On June 12, 1986, the Licensee identified a condition for which the breaker alignment of the "B" Train Charging/Safety Injection (SI) pumps resulted in disabling the pumps from an automatic start under conditions of a Loss of Offsite Power followed by an SI. Following modification retest activities on June 6, 1986, the "B" Charging/SI Pump was placed in pull-to-lock to prevent automatic starting in the event of an SI. The "B" Pump was capable of performing its intended function but had outstanding paperwork to be reviewed and signed off for completion of the modification. The "C" Charging/SI Pump was aligned to the "B" Train and was considered to be the operable pump on that train for the purpose of meeting the Technical Specification Limiting Condition for Operation (LCO). However, the alignment of the "B" and "C" Charging/SI pumps on the "B" Train with the "B" Pump in pull-to-lock would prevent the automatic start of either pump on the "B" Train under conditions of a Loss of Offsite Power followed by an SI. This design feature was not recognized by the operators at the time the action was taken to place the "B" Pump in pull-to-lock.

On June 10, 1986, the "A" Diesel Generator was removed from service for preventive maintenance which lasted 13 hours. This included verification of the operability of "B" Train components in accordance with the Action Statement of Technical Specification 3.8.1.1. Again, it was the operator's understanding that the "C" Charging/SI Pump was operable on the "B" Train. Under these conditions, the "A" and "C" pumps would have started on an SI. For a Loss of Offsite Power, the Charging/SI pumps are not required to start automatically. For an SI followed by a Loss of Offsite Power, the "A" and "C" pumps would have automatically started on an SI and following the Loss of Offsite Power, the "C" Power followed by an SI, no Charging/SI pumps would have automatically started.

On June 11, 1986, an operator questioned the alignment of the "B" Train Charging/SI pumps, and following discussions and evaluation by the Shift Supervisor, the "B" Charging/SI Pump Breaker was racked out. This alignment would allow the automatic start of the "C" Charging/SI Pump under conditions previously discussed.

The concern about the condition which existed from June 6, 1986 to June 11, 1986 was identified to Operations management and a review committee was convened to determine the safety significance and impact on Technical Specification LCO's.

The Licensee attributes this event to personnel error and inadequate procedures. The personnel error was a result of inadequate understanding of the system design. The operating procedures inadequately addressed various system configurations which are created by maintenance and modification activities. Administrative procedures for removal and restoration of equipment were also identified as being inadequate for control of equipment for post-maintenance and modification testing.

The consequences to safety for this event were minimal. The Charging/SI System would have functioned per design for all accident scenarios with the exception of a Loss of Offsite Power followed by an SI. However, under that condition, the "B" or "C" Pump could have been manually started as part of the operator's immediate actions. The Licensee considers this event to be a failure to meet the intention of the Limiting Condition for Operation for Technical Specification 3.8.1.1 action statement C.1.

> SUBJECT: Virgil C. Summer Nuclear Station Docket No. 50/395 Operating License No. NPF-12 LER 86-010

Dear Sir:

Attached is Licensee Event Report #86-010 for the Virgil C. Summer Nuclear Station. This report is submitted pursuant to the requirements of 10 CFR 50.73(a)(2)(i).

Should there be any questions, please call us at your convenience.

Very truly yours. D Nauman
