## INTRODUCTION

LaSalle Station, a two-unit BWR plant is located near Marseilles, Illinois, in LaSalle County, 3.5 miles south of the Illinois River. Each reactor is designed to have a capacity of 1078 MW net. Unit No. 1 loaded fuel in March 1982. Unit No. 2 loaded fuel in late December 1983. The plant has been designed to keep releases to the environment at levels below those specified in the regulations.

Liquid effluents from LaSalle County Station are released to the Illinois River in controlled batches after radioassay of each batch. Gaseous effluents are released to the atmosphere after delay to permit decay of short half-life gases. Releases to the atmosphere are calculated on the basis of analyses of daily grab samples of noble gases and continuously collected composite samples of iodine and particulate matter. The results of effluent analyses are summarized on a monthly basis and reported to the Nuclear Regulatory Commission as required per Technical Specifications. Airborne concentrations of noble gases, I-131 and particulate radioactivity in off-site areas are calculated using effluent and meteorological data on isotopic composition of effluents.

Environmental monitoring is conducted by sampling at indicator and reference (background) locations in the vicinity of the LaSalle County Station to measure changes in radiation or radioactivity levels that may be attributable to plant operations. If significant changes attributable to LaSalle County Station are measured, these changes are correlated with effluent releases. External gamma radiation exposure from noble gases and I-131 in milk are the most critical pathways at this site; however, an environmental monitoring program is conducted which includes other pathways of less importance.

### SUMMARY

Gaseous and liquid effluents for the period remained at a fraction of the Technical Specification limits. Calculations of environmental concentrations based on effluent, Illinois River flow, and meteorological data for the period indicate that consumption by the public of radionuclides attributable to the plant are unlikely to exceed the regulatory limits. Gamma radiation exposure from noble gases released to the atmosphere represented the critical pathway for the period with a maximum individual dose estimated to be 5.46E-02 mrem for the year, when a shielding and occupancy factor of 0.7 is assumed. The assessment of radiation doses are performed in accordance with the Offsite Dose Calculation Manual (ODCM). The results of analysis confirm that the station is operating in compliance with 10CFR50 and 40CFR190.

## 1.0 EFFLUENTS

### 1.1 Gaseous Effluents to the Atmosphere

Measured concentrations and isotopic composition of noble gases, radioiodine, and particulate radioactivity released to the atmosphere during the year, are listed in Table 1.1-1. A total of  $6.51E+03$  curies of fission and activation gases was released with a maximum release rate of  $3.8E+03 \mu\text{Ci/sec}$ .

A total of  $1.67E-02$  curies of I-131 was released during the year, with an average release rate of  $1.80E-03 \mu\text{Ci/sec}$  for all iodines.

A total of 2.95 curies of beta-gamma emitters and less than  $3.78E-06$  curies of alpha emitters was released as airborne particulate matter, with an average release rate of  $7.25E-03 \mu\text{Ci/sec}$ .

A total of 16.7 curies of tritium was released, with an average release rate of  $6.43 \mu\text{Ci/sec}$ .

### 1.2 Liquids Released to the Illinois River

A total of  $3.82E+06$  liters of radioactive liquid waste (prior to dilution) containing  $9.20E-01$  curies (excluding tritium, gases, and alpha) were discharged after dilution with a total of  $3.27E+09$  liters of water. These wastes were released at a monthly average concentration of  $2.84E-05 \mu\text{Ci/ml}$ , discharge; on an unidentified nuclide basis. A total of  $8.88E-06$  curies of alpha radioactivity and 1.09 curies of tritium were released. Monthly release estimates and principal radionuclides in liquid effluents are given in Table 1.2-1.

## 2.0 SOLID RADIOACTIVE WASTE

Solid radioactive wastes were shipped to Hanford, Washington; Beatty, Nevada; Richland, Washington; Barnwell Nuclear Center, South Carolina by Chemical Nuclear Company, Hittman Nuclear and Development Company, and Tri-State Motor Transport. The record of waste shipments is summarized in Table 2.0-1.

## 3.0 DOSE TO MAN

### 3.1 Gaseous Effluent Pathways

#### Gamma Dose Rates

Gamma air and whole body dose rates off-site were calculated based on measured release rates, isotopic composition of the noble gases, and meteorological data for the period (Table 3.1-1). Isodose contours of whole body dose are shown in Figure 3.1-1 for the year.

Based on measured effluents and meteorological data, the maximum dose to an individual would be 5.46E-02 mrem for the year, with an occupancy or shielding factor of 0.7 included. The maximum gamma air dose was 9.70E-02 mrad.

#### Beta Air and Skin Rates

The range of beta particles in air is relatively small (on the order of a few meters or less); consequently, plumes of gaseous effluents may be considered "infinite" for purpose of calculating the dose from beta radiation incident on the skin. However, the actual dose to sensitive skin tissues is difficult to calculate because this depends on the beta particle energies, thickness of inert skin, and clothing covering sensitive tissues. For purposes of this report the skin is taken to have a thickness of 7 mg/cm<sup>2</sup> and an occupancy factor of 1.0 is used. The skin dose from beta and gamma radiation for the year was 8.43E-02 mrem.

The air concentrations of radioactive noble gases at the off-site receptor locations are given in Figure 3.1-2. The maximum off-site beta air dose for the year was 1.37E-02 mrad.

#### Radioactive Iodine

The human thyroid exhibits a significant capacity to concentrate ingested or inhaled iodine, and the radioiodine, I-131, released during routine operation of the plant, may be made available to man thus resulting in a dose to the thyroid. The principal pathway of interest for this radionuclide is ingestion of radioiodine in milk by an infant. Calculation made in previous years indicate that contributions to doses from inhalation of I-131 and I-133, and I-133 in milk, are negligible.

#### Iodine-131 Concentrations in Air

The calculated concentration contours for I-131 in air are shown in Figure 3.1-3. Included in these calculations is an iodine cloud depletion factor which accounts for the phenomenon of elemental iodine deposition on the ground. The maximum off-site average concentration is estimated to be 7.66E-04 pCi/m<sup>3</sup> for the year.

#### Dose to Infant's Thyroid

The hypothetical thyroid dose to an infant living near the plant via ingestion of milk was calculated. The radionuclide considered was I-131 and the source of milk was taken to be the nearest dairy farm with the cows pastured from May to October. The maximum infant's thyroid dose was 3.54E-02 mrem during the year (Table 3.1-1).

### Concentrations of Particulates in Air

Concentration contours of radioactive airborne particulates are shown in Figure 3.1-4. The maximum off-site average level is estimated to be 7.42E-05 pCi/m<sup>3</sup>.

### Summary of Doses

Table 3.1-1 summarizes the doses resulting from releases of airborne radioactivity via the different exposure pathways.

### 3.2 Liquid Effluent Pathways

The three principal pathways through the aquatic environment for potential doses to man from liquid waste are ingestion of potable water, eating aquatic foods, and exposure while walking on the shoreline. Not all of these pathways are applicable at a given time or station but a reasonable approximation of the dose can be made by adjusting the dose formula for season of the year or type and degree of use of the aquatic environment. NRC\* developed equations were used to calculate the doses to the whole body, lower GI tract, thyroid, bone and skin; specific parameters for use in the equations are given in the Commonwealth Edison Off-site Dose Calculation Manual. The maximum whole body dose for the year was 6.21E-05 mrem and no organ dose exceeded 3.16E-04 mrem.

## 4.0 SITE METEOROLOGY

A summary of the site meteorological measurements taken during each quarter of the year is given in Appendix II. The data are presented as cumulative joint frequency distributions of 375' level wind direction and wind speed class by atmospheric stability class determined from the temperature difference between the 375' and 33' levels. Data recovery for these measurements was about 99.1%.

## 5.0 ENVIRONMENTAL MONITORING

Table 5.0-1 provides an outline of the radiological environmental monitoring program as required in the Technical Specifications.

Except for tables of special interest, tables listing all data are no longer included in the annual report. All data tables are available for inspection at the Station or in the Corporate offices.

Specific findings for various environmental media are discussed below.

---

\* Nuclear Regulatory Commission, Regulatory Guide 1.109 (Rev. 1).

### 5.1 Gamma Radiation

External radiation dose from on-site sources and noble gases released to the atmosphere was measured at ten indicator and four reference (background) locations using  $\text{CaSO}_4:\text{Dy}$  thermoluminescent dosimeters (TLDs). A comparison of the TLD results for reference stations with on-site and off-site indicator stations is included in Table 5.1-1. A total of 48 additional TLDs were installed on June 1, 1980 such that each sector was covered at both five miles and the site boundary. Six (6) TLD locations were added to the monitoring program on July 1, 1985.

### 5.2 Airborne I-131 and Particulate Radioactivity

Concentrations of airborne I-131 and particulate radioactivity at monitoring locations are summarized in Tables 5.0-3 through 5.0-6. Locations of the samplers are shown in Figure 5.0-1. Airborne I-131 remained below the LLD of  $0.10 \text{ pCi/m}^3$  throughout the year.

Gross beta concentrations ranged from  $0.004$  to  $0.067 \text{ pCi/m}^3$ , with an average concentration of  $0.027 \text{ pCi/m}^3$ . All gamma-emitting isotopes were below their respective LLD levels. No radioactivity attributable to station operation was detected in any sample.

### 5.3 Terrestrial Radioactivity

Well water was collected quarterly from five off-site wells and analyzed for tritium and gamma-emitting isotopes. All results were below the limits of detection, indicating that there was no measurable amount of radioactivity due to the station releases.

### 5.4 Aquatic Radioactivity

Weekly surface water samples from the Illinois River at Seneca, Kaiser Corporation, and LSCS Cooling Lake were composited monthly and analyzed for gamma-emitting isotopes. Weekly samples from the same locations were composited quarterly and analyzed for tritium. None of the composited samples indicated the presence of tritium or gamma-emitting isotopes above their respective LLD levels.

Sediment samples were collected twice a year, from one indicator location (downstream at Cooling Lake) and analyzed for gamma-emitters. Gamma-emitters were below the detection limits, indicating the presence of no radioactivity due to station operation.

Levels of gamma radioactivity in fish were measured and found in all samples to be below the lower limits of detection for the program.

### 5.5 Milk

Milk samples were collected monthly from November through April and weekly from May through October and analyzed for iodine-131 and gamma-emitting isotopes.

I-131 remained below the detection limit of 0.5 pCi/l.

Cs-134 and Cs-137 were below the LLD level of 5 pCi/l. All other gamma-emitting isotopes, except naturally-occurring K-40, were below their respective LLDs. There was no indication of the effect on the environment due to station operation.

### 5.6 Sample Collections

All samples were collected as scheduled except those listed in the Listing of Missed Samples, Appendix III.

### 5.7 Program Modifications

There were no program modifications in 1987.

## 6.0 ANALYTICAL PROCEDURES

A summary of the procedures used for analyzing radioactivity in environmental samples is given in Appendix III of the report for the period January-December 1985. Procedures used during the period covered by this report remained essentially unchanged.

## 7.0 MILCH ANIMAL CENSUS

A census of milch animals was conducted within five miles of the station. The survey was conducted by a "door-to-door" canvas and by information from Illinois Agricultural Agents. The census was conducted by A. Lewis on August 29, 1987.

There are no dairy farms within a five mile radius of the LaSalle County Power Station. A list of dairies that were sampled follows.

L-15 Granby Dairy Farm

Number of cows - 170  
Number of fresh cows - 130

Diet consists of the following:

Ground feed*	15 lbs. per day
Corn silage	Free choice
Green chop	Free choice

\* Ground feed consists of:

Corn	2,000 lbs.
Soybean meal	250 lbs.
Minerals	50 lbs.
Salt	25 lbs.

L-16 Lowery Dairy Farm

Number of cows - 100  
Number of fresh cows - 80

Diet consists of the following:

Ground feed*	20 lbs. per day
Corn silage	Free choice
Alfalfa hay	Free choice

\* Ground corn mix consists of:

Corn	2,500 lbs.
Soybean meal	600 lbs.
Oats	600 lbs.
Minerals	200 lbs.
Salt	50 lbs.

L-17 Norsen Dairy Farm

Number of cows - 31  
Number of fresh cows - 28

Diet consists of the following:

Ground corn mix*	20 lbs. per day
Pasture	Free choice
Hay	Free choice

L-17 Norsen Dairy Farm (continued)

\* Ground corn mix consists of:

Corn	1,600 lbs.
Oats	400 lbs.
Protein	100 lbs.
Minerals	50 lbs.
Salt	20 lbs.

L-18 Boldt Dairy Farm

Number of cows - 40

Number of fresh cows - 36

Diet consists of the following:

Ground corn mix*	20 lbs. per day
Hay	Free choice
Green chop	Free choice

\* Ground corn mix consists of:

Corn	2,000 lbs.
Soybean meal	600 lbs.
Oats	300 lbs.
Minerals	50 lbs.
Salt	50 lbs.

8.0 NEAREST RESIDENT CENSUS

A census of the nearest residences within a five (5) mile radius was conducted by A. Lewis on August 29, 1987. A list of the nearest residences follows.

<u>Direction</u>	<u>Distance</u>
N	2.2 miles
NNE	1.4 miles
NE	1.8 miles
ENE	3.4 miles
E	3.1 miles
ESE	1.6 miles
SE	1.5 miles
SSE	1.1 miles
S	2.2 miles
SSW	2.0 miles
SW	0.7 miles
W	1.3 miles
WNW	0.9 miles
NNW	1.0 miles
WW	2.6 miles
WW	1.2 miles

## 9.0 INTERLABORATORY COMPARISON PROGRAM RESULTS

Teledyne Isotopes Midwest Laboratory has participated in interlaboratory comparison (crosscheck) programs since the formulation of its quality control program in December 1971. These programs are operated by agencies which supply environmental-type samples (e.g., milk or water) containing concentrations of radionuclides known to the issuing agency but not to participant laboratories. The purpose of such a program is to provide an independent check on the laboratory's analytical procedures and to alert it to any possible problems.

Participant laboratories measure the concentrations of specified radionuclides and report them to the issuing agency. Several months later, the agency reports the known values to the participant laboratories and specifies control limits. Results consistently higher or lower than the known values or outside the control limits indicate a need to check the instruments or procedures used.

The results in Table A-1 were obtained through participation in the environmental sample crosscheck program for milk, water, air filters, and food samples during the period May 1984 through December 1987. This program has been conducted by the U. S. Environmental Protection Agency Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, Las Vegas, Nevada.

The results in Table A-2 were obtained for thermoluminescent dosimeters (TLDs) during the period 1976, 1977, 1979, 1980, 1984, and 1985-1986 through participation in the Second, Third, Fourth, Fifth, Seventh, and Eighth International Intercomparison of Environmental Dosimeters under the sponsorships listed in Table A-2.

Table A-3 lists results of the analyses on in-house spiked samples.

Table A-4 lists results of the analyses on in-house "blank" samples.

Attachment B lists acceptance criteria for "spiked" samples.

Table A-1. U.S. Environmental Protection Agency's crosscheck program, comparison of EPA and Teledyne Isotopes Midwest Laboratory results for milk, water, air filters, and food samples, 1984 through 1987.<sup>a</sup>

<sup>a</sup> Results obtained by Teledyne Isotopes Midwest Laboratory as a participant in the environmental sample crosscheck program operated by the Intercomparison and Calibration Section, Quality Assurance Branch, Environmental Monitoring and Support Laboratory, U. S. Environmental Protection Agency (EPA), Las Vegas, Nevada.

<sup>b</sup> All results are in the pCi/l, except for elemental potassium (K) data, which are in mg/l; air filter samples, which are in pCi/filter; and food, which is in pCi/kg.

<sup>c</sup> Unless otherwise indicated, the TIML results are given as the mean ±2 standard deviations for three determinations.

Table A-2. Crosscheck program results, thermoluminescent dosimeters (TLDs).

<sup>a</sup> Lab result given is the mean  $\pm 2$  standard deviations of three determinations.

<sup>b</sup> Second International Intercomparison of Environmental Dosimeters conducted in April of 1976 by the Health and Safety Laboratory (GASL), New York, New York, and the School of Public Health of the University of Texas, Houston, Texas.

<sup>c</sup> Value determined by sponsor of the intercomparison using continuously operated pressurized ion chamber.

<sup>d</sup> Mean  $\pm 2$  standard deviations of results obtained by all laboratories participating in the program.

<sup>e</sup> Third International Intercomparison of Environmental Dosimeters conducted in summer of 1977 by Oak Ridge National Laboratory and the School of Public Health of the University of Texas, Houston, Texas.

<sup>f</sup> Fourth International Intercomparison of Environmental Dosimeters conducted in summer of 1979 by the School of Public Health of the University of Texas, Houston, Texas.

<sup>g</sup> Fifth International Intercomparison of Environmental Dosimeter conducted in fall of 1980 at Idaho Falls, Idaho and sponsored by the School of Public Health of the University of Texas, Houston, Texas and

<sup>h</sup> Environmental Measurements Laboratory, New York, New York, U.S. Department of Energy.

<sup>i</sup> Seventh International Intercomparison of Environmental Dosimeters conducted in the spring and summer of 1984 at Las Vegas, Nevada, and sponsored by the U.S. Department of Energy, the U.S. Nuclear Regulatory

Commission, and the U.S. Environmental Protection Agency.

<sup>j</sup> Eighth International Intercomparison of Environmental Dosimeters conducted in the fall and winter of 1985-1986 at New York, New York, and sponsored by the U.S. Department of Energy.

## ACCEPTANCE CRITERIA FOR "SPIKED" SAMPLES

LABORATORY PRECISION: ONE STANDARD DEVIATION VALUES FOR VARIOUS ANALYSES<sup>a</sup>

Analysis	Level	One Standard Deviation for Single Determination
Gamma Emitters	5 to 100 pCi/liter or kg >100 pCi/liter or kg	5 pCi/liter 5% of known value
Strontium-89 <sup>b</sup>	5 to 50 pCi/liter or kg >50 pCi/liter or kg	5 pCi/liter 10% of known value
Strontium-90 <sup>b</sup>	2 to 30 pCi/liter or kg >30 pCi/liter or kg	3.0 pCi/liter 10% of known value
Potassium	>0.1 g/liter or kg	5% of known value
Gross Alpha	<20 pCi/liter >20 pCi/liter	5 pCi/liter 25% of known value
Gross Beta	<100 pCi/liter >100 pCi/liter	5 pCi/liter 5% of known value
Tritium	<4,000 pCi/liter >4,000 pCi/liter	1s = (pCi/liter) = 169.85 x (known).0933 10% of known value
Radium-226, Radium-228	<0.1 pCi/liter	15% of known value
Plutonium	0.1 pCi/liter, gram, or sample	10% of known value
Iodine-131, Iodine-129 <sup>b</sup>	<55 pCi/liter >55 pCi/liter	6 pCi/liter 10% of known value
Uranium-238, Nickel-63 <sup>b</sup> , Technetium-99 <sup>b</sup>	<35 pCi/liter >35 pCi/liter	6 pCi/liter 15% of known value
Iron-55 <sup>b</sup>	50 to 100 pCi/liter	10 pCi/liter 10% of known value

<sup>a</sup> From EPA publication, "Environmental Radioactivity Laboratory Intercomparison Studies Program, Fiscal Year 1981-1982, EPA-600/4-81-004.<sup>b</sup> TML limit.

Mr. A. Bert Davis  
Regional Administrator  
Directorate of Inspection and Enforcement  
Region III  
U.S. Nuclear Regulatory Commission  
799 Roosevelt Road  
Glen Ellyn, IL 60137

Subject: LaSalle Nuclear Power Station Operating Report,  
NRC Dockets 50-373 and 50-374

Dear Mr. Davis:

Enclosed is Part 3 of the LaSalle Nuclear Power Station Operating Report, reporting results of Environmental Radiological and Meteorological Monitoring. Part 1, facility operating experience was submitted under separate cover in February, and Part 2, radioactive effluents, in February and August.

Two copies of the report are provided for your use. One copy each will be forwarded to Document Control and the NRC Resident Inspector.

Sincerely yours,

A handwritten signature in black ink, appearing to read "N.J. Kalivianakis".

N. J. Kalivianakis  
General Manager  
LaSalle Station
