## I. INTRODUCTION

This Semiannual Radioactive Effluent Release Report for the period of January 1 through June 30, 1988, is submitted in accordance with Section 6.9.1.8 of Appendix A to Grand Gulf Nuclear Station (GGNS) License No. NPF-29. That portion of Appendix A which refers to the monitoring of radioactive effluents, Sections 3/4-11 and 3/4-12, will hereafter be referred to as the Radiological Effluent Technical Specification (RETS).

Airborne discharges at GGNS are ground-level releases. All liquid and airborne discharges to the environment were analyzed in accordance with the RETS requirements. All effluent releases were within the concentration and total release limits specified by the RETS.

Projected offsite doses were within the dose limits specified by the RETS. The doses were projected using the methodology of the GGNS Offsite Dose Calculation Manual (ODCM). Dose calculations will be summarized in the July-December 1988 Semiannual Radioactive Effluent Release Report.

The summation of all gaseous releases during the reporting period is given in Table 1A, while elevated releases and ground-level releases for the reporting period are given in Tables 1B and 1C, respectively. Table 1D describes the radioactive gaseous sampling and analysis program implemented at GGNS.

The summation of all liquid releases during the reporting period is given in Table 2A, while continuous and batch mode releases are given in Table 2B. Table 2C describes the radioactive liquid waste sampling and analysis program implemented at GGNS. Solid radioactive waste and irradiated fuel shipments during the reporting period are summarized in Table 3. Meteorological data is included in Tables 4A - 4C.

## II. DETAILED INFORMATION

### A. Regulatory Limits

#### 1. 10CFR20 Limits

- a. Fission and Activation Gases - The release rate limit at any time for noble gases to areas at or beyond the site boundary shall be such that:

$$D_{tb} = \text{average total body dose rate in the current year (mrem/yr)}$$

$$= \bar{X}/\bar{Q} \sum K_i Q'_i \leq 500 \text{ mrem/yr}$$

$$D_s = \text{average skin dose rate in the current year (mrem/year)}$$

$$= \bar{X}/\bar{Q} \sum (L_i + 1.1 M_i) Q'_i \leq 3000 \text{ mrem/yr}$$

where the terms are defined in the GGNS ODCM.

- b. Radioiodines and Particulates - The release rate limit for the sampling period for all radioiodines, tritium and radioactive materials in particulate form with half-lives greater than 8 days shall be such that:

$$D_o = \text{average organ dose rate in current year (mrem/yr)}$$

$$= \sum_i W f_i \bar{Q}'_i \leq 1500 \text{ mrem/yr}$$

where the terms are defined in the GGNS ODCM.

- c. Liquid Effluents - The concentration of radioactive materials released in liquid effluents to unrestricted areas from the reactors at the site shall not exceed at any time the values specified in 10CFR20, Appendix B, Table II, Column 2. The concentration of dissolved or entrained noble gases, released in liquid effluents to unrestricted areas from all reactors at the site, shall be limited to  $2 \times 10^{-4}$  microcuries/ml maximum concentration.

2. 10CFR50, Appendix I Limits

- a. Fission and Activation Gases - The dose from noble gases in gaseous effluents to areas at or beyond the site boundary shall be such that:

$$D_Y = \text{air dose due to gamma emissions from noble gases}$$

$$= 3.17 \times 10^{-8} \sum_i M_i \overline{X/Q^T} Q_i \leq 5 \text{ mrad/qtr}$$

$$\leq 10 \text{ mrad/yr}$$

$$D_\beta = \text{air dose due to beta emissions from noble gas}$$

$$= 3.17 \times 10^{-8} \sum_i N_i \overline{X/Q^T} Q_i \leq 10 \text{ mrad/qtr}$$

$$\leq 20 \text{ mrad/yr}$$

where the terms are defined in the GGNS ODCM.

- b. Radioiodines and Particulates - The dose to an individual from tritium, I-131, I-133, and radioactive material in particulate form with half-lives greater than 8 days in gaseous effluents shall be such that:

$$D_p = \text{dose to an individual from tritium, I-131, I-133, and radionuclides in particulate form with half-lives greater than 8 days (mrem)}$$

$$= 3.17 \times 10^{-8} \sum_i R_i W' Q_i \leq 7.5 \text{ mrem/qtr Any Organ}$$

$$\leq 15 \text{ mrem/yr Any Organ}$$

where the terms are defined in the GGNS ODCM.

- c. Liquid Effluents - The dose from radioactive materials in liquid effluents shall be such that:

$$D_{Tau} = \sum_i [A_i \tau_{Tau} \sum_{j=1}^m \Delta t_j C_{ij} F_j] \leq 1.5 \text{ mrem/qtr Total Body}$$

$$\leq 5 \text{ mrem/qtr Any Organ}$$

$$\leq 3 \text{ mrem/yr Total Body}$$

$$\leq 10 \text{ mrem/yr Any Organ}$$

where the terms are defined in the GGNS ODCM.

### 3. 40CFR190 Limits

Doses are calculated for Fission and Activation Gases; Radioiodines and Particulates; and Liquid Effluents according to equations contained in Sections 2.(a), (b), and (c), respectively, with the exception that the limits applied are:

$\leq 25$  mrem/yr, Total Body or Any Organ except Thyroid

$\leq 75$  mrem/yr, Thyroid

$\leq 10$  mrad  $\gamma$ /qtr or  $\leq 20$  mrad  $\gamma$ /yr, Fission and Activation Gases

$\leq 20$  mrad  $\beta$ /qtr or  $\leq 40$  mrad  $\beta$ /yr, Fission and Activation Gases

$\leq 15$  mrem/qtr or  $\leq 30$  mrem/yr, Any Organ, Iodine and Particulates

$\leq 3$  mrem/qtr or  $\leq 6$  mrem/yr, Total Body, Liquid Effluents

$\leq 10$  mrem/qtr or  $\leq 20$  mrem/yr, Any Organ, Liquid Effluents

### B. Maximum Permissible Concentrations

#### 1. Airborne

The Maximum Permissible Concentration (MPC) of radioactive materials in gaseous effluents is limited by the dose rate restrictions of 10CFR20. In this case, the MPCs are actually determined by the dose factors in Table 2.1-1 of the GGNS ODCM.

#### 2. Liquid

The MPC of radioactive materials in liquid effluents is limited by 10CFR20, Appendix B, Table II, Column 2. The MPC chosen is the most conservative value of either the soluble or insoluble MPC for each radioisotope.

### C. Average Energy

Not applicable for GGNS RETS.

## D. Measurements and Approximations of Total Activity

The following discussion details the methods used to measure and approximate total activity for the following:

1. Fission and Activation Gases
2. Radioiodines
3. Particulates
4. Liquid Effluents

Tables 1D and 2C give sampling frequencies and minimum detectable sensitivity requirements for the analysis of gaseous and liquid effluent streams, respectively.

Values in the attached tables given as zero do not necessarily imply that the radionuclides were not present. A zero indicates that the radionuclide was not present at levels greater than the sensitivity requirements shown in Tables 1D and 2C. For some radionuclides, lower detection limits than required may be readily achievable; when a radionuclide is measured below its stated limits, it is reported.

### 1. For Fission and Activation Gases

The following noble gases are considered in evaluating gaseous airborne discharges:

Ar-41	Xe-131m
Kr-85m	Xe-133
Kr-85	Xe-133m
Kr-87	Xe-135m
Kr-88	Xe-135
Kr-89	Xe-138.

Periodic grab samples from Station effluent streams are analyzed by a computerized pulse height analyzer system utilizing high-resolution germanium detectors. (See Table 1D for sampling and analytical requirements.) Isotopic values thus obtained are used for dose release rate calculations as given in Section II.A.1. of this report. Only those radionuclides that are detected are used in this computation. During the period between grab samples, the amount of radioactivity released is based on the effluent monitor readings. Monitors are assigned a calibration factor based upon the last isotopic analysis, using the following relationship:

$$C_i = U_i \div m$$

where

$$C_i = \text{isotopic calibration factor for isotope } i$$

$U_i$  = concentration of isotope  $i$  in the grab sample, in  $\mu\text{Ci}/\text{ml}$ .

$m$  = net monitor reading associated with the effluent stream. (Determined at the time of grab sampling).

These calibration factors, along with the hourly effluent monitor values and flow rates, are entered into the laboratory computer where the release rates for individual radionuclides are calculated and stored. If no activity is detected in the grab sample, the calibration factor for Kr-85 and the dose factor for Kr-89 are entered into the laboratory computer.

## 2. For Particulates and Radioiodines

The radioiodines and radioactive materials in particulate form to be considered are:

Zn-65	I-133
Cr-51	Cs-134
Mn-54	Cs-136
Fe-59	Cs-137
Co-58	Ba-140
Co-60	Ce-141
Sr-89	Other Radionuclides
Sr-90	with half-lives
Zr-95	greater than
Sb-124	8 days.
I-131	

## 3. For Continuous Releases

Continuous sampling is performed on the continuous release points (i.e., Radwaste Vent, Containment Purge, Fuel Handling Area Vent, Turbine Building Vent). Particulate material is collected by filtration. Radioiodines are collected by adsorption onto a charcoal filter. Periodically these filters are removed and analyzed on the pulse height analyzer to identify and quantify radioactive materials collected on the filters. Particulate filters are then analyzed for gross alpha and Strontium-89 and -90, as required. Gross alpha determinations are made using a 2-pi gas flow proportional counter. Strontium-89 and -90 values are obtained by chemical separation and subsequent analysis using 2-pi gas flow proportional counters. During major operational occurrences, the frequency of sampling is increased to satisfy the requirements of footnote "c" of Table 1D, "Radioactive Gaseous Waste, Sampling and Analysis," (GGNS RETS, Table 4.11.2.1.2-1).

## 4. For Batch Releases: Gases

The processing of batch type releases (from Containment Purge) is analogous to that for continuous releases.

## 5. For Batch Releases: Liquid Effluents

The radionuclides listed below are considered when evaluating liquid effluents:

H-3	Mo-99
Co-58	Tc-99m
Co-60	I-131
Fe-55	I-132
Fe-59	I-133
Zn-65	I-135
Mn-54	Cs-134
Cr-51	Cs-137
Sr-89	Cs-140
Sr-90	Ba-140
Nb-95	La-140
Zr-95	Ce-141
	Ce-144

Representative pre-release grab samples are obtained and analyzed as required by Table 2C. Isotopic analyses are performed using the computerized pulse height analysis system previously described. Aliquots of each pre-released sample, proportional to the waste volume released, are composited in accordance with the requirements of Table 2C. Strontium determinations are made by performing a chemical separation and counting the separated strontium using a 2-pi gas flow proportional counter. Gross alpha determinations are made using 2-pi gas flow proportional counters. Tritium and Iron-55 concentrations are determined by using liquid scintillation techniques. Dissolved gases are determined employing grab sampling techniques and then counting on the pulse height analyzer system.

### E. Batch Releases

#### 1. Liquid

##### 3rd Quarter 1987

- a. Number of batch releases: 88
- b. Total time period for batch releases: 28,669 minutes
- c. Maximum time period for a batch release: 2,880 minutes
- d. Average time period for batch releases: 326 minutes
- e. Minimum time period for a batch release: 235 minutes

##### 4th Quarter 1987

- a. Number of batch releases: 63
- b. Total time period for batch releases: 18,379 minutes
- c. Maximum time period for a batch release: 332 minutes
- d. Average time period for batch releases: 292 minutes
- e. Minimum time period for a batch release: 30 minutes

2. Gaseous

1st & 2nd Quarter 1988

No batch releases were made during this period.

F. Abnormal Releases

1. Liquid

1st & 2nd Quarter 1988

One abnormal liquid release occurred during the reporting period. This event was previously documented in Incident Report 88-2-5, and NRC Inspection Reports 50-416/88-01 and 50-416/88-03.

Event Summary

On January 28, 1988, GGNS personnel discovered that a blocked vent line on the Standby Service Water (SSW) basin overflow line had allowed water to siphon from SSW Basin B to the storm drain system. The release was terminated on January 29, 1988 when the vent line was repaired. The total water released was estimated to be 80,000 gallons. Grab samples taken from the storm drains and SSW Basin B showed no detectable radioactivity above background. Though samples were not taken during the actual release period, the SSW radiation monitor was operable and indicated no measurable radioactivity above background.

The cause of the release was an inaccurate Piping and Instrumentation Diagram (P&ID) that did not show the vent line. The overflow lines on SSW A and B were capped on March 16 and 17 to prevent similar events from occurring.

2. Gaseous

1st & 2nd Quarter 1988

One abnormal gaseous release occurred during the reporting period. This event was previously documented in Licensee Event Report (LER) 88-009-00 and NRC Inspection Report 50-416/88-05.

Event Summary

On February 27, 1988, hydrogen ignition occurred in the Offgas System causing ignition of the lower charcoal adsorber beds in A and B trains. The A and B charcoal adsorber trains were isolated with a nitrogen purge to extinguish the charcoal fire. Gaseous effluents were released without treatment by charcoal adsorption until March 2, 1988 when 3 of 4 charcoal beds in Train A were returned to operation.

The maximum release rate during the event corresponded to a 2.1 mrem/year instantaneous whole body dose rate at the site boundary. This was well within the regulatory limit of 500 mrem/year.

The event was caused by a malfunction of the A hydrogen recombiner due to wetting of the catalyst during the SJAE A startup sequence. The system operating instruction for SJAE startup has been revised and design changes are being considered to improve SJAE startup and operating performance.

#### G. Estimate of Total Error

##### 1. Liquid

The maximum errors are collectively estimated to be

	Fission & Activation Products	Tritium	Dissolved & Entrained Gases	Gross Alpha
Sampling	26%	26%	26%	26%
Measurement	68%	65%	61%	92%
Total	73%	70%	66%	96%

Sampling errors include uncertainty associated with mixing, representative sampling and discharge volume. Measurement errors include uncertainty associated with instrument calibration and the preparation and counting of low-activity samples. Counting errors are based on measurements of blank samples and, for germanium detectors, the least-readily-detectable radioisotope. Calibration errors are calculated by summing the errors associated with the calibration of a particular instrument with a radioactive source.

Total error is calculated by taking the square root of the sum of the squares of the individual errors.

##### 2. Gaseous

The maximum errors (not including sample line loss) are collectively estimated to be

	Fission & Activation Gases	Iodine	Particulate	Gross Alpha	Tritium
Sampling	32%	23%	22%	23%	23%
Measurement	61%	67%	65%	101%	62%
Total	69%	71%	69%	104%	66%

Sampling errors include uncertainty associated with sample flow, vent flow and monitor calibration.

Measurement errors include uncertainty associated with instrument calibration and preparation and counting of low-activity samples. Measurement and total errors are calculated by the same methods used for liquid effluents.

3. Solid Radioactive Waste

See Table 3 for error terms.

H. Solid Radioactive Waste Shipments

See Table 3 for shipment information.

I. Meteorological Data

1. Meteorological Data Recovery Rate

1st Qtr.

Parameter

% Data Recovery

50m Direction	100.00
50m Wind Speed	95.10
10m Direction	99.73
10m Wind Speed	95.24
Temperature	100.00
Dew Point	94.87
Delta T	100.00
Precipitation	100.00

2nd Qtr.

Parameter

% Data Recovery

50m Direction	99.91
50m Wind Speed	99.91
10m Direction	99.91
10m Wind Speed	99.91
Temperature	99.13
Dew Point	98.40
Delta T	98.81
Precipitation	100.00

2. Meteorological data for the period of the report is included in Tables 4A through 4C.

3. Annual Meteorological Data Summary reported in the July-December 1988 Semiannual Radioactive Effluent Report

J. Radioactive Effluent Monitoring Instrumentation Operability

No reportable instances of inoperability occurred during the report period.

III. OFFSITE DOSE CALCULATION MANUAL/PROCESS CONTROL PROGRAM/RADIOACTIVE WASTE TREATMENT SYSTEM CHANGES

A. Offsite Dose Calculation Manual (ODCM).

1. ODCM Revision 11

Revision 11 to the ODCM was reviewed and approved by the Plant Safety Review Committee on June 23, 1988. The changes within this revision can be characterized as administrative. Based on a technical review and consideration of the reasons for the changes, it was determined that the changes will not reduce the accuracy nor the reliability of the dose calculation or setpoint determinations.

Revision 11 to the GGNS ODCM was necessary to:

- Correct administrative and typographical errors
- Reflect the change in GGNS operator from Mississippi Power & Light Company to System Energy Resources, Inc.
- Insert bioaccumulation and dose factors for antimony
- Clarify X/Q and D/Q use with regard to exposure pathway
- Update descriptions of radiological environmental sampling locations.

A markup copy of Revision 10 showing changes for Revision 11 is included as Attachment I. Revision 11 is included as Attachment II and a detailed outline of Revision 11 is provided below:

SUBJECT: Grand Gulf Nuclear Station Offsite Dose Calculation Manual (ODCM), Revision 11, June 23, 1988.

\* Page vi

\*Affected Lines: 22 and 23

Revision: Added Reference 8 on Lines 22 and 23

Justification: Reference 8 is the source for antimony dose conversion factors inserted on page 1.0-11.

\* Line numbers reflect revision location in the ODCM, Revision 11.

- Page 1.0-9

Affected Lines: 27, 39 and 40

Revision: Inserted bioaccumulation factor for antimony on Line 27 and identified source on Lines 39 and 40.

Justification: Antimony bioaccumulation factor is necessary to calculate ingestion dose commitment factor. The bioaccumulation factor was not included in Reference 3.

- Page 1.0-11

Affected Lines: 21 through 24, 50 and 51

Revision: Inserted dose conversion factors for antimony on Lines 21 through 24 and identified source on Lines 50 and 51.

Justification: Antimony dose conversion factors are necessary to calculate dose commitment factors.

- Page 1.0-14

Affected Lines: 8 through 11

Revision: Inserted dose commitment factors for antimony on Lines 8 through 11.

Justification: Antimony dose commitment factors are required to calculate dose contribution from antimony in GGNS liquid effluents.

- Page 2.0-8

Affected Lines: 7, 8, 9, 10, 11, 14, 15, 17 and 19

Revision:

Lines 7, 8, 14, 15: The phrase "and all tritium pathways" was inserted following "inhalation"

Line 9: The equals and bracket symbols were replaced with the word "or"

Lines 10 and 11: "Other" was replaced with "food and ground plane."

Line 17: "Table" was made plural to indicate Table 2.2-1a and Table 2.2-1b

Line 19: "Sec" was changed to lower case for consistency

Justification: The changes on Lines 7, 8, 9, 10, 11, 14 and 15 provided clarification regarding use of X/Q for tritium dose calculations and D/Q for food and ground plane dose calculations.

• Page 2.0-10

Affected Lines: 17, 18, 19, 20, 21, 23, 24, 27 and 28

Revision:

Lines 17 and 18: Following the word "inhalation," the words "and all tritium pathways" were inserted.

Line 19: The equals and bracket symbols were replaced with the word "or."

Lines 20 and 21: The word "other" was replaced with "food and ground plane."

Lines 23 and 24: Following "(mrem/yr per  $\mu\text{Ci}/\text{m}^3$ )," inserted the phrase "for inhalation and all tritium pathways."

Lines 27 and 28: The acronym "MP&L" was replaced with "GGNS."

Justification: The changes on Lines 17, 18, 19, 20, 21, 23 and 24 were made to provide clarification regarding use of X/Q for tritium dose calculations and D/Q for food and ground plane dose calculations. The replacement of MP&L with GGNS on Lines 27 and 28 reflects the change in operator of GGNS.

• Page 2.0-23

Affected Line: 22

Revision: Replaced the acronym "MP&L" on Line 22 with "GGNS." Also, the term "site boundary" was changed to all capital letters.

Justification: The operator of GGNS is no longer MP&L. Capitalizing SITE BOUNDARY provided consistency with the Technical Specifications.

- Page 2.0-24

Affected Line: 16

Revision: Removed the symbol σ from underneath the radical sign.

Justification: Corrected a typographical error made in Revision 6.

- Page 3.0-1

Affected Lines: 2 through 6

Revision: The first sentence on Page 3.0-1 was replaced with an expanded, two sentence description of Tables 3.0-1 through 3.0-3.

Justification: The expanded description clarifies that sampling locations in addition to those described in Technical Specification Table 3.12.1-1 are included in Tables 3.0-1 through 3.0-3.

- General Comments for Pages 3.0-2 thru 3.0-6d:

Many of the descriptions of sampling locations included in pages 3.0-2 thru 3.0-6d have been updated or restated for clarification. The only physical changes in sampling locations involve the Trimble cistern and Grand Gulf Military Park well.

Grammatical changes on pages 3.0-2 thru 3.0-6c, such as capitalization and insertion or deletion of hyphens, commas and periods, are not discussed individually in this outline. However, such changes are noted in the markup copy of ODCM, Rev. 10, and indicated with change bars in ODCM, Rev. 11.

- Page 3.0-2

Affected Lines: 8, 10, 12, 14, 15, 16, 20, 21 and 22

Revision/Justification:

Line 8: The word "south" following Hwy. 61 was deleted because the direction (north vs. south) depends on location.

Line 10: The words "south of" following Hwy. 61 were replaced with "north of" to make the description more accurate.

Lines 12 and 21: Waterloo Road was changed to Bald Hill Road because the road was renamed.

Lines 14 and 15: The words "MP&L training" on Line 14 were replaced with words "the Support Services" to reflect a name change. On Line 15, the word "building" was deleted because of the change on Line 14.

Line 16: The word "side" was inserted following the word "south" for additional clarification.

Line 20: The words "former site of" were inserted preceding the proper name because Ms. M. Jackson's trailer has been relocated.

Line 22: Provided a more precise distance to location AS-8. Previous distance of 0.5 miles was changed to 0.6 miles.

\* Page 3.0-3

Affected Lines: 4, 7, 10, 11, 12, 18, 19, 20, 22, 23 and 24

Revision/Justification:

Line 4: Page 1 of 2 was changed to Page 1 of 3. This page was incorrectly identified.

Line 7: Changed "southwest" to "south-southwest" to be more specific regarding compass direction for Sector K.

Lines 10 through 12: The Trimble cistern was replaced with the McGee cistern. The Trimble cistern is no longer in service. McGee cistern is the closed available continuous service collection location.

Line 18: Changed Figure No. from "3.0-4" to "3.0-1. This corrected a typographical error made in a previous revision."

Lines 18 through 20: Provided clarification for the PGWELL sampling location by providing additional details on Lines 18 through 20.

Lines 22 through 24:

The GGMPWELL location was replaced with the AAWELL. The well at Grand Gulf Military Park has been abandoned. Water for the Park is now supplied by a community water supply well located approximately four miles from GGNS. To replace this sampling location, the well at the inactive Arnold Acres Trailer Park (AAWELL) is being sampled. The AAWELL is the closed offsite groundwater supply.

• Page 3.0-3a

Affected Lines: 6 thru 14, 16, 19, 21, 26, 31, 32, 34 and 35

Revision/Justification:

Lines 6 thru 12: The descriptions for the upstream and downstream surface water sampling locations were revised to provide additional clarification. The physical location of each sample collection site was not changed.

Line 13: Changed "west" to "west-northwest" to be more specific regarding compass direction for Sector P.

Line 14: The distance to the Discharge Basin was revised from "0.5" to "0.3" miles to reflect current measurement.

Line 16: The words "old training" were replaced with the words "Support Services" to reflect a name change.

Line 19: Revised distance to Sector R garden from "0.7" to "0.8" miles to reflect current measurement.

Line 21: Replaced the acronym "MP&L" with "GGNS." MP&L is no longer the operator of GGNS.

Line 26: "Southwest" was changed to "south-southwest" to be more specific regarding the compass direction for Sector K.

Lines 31, 32, 34 and 35: The descriptions for the fish sampling locations were revised to provide additional clarification. The physical location of each location was not changed.

• Page 3.0-3b

Affected Lines: 4 and 6 through 16

Revision/Justification:

Line 4: The asterisk was moved to Line 6 to provide clarification regarding which sample was a Technical Specifications requirement.

Lines 6 thru 11: For clarification, separate descriptions for locations SEDHAM and SEDBAR were provided in Lines 6 through 10 and Line 11, respectively. Also, the statement requiring collection during low water periods was deleted. A requirement for sample collection during low water periods does not exist. Improved flexibility is accomplished by deleting reference to low water collection.

Lines 12 thru 16: The description of the sediment control sampling location was revised to provide clarification and a Figure No.

• Page 3.0-4

Affected Lines: 4, 8 thru 16, 20 thru 23, 26 thru 29

Revision/Justification:

The descriptions of 1LD locations M-01 thru M-06, M-09, M-10, M-12 and M-13 were revised to provide clarification. The physical location of each site did not change. On Line 4, the page number was changed from 6" to 1 of 7" because a page was added.

• Page 3.0-5

Affected Lines: 4, 6, 7, 9, 11, 17, 18, 27, 30

Revision/Justification:

Line 4: The page number was changed from "1 of 6" to "1 of 7" because a page was added.

Lines 6, 7, 9 and 27: Revised the description for TLD locations M-14, M-16 and M-28 to provide additional clarification. The physical location of these sites did not change.

Lines 11 and 18: Inserted the word "former" because the railroad track has been removed.

Line 17: The word "training" was replaced with the words "Support Services" to reflect a name change.

Line 30. Inserted the word "inactive" to reflect the non-operating status of this trailer park.

• Page 3.0-6

Affected Lines: 4, 6 thru 9, 12, 14, 23 and 29

Revision/Justification:

On Line 4, the page number was changed from "1 of 6" to "1 of 7" because a page was added.

The descriptions of TLD locations M-31, M-32, M-34, M-35, M-40 and M-45 were revised to provide clarification. The physical location of each site did not change.

• Page 3.0-6a

Affected Lines: 4, 6, 7, 8, 9, 12, 14, 17, 19, 23, 24 and 26 thru 29

Revision/Justification:

Line 4: The page number was changed from "1 of 6" to "1 of 7" because a page was added.

Line 6: The words "power pole" were replaced with the words "church yard" to be more specific regarding the location of T/D No. M-46.

Lines 7 and 17: "Waterloo Road" was changed to "Bald Hill Road" to reflect a name change.

Lines 8 and 9: Inserted "Westside" following the word "Rodney" and replaced "Greenwood" with "Mont Gomer" to reflect name changes.

Line 12: Replaced "Greenwood" with "Mont Gomer" to reflect a name change.

Line 14: Inserted Figure No. 3.0-3 for TLD No. M-50.

Line 17: Deleted the phrase "marked with white paint" for TLD No. M-52 because it is no longer applicable or necessary.

Line 19: Inserted the word "inactive" preceding "trailer park" to reflect current status of this location.

Line 23: Changed the acronym "MSBH" to "MSDH" to reflect a name change.

Line 24: Deleted the word "south" because it was unnecessary and misleading.

Lines 26, 27, 28, 29: Revised the descriptions of the locations for TLDs M-57 and M-58 to provide additional clarification. The physical location of each site did not change.

• Page 3.0-6b

Affected Lines: 4, 6, 7, 11, 13, 15, 17, 27 and 28

Revision/Justification:

Line 4: The page number was changed from "1 of 6" to "1 of 7" because a page was added.

Lines 6, 7, 27 and 28: Revised the description of TLD locations M-60, M-71 and M-72 to provide additional clarification. The physical location of each site did not change.

Lines 11, 13, 15 and 17: Deleted the acronym "MP&L" because MP&L is no longer the operator of GGNS.

- Page 3.0-6c

Affected Lines: 4 and 25

Revision/Justification:

Line 4: The page number was changed from "1 of 6" to "1 of 7" because a page was added.

Line 25: Inserted "Westside" preceding "Road" to reflect a name change.

- Page 3.0-6d

Affected Lines: All, new page

Revision/Justification:

The last 4 lines (TLDs M-91 thru M-94) were transferred to Page 3.0-6d (new page) to accommodate spacing on Page 3.0-6c.

- Page 3.0-7

Affected Lines: 1, 2 and 3

Revision/Justification:

Line 1: Replaced "Mississippi Power & Light Company" with "System Energy Resources, Inc." Also, deleted "Mississippi Power & Light Company" in lower right corner of map.

Line 2: The "0.5" Mile Area Map was changed to "0-5" to correct a typographical error.

Line 3: Deleted "& 2" to indicate one operating unit.

2. ODCM Revision 12

Revision 12 to the ODCM was reviewed and approved by the Plant Safety Review Committee on August 9, 1988. The changes within this revision can be characterized as administrative. Based on a technical review and consideration of the reasons for the changes, it was determined that the changes will not reduce the accuracy nor the reliability of the dose calculation or setpoint determinations.

Revision 12 to the CGNS ODCM was necessary to:

- Correct administrative and typographical errors
- Revise gaseous setpoint calculation methodology

A markup copy of Revision 11 showing changes for Revision 12 is included as Attachment III. Revision 12 is included as Attachment IV and a detailed outline of Revision 12 is provided below:

SUBJECT: Grand Gulf Nuclear Station Offsite Dose Calculation Manual (ODCM), Revision 12, August 9, 1988.

\* Page 2.0-1

\* Affected Lines: 7, 8, 9, 10, 11, 13 thru 18, 23, 28, 29

Revision/Justification:

Lines 7 & 8: Inserted "(cpm) above background" for clarification. Also inserted "tha" preceding "alarm" for grammatical clarification.

Lines 9 & 11: Replaced "0.25" with the acronym "PF". The correction factor, PF, is the product of the safety and allocation factors.

Line 10: Deleted "(1)" because it was unnecessary.

Lines 13, 14, 15 & 16: Inserted definitions for the product and allocation factors. The revised methodology uses a correction factor to adjust for simultaneous release points, fluctuations in instrument efficiencies and other uncertainties.

Line 17: Replaced "0.25" with "SF" to make defining PF more obvious.

Line 18: Added ", normally set at 0.4" to provide the routine value of SF. Using the normal values of AF (0.25) and SF (0.4), PF equals 1 which is more conservative than the previous value (0.25) used as a correction factor in determining the monitor setpoint. This accounts for uncertainties including the + 25% calculated value provision added in Note 1, Line 6.

Lines 23 & 28: Removed the "less than or equal to" symbols because they were unnecessary.

Line 29: Inserted "(cpm)" for clarification.

\* Line numbers reflect revision location in the ODCM, Revision 12.

- Page 2.0-2

Affected Lines: 2 & 14

Revision/Justification: Inserted "(cpm) above background" on Line 2 and "cpm" on Line 14 to clarify the unit of measurement for count rate.

- Page 2.0-4

Affected Lines: 2, 5 thru 15, 17 thru 22, 25 thru 29

Revision/Justification:

Lines 2, 5, 6, 7, 8:

Replaced "be regarded as upper" with "determine the allowable" on Line 2. Deleted "lower" on Line 5. Replaced "than" with "that is less than or equal to + 25% of" on Lines 5 & 6. The upper limit was replaced with a + 25% limit to improve flexibility, and takes into account minor changes in isotopic abundances. On Lines 6, 7 & 8, added a provision for using the existing setpoint if radionuclides are not detected in grab sample.

Lines 9 thru 12:

The explanatory statement for Note 2) was expanded to clarify that the conservative setpoint methodology could be used to minimize the need for setpoint adjustment as well as when radioactivity was not detectable.

Lines 13 thru 15:

Provided the definition of  $S_v$  and the equation for determining monitor setpoint. As indicated by the footnote to the  $S_v$  definition, the setpoint will be based only on total body dose because it is always a more conservative value. Therefore, reference to skin dose is deleted.

Lines 17 & 18: Inserted a definition for  $PF_v$ .

Lines 19 & 20: Repeated the definition for AF to avoid confusion.

Lines 21 & 22: Inserted a definition for SF' to account for uncertainties including the  $\pm$  25% detector efficiency range added by Lines 14 & 15 of Page 2.0-5.

Lines 25 & 26: Simplified the equation for  $R_t''$  by combining the existing equation for  $R_t''$  and the equation for C'. This combination took into consideration the change to reciprocal units for X as noted on page 2.0-5. As a result the definitions for  $Q''$  and C' were no longer necessary and were deleted.

Lines 27, 28, 29: Added a footnote to explain why it was not necessary to calculate a setpoint based on skin dose.

• Page 2.0-5

Affected Lines: 2, 3, 4, 7, 8, 12 thru 15

Revision/Justification:

Lines 2, 3, 4: Restated the definition for X to identify the source of the efficiency factor and to show use of reciprocal units.

Lines 7 & 8: Clarified definitions for conversion factors.

Line 12: Added the value of K from Table 2.1-1 because it is constant for Kr-89. The definitions for  $R_s''$ , L and M were deleted since they will no longer be used.

Line 13: Added a statement identifying the location for definitions of variables not provided on pages 2.0-4 & 5.

Lines 14 & 15: Added a requirement for instrument calibration to ensure efficiencies remain within the  $\pm$  25% range.

B. Process Control Program (PCP).

No changes were made during the report period.

C. Radioactive Waste Treatment Systems.

No major changes were made during the report period.

Note: Footnotes indicated are listed in GGNS Technical Specifications, Table 4.11.1.1-1.

TABLE 3  
 Grand Gulf Nuclear Station  
 January - June 1988  
SOLID RADIOACTIVE WASTE AND IRRADIATED FUEL SHIPMENTS

A. Solid Waste Shipped Offsite for Burial or Disposal

1. Type of Waste	Unit	6-month Period	Estimate Total Error, %
a. Spent resins, filter sludges, oil evaporator bottoms, etc.	$\text{m}^3$ *Ci	2.20E+02 2.15E+02	7.2E+01
b. Dry compressible waste, contaminated equipment, etc.	$\text{m}^3$ *Ci	1.10E+02 4.34E+00	6.9E+01
c. Irradiated components, control rods, etc.	$\text{m}^3$ *Ci	None	N/A
d. Other	$\text{m}^3$ *Ci	None	N/A

\* Total curie quantity determined by measurement. Total volume used is burial container volume

2. Estimate of major radionuclide composition (by type of waste as identified above).

a. Fe-55	30%
Co-60	26%
Mn-54	23%
Cr-51	12%
Co-58	3%
All others	6%
b. Fe-55	21%
Co-60	19%
Mn-54	12%
Cr-51	28%
Fe-59	2%
All others	18%
c. N/A	N/A
d. N/A	N/A

TABLE 3

SOLID RADIOACTIVE WASTE AND IRRADIATED FUEL SHIPMENTS (cont'd)

3. Solid Waste Disposition

- a. Resins were dewatered in steel liners or polyethylene High Integrity Containers, or solidified in steel liners according to the requirements of the GGNS PCP and shipped LSA.
- b. DAW was packaged in steel 55 gallon drums or steel B-25 boxes and shipped LSA.

<u>Number of Shipments</u>	<u>Mode of Transportation</u>	<u>Destination</u>
41	Truck	Barnwell, SC

B. Irradiated Fuel Shipments (Disposition)

<u>Number of Shipments</u>	<u>Mode of Transportation</u>	<u>Destination</u>
None	N/A	N/A

$W$  = controlling sector annual average atmospheric dispersion at the SITE BOUNDARY or UNRESTRICTED AREAS inside the SITE BOUNDARY for the appropriate pathway.

and all tritium pathways

$$\overline{X/Q} = 4.537 \times 10^{-6*} \text{ sec/m}^3 \text{ for inhalation in the WNW sector.}$$

food and ground plane

$$\overline{D/Q} = 1.301 \times 10^{-8**} \text{ m}^{-2} \text{ for } \text{other pathways in the SSE sector}$$

$P_i$  = the total dose parameter for radionuclide  $i$ , ( $\text{mrem/yr per uCi/m}^3$ ) for inhalation and ( $\text{m}^2 \cdot \text{mrem/yr per uCi/sec}$ ) for food and ground plane pathways, from Table 2.2-1a-b.

$Q'_i$  = rate of release of noble gas radionuclide  $i$  ( $\text{uCi/sec}$ ) from the release point.

$\overline{Q'_i}$  = average release rate of isotope  $i$  of tritium, I-131, I-133 or other radionuclide in particulate form, with half-lives greater than eight (8) days in the current year ( $\text{uCi/sec}$ ).

5

6

\* The highest annual average  $X/Q$  for the GGNS SITE BOUNDARY or UNRESTRICTED AREAS inside the SITE BOUNDARY is Hamilton Lake (WNW, 0.75 miles). This value is taken from the Grand Gulf Nuclear Station Final Environmental Report, Table 6.1.28.

\*\* Value taken from Reference 4, Table 6.1.26.

$Q_i$  = cumulative release of radionuclide i of noble gas, tritium, I-131, I-133, or material in particulate form over the period of interest (uCi). | 5

2.2.2.b Dose to an individual from tritium, I-131, I-133 and radioactive materials in particulate form, with half-lives greater than eight (8) days will be calculated for the purpose of implementation of Specification 3.11.2.3 as follows:

$D_p$  = dose to an individual from tritium, I-131, I-133 and radionuclides in particulate form, with half-life greater than eight days (mrem)

$$= 3.17 \times 10^{-8} \sum_i R_i W' Q_i$$

and all tritium pathways | 5

Where,

$W'$  = relative concentration at a controlling location for an individual

$$\bar{X}/\bar{Q}' = 4.057 \times 10^{-6}^* \text{ sec/m}^3 \text{ for inhalation in}$$

the S sector | 5

$$\bar{D}/\bar{Q}' = 1.408 \times 10^{-8}^* \text{ m}^{-2} \text{ for other pathways in the S Sector}$$

food and ground plane

$R_i$  = the total dose factor for radionuclide i, ( $\text{mrem/yr per uCi/m}^3$ ) and ( $\text{m}^2 \cdot \text{mrem/yr per uCi/sec}$ ) for food and ground plane pathways from Tables 2.2-2a - d | 5

GGNS

\* This conservative approach utilizes values for the onsite gardens (Tables 2.2-3 and 2.3-1). As an alternative, MAPP may use the most conservative offsite controlling locations identified in the above referenced tables. | 5

Table based on 1986 Land Use Census

GGNS

\* These locations represent ~~40%~~ gardens located inside the site boundary.

\*\* Distances shown are actual mileage in each sector.

### 2.3 Meteorological Model

2.3.1 The atmospheric dispersion for gaseous releases may be calculated using a ground level, wake-split form of the straight line flow model.

$$\frac{X}{Q} = \text{atmospheric dispersion (sec/m}^3)$$

$$\frac{2.03 \delta k}{ru^2}$$

Where,

$r$  = distance (m) from release point to location of interest

$\delta$  = plume depletion factor at distance  $r$  from Figure 2.3-1

$u$  = wind speed at ground level (m/sec)

$k$  = open terrain recirculation factor at distance  $r$ , from page 2.0-34

$\Sigma$  = the lesser of  $(\sigma^2 + \frac{b^2}{n})^{1/2}$  or ~~30~~  $\sqrt{3} \sigma$

Where,

$\sigma$  = vertical standard deviation (m) of the plume at distance  $r$  for ground level releases under the stability category indicated by  $T$ , from Figure 2.3-2.

$T$  = temperature differential with vertical separation ( $^{\circ}\text{K}/100\text{m}$ )

$b$  = height of the reactor building = 53.3m.

| 10

.0 RADIOLOGICAL ENVIRONMENTAL MONITORING

~~Sampling locations as required in Section 3/4.12.1 of the Radiological Effluent Technical Specification are described in Tables 3.0-1 through 3.0-3 and shown on maps in Figures 3.0-1 through 3.0-3.~~ The types of vegetation and fish which are normally available for sampling are identified in Tables 3.0-4 and 3.0-5 respectively.

| 6

Sampling locations for the GGNS Environmental Surveillance Program are described in Tables 3.0-1 through 3.0-3 and shown on maps in Figures 3.0-1 through 3.0-3. Those sampling locations required to fulfill the requirements of Technical Specification 3/4.12.1, as described in Table 3.12.1-1, are identified with an asterisk in Tables 3.0-1 through 3.0-3.

\* Calculated from Equation 8.

$w$  = controlling sector annual average atmospheric dispersion at the SITE BOUNDARY or UNRESTRICTED AREAS inside the SITE BOUNDARY for the appropriate pathway.

$\overline{X/Q}$  =  $4.537 \times 10^{-6}*$  sec/m<sup>3</sup> for inhalation and all tritium pathways in the WNW sector.

or

| 11

$\overline{D/Q}$  =  $1.301 \times 10^{-8}**$  m<sup>-2</sup> for food and ground plane pathways in the SSE sector

$p_i$  = the total dose parameter for radionuclide i, (mrem/yr per  $\mu\text{Ci}/\text{m}^3$ ) for inhalation and all tritium pathways and (m<sup>2</sup> . mrem/yr per  $\mu\text{Ci}/\text{sec}$ ) for food and ground plane pathways, from Tables 2.2-1a-b.

| 11

| 11

$Q'_i$  = rate of release of noble gas radionuclide i ( $\mu\text{Ci}/\text{sec}$ ) from the release point.

| 11

$\overline{Q'_i}$  = average release rate of isotope i of tritium, I-131, I-133 or other radionuclide in particulate form, with half-lives greater than eight (8) days in the current year ( $\mu\text{Ci}/\text{sec}$ ).

\* The highest annual average X/Q for the GGNS SITE BOUNDARY or UNRESTRICTED AREAS inside the SITE BOUNDARY is Hamilton Lake (WNW, 0.75 miles). This value is taken from the Grand Gulf Nuclear Station Final Environmental Report, Table 6.1.28.

\*\* Value taken from Reference 4, Table 6.1.26.

$Q_i$  = cumulative release of radionuclide i of noble gas, tritium, I-131, I-133, or material in particulate form over the period of interest (uCi).

2.2.2.b Dose to an individual from tritium, I-131, I-133 and radioactive materials in particulate form, with half-lives greater than eight (8) days will be calculated for the purpose of implementation of Specification 3.11.2.3 as follows:

$$D_p = \text{dose to an individual from tritium, I-131, I-133 and radionuclides in particulate form, with half-life greater than eight days (mrem)}$$
$$= 3.17 \times 10^{-8} \sum_i R_i W' Q_i$$

Where,

$W'$  = relative concentration at a controlling location for an individual

$$\overline{X/Q'} = \frac{4.057 \times 10^{-6}*}{\text{sec/m}^3} \text{ for inhalation and all tritium pathways in the S sector}$$

or

$$\overline{D/Q'} = \frac{1.408 \times 10^{-8}*}{\text{m}^2} \text{ for food and ground plane pathways in the S Sector}$$

$R_i$  = the total dose factor for radionuclide i, (mrem/yr per uCi/m<sup>3</sup>) for inhalation and all tritium pathways and (m<sup>2</sup> . mrem/yr per uCi/sec) for food and ground plane pathways from Tables 2.2-2a - d

\* This conservative approach utilizes values for the onsite GGNS gardens (Tables 2.2-3 and 2.3-1). As an alternative GGNS may use the most conservative offsite controlling locations identified in the above referenced tables.

Table based on 1986 Land Use Census

\* These locations represent GGNS gardens located inside the SITE BOUNDARY.

| 11

\*\* Distances shown are actual mileage in each sector.

### 2.3 Meteorological Model

2.3.1 The atmospheric dispersion for gaseous releases may be calculated using a ground level, wake-split form of the straight line flow model.

X/Q = atmospheric dispersion (sec/m<sup>3</sup>)

$$\frac{2.03 \delta k}{ru \Sigma}$$

Where,

r = distance (m) from release point to location of interest

$\delta$  = plume depletion factor at distance r from Figure 2.3-1

$\mu$  = wind speed at ground level (m/sec)

k = open terrain recirculation factor at distance r, from page 2.0-34

$\Sigma$  = the lesser of  $(\sigma^2 + b^2)^{\frac{1}{2}}$  or  $\sqrt{3} \sigma$

|11

Where,

$\sigma$  = vertical standard deviation (m) of the plume at distance r for ground level releases under the stability category indicated by  $T$ , from Figure 2.3-2.

$T$  = temperature differential with vertical separation ( $^{\circ}\text{K}/100\text{m}$ )

b = height of the reactor building = 53.3m.

### 3.0 RADIOLOGICAL ENVIRONMENTAL MONITORING

Sampling locations for the GGNS Environmental Surveillance Program are described in Tables 3.0-1 through 3.0-3 and shown on maps in Figures 3.0-1 through 3.0-3. Those sampling locations required to fulfill the requirements of Technical Specification 3/4.12.1, as described in Table 3.12.1-1, are identified with an asterisk in Tables 3.0-1 through 3.0-3. The types of vegetation and fish which are normally available for sampling are identified in Tables 3.0-4 and 3.0-5, respectively.

REVISION 11

## 2.0 GASEOUS EFFLUENTS

### 2.1 Gaseous Effluent Monitor Setpoints

2.1.1 For the purpose of implementation of Specification

3.3.7.12 of the RETS, the alarm setpoint level for continuous ventilation noble gas monitors will be calculated as follows:

$S_V = \text{Count rate of vent noble gas monitor at alarm setpoint level}$

= the lesser of

there,  $D_{LES_A} \times R_t \times D_{TB}$   
 $D_{LES_A} \times R_s \times D_{SS}$

FF  
or

the

44

, normally set at 0.4

product of allocation factor (AF) and safety factor (SF), normally set at 0.1  
allocation factor allowing for a total of four normal effluent release points, normally set at 0.25  
= AF  
PF

$D_{TB}$  = Dose rate limit to the total body of an individual at the SITE BOUNDARY or at UNRESTRICTED AREAS inside the SITE BOUNDARY required to limit dose to 500 mrem in one year.

\*  $\not\geq 500 \text{ mrem/yr}$

$D_{SS}$  = Dose rate limit to the skin of the body of an individual at the SITE BOUNDARY or at UNRESTRICTED AREAS inside the SITE BOUNDARY required to limit dose to 3000 mrem in one year.

\*  $\not\geq 3000 \text{ mrem/yr}$

$R_t$  = count rate per mrem/yr to the total body

$$= C + \left[ \bar{x}/Q \sum_i K_i Q'_i \right]$$

(cpm)

(cpm) above  
background

Where,

C = count rate<sub>A</sub> of the vent monitor corresponding to  
grab sample radionuclide concentrations

X/Q = highest sector annual average atmospheric  
dispersion at the SITE BOUNDARY or at  
UNRESTRICTED AREAS inside the SITE BOUNDARY

=  $4.537 \times 10^{-6}$  sec/m<sup>3</sup> in the WNW sector.

K<sub>i</sub> = total body dose factor due to gamma emissions  
from each noble gas radionuclide i  
(mrem/yr per uCi/m<sup>3</sup>) from Table 2.1-1.

Q'<sub>i</sub> = rate of release of noble gas radionuclide i  
(uCi/sec) from the release point

R<sub>s</sub> = count rate<sub>A</sub> per mrem/yr to the skin  
= C + X/Q [  $\sum_i (L_i + 1.1 M_i) Q'_i$  ]

L<sub>i</sub> = skin dose factor due to beta emissions from  
isotope i (mrem/yr per uCi/m<sup>3</sup>) from Table 2.1-1

1.1 = mrem skin dose per mrad air dose

M<sub>i</sub> = air dose factor due to gamma emissions from  
isotope i (mrad/yr per uCi/m<sup>3</sup>) from Table 2.1-1

\* The highest annual average X/Q for the GGNS SITE BOUNDARY or  
UNRESTRICTED AREAS inside the SITE BOUNDARY is Hamilton Lake  
(WNW, 0.75 miles). This value is taken from the Grand Gulf  
Nuclear Station Final Environmental Report, Table 6.1.2B.

NOTES For Section 2.1.1

determine  
the allowable

- 1) The calculated setpoint values will ~~be regarded as upper~~ bounds for the actual setpoint adjustments. That is, setpoint adjustments are not required to be performed if the existing setpoint level corresponds to a ~~lower~~ count rate ~~than~~ the calculated value.
- 2) A more conservative setpoint may be calculated ~~to minimize requirements for adjustment of the monitor utilising the calculations provided in section 2.1.1 and the terms listed below.~~

SEE NEXT PAGE  
FOR CHANGES TO  
NOTES 1 & 2

$$D_{TB} = 500 \text{ mrem/yr}$$

$$D_{ss} = 3000 \text{ mrem/yr}$$

$R_t''$  = conservative count rate per mrem/yr to the total body (Xe-133 detection, Kr-89 dose)

$$= C' \cdot \frac{Q''}{V} \cdot X \cdot \frac{D''}{D}$$

Where:

$\overline{Q''}$  = assigned release rate value of, for example, 1.0 uCi/sec, Xe-133. Flow rate utilised is the minimum assigned flow (See definition of  $C'$  below).

$C'$  = count rate of most sensitive effluent concentration of Xe-133 corresponding to a 1.0 uCi/sec release rate of Xe-133. (Note: Calculate the related concentration based on dilution flow.)

$$= (X) \frac{\overline{Q''}}{V} (3.53E-5) (60)$$

If radionuclides are not detected in the grab sample, then the previously calculated setpoint may remain as the valid setpoint.

- 2) A more conservative setpoint may be calculated using the conservative Kr-89 total body dose factor. This method may be used when there are no valid isotopes available. The conservative setpoint will be calculated as follows:

$$\begin{aligned} S_v &= \text{count rate (CPM) above background of vent noble gas monitor at the alarm setpoint level*} \\ &= PF' \times D_{TB} \times R_t'' \end{aligned}$$

Where:

$$\begin{aligned} PF' &= \text{product of allocation factor (AF) and safety factor (SF'), normally set at 0.2} \\ AF &= \text{allocation factor allowing for a total of four normal effluent release points, normally set at 0.25} \\ SF' &= \text{safety factor allowing for cumulative uncertainties of measurements, normally set at 0.8} \\ R_t'' &= \text{conservative count rate per mrem/yr to the total body (Xe-133 detection, Kr-89 dose)} \\ &= \frac{(3.53E-5) (60)}{X/Q (X)(V)(K)} \end{aligned}$$

\* The setpoint calculation based on a Kr-89 skin dose is not required because the setpoint based on a Kr-89 total body dose will always be more conservative.

Xe-133

detector

Where,

in  $\mu\text{Ci}/\text{cc}/\text{cpm}$  as  
determined by the  
primary calibration\*

$X$  = volume efficiency factor of the system  
~~for Xe-133 to  $\mu\text{Ci}/\text{cc}$~~

$V$  = maximum designed ventilation flow rate in  
cubic feet per minute (cfm)

$3.53E-5$  = ~~conversion factor,  $\text{ft}^3/\text{cc}$~~

$60$  = ~~conversion factor, seconds per minute~~

 $\text{ft}^3 \text{ per cc}$ 

seconds per minute

$K$  = total body dose factor for Kr-89, the  
most restrictive isotope, from Table  
2.1-1.

~~consecutive count rate per second/yr  
the site~~

$$= C' + \left[ \frac{X/V}{Q} \times (I - I_{\text{min}}) \times \frac{60}{S} \right]$$

~~library~~

~~+----- dose factor for Kr-80, from Table  
2.1-1~~

~~+----- air dose factor for Kr-80 from Table  
2.1-1~~

$$= 1.66E + 04 \text{ mrem/yr per } \mu\text{Ci}/\text{m}^3$$

Other variables as defined in Section 2.1.1

\* The instrument calibration procedures will include checks to ensure that  
the detector efficiency does not vary by more than  $\pm 25\%$ .

## 2.0 GASEOUS EFFLUENTS

### 2.1 Gaseous Effluent Monitor Setpoints

2.1.1 For the purpose of implementation of Specification 3.3.7.12 of the RETS, the alarm setpoint level for continuous ventilation noble gas monitors will be calculated as follows:

$S_V$  = Count rate (cpm) above background of vent noble gas monitor at the alarm setpoint level

$$= \text{the lesser of } \frac{PF \times R_t \times D_{TB}}{\text{or}}$$

$$PF \times R_s \times D_{ss}$$

Where,

PF = product of allocation factor (AF) and safety factor (SF), normally set at 0.1

AF = allocation factor allowing for a total of four normal effluent release points, normally set at 0.25

SF = safety factor allowing for cumulative uncertainties of measurements, normally set at 0.4

$D_{TB}$  = Dose rate limit to the total body of an individual at the SITE BOUNDARY or at UNRESTRICTED AREAS inside the SITE BOUNDARY required to limit dose to 500 mrem in one year.

$$= 500 \text{ mrem/yr}$$

$D_{ss}$  = Dose rate limit to the skin of the body of an individual at the SITE BOUNDARY or at UNRESTRICTED AREAS inside the SITE BOUNDARY required to limit dose to 3000 mrem in one year.

$$= 3000 \text{ mrem/yr}$$

$R_t$  = count rate (cpm) per mrem/yr to the total body

$$= C \div [\overline{X/Q} \sum_i K_i Q'_i]$$

12

12

12

12

Where,

C = count rate (cpm) above background of the vent monitor  
corresponding to grab sample radionuclide  
concentrations

$\overline{X/Q}$  = highest sector annual average atmospheric  
dispersion at the SITE BOUNDARY or at  
UNRESTRICTED AREAS inside the SITE BOUNDARY  
=  $4.537 \times 10^{-6}*$  sec/m<sup>3</sup> in the WNW sector.

K<sub>i</sub> = total body dose factor due to gamma emissions from  
each noble gas radionuclide i (mrem/yr per  $\mu\text{Ci}/\text{m}^3$ )  
from Table 2.1-1.

Q'<sub>i</sub> = rate of release of noble gas radionuclide i  
( $\mu\text{Ci}/\text{sec}$ ) from the release point

R<sub>s</sub> = count rate (cpm) per mrem/yr to the skin  
=  $C \div \overline{X/Q} [\sum_i (L_i + 1.1 M_i) Q'_i]$

L<sub>i</sub> = skin dose factor due to beta emissions from  
isotope i (mrem/yr per  $\mu\text{Ci}/\text{m}^3$ ) from Table 2.1-1

1.1 = mrem skin dose per mrad air dose

M<sub>i</sub> = air dose factor due to gamma emissions from isotope i  
(mrad/yr per  $\mu\text{Ci}/\text{m}^3$ ) from Table 2.1-1

| 12

| 12

- \* The highest annual average X/Q for the GGNS SITE BOUNDARY or  
UNRESTRICTED AREAS inside the SITE BOUNDARY is Hamilton Lake  
(WNW, 0.75 miles). This value is taken from the Grand Gulf  
Nuclear Station Final Environmental Report, Table 6.1.28.

NOTES For Section 2.1.1

- 1) The calculated setpoint values will determine the allowable bounds for the actual setpoint adjustments. That is, setpoint adjustments are not required to be performed if the existing setpoint level corresponds to a count rate that is less than or equal to + 25% of the calculated value. If radionuclides are not detected in the grab sample, then the previously calculated setpoint may remain as the valid setpoint.
- 2) A more conservative setpoint may be calculated using the conservative Kr-89 total body dose factor. This method may be used when there are no valid isotopes available. The conservative setpoint will be calculated as follows:

$$\begin{aligned} S_V &= \text{count rate (CPM) above background of vent noble gas monitor at the alarm setpoint level*} \\ &= PF' \times D_{TB} \times R_t'' \end{aligned}$$

Where:

$$\begin{aligned} PF' &= \text{product of allocation factor (AF) and safety factor (SF'), normally set at 0.2} \\ AF &= \text{allocation factor allowing for a total of four normal effluent release points, normally set at 0.25} \\ SF' &= \text{safety factor allowing for cumulative uncertainties of measurements, normally set at 0.8} \\ R_t'' &= \text{conservative count rate per mrem/yr to the total body (Xe-133 detection, Kr-89 dose)} \\ &= \underline{(3.53E-5) (60)} \\ &\quad X/Q (X)(V)(K) \end{aligned}$$

\* The setpoint calculation based on a Kr-89 skin dose is not required because the setpoint based on a Kr-89 total body dose will always be more conservative.

Where,

X = Xe-133 volume efficiency factor of the detector system in  $\mu\text{Ci}/\text{cc}/\text{cpm}$  as determined by the primary calibration\* | 12

V = maximum designed ventilation flow rate in cubic feet per minute (cfm)

3.53E-5 = conversion factor,  $\text{ft}^3$  per cc | 12

60 = conversion factor, seconds per minute | 12

K = total body dose factor for Kr-89, the most restrictive isotope, from Table 2.1-1.

=  $1.66E + 04 \text{ mrem/yr per } \mu\text{Ci}/\text{m}^3$  | 12

Other variables as defined in Section 2.1.1 | 12

\* The instrument calibration procedures will include checks to ensure that the detector efficiency does not vary by more than  $\pm 25\%$ . | 12
