PACIFIC GAS AND ELECTRIC COMPANY)	(Reracking of Spent Fuel Pools)
)	
(Diablo Canyon Nuclear Power)	
Plant Units 1 and 2))	
)	

LICENSEE PACIFIC GAS AND ELECTRIC COMPANY'S
ANSWERS TO FIRST SET OF INTERROGATORIES
OF THE SIERRA CLUB, DATED SEPTEMBER 15, 1986

INTERROGATORY NO. I:

Identify all records and documents relating to theoretical work regarding the displacements of high density spent fuel racks at Diablo Canyon resulting from hypothetical seismic excitation of the the spent fuel pools. Such documents should include, but are not limited to, any reports of calculations regarding:

- 1) the displacement of any rack toward a wall or another rack;
- 2) displacements resulting in collisions between a rack and a wall;
- 3) the nearest approach of a rack to a wall;
- 4) the presentation made by PGandE to the NRC at the meeting of February 20, 1986;
- 5) the claim reported in the Safety Evaluation, Appendix A,

8610080272 861006
PDR ADOCK 05000275
G PDR

DS03

1 page 49, regarding rack displacements.

2
3 RESPONSE TO INTERROGATORY NO. I:

4
5 Theoretical work related to displacements are contained in Documents
6 4, 7, 8, 9, 10, 11, 12, 13, 14, 16, 18, (Section 6), 19, 24, 27, 28, 29, 33,
7 35, 36, and 37, and Documents A, B, and E which are identified in Attachment I.

8
9
10 INTERROGATORY NO. II:

11
12 Identify all records and documents relating to experimental studies
13 which serve to verify theoretical rack displacement calculations.

14
15 RESPONSE TO INTERROGATORY NO. II:

16
17 Experimental studies were not performed specifically to verify
18 theoretical calculations for the high density racks. However, related
19 experimental studies have been conducted which serve to verify portions of the
20 rack analysis they are contained in Documents 3, 17, and 22, and Document C
21 which are identified in Attachment I.

22
23
24 INTERROGATORY NO. III:

25
26 Identify all records and documents relating to theoretical work

1 regarding impact forces and/or fluid coupling forces exerted on spent fuel
2 racks as a result of interactions between racks or between a rack and a wall
3 in response to hypothetical seismic excitation of the spent fuel pools. Such
4 documents should include, but are not limited to, all reports of calculations
5 involving:

- 6
- 7 1) the forces on a rack arising from rack-rack interactions,
8 including collisions;
- 9 2) the forces on a rack arising from rack-wall interactions,
10 including collisions;
- 11 3) interaction forces reported or discussed by PGandE to the NRC at
12 the meeting of February 20, 1986;
- 13 4) the claim reported in the Safety Evaluation, Appendix A, page 49
14 regarding rack forces ("Safety Evaluation By The Office of
15 Nuclear Regulation Relating to the Reracking of the Spent Fuel
16 Pools At the Diablo Canyon Nuclear Power Plant, Units 1 and 2,
17 ...," U.S.N.R.C., Washington, D.C., May 30, 1986.);
- 18 5) the claim made in the Safety Evaluation, Appendix A, page 24,
19 that the fluid coupling method conservatively underestimates the
20 coupling forces.
- 21

22 RESPONSE TO INTERROGATORY NO. III:

23

24 Records and documents relating to theoretical work regarding impact
25 forces and/or fluid coupling forces exerted on the racks are included in
26 Documents 1, 4, 5, 6, 8, 9, 10, 13, 15, 16, 18, 20, 21, 22, 23, 24, 30, 34,

1 36, and 37, and Documents A, B, D, and H (Chapter 9) which are identified in
2 Attachment I.

3
4
5 INTERROGATORY NO. IV:

6
7 Identify all records and documents relating to experimental studies
8 which serve to verify theoretical calculations regarding rack forces,
9 including impact and fluid coupling forces.

10
11 RESPONSE TO INTERROGATORY NO. IV:

12
13 See response to Interrogatory No. II.

14
15
16 INTERROGATORY NO. V:

17
18 Identify all records and documents relating to theoretical analysis
19 of rack strength. Such documents should include, but are not limited to,
20 reports of calculations involving both impact loads and fluid coupling loads.

21
22 RESPONSE TO INTERROGATORY NO. V:

23
24 Records and documents relating to theoretical analysis or rack
25 strength are included in Documents 1, 2, 4, 5, 6, 11, 15, 18 (Part I and
26 Section 6), 20, 25, 26, 30, and 32, and Documents A, B, and E which are

1 identified in Attachment I.
2
3

4 INTERROGATORY NO. VI:
5

6 Identify all records and documents relating to experimental studies
7 which serve to verify predicted rack strengths. Such documents should
8 include, but are not limited to, reports of experiments involving both impact
9 loads and fluid coupling loads.
10

11 RESPONSE TO INTERROGATORY NO. VI:
12

13 See response to Interrogatory No. II.
14
15

16 INTERROGATORY NO. VII:
17

18 Identify all records and documents relating to the fluid coupling
19 coefficients used in the time-history analysis, as discussed in section 6.2.3
20 of the Reracking Report. ("Reracking of Spent Fuel Pools Diablo Canyon
21 Units 1 and 2", PGandE, September, 1985.) Such documents should include, but
22 are not limited to, reports of calculations involving:
23

- 24 1) a complete description of the fluid coupling coefficients;
25 2) the theoretical derivation of the fluid coupling coefficients;
26 3) experimental verification of the fluid coupling coefficients;

1 4) limiting values attained by the fluid coupling coefficients
2 during time-history analysis of rack behavior during seismic
3 excitation.
4

5 RESPONSE TO INTERROGATORY NO. VII:
6

7 Records and documents relating to fluid coupling coefficients are
8 included in Documents 5, 16, 18, and 37, and Documents A, B, and H which are
9 identified in Attachment I.
10

11
12 INTERROGATORY NO. VIII:
13

14 Identify all records and documents relating to theoretical analysis
15 of the fluid coupling between racks.
16

17 RESPONSE TO INTERROGATORY NO. VIII:
18

19 Records and documents related to fluid coupling between racks are
20 included in Documents 4, 5, and 15 through 24, and cited in Document H which
21 are identified in Attachment I.
22

23
24 INTERROGATORY NO. IX:
25

26 Identify all records and documents relating to experimental studies

1 performed to verify the theoretical analysis of fluid coupling between racks.
2

3 RESPONSE TO INTERROGATORY NO. IX:
4

5 See response to Interrogatory No. II.
6
7

8 INTERROGATORY NO. X:
9

10 Identify all records and documents relating to theoretical analysis
11 of fluid coupling between a fuel rack and a wall of the spent fuel pool.
12

13 RESPONSE TO INTERROGATORY NO. X:
14

15 See response to Interrogatory No. VIII. Additional references are
16 provided in Documents A and B which are identified in Attachment I.
17
18

19 INTERROGATORY NO. XI:
20

21 Identify all records and documents relating to experimental studies
22 performed to verify the theoretical analysis of fluid coupling between a rack
23 and a wall.

24 ///

25 ///

26 ///

1 RESPONSE TO INTERROGATORY NO. XI:

2
3 See response to Interrogatory No. II.
4

5
6 INTERROGATORY NO. XII:

7
8 Identify all records and documents relating to the density of the
9 racks and/or the bouyant force on racks under water. Such documents should
10 include, but are not limited to, any discussion of the effect of rack bouyancy
11 on rack behavior during seismic excitation.
12

13 RESPONSE TO INTERROGATORY NO. XII:

14
15 The documents used for analysis of the racks are included as
16 Documents 4, 5, and 15 through 24 which are identified in Attachment I.
17

18
19 INTERROGATORY NO. XIII:

20
21 Identify all records and documents relating to the velocity
22 dependence of the coefficient of friction between stainless steels.
23

24 RESPONSE TO INTERROGATORY NO. XIII:

25
26 Documents relating to the velocity dependence of the coefficient of

1 friction between stainless steels are Document 3 and Document C which are
2 identified in Attachment I.
3
4

5 INTERROGATORY NO. XIV:
6

7 Identify all records and documents relating to the time during which
8 a rack may be in contact with another rack during a collision with another
9 rack or in contact with a wall during a rack-wall collision. Such documents
10 should include, but are not limited to, reports of calculations involving:
11

- 12 1) velocity and/or displacement time-histories for racks undergoing
13 collisions;
- 14 2) typical or average times during which a rack is expected to be
15 in contact with another rack or with a wall during a collision.
16

17 RESPONSE TO INTERROGATORY NO. XIV:
18

19 During time history analyses, displacements are computed at each time
20 step; however, only maximum values for the entire event are stored and
21 printed. Therefore, no detailed results are included herein. See Documents
22 15 and 20 and Document E which are identified in Attachment I.

23 ///

24 ///

25 ///

26 ///

1 INTERROGATORY NO. XV:

2
3 Identify all records and documents relating to the possibility of
4 and/or consequences of two or more racks colliding with a third rack or with a
5 wall. Such documents should include, but are not limited to, reports of
6 calculations involving:

- 7
8 1) the frequency of such three-body collisions;
9 2) typical velocity and/or displacement time-histories of such
10 collisions;
11 3) maximum impact and fluid coupling loads on racks involved in
12 multiple collisions.
13

14 RESPONSE TO INTERROGATORY NO. XV:

15
16 The possibility of two or more racks colliding with a third rack or
17 with a wall is discussed in Documents 15, 22, and 37, and Document B which are
18 identified in Attachment I.
19
20

21 INTERROGATORY NO. XVI:

22
23 It appears from the Reracking Report that the time-history analyses
24 performed assume that a rack will collide with another rack "out of phase"
25 whenever it has moved a distance of 0.125 inches relative to the pool floor
26 from its equilibrium position. In other words, it appears that the

1 time-history analyses assume as a constraint that the maximum displacement of
2 a rack relative to the pool floor is 0.125 inches. Is it true that such a
3 assumption was made for the purposes of the time-history analyses?
4

5 RESPONSE TO INTERROGATORY NO. XVI:
6

7 Such an assumption was not made. The assumption is that for a rack
8 adjacent to another rack, the free movement is 0.125" before any force
9 develops in the gap element (simulating the adjacent rack). The subsequent
10 compression of the gap element yields the value of the developed impact
11 force. There is no absolute constraint imposed except when contact occurs
12 with the stiff non-linear spring (gap element).
13
14

15 INTERROGATORY NO. XVII:
16

17 If the assumption in XVI was made, identify all records and documents
18 relating to the verification of the validity of this assumption. Such
19 documents should include, but are not limited to, reports of calculations
20 involving the change in the average separation between racks during seismic
21 activity.
22

23 RESPONSE TO INTERROGATORY NO. XVII:
24

25 Not applicable based on the response to Interrogatory No. XVI.
26

1 INTERROGATORY NO. XVIII:

2
3 If the assumption discussed in XVI was made, identify all reports and
4 documents relating to the examination of the consequences of this assumption.
5 Such documents should include, but are not limited to, reports of calculations
6 involving the effect of changes in the value of 0.125 inches on rack behavior,
7 including rack velocity, maximum impact loading and maximum fluid coupling
8 loads.

9
10 RESPONSE TO INTERROGATORY NO. XVIII:

11
12 Not applicable based on response to Interrogatory No. XVI.
13
14

15 INTERROGATORY NO. XIX:

16
17 If the assumption discussed in XVI was not made, describe when and
18 where collisions between racks are expected to occur in the time-history
19 analyses.
20

21 RESPONSE TO INTERROGATORY NO. XIX:

22
23 Collisions occur at corners of racks (nearly always at top of racks
24 where girdle bars are present). Tables in Document 18, Section 6
25 (Attachment I) , provide a listing of maximum values. Each computer output
26 presents a summary of maximum impact forces occurring on each non-linear

1 spring element and the time step where it occurs. Documents 15 and 20
2 (Attachment I) also contain some information dealing with impact forces.
3
4

5 INTERROGATORY NO. XX:
6

7 Identify all records and documents containing evidence that sliding
8 and tilting motion will be contained within suitable geometric constraints
9 such as thermal clearances, and that any impact due to the clearances is
10 incorporated.
11

12 RESPONSE TO INTERROGATORY NO. XX:
13

14 Document 19 (computer outputs) (Attachment I) provides details of the
15 maximum displacements for all racks studied. They are presented in a summary
16 table at the end of the computer printout. Document 18 (Attachment I) also
17 contains similar data in Section 6. All adjacent structures (walls, other
18 racks) are simulated by impact springs (gap elements) which have gaps that
19 reflect the assumed clearances. Other reports providing information on
20 sliding and tilting evaluations include Documents 1, 2, 15, 18, 20, and 31,
21 and Documents B, F, and G (Attachment I).
22
23

24 INTERROGATORY NO. XXI:
25

26 What equations of motions were used for the time-history analyses in

1 the eight degree of freedom model? If the equations of motion were
2 transformed before being solved, give both the original and transformed
3 equations. All parameters in these equations should be fully identified.
4

5 RESPONSE TO INTERROGATORY NO. XXI:
6

7 Documents 16 and 18 (Attachment I) contain the derivation of the
8 equations of motion. All transformations of subsequent equations (matrix
9 manipulations, etc.) are carried out within the simulation code.
10

11
12 INTERROGATORY NO. XXII:
13

14 What is the maximum allowable impact force on a fuel assembly?
15 Identify all records and documents related to the experimental and/or
16 theoretical derivation of this value.
17

18 RESPONSE TO INTERROGATORY NO. XXII:
19

20 Unknown.
21
22

23 INTERROGATORY NO. XXIII:
24

25 Identify all records and documents relating to the damage sustained
26 by a fuel element if the maximum allowable impact force is exceeded.

1 RESPONSE TO INTERROGATORY NO. XXIII:

2

3 Unknown.
