn't not make any difference either, whether
3 you used a Dearman clamp or what you used.

4 MR. RICHARDSON: In some, but not
5 all?

6 MR. DURR: In some, but not all. You
7 can see the distribution here. It's way over. It
8 exceeds its 3 1/2 inches and beyond in most cases. I
9 think that may be part of the answer to your
10 question.

11 MR. HAVERKAMP: What table are you
12 referring to, Jacque?

13 MR. CERNE: Those aren't examples of
14 cold pull. Those are examples of what the design
15 allows for --

16 MS. TRACY: Shall we move onward?

17 MR. DURR: The next one, 2.1.9.

18 MS. TRACY: I would say on this issue
19 the question is, what are the causes of the
20 problems. The reason we're asking the question is
21 that the concern that was raised about grit in the
22 valves was said to be a negligible concern. However,
23 there was further failure of valves. So we're asking
24 the cause of those failures to see if the concern we

1 raised corrolates with them.

2 MR. DURR: These were later inspection
3 reports. I guess, Harold, this is your stuff.

4 MR. GRAY: Yes.

5 First, there is very negligible grit
6 that has been found in the service water system. The
7 source of water for the service water system is such
8 that it's unlikely to draw grit in from the outside.

9 The failure in the valve seats is not
10 due to grit, but was due to a design problem. If
11 this was a section of the valve, it's the inner
12 section of the curved surface that's rotated 90
13 degrees into a flat section that caused some abrasion
14 and eventual tearing of a very small portion of the
15 rubber liner. So it was completely unrelated to
16 grit, but that is explained in the later inspection
17 report.

18 MS. TRACY: So that's talking about
19 the wear in the valve body liner?

20 MR. GRAY: That's right.

21 MS. TRACY: Does that also refer to
22 the generic problem with the 30 Fisher valves, or was
23 that caused by a different problem?

24 MR. RUSCITTO: That is the 30 Fisher

1 valves.

2 MR. CERNE: The Fisher valve problem
3 is the valve liner problem.

4 MS. TRACY: So these 2 different
5 reports are talking about the same valves.

6 MR. CERNE: We have several reports
7 that address that issue.

8 MS. TRACY: So that's basically a
9 manufacturing problem, rather than a problem with
10 something from the outside?

11 MR. DURR: It's in the original design
12 of the valve, that's correct.

13 MR. RICHARDSON: I've got a question
14 for you in relation to that. One of your reports on
15 that subject notes that Yankee had not, at the time
16 at least, made formal notification to the
17 manufacturer that this problem had been discovered.
18 And in the discussion at the SALP meeting with the
19 licensee back a month or so ago, somebody -- was it
20 Mr. Kane? -- got into a discussion in the area of
21 the steam powered emergency feedwater pump,
22 questioning again whether Yankee had been in touch
23 with other plants or with the manufacturer as to how
24 to handle that particular situation.

1 Is this problem with passing on
2 communication back and forth when they find a problem
3 of some degree of severity? Is that a matter of
4 concern to you? What do you plan to correct that?

5 MR. CERNE: If they violated the Code
6 of Federal Regulations, we would write a violation on
7 it.

8 On the original problem of the Fisher
9 valve seats, they reported it under a 10 CFR 50.55(e)
10 and they made a valid report, and the corrective
11 action was tracked under that mechanism. When the
12 problem recurred more recently, they reported it
13 under 10 CFR Part 21. That was the regulatory
14 reporting requirements. So there wasn't any evidence
15 where they had violated reporting requirements.

16 MR. RICHARDSON: Is the notification
17 or discussion between the manufacturer and the
18 utility, or from one utility to another, is that a
19 requirement, or is that merely recommended?

20 MR. DURR: It's only required to
21 report it to the NRC. We look for generic problems
22 also.

23 MR. RUSCITTO: That was a
24 recommendation made by one of our specialists.

1 MR. CERNE: But the reporting
2 requirement under the original problem, the Fisher
3 valve seat problem, was reported under 50.55(e). They
4 met their regulatory requirements, and it is the
5 NRC's job to do something with that. If it was a
6 generic problem, there wasn't any evidence of it at
7 the time.

8 MR. DURR: Next issue?

9 MS. TRACY: 2.2.0.

10 MR. DURR: We've discussed that one,
11 haven't we? Is that the one where we decided we had
12 mixed 2 issues together?

13 MS. TRACY: Yeah. I would say that
14 they aren't necessarily mixed here. Maybe I could
15 use a little clarification.

16 MR. DURR: This is the one that's
17 addressed in inspection report 84-12.

18 MS. TRACY: Right.

19 MR. DURR: We have already addressed
20 that. Are there any questions concerning it?

21 MS. TRACY: Yes. There's a couple of
22 questions. One is, it's being downgraded in safety
23 requirements when the bad welds were discovered. The
24 other question has to do with the OI report, and

1 perhaps Harold can explain again why the OI report is
2 not applicable to these welds.

3 MR. GRAY: First, the 100 poor welds
4 in the service water system are not in the service
5 water system, if we're discussing the OI report.

6 MS. TRACY: Okay. They're in the
7 radioactive pipe tunnel?

8 MR. GRAY: That's right.

9 MR. CERNE: Which were the subject of
10 the 84-12 inspection, and they were never downgraded
11 because they were safety related. That was addressed
12 in that report also. That's the David Day
13 allegations that have resurfaced exactly verbatim.

14 MR. GRAY: The OI report includes an
15 interview of the person that David Day received his
16 allegation from.

17 MS. TRACY: Right.

18 MR. GRAY: When OI interviewed that
19 person, that person said that he did not have a
20 problem with the 100 welds because they were bad. He
21 had a concern about them with respect to the internal
22 surface, but he did not consider that the welds were
23 bad. The exact verbage is available in our OI
24 report, but it leads us to conclude that there was

1 nothing to follow at that particular item.

2 MS. TRACY: When you say the inside
3 surface is bad --

4 MR. GRAY: He had a concern with the
5 automatic welding process and its fusion of the K
6 insert for the route pass of the weld, and he only
7 had an opinion that there was a problem there, but he
8 did not know for a fact that there was a problem. In
9 84-12 we looked at some of those welds on the inside
10 of the pipe with mirrors and did not find a problem.

11 MS. TRACY: So it's a presumption on
12 his part that this particular equipment didn't do the
13 job properly. But when you looked at it with
14 mirrors, you felt that he was wrong in his
15 assumption.

16 MR. GRAY: That's true. But more
17 importantly, he didn't feel that there was actually a
18 problem, the allegor. When the allegor was
19 interviewed in detail, he concluded that there was
20 not a problem.

21 MR. DURR: Anything else?

22 MS. TRACY: I would say not.

23 MR. DURR: On 2.2.1 you didn't have
24 any questions. Do you have any questions now? We

1 addressed that in 2.4.

2 MS. TRACY: Right, we did.

3 MR. DURR: 2.2.7 was on the pump.

4 MS. TRACY: This was the issue I think
5 you referred to earlier, Jacque, where you said that
6 it was something that the engineers were well aware
7 of, and were working on and so forth. I was
8 wondering about a timing discrepancy here, how soon
9 they caught on, if they knew right away that there
10 was a problem, that kind of thing.

11 MR. DURR: No. They knew very well
12 that there was a problem. Part of the solution to
13 the problem was a redesign. That was the time
14 element. They had to go back to the manufacturer and
15 redesign some of these supports to accommodate the
16 system.

17 MS. TRACY: That's what took so long.

18 MR. DURR: Yes. But here again, these
19 are non-safety related components.

20 MR. RUSCITTO: I was personally aware
21 of this issue long before it was brought up as an
22 allegation, and as soon as the words came out in the
23 allegation, I was able to steer Jacque to the exact
24 room where it was. We've been following it only from

1 an interest point of view because of it's non-safety
2 classification.

3 MS. TRACY: On section 2.3.1 the
4 concern was that there was a structural problem that
5 was apparently discovered by the Nuclear Regulatory
6 Commission, and came up when we raised the issue of
7 the wracking of the building which you pretty much
8 dismissed, but it was a concern that this lack of
9 structural integrity was discovered by the NRC rather
10 than --

11 MR. DURR: We did our job.

12 MS. TRACY: You certainly did,
13 Jacque. I'm sure Tony and Dave did too.

14 MR. DURR: Yes.

15 MS. TRACY: However, it seems that you
16 all had to do the job because the licensee did not,
17 if you understand what I'm saying. And for that
18 reason this was raised as a further example of the
19 fact that the utility is not necessarily as careful
20 as might be expected.

21 MR. DURR: That's why we have a job.
22 That's one of the reasons that we are here, is to
23 make sure that the licensee complies with Code and
24 Federal Regulations, and where they don't, we force

1 them to.

2 Now, if we felt it was a wide-spread
3 problem, then we would have taken different action
4 obviously. But this is a very focused look at a
5 particular structure, and I would have to defer to
6 Kamal because this is really his area. But it's an
7 approach method, and sometimes engineers take
8 different approaches, and you have to call that into
9 question, whether it's a good judgment. I don't know
10 in this particular case what the implications were.

11 MR. MANOLY: The staff had
12 disagreements with the licensee design engineer, at
13 that time UE&C, about the methods of incorporating
14 the properties of the structure -- the concrete, not
15 the steel. The issue was about steel changes. The
16 steel has no influence on the validity of seismic
17 analysis. To put your mind at ease, there is no
18 relation. Steel contributes almost nothing to the
19 seismic analysis. It's the concrete. The analysis
20 was primarily on the concrete part. It was
21 identified in the IDI inspection, and the purpose of
22 that, you do the IDI early enough in the process so
23 that the staff will have a good feel of which way the
24 architect or engineer is going with the analysis of

1 the structures. Like Jacque said, it was caught and
2 addressed.

3 MR. CERNE: Another factor, the IDI,
4 we picked this out specifically out of the area, but
5 if you go to the summary of the IDI, it clearly
6 states what the purpose of that entire inspection was
7 and what the results were. You will find that the IDI
8 records the NRC's overall result of that inspection
9 which is a plant in general compliance with the
10 design, and built in accordance with that design.

11 MR. DURR: This wasn't the only area
12 looked at.

13 MS. TRACY: I realize that.

14 MR. MANOLY: The plant, they have gone
15 beyond typical normal practice in some of the other
16 seismic analyses, way beyond even our requirements
17 that I know of.

18 Do you have any other questions?

19 MS. TRACY: At this point I'm not sure
20 that I do.

21 MR. DURR: As I have written down
22 here, we owe you an answer on the acceptability of
23 the reactor coolant pump levelness after heat up. We
24 owe you -- or you owe us the CBA drawings for

1 non-seismic versus seismic.

2 MR. RICHARDSON: Will you give us an
3 answer on that when you've had a chance to
4 investigate that one?

5 MR. DURR: Yes.

6 MR. RICHARDSON: There's quite a
7 discrepancy between your statement that that was
8 seismic qualified, and the papers I have that say it
9 wasn't.

10 MR. DURR: We can give you an answer
11 on the question, if it's only a question.

12 MR. RICHARDSON: I think I would
13 prefer to word it as an allegation.

14 MR. DURR: No. We will make that
15 determination. Once we get the paper & if it
16 conclusively establishes that it says non-seismic on
17 your drawings, and we say seismic in the report, that
18 will make it an allegation. And then we will do
19 something with it in the normal allegation process.

20 But if we don't find that
21 discrepancy, or it's a simple answer, we will give
22 you the simple answer.

23 I assume you want those drawings
24 back. I sent them back to you once before.

1 MR. RICHARDSON: I can make copies. I
2 don't need them back.

3 MR. DURR: Fine. Just so they're
4 legible.

5 And then we have an allegation, a new
6 allegation on the EFW weldalet, on a 8 to 10-inch
7 line, wrong paper configuration, and scribed
8 identification number?

9 MR. RICHARDSON: That's correct.

10 MR. DURR: And we will respond to
11 that.

12 MS. TRACY: There was one other
13 issue.

14 MR. DURR: Okay.

15 MS. TRACY: Scott Kennedy raised this,
16 and he raised it in our April meeting as well. I
17 think that in the transcript from our April meeting
18 it's identified more clearly, but he referred to some
19 seismic restraints that were put in backwards.

20 MR. DURR: Yes. I went down there and
21 looked in the area that he said, and we couldn't find
22 anything.

23 MS. TRACY: Nothing?

24 MR. DURR: We couldn't find a thing.

1 MS. TRACY: No seismic restraints?

2 MR. DURR: He's going to have to give
3 us a much better description on what his concerns are
4 because I looked at the bottom of about 3 or 4
5 different stairways in the containment building, and
6 I couldn't find anything. If there is anything
7 there, we need additional information. But, yes, I
8 looked at that. The fact is, I took pictures of that
9 whole area down there.

10 MS. TRACY: Did you?

11 MR. DURR: I couldn't find anything.

12 MS. TRACY: No seismic restraints?

13 MR. DURR: No seismic restraints.

14 MS. TRACY: I'll get back to him on
15 that.

16 MR. DURR: He'll have to give us some
17 more information on that.

18 MR. HAVERKAMP: Are there any comments
19 regarding the Appendix B items, points 1 and 2?

20 MR. DURR: I think Appendix B
21 essentially incorporates your agenda; is that
22 correct?

23 MS. TRACY: That's essentially
24 correct. I believe that we have gone through most of

1 these issues, or if we haven't, I can make a good
2 assumption of what your answer would be.

3 MR. DURR: I would like to
4 re-emphasize before we close the record that the
5 issues that are discussed in 87-07 and 86-52, except
6 for those that are considered unresolved items, the
7 NRC considers closed, and will not do anymore
8 inspection on those specific items.

9 The items that you gave to us on
10 April 20th that are not addressed in those reports,
11 and the ones that we have sent you a letter on
12 requesting additional information, will be pursued
13 separately from these issues, and through another
14 group. The team inspection, the 2 team inspections
15 that took place at Seabrook, we've disbanded that
16 group for all intents and purposes.

17 MS. TRACY: Your team?

18 MR. DURR: Yes.

19 The rest of these allegations will be
20 handled through a normal allegation process.

21 MS. TRACY: What's your normal
22 allegation process?

23 MR. DURR: The normal allegation
24 process is essentially where there are one or two

1 items or non-specific items, the first thing that
2 will happen is, as these did, all these other
3 allegations did, they will go through the allegation
4 review panel. The panel will decide what's to be
5 done and how they are to be dispositioned, and they
6 will probably be inspected on a one-inspector per
7 item kind of thing. For instance, Tony or Dave will
8 probably inspect most of these, that the panel deems
9 to be inspectable.

10 MS. TRACY: Who is the panel?

11 MR. DURR: The panel? It consists of
12 either the Director or the Deputy Director of the
13 Division of Reactor Projects, Mr. Kane or his Deputy
14 Director, Sam Collins, and the Section Chief and the
15 Branch Chief who are responsible for the plant, and
16 whatever technical assistants they need from the
17 Division of Reactor Safety, which is my side of the
18 house.

19 MS. TRACY: So further allegations
20 that are brought to the Employee's Legal Project
21 should still be directed to Bill Kane.

22 MR. DURR: To Bill Kane. He is part of
23 the formal process that handles these things.

24 MR. HAVERKAMP: I would encourage, to

1 the extent possible, that you try to contact me by
2 telephone on any of these matters. You don't have to
3 wait until you have a collection of items and then
4 send us a letter. You are certainly welcome to follow
5 up with a letter, if that suits you. But we will try
6 to, of course, identify the issues that are still on
7 the table that are not closed by the inspections by
8 Jacques Durr and his team. We will be going through a
9 sorting process to identify how to follow those items
10 through our construction process.

11 I will try to keep you informed as to
12 how we are progressing. I'll be doing this by
13 telephone as much as possible, and as necessary, I
14 will follow it up with written letters.

15 MS. TRACY: Sounds good. I do like
16 the written letter follow-up format. Then if there's
17 questions in the future, we have it in writing.

18 MR. HAVERKAMP: We do too, but I'm
19 encouraging telephone communications to the extent
20 possible, so we understand the concern, and you
21 understand what we've done on it. If there's more to
22 do, we can work that out.

23 MR. DURR: Are there any other
24 subjects we need to discuss?

C E R T I F I C A T E

I hereby certify that the proceedings,
evidence and objections noted are contained fully and
accurately in the notes taken by me on this meeting
between the Employee's Legal Project and the Nuclear
Regulatory Commission, held on Tuesday, December 29,
1987, at 631 Park Avenue, King of Prussia, Penna.,
and that this is a correct transcription of same.

NORMA CARR

Exhibit A
NC 12-31-87

MEETING BETWEEN THE EMPLOYEE'S LEGAL PROJECT AND THE NRC
KING OF PRUSSIA, PENNSYLVANIA
DECEMBER 29, 1987

PROPOSED AGENDA

1. INTRODUCTION: This meeting's purpose is to discuss "procedural problems" at Seabrook Station, raised by the Employee's Legal Project (ELP) in September 1986 and thereafter, and not yet addressed by the NRC. These include evidence of breakdowns in quality assurance/quality control (QA/QC), design control, document control, poor training, and the utility's ongoing inability to deal with these problems. Numerous former Seabrook Station employees have raised these concerns, and utility and NRC reports substantiate them. A breakdown of these programs, designed to ensure safe construction of the plant, means the plant has many underlying technical problems.

The ELP provides confidentiality and legal protection to nuclear plant employees who have chosen to come forward with concerns about plant safety. Former Seabrook Station employees have brought these issues to the attention of the ELP, at what they consider to be some risk to themselves, because they believe the plant is unsafe. The ELP has a dual responsibility to these individuals: to protect their identities, and to ensure these problems are investigated and resolved. This organization also extends an offer of protection to members of the NRC who have similar concerns.

2. QUALITY ASSURANCE/QUALITY CONTROL
 - a. Various sorts of debris were discarded in containment concrete.
 - b. Some welds were never tested.
 - c. Painters did quality control checks of other painter's work. A recent NRC report shows there is peeling paint in containment areas where the QA program was relaxed
 - d. People reporting safety problems suffered harassment/dismissal.
 - e. Start-up checkoffs were done carelessly.
 - f. When construction procedures were violated, procedures were rewritten to allow the violations to stand. Procedures were implemented to eliminate inspection tests.
 - g. During the last few years of construction, there was no quality assurance on third shift, and none for concrete on second shift.
 - h. The reactor was filthy; general practices were slovenly.
 - i. Dravo shop welds in the turbine building were defective and uncorrected.
 - j. Weld inspections were inadequate; welds weren't properly identified; welds were performed incorrectly.
 - k. Pipes were forced into place using comealongs and sledgehammers, violating procedure.
 - l. A quality assurance person in charge of inspecting sadwelds in containment consistently reported incorrect figures.
 - m. Concrete was poured when the temperature was too low, creating cold seams.
 - n. There is exposed rebar in the cooling tunnels, and there are voids in the tunnel's concrete.
 - o. There was a lack of weld safety and people were harassed if they raised

- safety problems according to a QA engineer.
- p. People were hired to inspect work they had previously performed according to a different QA engineer.
 - q. Welds were improperly certified and quality assurance was poor according to a third QA engineer.
 - r. A weld rejected by an inspector was penciled in with graphite, and then passed inspection.
 - s. Several weld inspectors, commenting on James Padavano's conviction for falsifying weld inspections, said he was following common practice and was singled out.

3. DOCUMENT CONTROL

- a. Drawing revision control was ineffective.
- b. Pipe and pipe supports were assembled using the wrong materials after the identification numbers were ground out and rescribed.
- c. Blueprints were not updated, workers in the document control department were untrained, did not know how to read blueprints, and put incorrect numbers on blueprints.
- d. Blueprints were destroyed in the blueprint room.
- e. There was massive destruction and theft of documents during the 1984 reduction in force according to a former United Engineers and Constructors manager.
- f. Document traceability was a problem, and materials could not be traced back to the vendors according to a QA inspector.

4. DESIGN CONTROL

- a. Tracking of blueprints was impossible.
- b. The control building air handling equipment lacks separation, thus could fail at the same time.
- c. The emergency feedwater system is supplied from a single tank which also serves as condensate storage for the main steam feedwater system. In an emergency an adequate supply of water to the reactor cannot be guaranteed since a dual system is supplied from one source.
- d. Blueprints were frequently incorrect and were very difficult to interpret.
- e. Blueprints do not match the as-built plant.
- f. There were an exceptionally large number of "accept as is" engineering dispositions toward the end of construction, changing the plant's design to what had been built. This was done to save time and money rather than for safety reasons.
- g. Large numbers of nonconformance reports were voided when procedures were changed to accept the nonconforming condition.
- h. Equipment was renumbered so it appears to conform to specifications.
- i. The four primary cooling pumps were not installed according to design, possibly causing stress on the welds at the reactor and the pumps, and premature bearing wear.

5. POOR TRAINING

- a. Technical training records do not exist prior to April 1985, preventing assessment and verification of training. Some people were untrained, some were retrained.
- b. Procedures and instructions, a primary training tool, were written in ambiguous language.
- c. Some welders were trained on the spot; some were improperly trained.
- d. Some electricians were improperly trained.

- e. Training classes were inadequate to the needs of those being trained.
- f. There was cheating on tests several years ago, and a recent NRC report mentioned a current cheating problem.
- g. Prohibited work practices like cold pulling and incorrect weld identification were used throughout the plant.

6. ADDITIONAL ISSUES

- a. Two issues raised since April, 1987, which have not received a response from the NRC: a crack in the core barrel, and falsification by a vendor of certification required from the manufacturer.
- b. Ongoing problems like the cracks in the equipment vault, the PAB, and other structures which are leaking water, and like the chronic equipment breakdowns, are much less likely to be repaired expeditiously since the plant owners are constantly on the brink of bankruptcy.
- c. Cold pulling.
- d. The 100 bad welds in the service water system are of concern due to the possible effect of MIC, and the current problem of flaking joints in this system.
- e. There are a number of issues mentioned in current NRC reports which substantiate problems raised in the past by the ELP but which have been treated as isolated instances by the NRC.

MEETING BETWEEN THE EMPLOYEE'S LEGAL PROJECT AND THE NRC
KING OF PRUSSIA, PENNSYLVANIA
DECEMBER 29, 1987

PROPOSED AGENDA

1. INTRODUCTION: This meeting's purpose is to discuss "procedural problems" at Seabrook Station, raised by the Employee's Legal Project (ELP) in September 1986 and thereafter, and not yet addressed by the NRC. These include evidence of breakdowns in quality assurance/quality control (QA/QC), design control, document control, poor training, and the utility's ongoing inability to deal with these problems. Numerous former Seabrook Station employees have raised these concerns, and utility and NRC reports substantiate them. A breakdown of these programs, designed to ensure safe construction of the plant, means the plant has many underlying technical problems.

The ELP provides confidentiality and legal protection to nuclear plant employees who have chosen to come forward with concerns about plant safety. Former Seabrook Station employees have brought these issues to the attention of the ELP, at what they consider to be some risk to themselves, because they believe the plant is unsafe. The ELP has a dual responsibility to these individuals: to protect their identities, and to ensure these problems are investigated and resolved. This organization also extends an offer of protection to members of the NRC who have similar concerns.

2. QUALITY ASSURANCE/QUALITY CONTROL
 - a. Various sorts of debris were discarded in containment concrete.
 - b. Some welds were never tested.
 - c. Painters did quality control checks of other painter's work. A recent NRC report shows there is peeling paint in containment areas where the QA program was relaxed.
 - d. People reporting safety problems suffered harassment/dismissal.
 - e. Start-up checkoffs were done carelessly.
 - f. When construction procedures were violated, procedures were rewritten to allow the violations to stand. Procedures were implemented to eliminate inspection tests.
 - g. During the last few years of construction, there was no quality assurance on third shift, and none for concrete on second shift.
 - h. The reactor was filthy; general practices were slovenly.
 - i. Dravo shop welds in the turbine building were defective and uncorrected.
 - j. Weld inspections were inadequate; welds weren't properly identified; welds were performed incorrectly.
 - k. Pipes were forced into place using comealongs and sledgehammers, violating procedure.
 - l. A quality assurance person in charge of inspecting cadwelds in containment consistently reported incorrect figures.
 - m. Concrete was poured when the temperature was too low, creating cold seams.
 - n. There is exposed rebar in the cooling tunnels, and there are voids in the tunnel's concrete.
 - o. There was a lack of weld safety and people were harassed if they raised

safety problems according to a QA engineer.

- p. People were hired to inspect work they had previously performed according to a different QA engineer.
- q. Welds were improperly certified and quality assurance was poor according to a third QA engineer.
- r. A weld rejected by an inspector was penciled in with graphite, and then passed inspection.
- s. Several weld inspectors, commenting on James Padavano's conviction for falsifying weld inspections, said he was following common practice and was singled out.

3. DOCUMENT CONTROL

- a. Drawing revision control was ineffective.
- b. Pipe and pipe supports were assembled using the wrong materials after the identification numbers were ground out and rescribed.
- c. Blueprints were not updated, workers in the document control department were untrained, did not know how to read blueprints, and put incorrect numbers on blueprints.
- d. Blueprints were destroyed in the blueprint room.
- e. There was massive destruction and theft of documents during the 1984 reduction in force according to a former United Engineers and Constructors manager.
- f. Document traceability was a problem, and materials could not be traced back to the vendors according to a QA inspector.

4. DESIGN CONTROL

- a. Tracking of blueprints was impossible.
- b. The control building air handling equipment lacks separation, thus could fail at the same time.
- c. The emergency feedwater system is supplied from a single tank which also serves as condensate storage for the main steam feedwater system. In an emergency an adequate supply of water to the reactor cannot be guaranteed since a dual system is supplied from one source.
- d. Blueprints were frequently incorrect and were very difficult to interpret.
- e. Blueprints do not match the as-built plant.
- f. There were an exceptionally large number of "accept as is" engineering dispositions toward the end of construction, changing the plant's design to what had been built. This was done to save time and money rather than for safety reasons.
- g. Large numbers of nonconformance reports were voided when procedures were changed to accept the nonconforming condition.
- h. Equipment was renumbered so it appears to conform to specifications.
- i. The four primary cooling pumps were not installed according to design, possibly causing stress on the welds at the reactor and the pumps, and premature bearing wear.

5. POOR TRAINING

- a. Technical training records do not exist prior to April 1985, preventing assessment and verification of training. Some people were untrained, some were retrained.
- b. Procedures and instructions, a primary training tool, were written in ambiguous language.
- c. Some welders were trained on the spot; some were improperly trained.
- d. Some electricians were improperly trained.

- e. Training classes were inadequate to the needs of those being trained.
- f. There was cheating on tests several years ago, and a recent NRC report mentioned a current cheating problem.
- g. Prohibited work practices like cold pulling and incorrect weld identification were used throughout the plant.

6. ADDITIONAL ISSUES

- a. Two issues raised since April, 1987, which have not received a response from the NRC: a crack in the core barrel, and falsification by a vendor of certification required from the manufacturer.
- b. Ongoing problems like the cracks in the equipment vault, the PAB, and other structures which are leaking water, and like the chronic equipment breakdowns, are much less likely to be repaired expeditiously since the plant owners are constantly on the brink of bankruptcy.
- c. Cold pulling.
- d. The 100 bad welds in the service water system are of concern due to the possible effect of MIC, and the current problem of flaking joints in this system.
- e. There are a number of issues mentioned in current NRC reports which substantiate problems raised in the past by the ELP but which have been treated as isolated instances by the NRC.
