1.0 INTRODUCTION

A Primary Containment Integrated Leak Rate Test was conducted at Cooper Nuclear Station May 27-29, 1988 per CNS Technical Specification 4.7.A, CNS Surveillance Procedure 6.3.1.3, and 10CFR Part 50, Appendix J.

This report contains a description and analysis of the test as required by 10CFR Part 50, Appendix J, Paragraph V.B. The test Technical Data Summary is listed on Attachment 1.

2.0 PREREQUISITES

All instrumentation used for the Cooper Nuclear Station IIRT met the instrument selection guide (see Attachment 2), and the six month calibration and loop check requirements of ANSI N45.4-1972 and ANSI/ANS 56.8-1987. The drywell and suppression chamber were inspected to uncover any structural deterioration that could affect the containment integrity or leak tightness. No structural discrepancies were noted. The valve lineups were performed and independently verified, the twelve suppression chamber to drywell vacuum breakers were blocked open to allow pressurization of the torus and two oil-free air compressors with a capacity of 2400 scfm were connected to the air dryer skid and prepared for operation.

3.0 INSTRUMENTATION

The following instrumentation was used in the performance of the 1988 Cooper Nuclear Station Integrated Leak Rate Test.

3.1 Pressure

Two (2) precision pressure gauges with vibrating stainless steel cylinder type sensors monitored containment pressure. The average of the two readings was utilized in the leakage rate calculations.

3.2 Dewpoint Temperature

Six (6) chilled mirror dewpoint hygrometers were installed to measure the containment dewpoint temperature. Eventually one hygrometer in the drywell failed and weighing factors were appropriately re-distributed. Since the dewpoint temperature was at or near the saturation point in the suppression chamber, two (2) platinum RTDs were employed to measure the dewpoint temperature and the two dewpoint hygrometers were weighted out of the leakage rate calculations.

3.3 Drybulb Temperature

Containment drybulb temperature was monitored by twenty-six (26) platinum Resistance Temperature Detectors (RTDs).

3.4 Flow Rate

The flow rate of the superimposed leak required for the verification test was measured by a thermal mass flowmeter.

3.0 INSTRUMENTATION (continued)

3.5 Data Acquisition

The CNS Plant Management Information System (PMIS) was utilized to collect data from all sensors. A personal computer received the data from the PMIS and performed the necessary calculations.

Instrument weighing factors and locations are listed on Attachment 3A. Pressure and flow instrumentation are shown on Attachment 3B and dewcell and RTD locations are illustrated on Attachments 3C and 3D respectively.

4.0 TEMPERATURE STABILIZATION

The temperature stabilization period began at 0300 on May 28, 1988. The criteria for temperature stabilization were: 1) The latest rate of change of the weighted average contained air temperature, averaged over the last hour, does not deviate by more than 0.5° F/hour from the average rate of change of the weighted average contained air temperature over the last four hours (ANSI/ANS 56.8-1987). 2) The rate of change of average temperature is less than 1° F/hour averaged over the last two hours (Bechtel Typical Report BN-TOP-1). 3) The rate of change of temperature changes less than 0.5° F/hour averaged over the last two hours.

All of the above criteria were met at 0715 on May 28, 1988. Supporting graphs and listings are contained in Attachment 4.

5.0 TYPE A TEST

The Type A Test started at 1015 on May 28, 1988. Containment pressure, weighted average temperature, and weighted average dewpoint temperature were recorded at approximately fifteen minute intervals. The total time leak rate was calculated per Bechtel Topical Report BN-Top-1, Section 6.0. The mass point calculations were based on ANSI/ANS 56.8-1987, Section 5.7.

The Type A Test was concluded after 24 hours at 1015 on May 29, 1988. Attachment 5 contains supporting graphs and listings pertaining to the Type A Test.

6.0 VERIFICATION TEST

Immediately following the Type A Test, a metering valve was adjusted on flowmeter FR1 to a flow rate of approximately 5.1 scfm. The Verification Test began at 1030 on May 29, 1988. Containment pressure, weighted average temperature, and weighted average dewpoint temperature were again recorded at approximately fifteen minute intervals. The total time and mass point leak rate analysis techniques were again employed.

The Verification Test ended at 1430 on May 29, 1988. Graphs and listings related to the Verification Test are contained in Attachment 6.

7.0 TEST SUMMARY

Pressurization for the ILRT began at 1648 on May 27, 1988 at a rate of approximately 7.0 psi per hour. At 1830 it was discovered that relief valve PHR-15RV (loop B supply to the suppression chamber) had been removed for testing and setting and had not been reinstalled. Pressurization was temporarily suspended while a blank flange was installed. Pressurization was restarted at 2013. At 2211 a leak was discovered on the drywell vent monitor. The leak was quantified at 0.7 scfm using an electronic mass flow meter and the vent monitor was isolated. The pressurization equipment was secured at 0247 on May 28, 1988 with a peak instantaneous pressure of 72.5157 psia.

The temperature stabilization period began at 0300, the test criteria were satisfied at 0715 and the Type A Test began at 1015 on May 28, 1988. Temperature, dewpoint temperature, and pressure data were recorded at approximately fifteen minute intervals during the test.

The Type A test was completed at 1015 on May 29, 1988 with a Total Time Upper Confidence Level leak rate of .25104 λ wt/day and a Mass Point Upper Confidence Level leak rate of .2602 λ wt/day. See Attachment 7A for complete test results.

A superimposed leak of approximately 5.1 scfm was metered through a mass flowmeter and the verification test began at 1030 on May 29, 1988. Acceptability of the ILRT was demonstrated (see Attachment 7B) and the verification test was completed at 1430. Depressurization of the primary containment began at 1508 and was completed at 2258.

The Cooper Nuclear Station Primary Containment Integrated Leak Rate Test was successfully completed demonstrating the leak-tight integrity of the reactor primary containment and the systems and components which penetrate the primary containment.

8.0 LOCAL LEAK RATE TEST DATA

The 1986 and 1988 local leak rate test results reflect the total leakage as determined by testing between containment isolation valves. In 1988, the individual leakage from the inboard and outboard valves of each penetration which required corrective or preventive maintenance was also quantified. The difference was reported in addition to the Type A leakage. This was done in order to reconstruct the as found condition of the primary containment before repairs were made.

A summary of the local leak rate test data from 1986 and 1988 can be found in Attachment 8A. The data includes the as found leakage rates, a brief description of repairs, and the as left leakage rates. The leakage adjustments to the 1988 LLRT are listed on Attachment 8B.

9.0 BACKUP DATA

The backup data retained at Cooper Nuclear Station includes the following:

- Integrated Leak Rate Test Procedure 6.3.1.3
- Local Leak Rate Test Procedure 6.3.1.1
- System Piping and Instrumentation Diagrams
- Test Instrument Calibration Data
- Computer Program Verification and Validation
- Containment Penetration Listing
- System Status (at the time of the test)
- Test Director's Log
- Instrument Weighing Factor Data

10.0 EDITED LOG OF EVENTS

This log was edited from the Test Director's official log of events.

May 27, 1988

- 1000 - Completed Torus inspection. No discrepancies were noted.
- 1500 - Completed Drywell inspection. No discrepancies were noted.
- 1648 - Started pressurization of containment.
- 1830 - Discovered that relief valve RHR-15RV had not been reinstalled after removal for testing and setting. Stopped pressurization and installed a blank flange.
- 2015 - Restarted pressurization. Found a leak on purge and vent inboard isolation valve PC-233MV which had been removed for repair. Tightened flange and stopped leak.
- 2211 - Discovered a leak on the Drywell Vent Monitor. The leakage was quantified and the vent monitor was isolated.

May 28, 1988

- 0247 - Reached test pressure. Stopped pressurization.
- 0300 - Temperature stabilization period began.
- 0715 - Temperature stabilization criteria met.
- 1015 - Started Type A test.

10.0 EDITED LOG OF EVENTS (continued)

May 29, 1988

- 1015 - Completed Type A Test.
- 1030 - Adjusted flowmeter FR1 to approximately 5.1 scfm and started the Verification Test.
- 1430 - Completed the Verification Test.
- 1508 - Started depressurization of containment.
- 2250 - Depressurization complete.
- 2300 - Performed post-ILRT containment inspection. No discrepancies were noted.
