

UNITED STATES
NUCLEAR REGULATORY COMMISSION
WASHINGTON, D. C. 20555

CONSUMERS POWER COMPANY

BIG ROCK POINT PLANT

DOCKET NO. 50-155

AMENDMENT TO FACILITY OPERATING LICENSE

Amendment No. 97
License No. DPR-6

1. The Nuclear Regulatory Commission (the Commission) has found that:
 - A. The application for amendment by Consumers Power Company (the licensee) dated February 6, 1987 superseded previous submittals dated September 30, 1985, March 4, April 21 and December 17, 1986 plus additional information provided on August 27, 1986, complies with the standards and requirements of the Atomic Energy Act of 1954, as amended (the Act), and the Commission's rules and regulations set forth in 10 CFR Chapter I;
 - B. The facility will operate in conformity with the application, the provisions of the Act, and the rules and regulations of the Commission;
 - C. There is reasonable assurance (i) that the activities authorized by this amendment can be conducted without endangering the health and safety of the public; and (ii) that such activities will be conducted in compliance with the Commission's regulations;
 - D. The issuance of this amendment will not be inimical to the common defense and security or to the health and safety of the public; and
 - E. The issuance of this amendment is in accordance with 10 CFR Part 51 of the Commission's regulations and all applicable requirements have been satisfied.

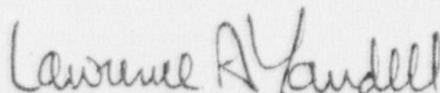

2. Accordingly, the license is amended by changes to the Technical Specifications as indicated in the attachment to this license amendment and Paragraph 2.C.(2) of Facility Operating License No. DPR-6 is hereby amended to read as follows:

Technical Specifications

The Technical Specifications contained in Appendix A, as revised through Amendment No. 97, are hereby incorporated in the license. The licensee shall operate the facility in accordance with the Technical Specifications.

3. This license amendment is effective as of the date of its issuance.

FOR THE NUCLEAR REGULATORY COMMISSION

Lawrence Yandell, Acting Director
Project Directorate III-1
Division of Reactor Projects - III, IV, V
& Special Projects
Office of Nuclear Reactor Regulation

Attachment:
Changes to the Technical
Specifications

Date of Issuance: May 31, 1989

ATTACHMENT TO LICENSE AMENDMENT NO. 97

FACILITY OPERATING LICENSE NO. DPR-6

DOCKET NO. 50-155

Revise Appendix A Technical Specifications by removing the pages identified below and inserting the attached pages. The revised pages are identified by the captioned amendment number and contain marginal lines indicating the area of change.

Limiting Conditions for Operation

11.3.5.3 EMERGENCY POWER SOURCES

Applicability:

Applies to the operational status of the emergency power sources.

Objective:

To assure the capability of the emergency power sources to provide power required for emergency equipment in the event of a Loss of Coolant Accident.

Specification:

A. For all reactor operating conditions except cold shutdown, there shall normally be available one 138 kV line, one 46 kV line, one diesel generator system, one station battery system, four RDS uninterruptible power supplies including batteries and one alternate shutdown battery system, except as specified below:

1. Refueling operations and related testing may be conducted with the 138 kV line de-energized.
2. The 46 kV line or the diesel generator may be out of service for repair for periods up to three (3) days during reactor operation and for extended periods during refueling or shutdown operations.

Surveillance Requirement

11.4.5.3 EMERGENCY POWER SOURCES

Applicability:

Applies to the periodic testing requirements for the emergency power sources.

Objective:

To assure the operability of the emergency power sources to provide emergency power in the event of a Loss of Coolant Accident.

Specification:

A. The emergency power system surveillance will be performed as indicated below. In addition, components on which maintenance has been performed will be tested.

1. During each operating cycle -
 - (a) Test of automatic initiation sensors and load test the emergency diesel to 180-200 kW generator output for at least 20 minutes.
 - (b) Test and calibrate the following instruments and controls associated with diesel generator:
 - (1) Fuel oil level.
 - (2) Oil Pressure tripping.
 - (3) Water temperature tripping.

11.3.5.3 EMERGENCY POWER SOURCES (Cont'd)

11.4.3.3 EMERGENCY POWER SOURCES (Cont'd)

- 3. The diesel generator fuel supply shall be adequate for three-day operation.
- 4. If Specifications A.2 or A.3 are not met, a normal orderly shutdown shall be initiated within one (1) hour and the reactor shall be shut down as described in Section 1.2.5(a) within twelve (12) hours and shut down as described in Section 1.2.5(a) and (b) within the following 24 hours. During refueling operations cease all changes which could affect reactivity.
- 5. The station battery system and alternate shutdown battery system shall be operable under all conditions except during cold shutdown. If the station battery or the alternate shutdown battery is inoperable, no actions shall be taken which result in a reactivity addition, except cooldown, or which might result in the primary coolant system being drained. The alternate shutdown battery may be inoperable during refueling or shutdown operations as long as containment integrity for the main steam line is established.
- 6. If specification A.5 is not met a normal orderly shutdown of the reactor shall be initiated within one (1) hour and the reactor shall be shut down as described in Section 1.2.5(a) within twelve (12) hours and shut down as described in Section 1.2.5(a) and (b) within the following 24 hours.
- 7. One RDS uninterruptible power supply including battery may be out of service as described in Section 3.1.5 Action 3.

- (4) Overspeed tripping.
- (5) Battery undervoltage alarm.
- (c) Verify the automatic transfer of station power from the 138 kV line to the 46 kV line.
- (d) Verify the automatic transfer of power sources for the 1Y and 2Y instrument and control panels.
- (e) Verify the cells, cell plates, and battery racks show no visual indication of physical damage or abnormal deterioration for the station battery the RDS batteries and the alternate shutdown battery.
- (f) Verify the cell-to-cell and terminal connections are clean, tight, free of corrosion and coated with anti-corrosion material for the station battery, the RDS batteries and the alternate shutdown battery.
- (g) Verify that the battery charger for the station battery and the RDS batteries will supply at least 30 amperes at a minimum of 135 volts for at least 4 hours.
- (h) Verify that the capacity of the station battery and the RDS batteries is adequate to supply and maintain in OPERABLE status all of the actual emergency loads for the design time interval when the battery is subjected to a battery service test. The design time interval for the RDS batteries is one hour, two hours for the station battery and seventy-two hours for the alternate shutdown battery.
- (i) Test and calibrate the 2400 volt bus undervoltage trip control components as follows:
 - (1) The undervoltage relays 127-10KV, KZ and YZ will drop out on decreasing voltage of no lower than 107.8 volts, after a delay of 5.6 seconds.
 - (2) The auxiliary timing relay 167-10K will be actuated after a 10 ± 0.5 second time delay upon receiving a signal from all three (3) undervoltage relays.

Surveillance Requirement

Limiting Conditions for Operation

11.4.5.3 EMERGENCY POWER SOURCES (Contd)

11.3.5.3 EMERGENCY POWER SOURCES (Contd)

8. During reactor power operation, the 138 kV line may be out of service for repair for periods up to three (3) days.
9. If Specification A.8 is not met, a normal orderly shutdown shall be initiated within one (1) hour and the reactor shall be shut down as described in Section 1.2.5(a) within twelve (12) hours and shut down as described in Section 1.2.5(a) and (b) within the following 24 hours.
8. During power and refueling operations, the 2400 volt bus undervoltage components shall be operable or placed in the tripped condition, except during the monthly channel functional testing period.

2. Monthly -
 - (a) Test start diesel generator and operate at least the fire pump as a load to 400 V Bus 2B for at least 20 minutes.
 - (b) Verify that the cell voltage is ≥ 2.0 volts and specific gravity is > 1.2 of each cell of the station battery; and verify that the cell voltage is > 6.0 volts and specific gravity is > 1.2 on each cell of the RDS batteries; and verify that the cell voltage is > 2.1 volts and specific gravity is > 1.2 of each cell of the alternate shutdown battery.

- (c) Test operate the rod position motor generator set.
- (d) Perform a channel functional test of the 2400 volt bus undervoltage trip system.

3. Weekly -

- (a) Verify the electrolyte level of each RDS battery pilot cell, the station battery pilot cell, and the alternate shutdown battery pilot cell is between the minimum and maximum level indication marks.
- (b) The pilot cell specific gravity for RDS station and alternate shutdown batteries corrected to (77) $^{\circ}$ F, is > 1.2 .
- (c) The station battery pilot cell voltage is > 2.0 volts. The RDS battery pilot cell voltage is > 6.0 volts and the alternate shutdown battery pilot cell voltage is ≥ 2.1 volts.
- (d) Verify the overall battery voltage is > 125 volts for the station battery the RDS batteries and the alternate shutdown battery.
- (e) Test start the diesel generator and run for warm-up period.

11.4.5.3 EMERGENCY POWER SOURCES (Contd)

(f) Verify that the diesel generator battery electrolyte level above plates and over-all battery voltage is > 24 volts.

h. Quarterly - Verify the following:

- (a) That the specific gravity of the diesel generator battery is appropriate for continued service.
 - (b) That the diesel generator battery and battery rack show no visual indication of physical damage or abnormal deterioration; and
 - (c) That the diesel generator battery terminal connections are clean, tight, free of corrosion and coated with anticorrosion material.
5. Sixty Months - At least once per 60 months during shutdown, verify that the RDS batteries, the alternate shutdown batteries and the station battery capacity is at least 80% of the manufacturer's rating when subjected to a performance discharge test. This performance discharge test shall be performed subsequent to the satisfactory completion of the required battery service test of Part 11.4.5.3.A.1.(h);

Pages:

Normal station power can be provided by the station turbine generator, the 136 kV transmission line or the 46 kV line. These sources are adequate to provide emergency a-c power. When none of these sources is available, a single emergency diesel generator rated at 200 kW starts automatically to provide emergency a-c power to 400 V Bus 2B. The weekly starting test is based on Manufacturer's Bulletin 13741-1 for re-lubrication protection of moving parts. Diesel generator initiation and output circuit breaker closure is accomplished by two voltage sensors: one to detect loss of normal power on Bus 2B; and, the other to provide assurance of generator output prior to automatic closure of the generator output breaker. Additional breaker interlocks are provided to assure that the normal Buses 1A and 2A are isolated prior to closing the generator output breaker. This prevents overloading of the generator during the starting period. An overvoltage trip at $\pm 09.25\%$ of normal voltage isolates the 2400 volt bus prior to any postulated equipment degradation.

The operability of the diesel battery and charger is verified by the weekly starting test of the diesel and by the weekly verification of the electrolyte level and overall battery voltage.

The diesel fuel oil tank is sized for ten-day full-load operation. Three-day supply is considered adequate to provide fuel makeup.

A single station battery supplies power for normal station services and is sized for emergency uses including valves and controls of loss of Coolant Accidents. The battery can be charged from the emergency diesel generator output if normal station power sources are not available.

The primary core spray valves and the primary containment spray valve are operated and controlled by power from the station battery. The backup core spray valves and backup containment spray valve are operated by power from normal station power sources or the emergency diesel generator.

RDS uninterruptible power supplies (UPS) A, B, C, and D (each consisting of a battery, battery charger and an inverter) supply each division (except division 5) with electrical power. Each UPS has outputs of 120 V a-c, 60 Hz, and 125 V d-c. One of these batteries supplies control power for the emergency diesel generator. Divisions 1 & 2 and 3 & 4 normally receive power from 480 V a-c Buses 1A and 2A, respectively. In the event of loss of power to either or both buses, provision is included for supplying input power from 480 V a-c Bus 2B which is tied to the emergency diesel generator. If all 480 V a-c power is lost, the RDS UPS is capable of sustaining its outputs for one hour. The Station Battery has adequate capacity to supply and maintain in an operable status all of the emergency loads during a Loss of Coolant Accident plus an assumed Loss of AC Power for two hours. The station battery and the four (4) RDS batteries will be considered operable if they are essentially fully charged and the battery charger is in service. Additionally, prior to the startup following the 1977 refueling outage, successful completion of service testing and performance discharge testing within each operating cycle and each sixty months, respectively, will further establish battery reliability.

An alternate shutdown battery supplies power to the main steam isolation valve, the emergency condenser outlet valves and other alternate shutdown equipment. The battery is sized so that loss of the charger does not affect operability of the battery for up to six (6) days at a minimum of 25°F (nine (9) days at a minimum of 40°F).

PLANT SYSTEMS

3/4.7.12 PENETRATION FIRE BARRIERS

MITTING CONDITIONS FOR OPERATION

3.7.12 All penetration fire barriers including fire doors and fire dampers protecting safety related areas shall be functional.

APPLICABILITY: At all times

ACTION:

- a. With one or more of the above required penetration fire barriers non-functional and with the area of the affected barrier(s) monitored by OPERABLE (pursuant to Specification 3.3.3.8) fire detection instrumentation, within 1 hour establish a fire watch patrol and inspect the affected area(s) at least once per hour.
- b. With one or more of the above required penetration fire barriers non-functional and with the area of the affected barrier(s) not monitored by OPERABLE (pursuant to Specification 3.3.3.8) fire detection instrumentation, establish a continuous fire watch on at least one side of the affected penetration within 1 hour.

SURVEILLANCE REQUIREMENTS

4.7.12 Each of the above required penetration fire barriers shall be verified to be functional by a visual inspection;

- a. At least once per 18 months, and
- b. Prior to declaring a penetration fire barrier functional following repairs or maintenance.

PLANT SYSTEMS

3/4.7.13 ALTERNATE SHUTDOWN SYSTEM

LIMITING CONDITIONS FOR OPERATION

- 3.7.13 The alternate shutdown system (ASD) equipment shown in Table 3.3-9 shall be OPERABLE.

APPLICABILITY

During power operation.

ACTION

With less than the minimum ASD equipment in Table 3.3-9 OPERABLE, restore the inoperable equipment to OPERABLE within 7 days, or provide equivalent shutdown capability and restore the inoperable equipment to OPERABLE within 60 days, or be shutdown as described in Section 1.2.5(a) within 12 hours and shutdown as described in Section 1.2.5(a) and (b) within the following 24 hours.*

*The #1 control rod drive pump, its associated ASD power source and the two emergency condenser indicating lights are the ASD equipment considered to have equivalent shutdown capability.

SURVEILLANCE REQUIREMENTS

- 4.7.13.1 The ASD monitoring instruments shall be demonstrated OPERABLE by performing a check and a calibration per Table 4.3-9.
- 4.7.13.2 Each transfer switch, power supply and control circuit shall be demonstrated OPERABLE at each major refueling shutdown* by operating each actuated component from both the control room and the remote location.
- 4.7.13.3 At each major refueling shutdown*, perform a verification to ensure that equipment (alternate power sources) needed to achieve and maintain cold shutdown is available.
- 4.7.13.4 The ASD battery charger shall be demonstrated OPERABLE by performing a weekly verification that the float voltage is greater than 130 volts.
- 4.7.13.5 The ASD battery surveillance requirements are contained in Section 11.4.5.3

*But no less than once every 18 months.

3/4.3.3.B FIRE DETECTION INSTRUMENTATION

OPERABILITY of the fire detection instrumentation ensures that adequate warning capability is available for the prompt detection of fires. This capability is required in order to detect and locate fires in their early stages. Prompt detection of fires will reduce the potential for damage to safety related equipment and is an integral element in the overall facility fire protection program.

In the event that a portion of the fire detection instrumentation is inoperable, the establishment of frequent fire patrols in the affected areas is required to provide detection capability until the inoperable instrumentation is restored to OPERABILITY.

3/4.7.11 FIRE SUPPRESSION SYSTEMS

The OPERABILITY of the fire suppression systems ensures that adequate fire suppression capability is available to confine and extinguish fires occurring in any portion of the facility where safety related equipment is located. The fire suppression system consists of the water system, spray and/or sprinklers, and fire hose stations. The collective capability of the fire suppression systems is adequate to minimize potential damage to safety related equipment and is a major element in the facility fire protection program.

In the event that portions of the fire suppression systems are inoperable, alternate backup fire fighting equipment is required to be made available in the affected areas until the inoperable equipment is restored to service.

In the event the fire suppression water system becomes inoperable, immediate corrective measures must be taken since this system provides the major fire suppression capability of the plant. The requirement for a twenty-four hour report to the Commission provides for prompt evaluation of the acceptability of the corrective measures to provide adequate fire suppression capability for the continued protection of the nuclear plant.

3/4.7.12 PENETRATION FIRE BARRIERS

The functional integrity of the penetration fire barriers ensures that fires will be confined or adequately retarded from spreading to adjacent portions of the facility. This design feature minimizes the possibility of a single fire rapidly involving several areas of the facility prior to detection and extinguishment. The penetration fire barriers include active and passive elements in the facility fire protection program and are subject to periodic inspections.

During periods of time when the barriers are not functional, routine fire watch patrols in conjunction with OPERABLE fire detection instrumentation or a continuous fire watch are required to be maintained in the vicinity of the affected barrier until the barrier is restored to functional status.

3/4.7.13 ALTERNATE SHUTDOWN SYSTEM

The requirements for the Alternate Shutdown System provide assurance that shutdown and cooldown to approximately 212°F can be achieved in the event of major fire in critical areas of the plant. This capability is in accordance with the criteria of Appendix R to 10 CFR 50.
