On June 19, 1986, at 1315 hours, with the plant in Mode 2, the blowdown line from the No. 3 steam generator was isolated (closed VD-V-631) in preparation to repair a weld leak in the downstream line. As a result, the No. 3 blowdown monitor was declared inoperable since it was unable to monitor the steam generator.

T.S. 3.3.3.1 action statement required an operable, continuous monitor be placed in service within 8 hours. This action was not met since the effluent flowpath from the steam generator had been isolated. The plant entered Mode 5 at 0615 on June 20, at which time the monitor was no longer required by technical specification. The blowdown line was returned to service on June 21, 1986, and the monitor declared operable. This event is an isolated occurrence and was necessary for maintenance repair activities. No further corrective action is necessary.

There was no primary or secondary leakage before or after the event which would have been detected by the monitor.

There was no adverse effect to the public health and safety as a result of this event.

Subject: Licensee Event Report 50-29/86-06

Inoperable No. 3 Steam Generator Blowdown Monitor

Dear Sir:

In accordance with 10 CFR 50.73(a)(2)(i), the attached Licensee Event Report is hereby submitted.

Very truly yours.

Normand N. St. Laurent Plant Superintendent
