PUBLIC SERVICE COMPANY OF NEW HAMPSHIRE, et al.

(Seabrook Station, Units 1 and 2)

Docket Nos. 50-443-OL-1 50-444-OL-1 (On-Site Emergency Planning and Safety Issues)

### AFFIDAVIT OF TRAVIS N. BEARD

I, Travis N. Beard, being on oath, depose and say as follows:

 I am a Senior Emergency Planner for New Hampshire Yankee. A statement of my professional qualifications are attached hereto and marked "A".

2. The purpose of this affiGavit is to address allegations in Contention Fases A.5 and B.3. The allegations I address are: (1) the time required to get the VANS vehicles on the road, after driver alert, and set the vehicles up at the acoustic locations in combination with the transit and siren activation time will exceed 15 minutes (Basis A.5); and (2) the airborne system sound coverage is inadequate (Basis B.3).

B809260041 880917 FDR ADOCK 05000443

# Basis A.5: VANS Dispatch and Setup Time

3. I was the New Hampshire Yankee Test Director for the VANS dispatch and setup timing tests conducted on August 25 and 26, 1988. The test procedure is documented as Emergency Preparedness and Community Relations Procedure No. 90520, "VANS Dispatch and Setup Timing Test Procedure", dated August, 1988. The objective of the test procedure was to provide direction for testing the time required for the VANS operator to accomplish the following tasks following notification to dispatch the VANS vehicle:

- Prepare VANS vehicles for dispatch and exit the simulated staging area;
- b. Prepare siren/boom for elevation;
- c. Set outriggers; and

-

1.1.1

d. Raise siren/boom to operable position.

4. The New H: mpshire Yankee prototype VANS vehicle and an onsite simulated staging area were used in the tests. The test procedure sequence for dispatch and setup was executed 50 times and was timed with a stopwatch.

5. Dispatch timing started when the VANS operator acknowledged notification and included the time required for the VANS operator to acknowledge activation notification, walk 100 feet to the vehicle, prepare the VANS vehicle for drive-out (disconnect external power cord to pattery charger), start the vehicle and roll the vehicle. Dispatch

-2-

timing stopped when the rear of the vehicle cleared the simulated staging area door.

-

.

6. Setup timing started when the vehicle stopped rolling and included the time required for the VANS operator to proceed from the vehicle cab and prepare the siren/boom for elevation, set outriggers, raise the siren/boom from the stored position (i.e., to the 80° position with the two outer boom sections positioned within the first boom section and clear the limit switch).

7. The results of the test are attached to this affidavit, Attachment "B". The test results are summarized as follows:

	TIMES (seconds)	AVERAGE (seconds)
DISPATCH	33.39 to 53.35	38.98
SET UP	43.81 to 64.80	49.79

8. At the staging areas the VANS drivers are responsible for ensuring that the vehicles are ready at all times for immediate dispatch, SPMC procedure IP 2.16.

Basis B.3: Airborne System Coverage

9. The Seabrook airborne alerting system is a standard

helicopter with the amplifiers and batteries located in the cabin behind the pilot. Controls for the system are mounted near the forward right seat to make them accessible to the co-pilot/flight director. Loudspeakers are mounted in a configuration adapted to the mechanical constraints of the helicopter airframe but designed to

-3-

achieve wide coverage on the ground when the helicopter is flying at low altitudes.

10. The primary loudspeaker consists of 28 drivers mounted on the left side of the helicopter in a 4-wide x 7high array. The drivers' horns have a square mouth and a center-to-center distance of about 4 and 9/16 inches. This array is driven with three 900-watt and one 450-watt batterypowered amplifiers. The loudspeaker array is mounted in the left rear doorway with its angle of symmetry pointing 90 degrees to the left of the helicopter heading and slightly down at a 5-degree angle.

11. A second set of two loudspeaker arrays is mounted under the helicopter between the landing skids. Each of these consists of a horizontal array of four in-line drivers with 7-inch square horns. The axes of the two speaker arrays are pointed left and right at (+-)20 degrees from the helicopter's heading. They also are tilted downward at a 5degree angle. This orientation was devised to provide optimum acoustic coverage in front of the helicopter where the helicopter-generated ambient noise levels are lower. The smaller arrays are driven by a 900-watt amplifier.

12. The helicopter sound system was provided by

is a major supplier of airborne sound systems. Examples of the use of helicopter alerting systems are:

-4-

uses four

 $^{\odot}$ 

helicopter systems for primary notification of

helicopter alerting system was evaluated by FEMA and was determined to be satisfactory.

(b) Two helicopter-mounted are used as part of the primary public alerting system for the

nuclear plants.

.

....

Ŷ

(c) The U.S. Coast Guard uses on helicopters for control of boat traffic and are being installed on U.S. Customs .

(d) In , the U.S. Navy purchased

for their HH-46 Boeing Helicopters for use in search and rescue missions. Additional systems have been purchased in the past two years for the same mission.

(e) The Police Department has been flying since 1972 and currently has 25 operational systems for its fleet of helicopters. The is ordering a 1400-Watt System for their Command Helicopter for emergency evacuation notification requirements.

13. There are no regulatory requirements or guidelines for supplemental or bac p systems to primary public alerting systems; therefore, the steady 3 to 5 minute tone, as mentioned in the contention basis, is not considered an applicable requirement for the Seabrook airborne alerting system. Nevertheless, even though this airborne system is

-5-

(a)

supplemental, New Hampshire Yankee has designed, implemented, and tested its airborne alerting system so that its performance is compatible with NRC and FEMA guidelines for a primary mobile siren alerting system (FEMA-REP-10, paragraph E.6.2.2).

14. I was the Project Test Director for the New Hampshire Yankee evaluation tests of the airborne alerting system. The test results are documented in Wyle Research Report WR 88-6(R) which is contained in Appendix B of the Seabrook Station FEMA-REP-10 Design Report. This report shows that the airborne system can:

- Achieve a siren sound leve? of 70 dBC (for areas of high population density, as required by FEM7.-REP-10); or
- Achieve a siren sound level of 60 dBC in areas of lower population density (less than 2,000 persons per square mile); and, for either case,
- Achieve a level of 10 dB above the total helicopter masking roise level in the one-third octave band (630 Hz) containing the siren fundamental tone of 680 Hz; and
- Comply with the above for a period of at least 30 seconds.

15. The report also shows that, for a siren tone, the width of the coverage band for the hulicopter flying 40 miles per hour at 500 feet varies from a minimum of 6,700 feet to a

-6-

maximum of 11,200 feet for 70 dBC and 60 dBC tone levels respectively.

-7-

ij,

-

.

## TRAVIS N. BEARD

#### EDUCATION

Georgia State University: M.B.A., 1983 Texas A&M University: M.S., Health Physics, 1975 U.S. Naval Academy: B.S., 1963

### EXPERIENCE

1986 to present:

Public Service Company of New Hampshire, New Hampshire Yankee Division

POSITION: Senior Emergency Planner

Manage the existing Seabrook Station emergency DUTIES: siren system and develop plans for alternate public alerting systems. Provide technical review for the site emergency plan and implementing procedures.

#### 1980 to 1986:

Institute of Nuclear Power Operations

POSITION: Program Manager

Developed criteria for program review and DUTIES: assistance to nuclear utility emergency preparedness programs. Led emergency preparedness assistance teams in visits to nuclear power plants. Developed a workshop for utility radiological assessment teams. As member of INPO Evaluation and Assistance teams, evaluated utility radiological protection programs.

> As Manager, Country Services, was responsible for development and implementation of methods for exchange of operating experience between INPO utility members and far eastern utilities. Planned and participated in assistance visits to Taiwan and South Korea.

1976 to 1980:

0

U.S. Department of Energy

POSITION: Emergency Planning Specialist, Project Officer and Health Physicist.

As Emergency Planning Specialist at D.O.E. DUTIES: Headquarters, conducted independent reviews of D.O.E. field office programs. Project Officer for Aerial Measurement System program. As Health Physicist at the Idaho Falls National Engineering Laboratory, conducted independent appraisals of contractor radiological safety programs. Supervised two engineering professionals as acting Branch Chief.

1975 to 1976: Westinghouse Electric Corporation POSITION: Senior Radiological Control Engineer DUTIES: Investigated potential radiological health problems and conducted audits at the Naval Reactors Facility, Idaho Falls. Emergency planning coordinator for site.

1973 to 1975: Texas A&M University, Graduate Student in Health Physics.

1963 to 1973: United States Navy POSITION: Naval Aviator
