General Comment

Any "generic" environmental impact statement of an advanced nuclear reactor must clearly state the boundary conditions of the type of reactor considered? Is it small, very small, medium size, or what sized? What type of fuel is used, including uranium or other fuels? What type of cooling and containment is being considered? Is it supposed to be self shutting down in case of an accident? What type of neutron buffer is within the envelope being considered. There does not seem to be much point in a generic analysis unless you know what the boundaries of the envelope for generic means.
