Attention: Charles L. Cain
Radiation Specialist

Dear Mr. Cain:

This will confirm our telephone discussion and inform you that Tamko Asphalt Products, Inc. has purchased the roofing assets of Allied Materials Corporation located in Stroud, Oklahoma. As per our discussion, it is necessary that we transfer the materials license to authorize possession and use of the nuclear devices presently in this plant.

To my knowledge, there are three devices within the plant that may have some future use at one of our other plants. Two of these devices are Fife gauges which utilize a strontium 90 source for measuring the density of roofing materials in order to integrate this number into a weight profile. These two devices were recently returned to the Fife Corporation located in Oklahoma City for refurbishing. The source was properly packaged and sealed by Fife personnel prior to shipment. This equipment will be refurbished and utilized at two of our other plants and not returned to the Stroud location.

The other device is a Kay-Ray device utilizing a cesium 137 source and is on a mixing tank utilized to indicate level control. This device is still installed on the tank at Allied and at the present time, I know of no future use for this equipment. This, of course, could change. This equipment can be removed and stored or shipped to any of our other plants where we have personnel available to properly handle the material.

Based on this information, I do not feel that a license for the Stroud, Oklahoma plant is necessary, however, I would appreciate your comments and thoughts regarding the license that is presently in effect with Allied Materials Corporation. If you have any further questions, please don't hesitate to call me at any time.
