CHECK LIST OF DESIGN VERIFICATION QUESTIONS FOR DESIGN REVIEW METHOD

EE-FR 0005 BY SCHMALZ PAGE N/A

YES NO N/A

- 1. Were the inputs correctly selected and incorporated into design?
2. Are assumptions necessary to perform the design activity adequately described and reasonable?
3. Are the appropriate quality and quality assurance requirements specified?
4. Are the applicable codes, standards and regulatory requirements including issue and addenda properly identified and are their requirements for design met?
5. Have applicable construction and operating experience been considered?
6. Have the design interface requirements been satisfied?
7. Was an appropriate design method used?
8. Is the output reasonable compared to inputs?
9. Are the specified parts, equipment, and processes suitable for the required application?
10. Are the specified materials compatible with each other and the design environmental conditions to which the material will be exposed?
11. Have adequate maintenance features and requirements been specified?
12. Are accessibility and other design provisions adequate for performance of needed maintenance and repair?
13. Has adequate accessibility been provided to perform the in-service inspection expected to be required during the plant life?
14. Has the design properly considered radiation exposure to the public and plant personnel?
15. Are the acceptance criteria incorporated in the design documents sufficient to allow verification that design requirements have been satisfactorily accomplished?
16. Have adequate pre-operational and subsequent periodic test requirements been appropriately specified?
17. Are adequate handling, storage, cleaning and shipping requirements specified?
18. Are adequate identification requirements specified?
19. Are requirements for record preparation review, approval, retention, etc., adequately specified?

NOTE: If the answer to any question is no, provide additional information and resolution below.

RESOLUTION OF DESIGN DEFICIENCIES UNCOVERED DURING THE DESIGN VERIFICATION PROCESS

## Evaluation of cable trays outside of the Congested Cable Area.

## 1.0 Purpose:

The purpose of this evaluation is to determine if there is a significant concentration of non IEEE-383 cables outside of the Congested Cable Area (which includes the Three Room Complex) which does not meet the requirements of Appendix A paragraph D.3(F) to BTP APCSB 9.5-1.

## 2.0 Summary:

No areas were found to exceed our criteria set forth in PSCO letter P-88200 dated June 13, 1988 to the NRC (NRC request #3). Since some areas were close to the maximum allowed, it is recommended that this study be completed biennially to ensure that no area exceeds our limits.

## 3.0 Scope:

Tray locations outside of the Congested Cable Area were reviewed to determine where significant concentrations of all types of cables exist. A significant concentration of cables is defined as being the equivalent of 3.5 standard 30" wide, fully loaded cable trays within a 20 ft. radius. These guidelines were set forth in PSCO letter P-88200 to the NRC dated June 13, 1988 (see NRC request #3). This evaluation is looking at all cables in trays including both IEEE-383 and non IEEE-383 cables.

## 4.0 Procedure:

Drawings E-88 rev P, E-89 rev R, and E-1948-1 rev A, were reviewed and marked up to show all 20 ft. radius areas of possible significant concentration of cables in cable trays. Highlighted on these drawings are all cable trays that presently are coated with flameastic (see attachments G, H and I). Trays that are coated with flameastic were not reviewed because they already are protected against fire propagation. See attachment F for the list of cable trays where flameastic has been applied. Drawings E-88 rev P, and E-89 rev R, for the Reactor and Turbine Buildings respectively have calculations completed to show the percent area fill for each 20 ft. radius area. Calculations are shown on attachment A. Attachment D was used in these calculations as it shows all cable trays that have tray fill calculated for the Reactor and Turbine Buildings.

Drawing E-1948-1 rev A shows cable trays for Building 10. Tray fill for these trays was done by hand. See attachment C which shows the calculations to find the percent area fill of each tray. The cable tabulation database (I-9301-700) and the tray file database were also used in these calculations. Each tray was found in the tray file database with all cables going thru that particular tray listed. Then each cable was found in the

cable tabulation database which listed the Bill of Material (BOM) under which each cable was purchased. Attachment E lists by BOM number the area and diameter for each type of cable, used at FSV. By adding up all the areas of cables that run thru a specific tray and then dividing that number by the tray area, the percent area fill for each tray in Building 10, was calculated. (See attachment B).

At tray intersections the following criteria was used to evaluate the percent area fill. In areas where trays are physically together as one tray, even though they have different tray numbers along the routing, an average percent tray area fill was calculated within the 20 ft. radius. There are basically two types of intersections. Type 1 is called a T-type connection and considered to be two trays. At these connection points the following rules were used. The main run of tray had its percent fill calculated as an average percent fill for the tray even if it consisted of different tray numbers. Then the tray that intersected into the main run of trays had its tray fill added to the main run fill. See example below:

Trays 101T and 100T had their percent fill averaged and then tray 99T had its percent fill added to get a complete percent fill for this area.

The other type of intersection encountered was a H-type connection and was considered to be three trays. At these intersection points the same basic rules were used as for the T-type connection. Both main runs of tray had an average percent tray area fill calculated separately and then added together. Additionally the percent fill of the connecting tray was added. See example below:

Trays 102T and 103T had their percent fill averaged. Trays 104T and 105T also had their fills averaged. Then tray 106T had its

percent fill added to the two other tray averages to get a total percent fill for this area.

Each area was considered to meet our criteria if its total percent area fill did not exceed 350%. It should be noted that this percent is based on a full tray being 40% full.

#### 5.0 Evaluation:

No areas were found to exceed our criteria of 350% allowable tray fill for any 20 ft. radius area. Some areas were close to the maximum allowed. If a significant amount of cables are installed through these areas in the future it could put that area over the maximum 350% allowed fill level.

#### 6.0 Conclusion:

Presently no further action is required. There are no 20 ft. radius areas presently that exceed the maximum fill for the area. This study should be completed biennially to ensure that no area exceeds our limits set forth in PSCO letter P-88200 (request #3).

#### 7.0 References:

- 1) Cable Tabulation & Tray File Database (I-9301-700 Rev AB).

TOTAL AREA OF CABLES = 2.19 in<sup>2</sup>

TOTAL 8 AREA FILL OF TRAY

$A_8 = \frac{\text{TOTAL AREA CABLES}}{\text{AREA AVAIL. OF TRAY}} = \frac{2.19}{43.2} = \boxed{5.078}$

FORT ST. VRAIN NUCLEAR GENERATING STATION  
 PUBLIC SERVICE COMPANY OF COLORADO  
 CALCULATION WORKSHEET

CALCULATION FOR <b>8 TRAY FILL FOR TRAYS IN BUILDING 18 (E-1948-1)</b>		CALCULATION NUMBER <b>EE-FP-0045</b>	
PREPARED BY <b>DJ Bonadies</b>	DATE <b>8/11/88</b>	CALC. REV.	PAGE <b>11</b> OF <b>11</b>
REVIEWED BY	DATE		

**TRAY 409T** → 18" TRAY

CABLE	CON	AREA(in <sup>2</sup> )
3254	12-A-284	.7014
5424	12-A-12	.7163
1117	12-B-14	.1935

TOTAL AREA OF CABLE = 1.59 in<sup>2</sup>  
 TOTAL 8 AREA FILL OF TRAY  
 $8A = \frac{\text{TOTAL AREA CABLES}}{\text{AREA AVAIL OF TRAY}} = \frac{1.59}{43.2} = \boxed{3.68\%}$

**TRAY 409M** → 18" TRAY

TOTAL 8 AREA FILL OF TRAY  
 $8A = \text{NO CABLES IN TRAY} = \boxed{0.00\%}$

**TRAY 409B** → 18" TRAY

TOTAL 8 AREA FILL OF TRAY  
 $8A = \text{NO CABLES IN TRAY} = \boxed{0.00\%}$

Docket No. 50-267

SUBJECT: NRC Review of FSV's Fire  
Protection Program Plan

REFERENCE: 1) PSC letter dated April 1,  
1985, Lee to Johnson  
(P-85113)  
2) PSC letter dated June 13,  
1988, Williams to Docu-  
ment Control Desk  
(P-88200)

Gentlemen:

This letter documents and summarizes PSC's actions and commitments resulting from the August 31, 1988 meeting between the NRC and PSC representatives on the open items associated with the NRC review of the FSV Fire Protection Program Plan (FPPP). The three topics discussed were: (1) fire detection coverage (2) concentrated cable locations outside the defined congested cable areas, and (3) emergency lighting verification.

P-88327  
Page 2  
September 20, 1988

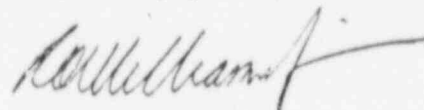

Regarding fire detection coverage, PSC provided drawings which detail the present fire detection coverage at FSV and acknowledged that additional fire detectors will be installed to ensure coverage as previously committed in Reference 1. Furthermore, PSC committed to install additional fire detectors in areas not previously committed to, including areas such as the Fire Water Pump rooms and welding shop. It is anticipated that these modifications will be completed by start up after the 4th refueling outage. PSC will keep the NRC informed of any changes in the present schedule.

The analysis results of the concentrated cable locations outside the congested cable areas, using the methodology defined in Reference 2, were exhibited at the meeting. The analysis identified no locations where cable concentrations exceed the agreed upon limit of 350% of 40% filled cable trays within a 20 foot radius. Attachment 1 provides a copy of Engineering Evaluation EE-FP-0005 which documents these conclusions.

Verification testing results of the emergency lighting will be addressed in a follow-up letter (P-88343).

If you have any questions or comments, please contact Mr. M. H. Holmes at (303) 480-6960.

Very truly yours,

R. O. Williams, Jr.  
Vice President  
Nuclear Operations
