Gentlemen:

ULNRC-1830

DOCKET NO. 50-483
CALLAWAY PLANT
NONCONFORMING MATERIALS

- References: 1) NRC Bulletin 88-05, dated May 6, 1988
2) NRC Bulletin 88-05, Supplement 1,
dated June 15, 1988
3) NRC Bulletin 88-05, Supplement 2,
dated August 3, 1988

The referenced NRC bulletin and supplements required licensees to review records, test, and evaluate material supplied by West Jersey Manufacturing (WJM), Piping Supplies Incorporated (PSI) and Chews Landing Metal Manufacturers Inc. (CLM). The attachment to this letter provides the information as required by NRC Bulletin 88-05 and as amended by NRC Bulletin 88-05, Supplement 2 (i.e., provide information compiled as of August 3, 1988).

Union Electric has completed the records search and identification of all safety related material supplied either directly or indirectly by WJM, PSI, or CLM to the Callaway Plant. No PSI or CLM supplied material was found during the records search. A total of 343 components supplied from WJM were found to be installed in safety related systems. Evaluations showed that 223 components are located in accessible areas of the plant. Testing of these components was completed on August 5, 1988. Of the 223 components, 11 are stainless steel (SA182) and were tested for magnetism using a Severn Gauge. All 11 stainless steel components were found acceptable since their delta ferrite numbers were less than 15. The remaining 212 accessible components are carbon steel (SA105) and were tested using the Equotip hardness method. Eighty-four of

TEL
11

these components fell outside the acceptance range of 137HB to 187HB (using the NUMARC acceptance criteria of greater than 116HB, only 4 components would be found unacceptable).

JCOs have been completed for 22 of the unacceptable components. JCO preparation for the remaining 62 components was in progress when Bulletin 88-05, Supplement 2 suspended all JCO requirements. All components tested before August 3, 1988 which fell outside the acceptance range were reported to the NRC within 48 hours as required by Bulletin 88-05, Supplement 1.

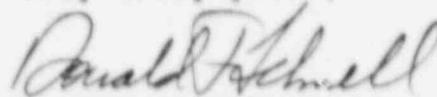

The remaining 120 components were determined to be inaccessible and were scheduled for testing during Callaway's Refuel III outage (scheduled for March, 1989). However, testing of these components has been temporarily suspended by Bulletin 88-05, Supplement 2. All inaccessible items were reported to the NRC within 48 hours of being located as required by Bulletin 88-05, Supplement 1. A generic qualitative JCO has been prepared to address all the inaccessible material (as well as any untested material).

A total of 8 safety related flanges were located in the warehouse (not installed in safety related systems). One of these flanges was donated to NUMARC for testing and the balance were Equotip tested. None of the flanges tested by Union Electric fell outside the acceptance range of 137HB to 187HB. The testing results from the flange donated to NUMARC have not been received.

Union Electric has not located all of the non-safety related material. Only 34 non-safety related flanges have been located installed in the plant and 4 non-safety related flanges have been found in the warehouse. None of the non-safety related material has been tested.

Union Electric plans no further actions in response to Bulletin 88-05 unless otherwise notified by the NRC or NUMARC. If you have any questions concerning this letter, please contact me.

Very truly yours,

Donald F. Schnell
