

**DATA SCIENCE AND ARTIFICIAL INTELLIGENCE  
REGULATORY APPLICATIONS WORKSHOPS**

# Opening Remarks

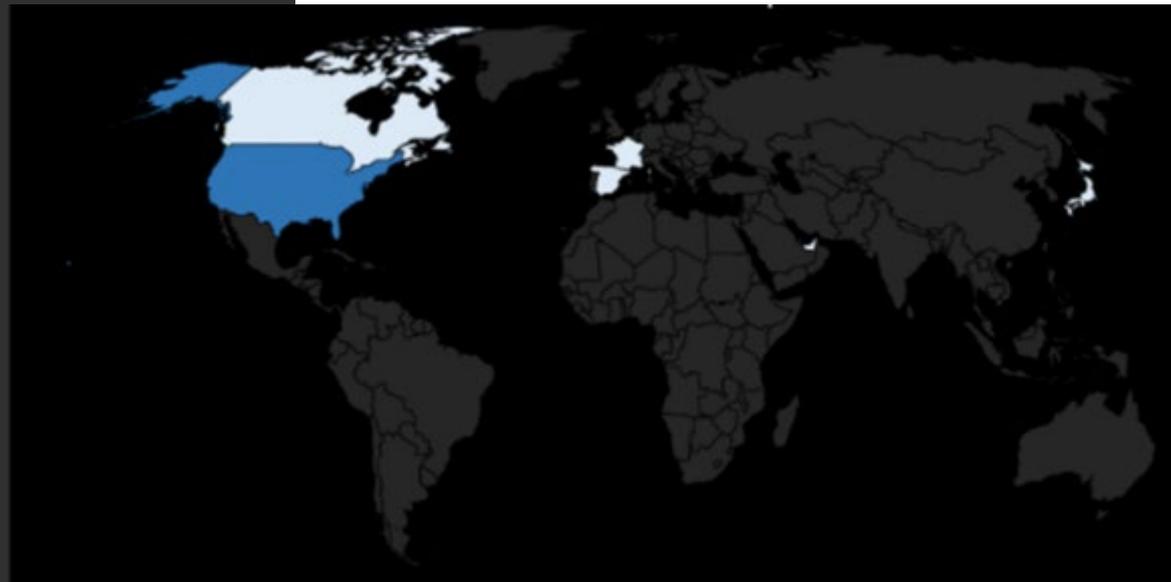

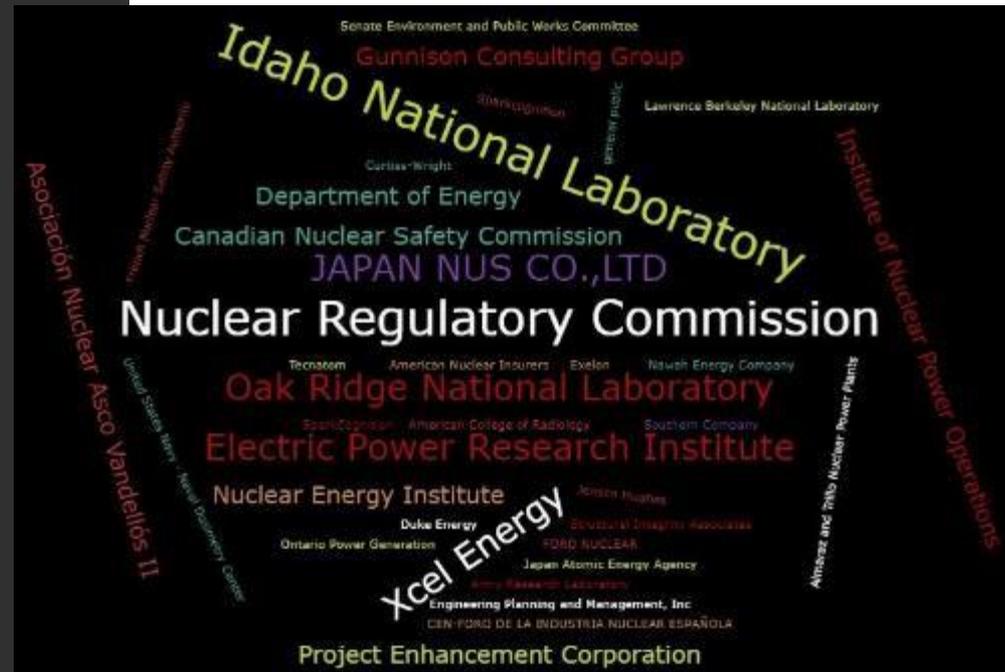

Theresa Lalain, Ph.D.

Deputy Director, Division of Systems Analysis  
Office of Nuclear Regulatory Research

---

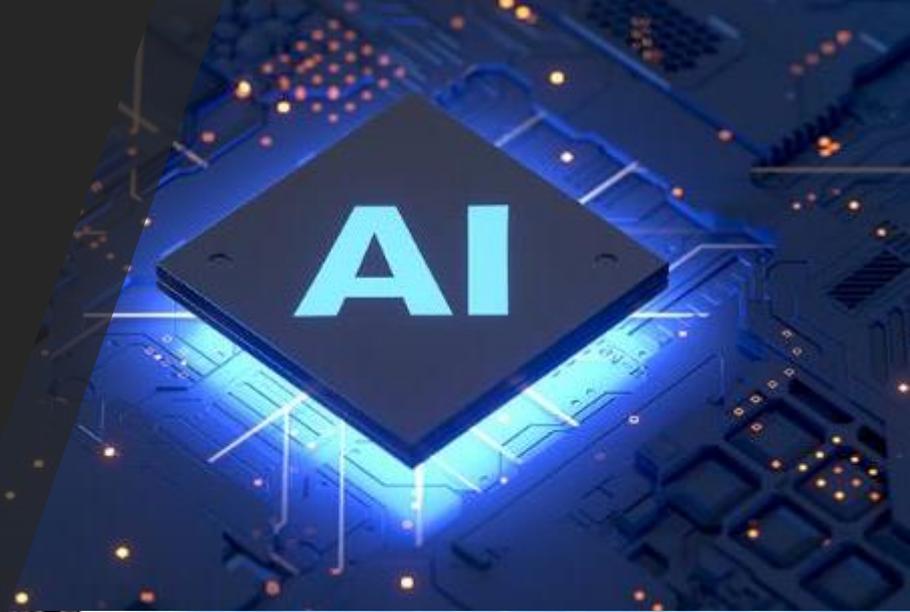

# WELCOME

- Over 250 registered attendees
- Participation from U.S., Canada, Spain, France, UAE, and Japan

# Regulatory Purpose

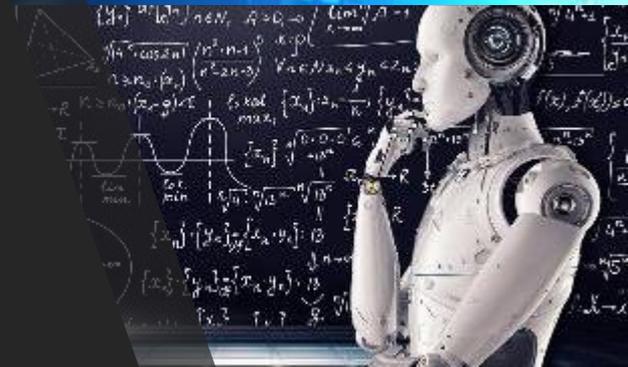

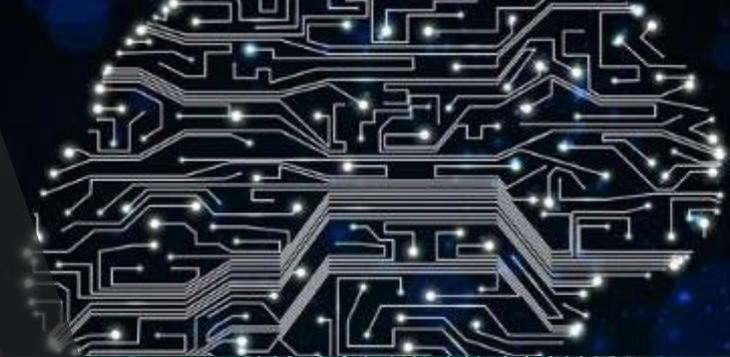

- NRC recognizes a need to use data analytics for regulatory enhancements as part of its effort to become a modern, risk-informed regulator<sup>1</sup>
- The nuclear industry is investigating and using AI applications; therefore, the NRC must be prepared to understand and evaluate the technology

<sup>1</sup> "The Dynamic Futures for NRC Mission Areas," (ML19022A178)

# Data Science and Artificial Intelligence Overview

- Artificial Intelligence (AI)
  - Build “intelligent” smart machines
- Machine Learning (ML)
  - Learn from data and deliver predictive models
- Natural Language Processing (NLP)
  - Process and analyze large amounts of natural language data
- Deep Learning (DL)
  - ML methods based on artificial neural networks

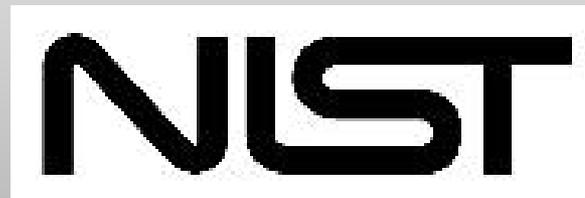

# Engagement and Initiatives

**SHARING KNOWLEDGE  
AND SEEKING  
STAKEHOLDER INPUT**

**LEVERAGING  
RESEARCH  
ACTIVITIES**

**NRC is engaging and participating with external entities to best prepare for AI impacts on regulatory processes and decisionmaking**

# DATA SCIENCE AND ARTIFICIAL INTELLIGENCE REGULATORY APPLICATIONS WORKSHOPS

Virtual - Microsoft Teams Meeting

NRCAIWorkshop@nrc.gov

**Workshop #1**  
Introduction to AI  
June 29, 2021  
10am – 3pm ET

**Workshop #2**  
Current Topics  
August 2021

**Workshop #3**  
Future Focused  
Initiatives  
September 2021

## Upcoming Workshops

- Current Topics
  - AUGUST 2021
- Future Focused Initiatives
  - SEPT/OCT 2021

June 29, 2021

Ronald Laurids Boring, PhD, FHFES

# Introduction to Artificial Intelligence (AI) and Some of Its Basic Terminology

# Is this AI?

Decoder Ring

# Is this AI?

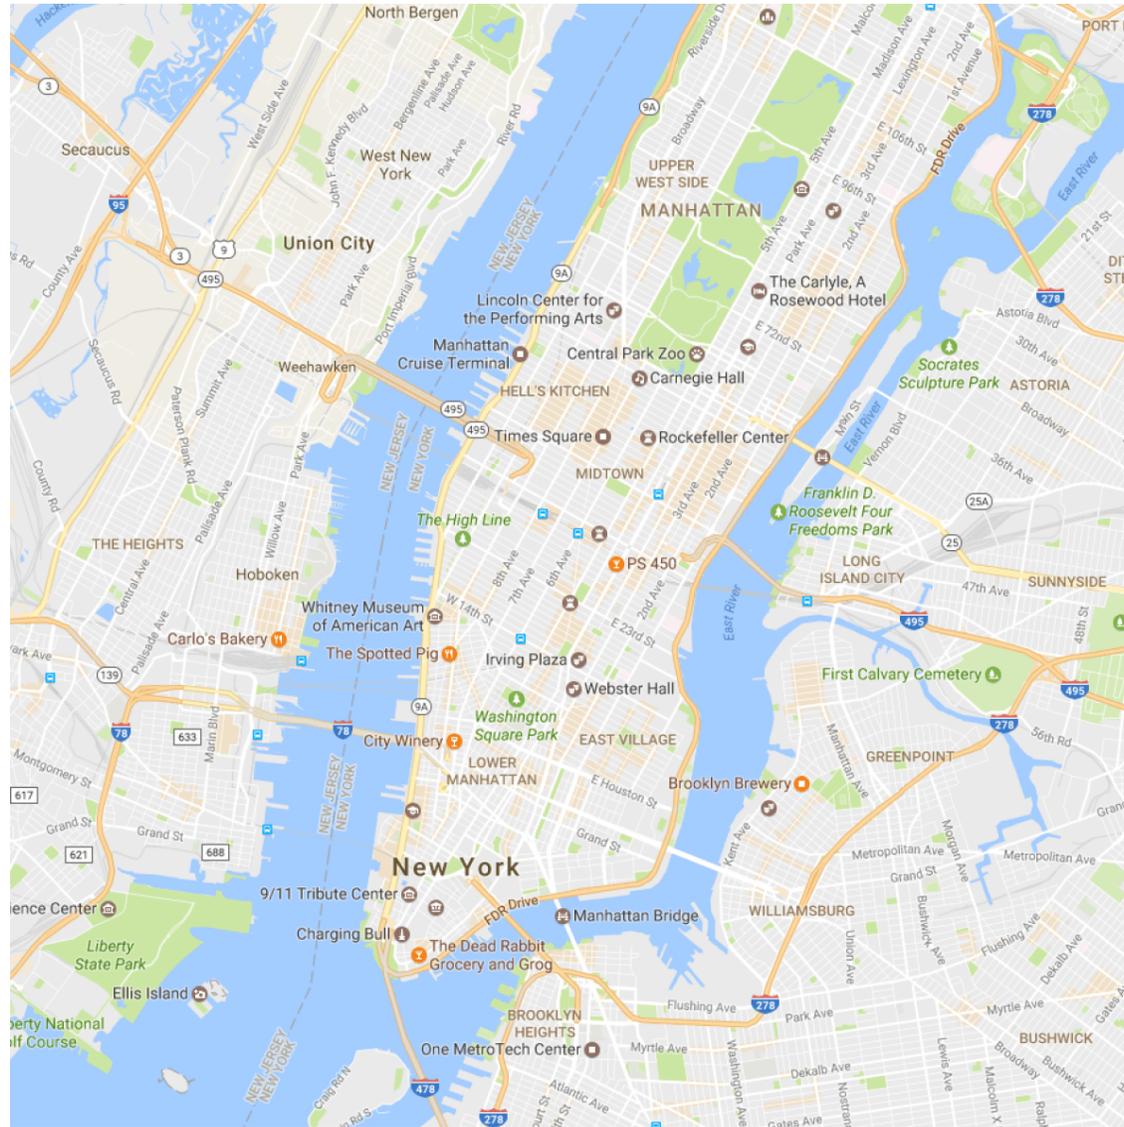

It looks like you're writing a letter.

Would you like help?

- Get help with writing the letter
- Just type the letter without help
- Don't show me this tip again

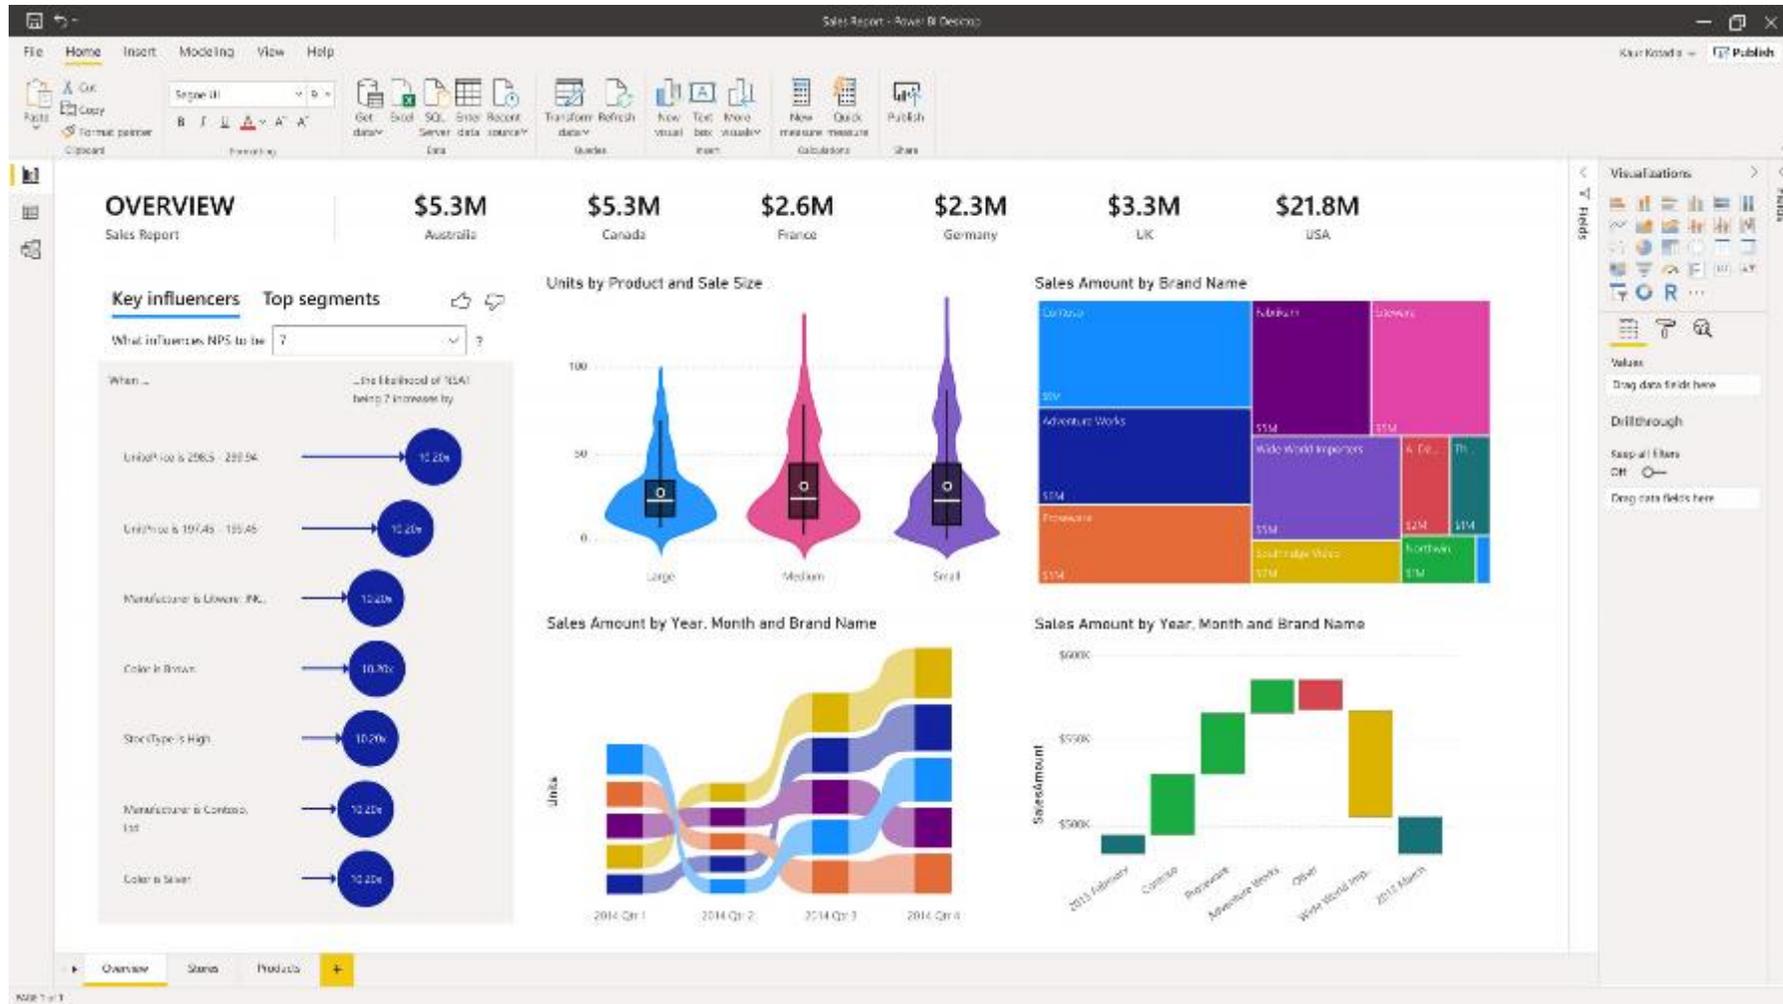

# Is this AI?

# Is this AI?

# Is this AI?

# Is this AI?

**They All Feature Applications of AI**

**Let's Look at Some of the  
History and Technology Underlying AI**

It all began in

1956

# 1956 Was a Watershed Year

- Two Congressional Hearings on Automation
- Dartmouth Summer Workshop on Artificial Intelligence
  - “We propose that a 2-month, 10-man study of artificial intelligence be carried out during the summer of 1956 at Dartmouth College in Hanover, New Hampshire. The study is to proceed on the basis of the conjecture that every aspect of learning or any other feature of intelligence can in principle be so precisely described that a machine can be made to simulate it.”
  - Birth of AI, featuring founders like Marvin Minsky, John McCarthy, Claude Shannon, Allen Newell, and Herb Simon
- Symposium on Information Theory at MIT on September 11, 1956
  - Birthplace of information processing theory and study of cognition
  - Featured George Miller, Noam Chomsky, Allen Newell, and Herb Simon, and others
- Birth of AI and cognitive psychology occurred at the same time, because they were interested in the same problems
  - Deconstructing human thinking into information allowed us to make computer models of it

# 1956 Was a Watershed Year

# Big Picture in Information Processing

## Human-System Interface (HSI)

- Computer output = human sensation and perception
- Human action = computer input
- It's a feedback loop

Each step also represents a form of intelligence that may be modelled artificially

- Perception: Pattern recognition, computer vision, natural language processing
- Knowledge: Expert systems
- Actions and behaviors: Automated controllers

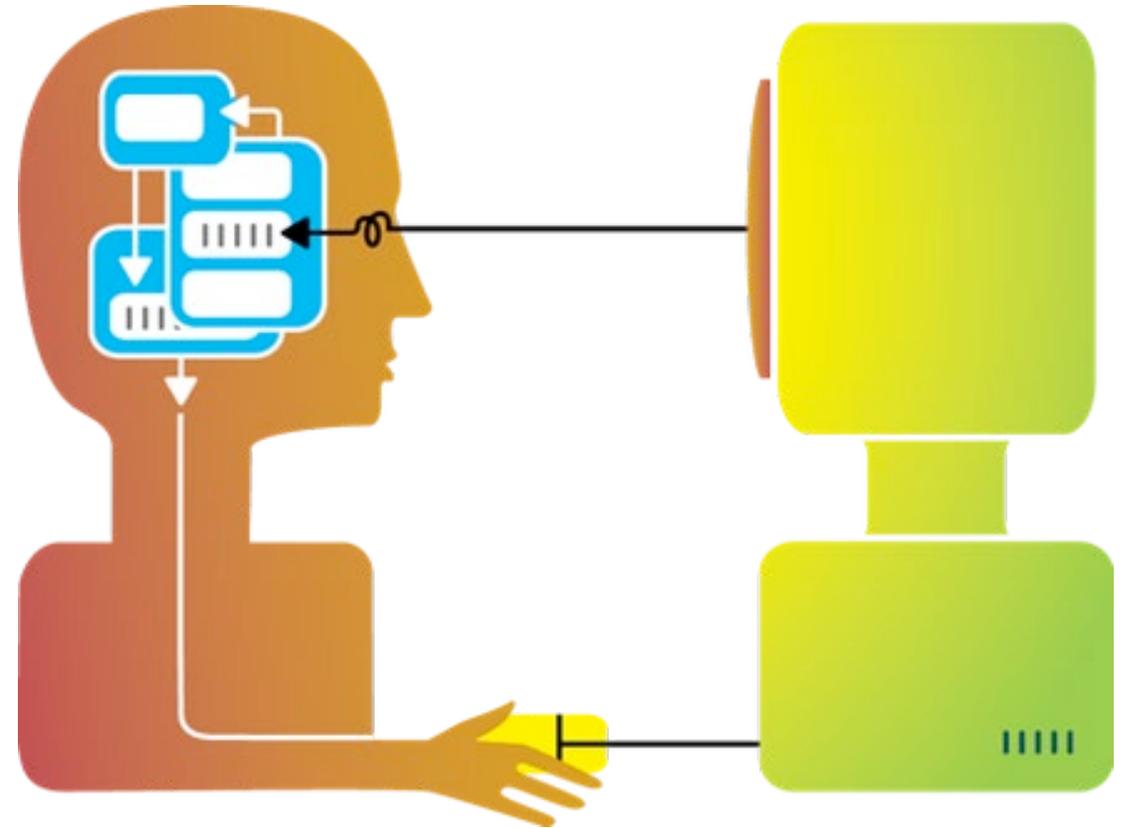

# Big Picture in Information Processing

# How Does AI Work?

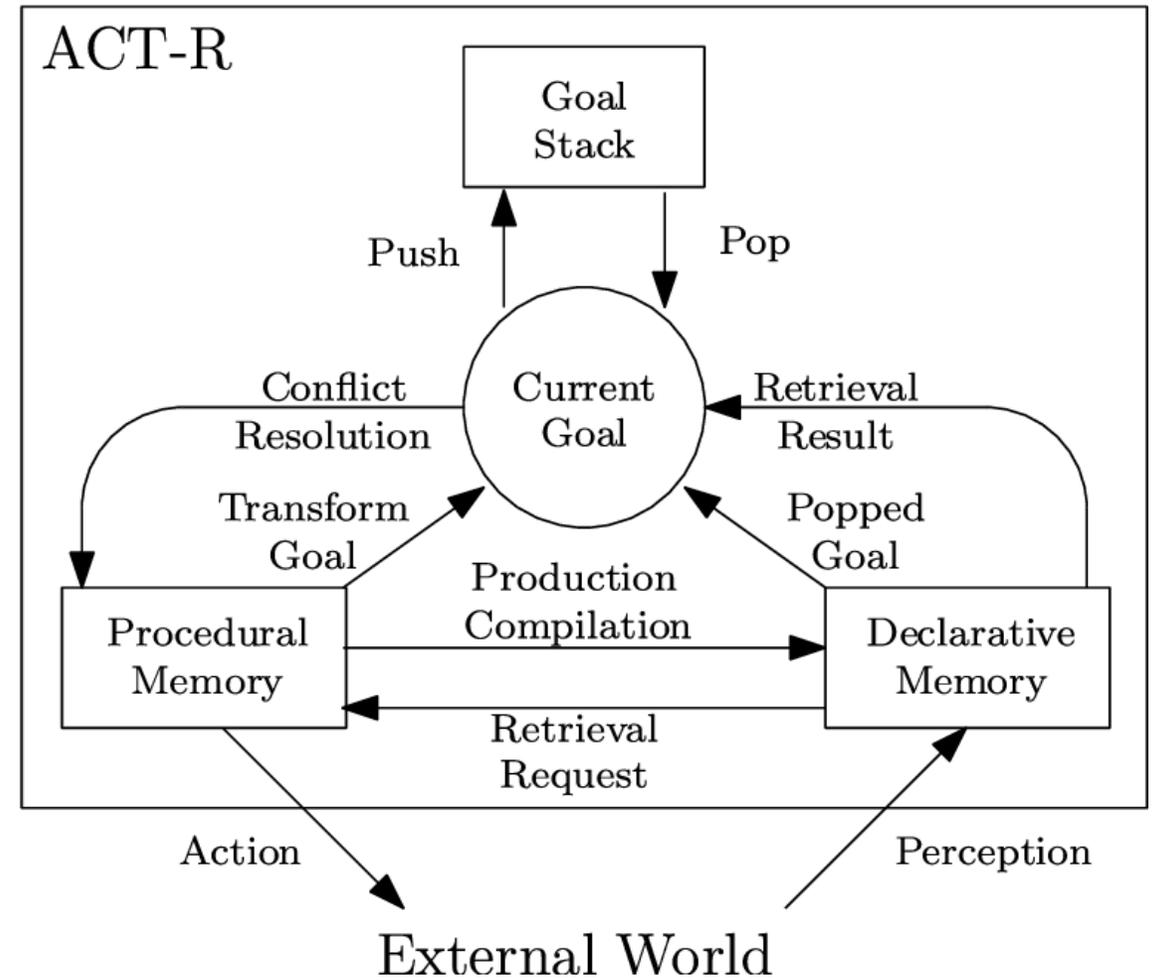

# Two Types of AI

- **Good Old-Fashioned AI (GOF AI)**
  - Symbolic logic systems to represent basic elements of human thought like language, numbers, or goals
  - **Production systems** featuring if-then logic
    - General Problem Solver created by Newell and Simon in 1959
  - **Cognitive modeling architectures**
    - Systems like Soar and ACT-R with a heavy emphasis on how humans accomplish goals
  - Much of focus is not to create learning but to capture human-like intelligence related to how humans carry out decisions and actions

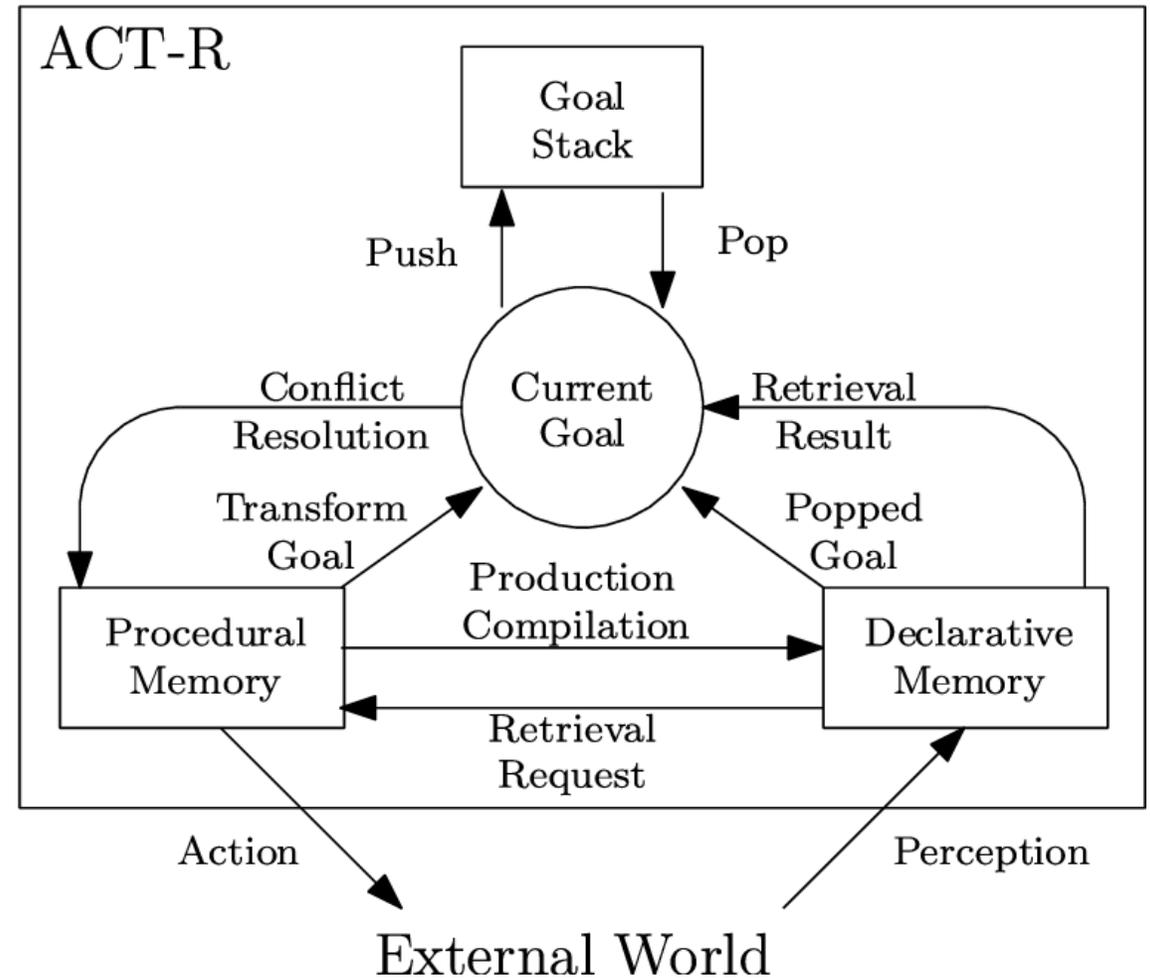

# Two Types of AI

- **Good Old-Fashioned AI (GOF AI)**

# Two Types of AI

- **Neural Networks**

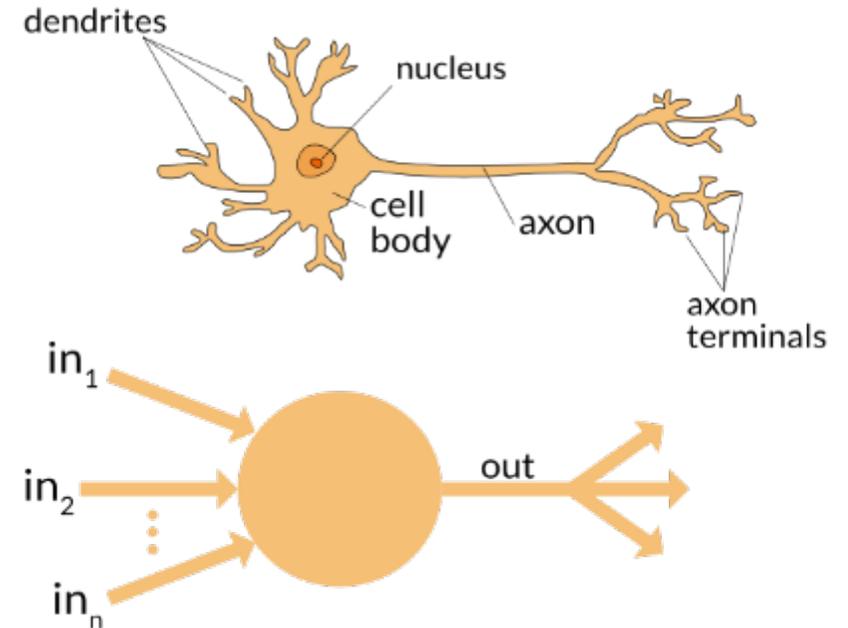

- **Perceptron** developed in 1958 as approximation of single-cell neuron
- By 1960s, mathematical algorithms like backpropagation developed to allow perceptrons to learn through training
  - **Machine learning**
- Multiple perceptrons chained together to create neural networks
  - More layers of neural networks chained together to create **deep learning**
  - Facilitated by greater availability of parallel computing (e.g., graphical processing units)

# Two Types of AI

# Two Types of AI

- **Different Uses**

- GOFAI is good at following rules and making decisions
- Neural networks are good at pattern recognition when trained

- **Self-Driving Vehicle Example**

- Use GOFAI for the rules of the road
  - Procedural knowledge
  - Control automation
- Neural networks used to recognize the world
  - The eyes on the road
  - Information automation

# Two Types of AI

**Very Briefly Noted**

**Some Key Applications of AI in Nuclear Industry**

# Key Applications of AI in Nuclear Industry

## Automation

- Control automation: Using AI to control a system (or a plant, such as might be the case in a microreactor)
- Information automation: Using AI to intelligently gather information that operator needs
  - Detection of problems such as early warning systems and condition monitoring

## Prediction

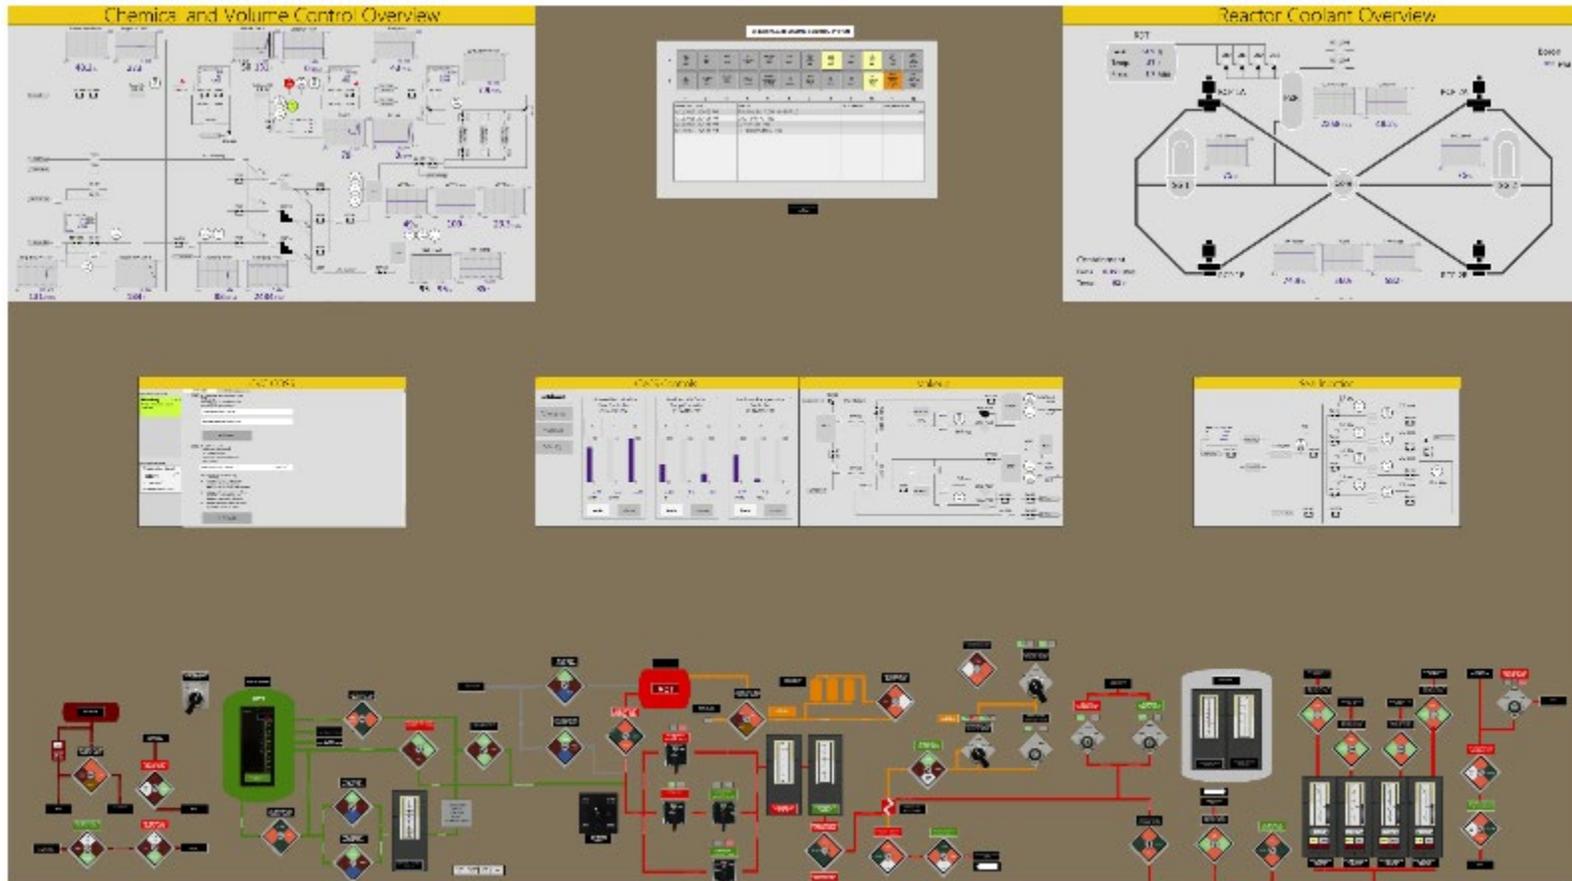

- Predictive—instead of *prescriptive*—maintenance systems

## Human-System Interface

- Smart notification systems like alarm filtering
- Natural language processing for hands-free interactivity

# Example Possible Automation in Nuclear Power

Information Automation (*Top*), Control Automation (*Middle*), and Analog Control (*Bottom*)

# Key Applications of AI in Nuclear Industry

## Automation

- Control automation: Using AI to control a system (or a plant, such as might be the case in a microreactor)
- Information automation: Using AI to intelligently gather information that operator needs
  - Detection of problems such as early warning systems and condition monitoring

## Prediction

- Predictive—instead of *preventative*—maintenance systems

## Human-System Interface

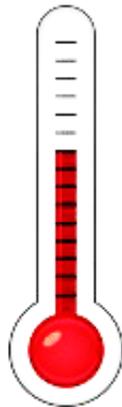

- Smart notification systems like alarm filtering
- Natural language processing for hands-free interactivity

# Predictive Maintenance

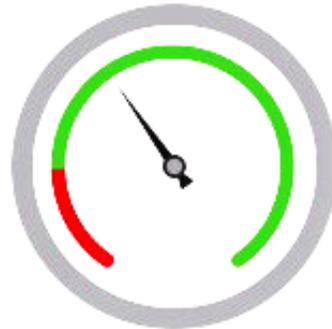

- Look for signs of performance degradation through sensor data
  - Catch parts that are failing sooner than anticipated
  - Leave perfectly good parts in operation
- Anomaly detection using machine learning
- Convey information to human

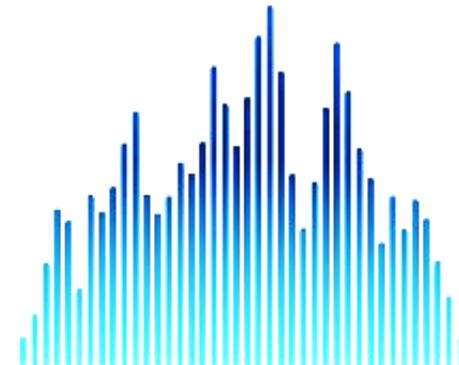

VIBRATIONS

TEMPERATURE

PRESSURE

NOISE

# Where do you go from here?

## Technical Challenges

How do we create, collect, and share benchmark datasets?

How do we best combine existing Engineering knowledge with ML techniques?

How do we perform Verification and Validation?

What are appropriate Standards for such models?

What are the key Figures of Merit we should be optimizing in such systems?

## Socio-Economic Challenges

How do we estimate the economic Return on Investment for ML techniques or datasets?

How do we protect IP or Privacy in trained models?

What regulatory frameworks do we need for verification of safety critical or other systems?

How should we train our workforce differently to leverage these techniques?

For more details see:

- JMD Editorial: ML in Engineering Design: <http://ideal.umd.edu/papers/paper/ml-eng-design-jmd>
- Summary of Data-Driven Design workshop: <http://ideal.umd.edu/papers/paper/d3-implications>

# Where do you go from here?

## What can you do?

Continue your education in these areas, or for those of your workforce.

Reach out to researchers and domain experts for new technical challenges we can resolve in these areas.

Provide guidance to policy and regulatory bodies on how these techniques might be managed.

Advocate for additional studies of impact in these areas.

# Thank you

# Typical unreadable Deep Learning Slide from my research group for a recent DoE Technical Review

Let's build a Deep Learning model to predict airfoil lift

What should the input be?  
(This will be our *basis function*)

$$\text{Lift} = \text{Model}(\text{Input})$$
$$y = f(x)$$

How do you mathematically *represent* an airfoil?

How do you mathematically *represent* an airfoil?

$$\text{Lift} = \begin{pmatrix} w_1 \\ w_2 \\ \vdots \\ w_{199} \\ w_{200} \end{pmatrix}^T \begin{pmatrix} x_1 \\ y_1 \\ \vdots \\ x_{100} \\ y_{100} \end{pmatrix}$$

$\{x_1, y_1\}$

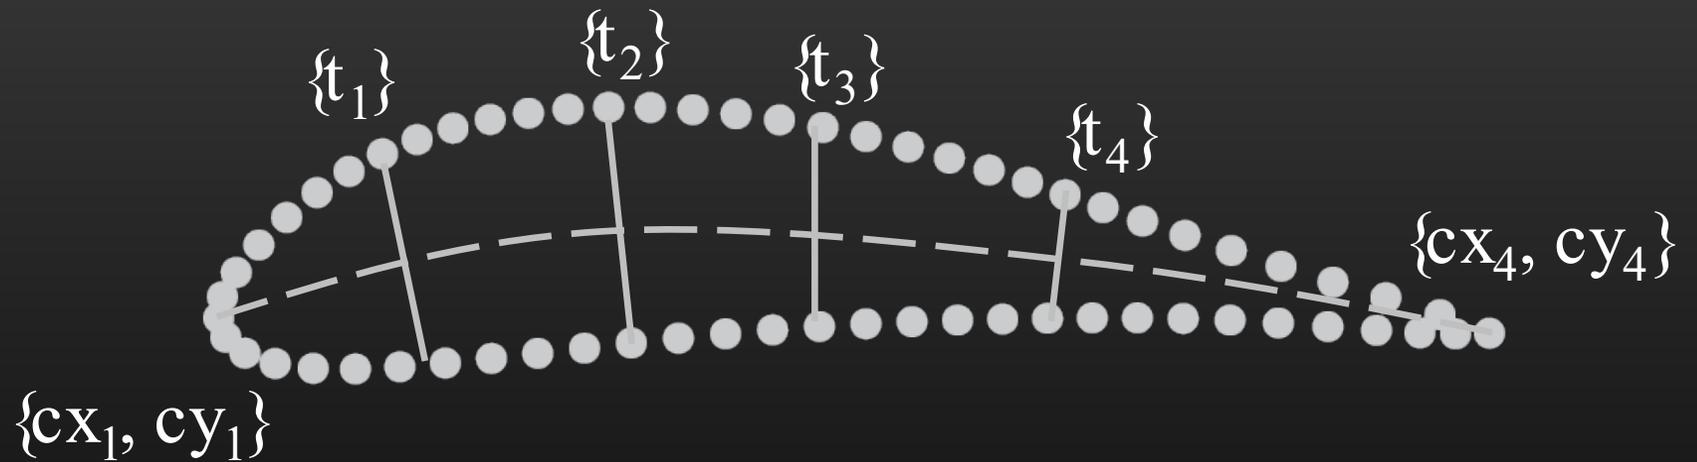

$$\begin{aligned} \text{Loss} &= (\text{Lift}_{\text{predicted}} - \text{Lift}_{\text{actual}})^2 \\ &= (\mathbf{w}^T \mathbf{x} - \text{Lift}_{\text{actual}})^2 \end{aligned}$$

Find  $w$  where:

$$\frac{\partial \text{Loss}}{\partial w} = 0$$

How do you mathematically *represent* an airfoil?

$$\text{Lift} = \begin{pmatrix} w_1 \\ w_2 \\ \\ w_{11} \\ w_{12} \end{pmatrix}^T \begin{pmatrix} cx_1 \\ cy_1 \\ \\ t_3 \\ t_4 \end{pmatrix}$$

Only thing we changed was the *basis*.

But the basis was fixed/ static.

What if we *adapted* or *learned* the basis?

How do you *adapt* a basis?

$$\text{Lift} = \begin{pmatrix} w_1 \\ w_2 \\ \vdots \\ w_{199} \\ w_{200} \end{pmatrix}^T \begin{pmatrix} x_1 \\ y_1 \\ \vdots \\ x_{100} \\ y_{100} \end{pmatrix}$$

$$\begin{aligned} \text{Loss} &= (\text{Lift}_{\text{predicted}} - \text{Lift}_{\text{actual}})^2 \\ &= (\mathbf{w}^T \mathbf{x} - \text{Lift}_{\text{actual}})^2 \end{aligned}$$

How do you *adapt* a basis?

$$\text{Lift} = \begin{pmatrix} w_1 \\ w_2 \\ \vdots \\ w_{199} \\ w_{200} \end{pmatrix}^T \begin{pmatrix} g(x_1) \\ g(y_1) \\ \vdots \\ g(x_{100}) \\ g(y_{100}) \end{pmatrix}$$

$$\begin{aligned} \text{Loss} &= (\text{Lift}_{\text{predicted}} - \text{Lift}_{\text{actual}})^2 \\ &= (\mathbf{w}^T \mathbf{g}(\mathbf{x}) - \text{Lift}_{\text{actual}})^2 \end{aligned}$$

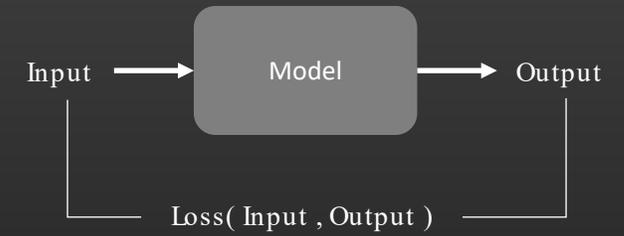

How do you *adapt* a basis?

What is  $g$ ?

Another model!

$$\text{Lift} = \begin{pmatrix} w_1 \\ w_2 \\ \vdots \\ w_{199} \\ w_{200} \end{pmatrix}^T \begin{pmatrix} g(x_1) \\ g(y_1) \\ \vdots \\ g(x_{100}) \\ g(y_{100}) \end{pmatrix}$$

$\{x_1, y_1\}$

$$\begin{aligned} \text{Loss} &= (\text{Lift}_{\text{predicted}} - \text{Lift}_{\text{actual}})^2 \\ &= (w^T g(x) - \text{Lift}_{\text{actual}})^2 \\ &= (w_1^T \{w_2^T(x)\} - \text{Lift}_{\text{actual}})^2 \end{aligned}$$

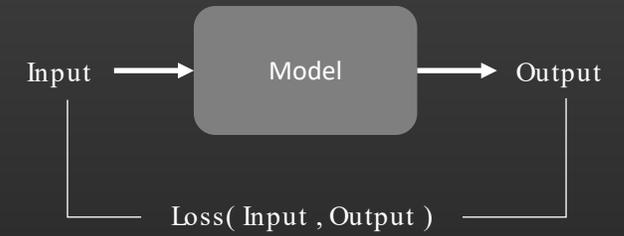

How do you *adapt* a basis?

What is  $g$ ?

Another model!

$$\text{Lift} = \begin{pmatrix} w_1 \\ w_2 \\ \vdots \\ w_{199} \\ w_{200} \end{pmatrix}^T \begin{pmatrix} g(x_1) \\ g(y_1) \\ \vdots \\ g(x_{100}) \\ g(y_{100}) \end{pmatrix}$$

$\{x_1, y_1\}$

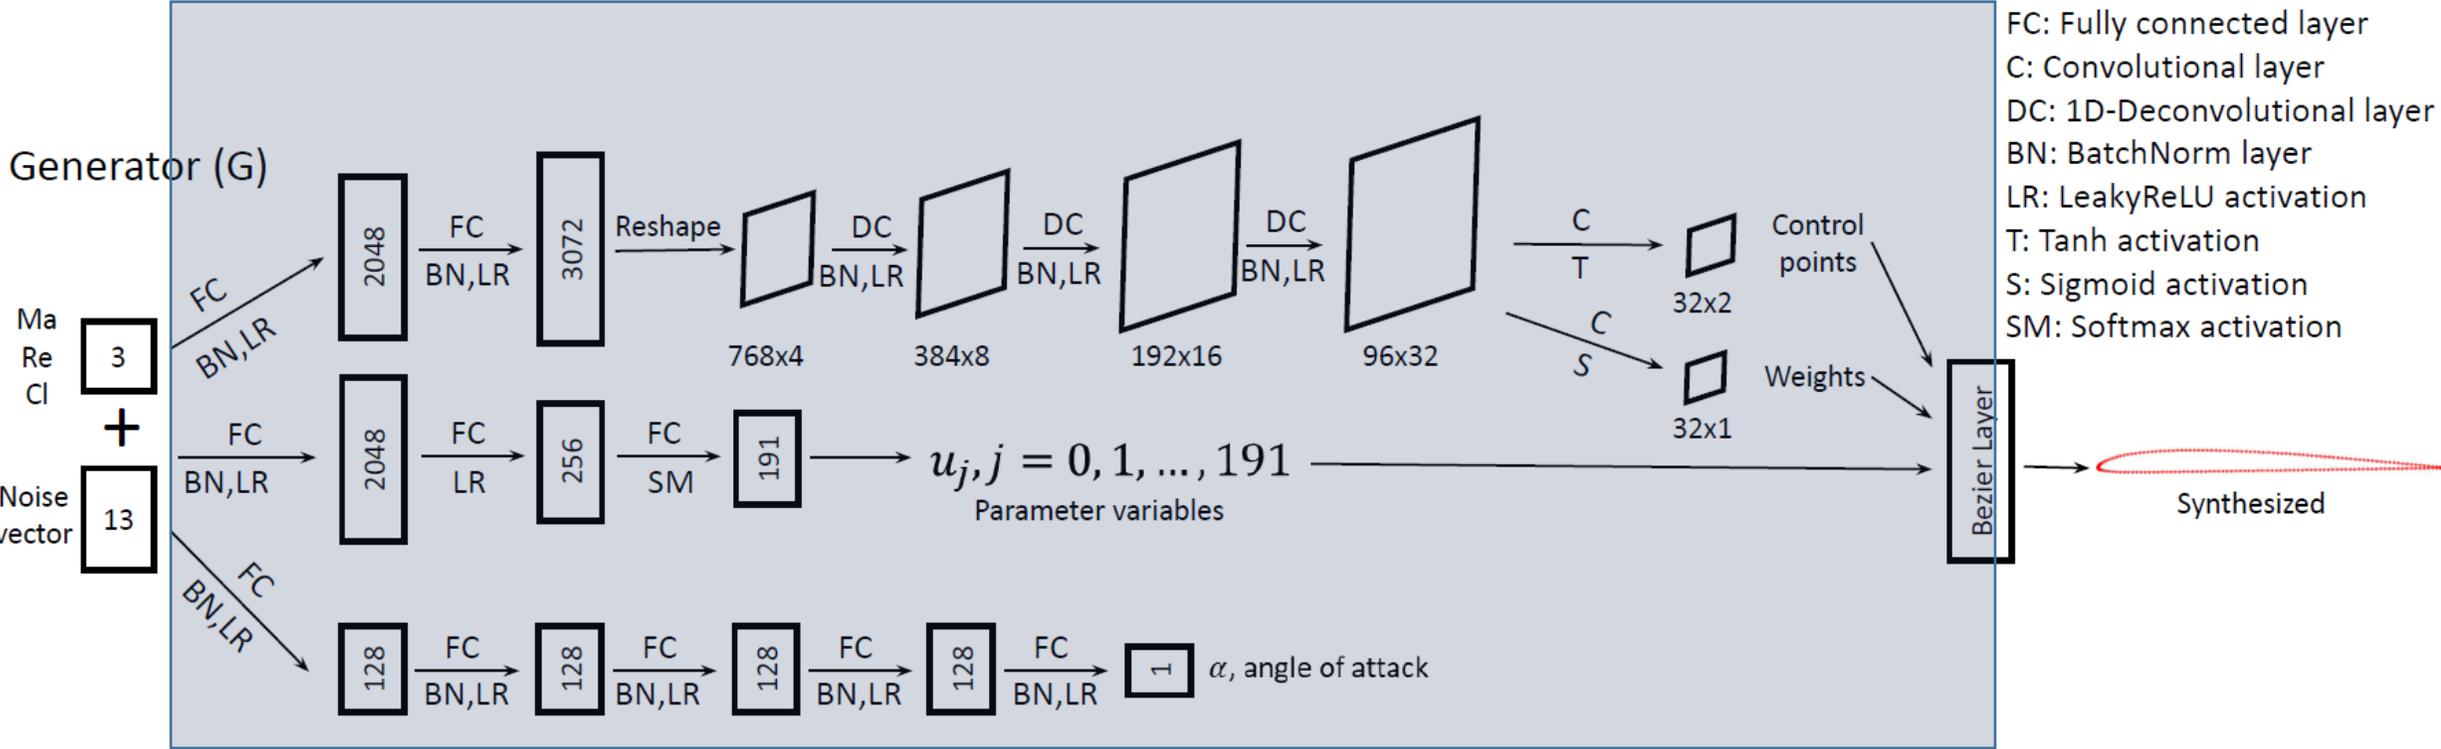

$$\begin{aligned} \text{Loss} &= (\text{Lift}_{\text{predicted}} - \text{Lift}_{\text{actual}})^2 \\ &= (w^T g(x) - \text{Lift}_{\text{actual}})^2 \\ &= (\sigma(w_1^T \{ \sigma(w_2^T(x)) \}) - \text{Lift}_{\text{actual}})^2 \end{aligned}$$

Now we can see that the Deep Learning model is (in essence) a series of chained basis transformations!

# Model

$g(x)$

# Why use Deep Learning over other (non-Deep) approaches or not?

## Advantages

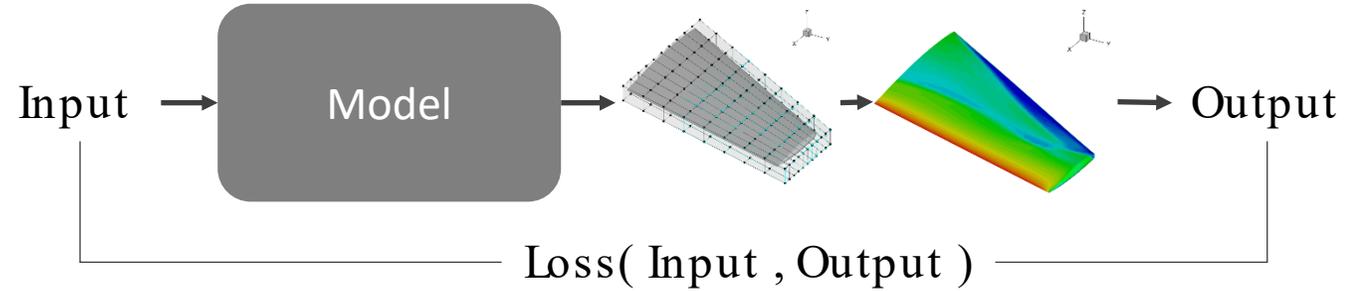

1. Fairly extensible with modern libraries
2. Plays nicely with other differentiable approaches
3. Good hardware acceleration
4. Active research community + industrial investment

## Disadvantages

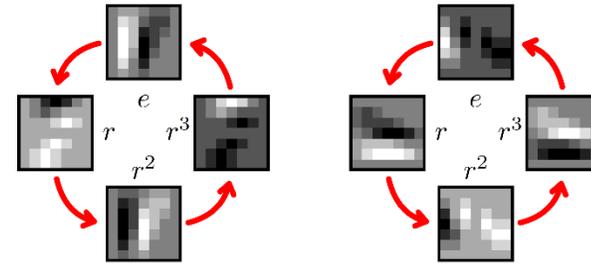

1. Certain modeling assumptions difficult to do
2. Certain architectures have difficulty converging or possess pathologies
3. Theory less developed than some other models

**National Institute of  
Standards and Technology**

U.S. Department of Commerce

## DISCLAIMER

*The use of any products described in any presentation does not imply recommendation or endorsement by the National Institute of Standards and Technology, nor does it imply that products are necessarily the best available for the purpose.*

*This material is declared a work of the U.S. Government and is not subject to copyright protection in the United States. Approved for public release; distribution is limited.*

### *Knowledge Extraction and Application*

- Much of manufacturing know-how is computationally inaccessible, within informally-written documents
- Create human-centric data pipelines to extract value from existing unstructured data at minimal labor cost
- Develop guidelines for using semi-structured data in KPI creation, functional taxonomy prediction, and customized worker training paths

# BACKGROUND: MAINTENANCE WORK-ORDER DATA

“Hyd leak at saw attachment”

“HP coolant pressure at 75 psi”

“Major hydraulic leak at Sp#6 horseshoe”

“Replaced seal in saw attachment but still leaking – Reapirs pending with ML”

“Clamping spool guard broken”

“Bad Gauge / Low pressure lines cleaned ou”

“Replaced – Operator could have done this!”

“Repaired horseshoe seals”

# BACKGROUND: CURRENT MWO DATA ENTRY

## SPREADSHEETS

Date	Mach	Description	Issued By	Date Up	Maint Tech Assigned	Resolution
29-Jan-16	H15	St#14 tool detect INOP	JS	29-Nov-16	SA	Slug detector at station 14 not working. Would not recognize "Start" signal.
1-Jun-16	Mitsu FT	Brakes worn -Not stopping when in gear	AB	28-Jun-16	Steve A	Repaired
1-Jun-16	H8	St#7 rotator collet broken -wait for Bob B to show him how to remove	JS	8-Jun-16	John Smith	Machine went offline on 6/8 -Mark removed and instructed Bob B on removal/install process

## WORK ORDER FORMS

# Do “AI” to it! (...?)

---

Natural Language Processing (et al.) as Engineering Tools

# TODAY'S TALK: TAKE-HOME

- NLP “Theory” Basics
  - a. Data **models** and engineering **assumptions**
  - b. NLP “**Tasks**” and **approaches**
  - c. **Metrics** and **Evaluation**
- Contextualize NLP techniques, paradigms
  - a. How NLP concepts interface with “Engineering Practice”
  - b. Continuous interaction between experts (domain  $\leftrightarrow$  NLP)

## *Engineering Practice*

- Goal & Approach *“State the methods followed and why.”*
- Assumptions *“State your assumptions.”*
- Measure & Evaluate *“Apply adequate factors of safety.”*
- Validate *“Always get a second opinion.”*

Hutcheson, M. L. (2003). *Software testing fundamentals: Methods and metrics*. John Wiley & Sons.

## *Engineering Practice*

- Goal & Approach *“State the methods followed and why.”*
- Assumptions *“State your assumptions.”*
- Measure & Evaluate *“Apply adequate factors of safety.”*
- Validate *“Always get a second opinion.”*

Start  
Here

Hutcheson, M. L. (2003). *Software testing fundamentals: Methods and metrics*. John Wiley & Sons.

# ASSUMPTIONS

---

That turn “Natural Language” into something to “Process”

## ASSUMPTIONS: RULE-BASED VS. NUMERICAL

Some very successful ways to “process” natural language involve **rules**.

*Assume a language model based on known “logic”:*

- Pattern Matching (e.g. regex), “coding”, etc.
- Clear definitions and transparent assumptions (iterate!)
- Can be **powerful** and **efficient**
- Can be **brittle** and **labor**-intensive

Newer techniques assume the text and its **statistical** properties **alone**

# ASSUMPTIONS: THE CONTEXT SPECTRUM

- How do we turn text into “numbers”?
- Traditional techniques come in two “flavors”
  - a. Bag-of-Words (*Global Frequency and Context*)
  - b. Markov Model (*Local Sequence Probability*)
- Opposite answers to the question:

“How much does **global** vs. **local** matter to you and/or this text?”

# ASSUMPTION: GLOBAL FREQUENCY & CONTEXT

## Basic Bag-of-Words

Words in similar **contexts** are **similar**.

- *Hydraulic leak at saw attachment*
- *Worn seal caused leak, replaced seal.*
- *Replaced saw, operator could have done this...*

	Hyd.	leak	saw	seal	rep.	...
Doc 1	1	1	1	0	0	...
Doc 2	0	1	0	2	1	...
Doc 3	0	0	1	0	0	...

- Remarkably Powerful
- Similarity is “vector directional”
  - Documents or Terms
  - → Cosine Similarity

# ASSUMPTION: GLOBAL FREQUENCY & CONTEXT

## Basic Bag-of-Words

Words in similar **contexts** are **similar**.

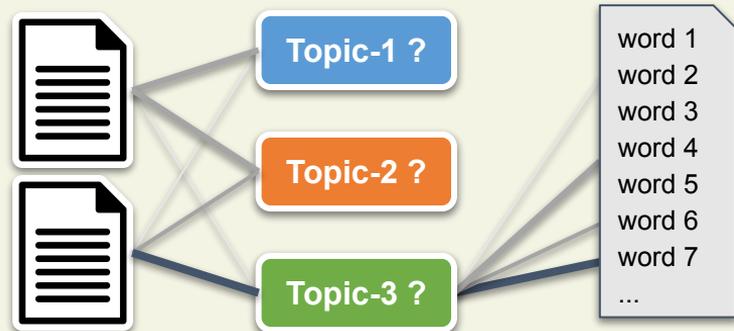

- Hydraulic leak at saw attachment
- Worn seal caused leak, replaced seal.
- Replaced saw, operator could have done this...

	Hyd.	leak	saw	seal	rep.	...
Doc 1	1	1	1	0	0	...
Doc 2	0	1	0	2	1	...
Doc 3	0	0	1	0	0	...

- Remarkably Powerful
- Similarity is “vector directional”
  - Documents or Terms
  - → Cosine Similarity

## Modifications

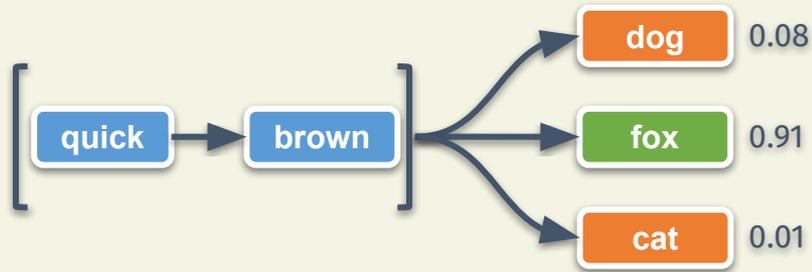

- Re-weighting schemes
  - Normalization, TF-IDF
  - Ties to informational entropy
- Dimension Reduction & **Topics**
  - Some “latent” set of topics:  
“Stuff we talk about” has less variety than “words we have”
  - Acronym soup  
PCA,SVD,LSA,NMF,LDA,TSNE,UMAP

# ASSUMPTION: LOCAL SEQUENCE PROBABILITY

## Markov Model

Next “states” (read: token/character) is conditionally dependent on the past:

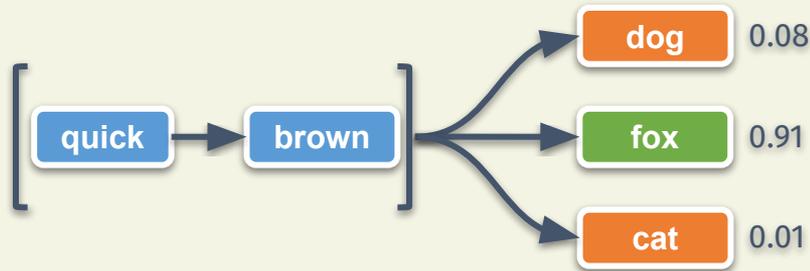

- Useful to generate text and estimate cond. probabilities
- High preference for observed sequences (precision)

# ASSUMPTION: LOCAL SEQUENCE PROBABILITY

## Markov Model

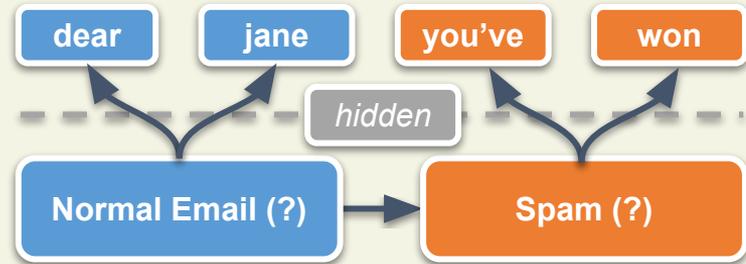

Next “states” (read: token/character) is conditionally dependent on the past:

- Useful to generate text and estimate cond. probabilities
- High preference for observed sequences (precision)

## Hidden Markov Model

What we “observe” are emissions from a sequence of states we cannot observe.

- Used for last-gen. language models, bio-informatics, etc.
- Modular! See: GMMs, Bayes-nets...

# ASSUMPTIONS: MODERN EMBEDDINGS

But... neural-nets?!

- We like the global context, but also want local sensitivity...
- Neural Nets can be “trained” to find a **vector space** model that **balances** both
  - a. **Trained** is the operative term
  - b. Packages/tools that let us “embed” text have **already trained** on a textual corpus
- You are assuming your text is “like” *that* text

*Otherwise these are an **approach**—and require proper design!*

# ASSUMPTIONS: MORE ON “MODERN EMBEDDINGS”

- *Word2Vec* (2013) trains on a *word-level*
  - Continuous Bag-of-Words (**CBOW**): target word from local context
  - **Skip-Gram**: local context from target word
  - Maintains semantic linearity (“word algebra”) — also see GloVe (2014)

lunch + night - day → dinner

better - good + bad → worse

wine + barley - grapes → beer

coffee - drink + snack = pastry

# ASSUMPTIONS: MORE ON “MODERN EMBEDDINGS”

- *Word2Vec* (2013) trains on a *word-level*
  - Continuous Bag-of-Words (**CBOW**): target word from local context
  - **Skip-Gram**: local context from target word
  - Maintains semantic linearity (“word algebra”) — also see GloVe (2014)

lunch + night - day → dinner

better - good + bad → worse

wine + barley - grapes → beer

coffee - drink + snack → pastry

- *BERT* (2018) is a *sub-word* model...**context** (sentence) dependent!
  - Can capture separate semantic meaning (homophones) and out-of-vocab.
  - State-of-the-art in 2019; used for your Google searches.

# GOALS & APPROACH

---

NLP Tasks and “The Pipeline”

# GOALS & APPROACHES: OVERVIEW

- Typical NLP Tasks  
*(and their image-processing relatives)*
  - a. Document Grouping, Classification
  - b. Keyword Extraction, Multi-Label Classification
  - c. Named Entity Recognition and Parts-of-Speech
- The NLP “Pipeline”
  - a. Preprocessing
  - b. Analyses

# GOAL: DOCUMENT TYPING

- Clustering (Unsupervised)
  - Detect “natural groupings” for analysts to parse
  - Also: interpreting topic models
  - May or may not be relevant, but a useful tool

## The Structure of Recent Philosophy

Noichl, M. Modeling the structure of recent philosophy. *Synthese* **198**, 5089–5100 (2021).

<https://doi.org/10.1007/s11229-019-02390-8>

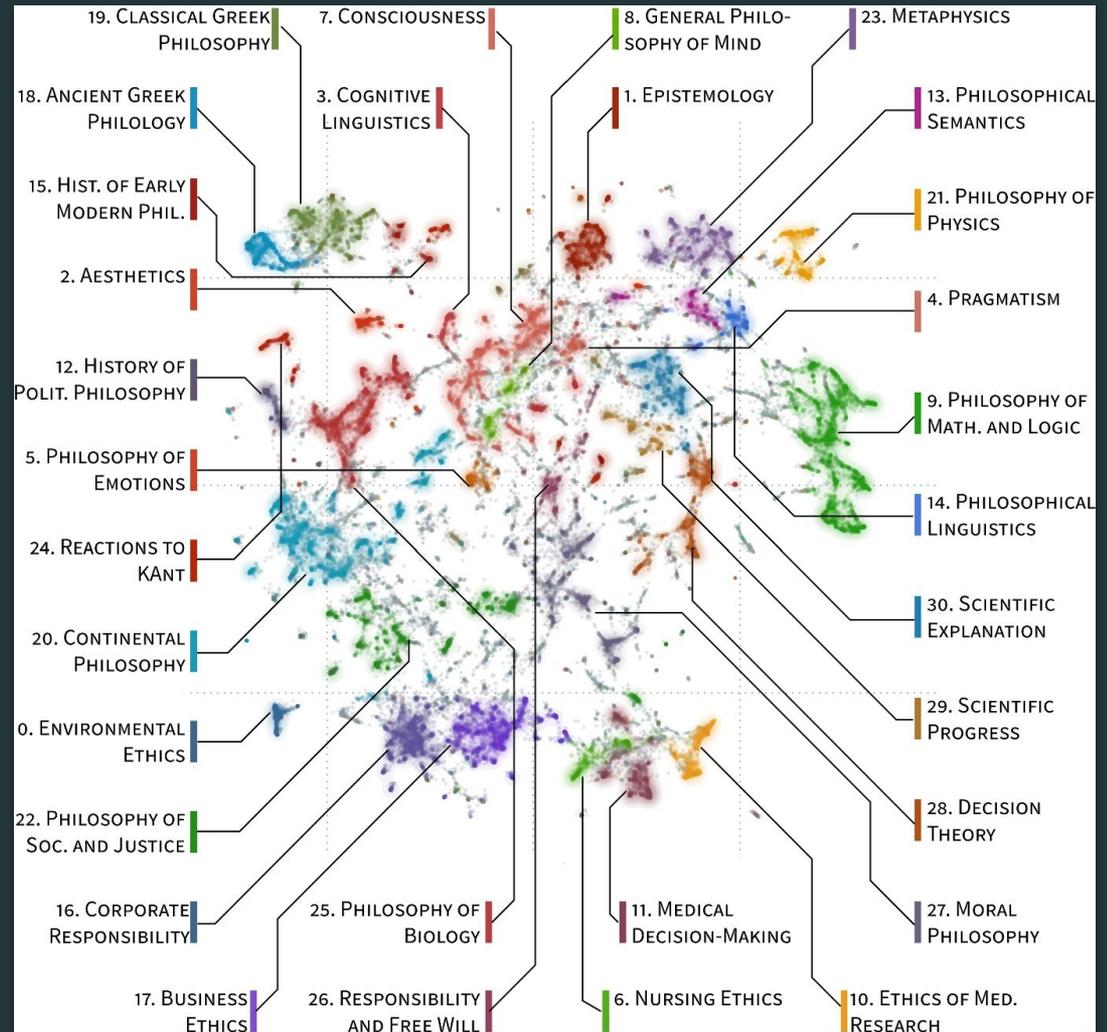

Image distributed as [CC BY 4.0](https://creativecommons.org/licenses/by/4.0/)

Each “dot” is a paper.

- Embed to 2-dimensions (UMAP)
- Clustering (HDBScan)
- Interpret, synthesize (hard)

Fully interactive online:

[https://homepage.univie.ac.at/maximilian.noichl/full/zoom\\_final/index.html](https://homepage.univie.ac.at/maximilian.noichl/full/zoom_final/index.html)

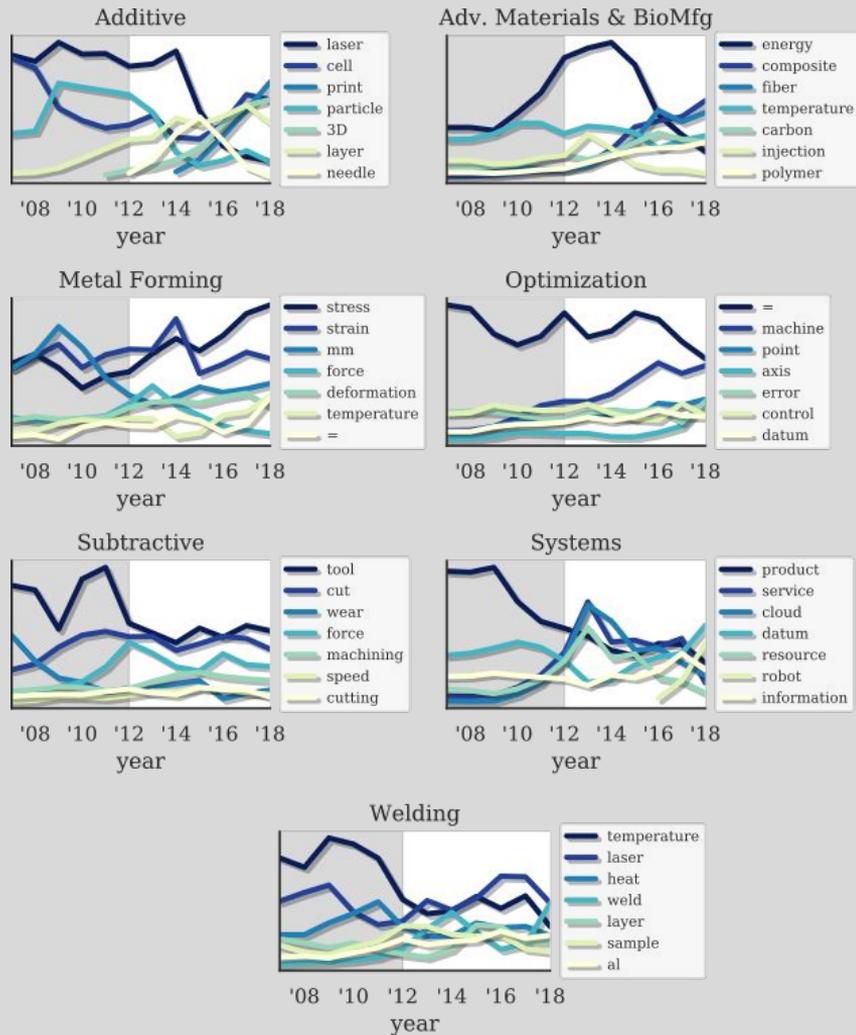

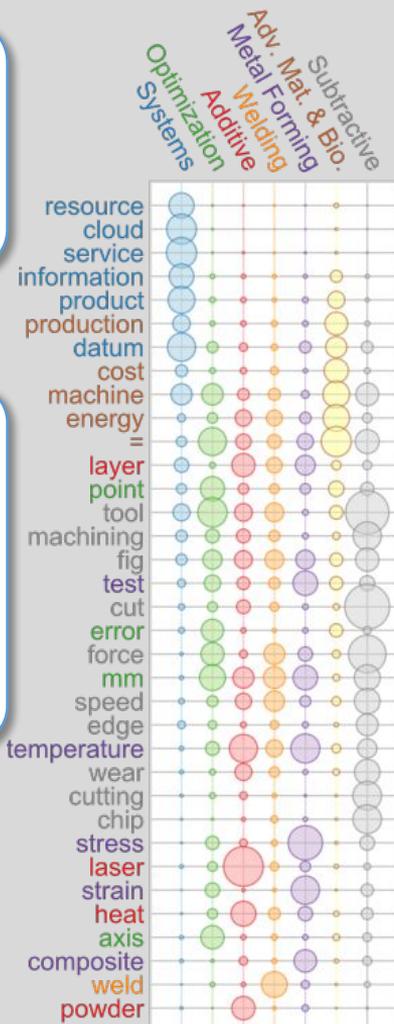

# MSEC: A Quantitative Retrospective

Sexton, T, Brundage, MP, Dima, A, & Sharp, M. "MSEC: A Quantitative Retrospective." September 2020  
<https://doi.org/10.1115/MSEC2020-8440>

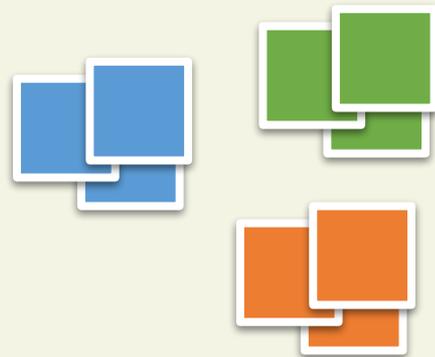

- Topic Models as an approach to typing:
- Useful understanding
  - LDA for static
  - Dynamic LDA over time

We had to name the topics.

# GOAL: DOCUMENT TYPING

- Clustering (Unsupervised)
  - Detect “natural groupings” for analysts to parse
  - Also: interpreting topic models
  - May or may not be relevant, but a useful tool
- Classification (Supervised)
  - Labels required: 1 per category (mutually exclusive)
  - Can be useful for recommendations: “relevant vs. not”
  - Images: “*is this a stoplight?*” or “*which animal?*”, etc.

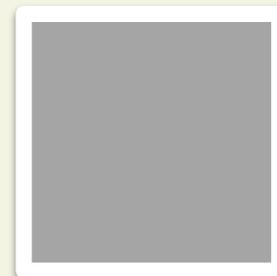

Cat ?

Dog ?

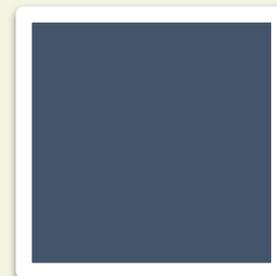

# GOAL: DOCUMENT KEYWORDS

- Keyword Extraction (Unsupervised)
  - Use statistical properties to find “important terms”
  - Also see: text summarization
  - TF-IDF (sum), TextRank (graph-based), YAKE, +more
- Multi-Label Classification (Supervised)
  - Labels required: **multiple**-per-document (multiset)
  - Several ways to train, can use domain-knowledge
  - **Harder** problem, but maybe easier to **make** training data...
  - Images: “*What animals are present?*”

cat?

tree?

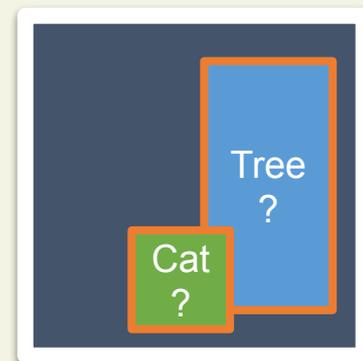

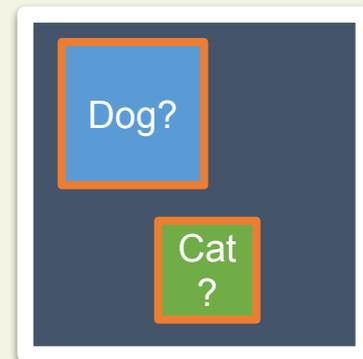

cat?

dog?

# GOAL: ENTITY RECOGNITION

- Named Entity Recognition
  - Find **text spans** that contain **keywords**, and **annotate** them
  - Predetermined vocabulary/taxonomy (usually 2-levels)
  - E.g. “I went to **New York [LOC]**” or “They owe me **\$25 [CURR]**”
  - Images: *“highlight and label the animals...”*
- Parts-of-Speech
  - Automatic determination of **grammar** information
  - SVO triples, dependency parsing, etc.
  - Can be used to “mine” **knowledge graphs**
  - Domain/language-dependent... hard with technical text!

# GOALS: OTHERS WORTH MENTIONING

Wide variety of other tasks:

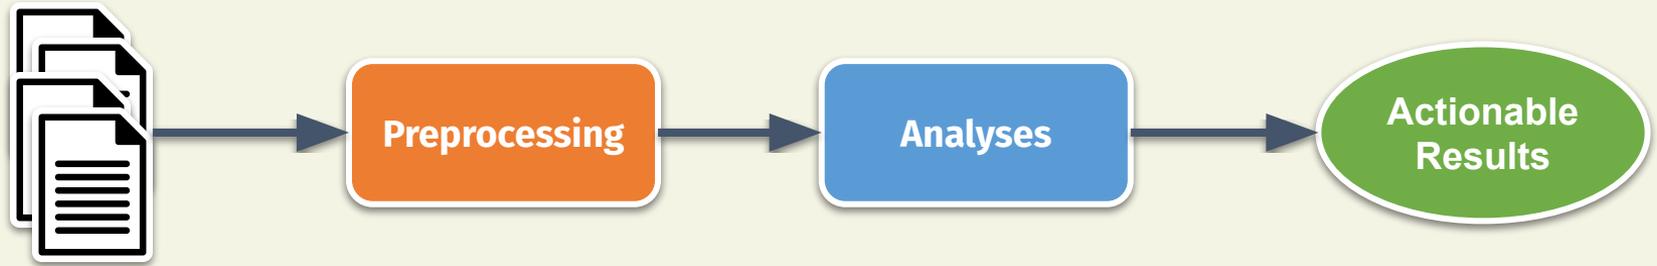

- Sentiment Analysis
- Seq2Seq & Machine Translation
- Reading complexity and writing quality, inclusivity
- Question Answering
- Text Synthesis

What does it take to get to this point?

# PROCESS: “THE PIPELINE”

In theory, the NLP Pipeline is a

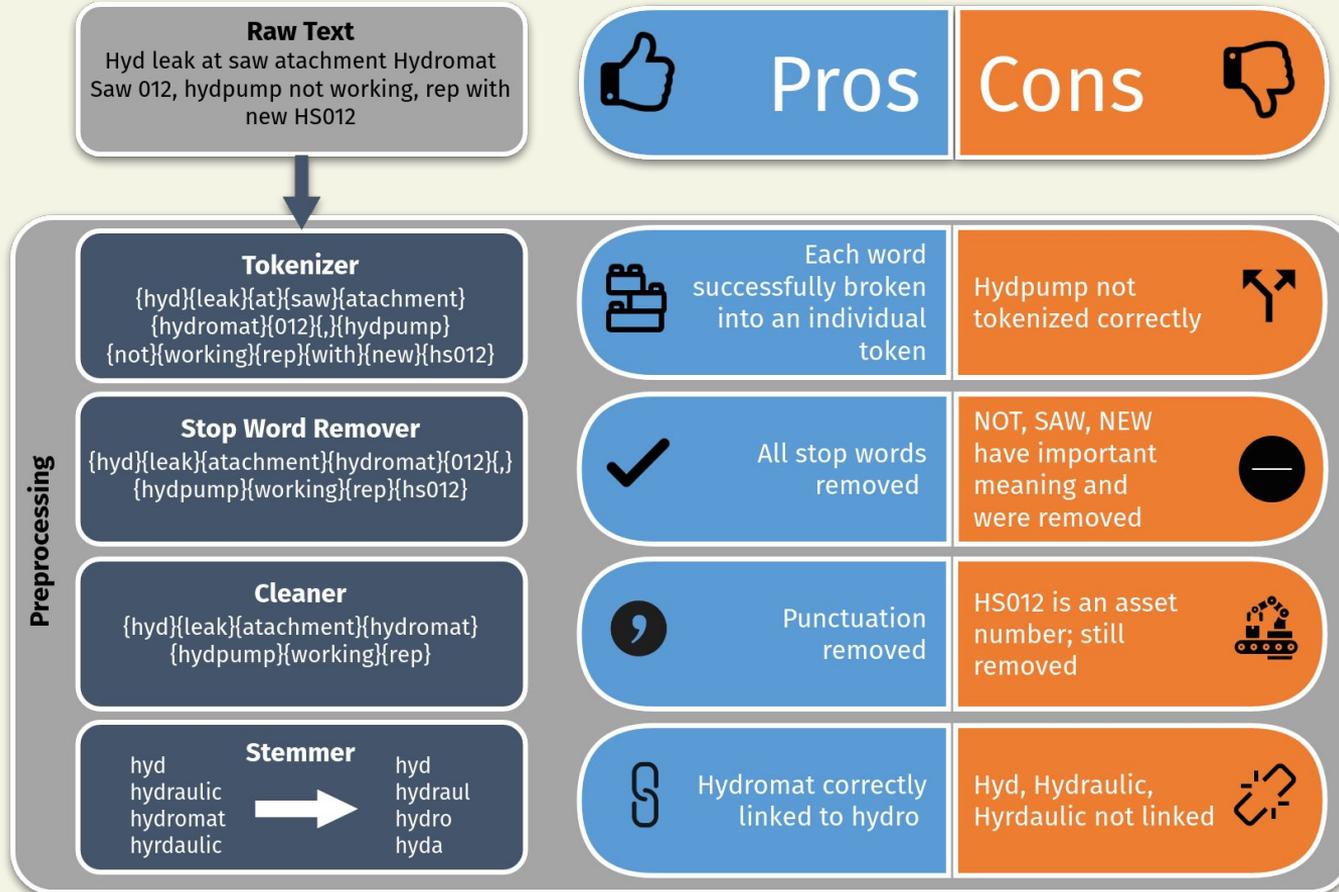

- Sequential progression, that
- Provides usable insight

Impossible to outline the number of variations on this “theme”... Here’s:

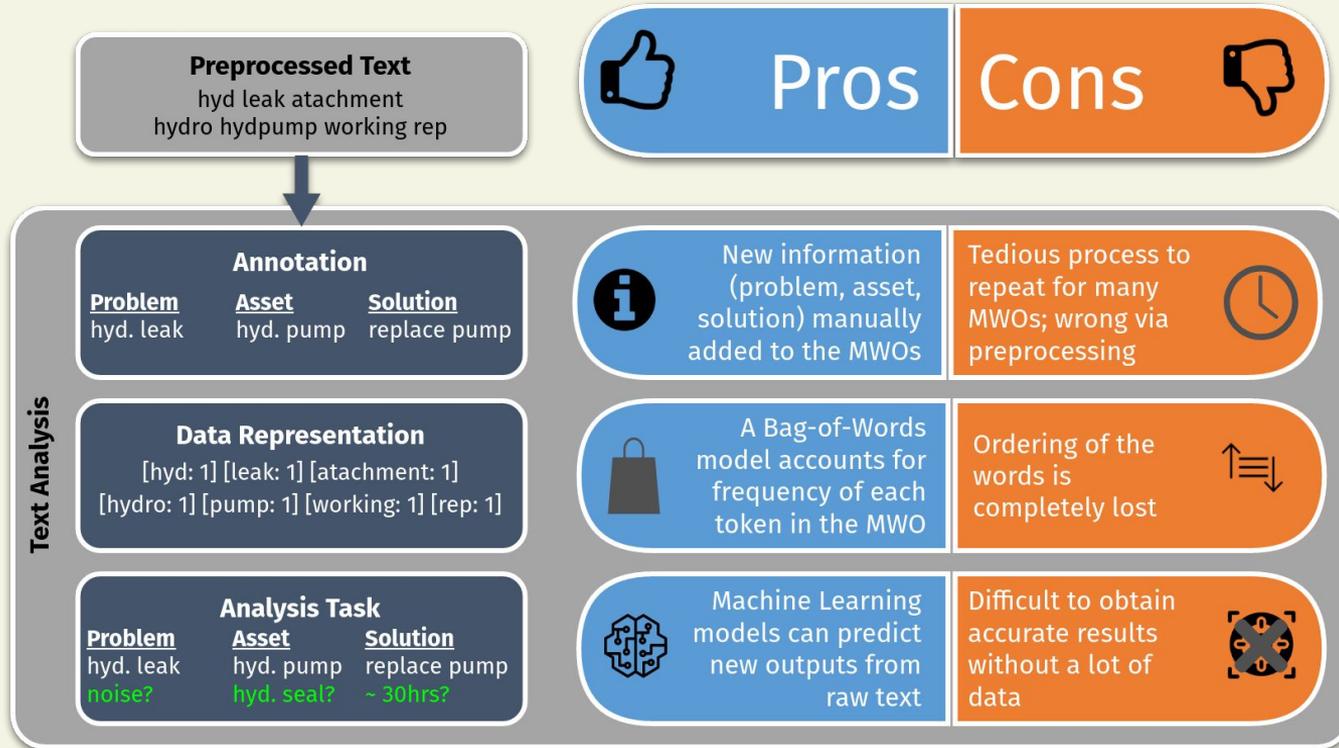

- A common sequence – a *day-in-the-life* of your analyst.
- Benefits and drawbacks of each step

# PROCESS: TEXT PREPROCESSING

Technical language processing:  
Unlocking maintenance knowledge.  
Brundage, M. P., Sexton, T.,  
Hodkiewicz, M., Dima, A., &  
Lukens, S. (2021). *Manufacturing  
Letters*, 27, 42-46.  
Image adapted from original.

# PROCESS: TEXT ANALYSES

Technical language processing:  
Unlocking maintenance knowledge.  
Brundage, M. P., Sexton, T.,  
Hodkiewicz, M., Dima, A., &  
Lukens, S. (2021). *Manufacturing  
Letters*, 27, 42-46.  
Image adapted from original.

# MEASURE & EVALUATE

---

Importance of metrics and knowing what gets evaluated

# MEASURE & EVALUATE: OVERVIEW

Key skill of the analyst or engineer is knowing how to **translate**:

***Qualitative** needs and constraints → **Quantitative** metrics and evaluations*

- What do I want to measure?
  - Do **my assumptions** conflict with the measurement?
  - Do the **metric's assumptions** conflict with my goal/process?
  - Will **multiple metrics** provide a broader insight? (yes)
- What constitutes progress toward, or success in, my goal?
  - Have I encoded my (stakeholder) expectations (preferences) sufficiently?
  - Do I have parameters to tune (continuously and/or iteratively)?

*Most important:* have I **transparently documented** my decisions for **iteration**?

What do I need to measure? Have I “done my homework”?

- Similarity or Distance
  - Discrete options, spellings: *Levenstein, Hamming, SymSpell, Jaccard*
  - Vector/Geometry: *Euclidean, Mahalanobis, Minkowski*
  - Distributions: *Kullback-Leibler, Earth-mover/Wasserstein, Cross-Entropy*
- Quality
  - Annotation coverage, label/class imbalance (rare-event?)
  - “Usefulness”: *topic perplexity, (B/A) Information Criterion*
  - Inter-rater agreement: *Fleiss’  $\kappa$ , Kendall’s  $\tau$ , graph-based?*
- Importance
  - Information content: *Shannon Entropy, log-odds, lift, sum-TFIDF*
  - Centrality: *degree, betweenness, spectral (e.g. TextRank),*

# EVALUATE: PRECISION & RECALL

NLP often involves *multilabel* or *imbalanced* classification.

→ Accuracy is **unfair** or **overly optimistic**

- Precision

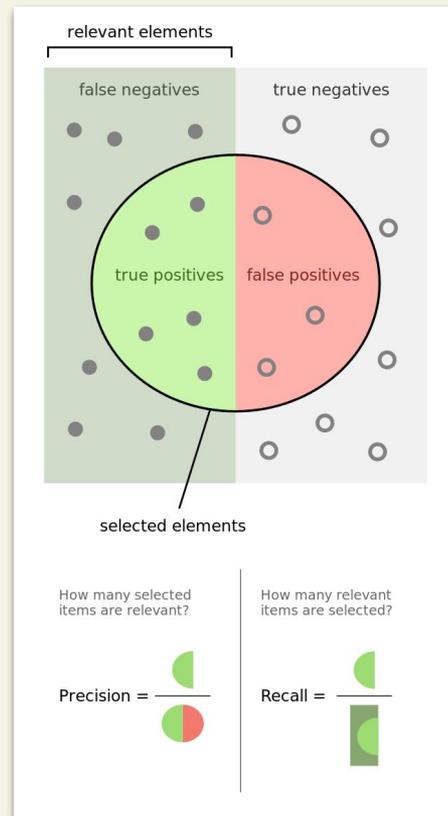

- Also *Positive Predictive Value (PPV)*:  $[TP / (TP + FP)]$
- “Of things **predicted** X, how many **are** X?”

- Recall

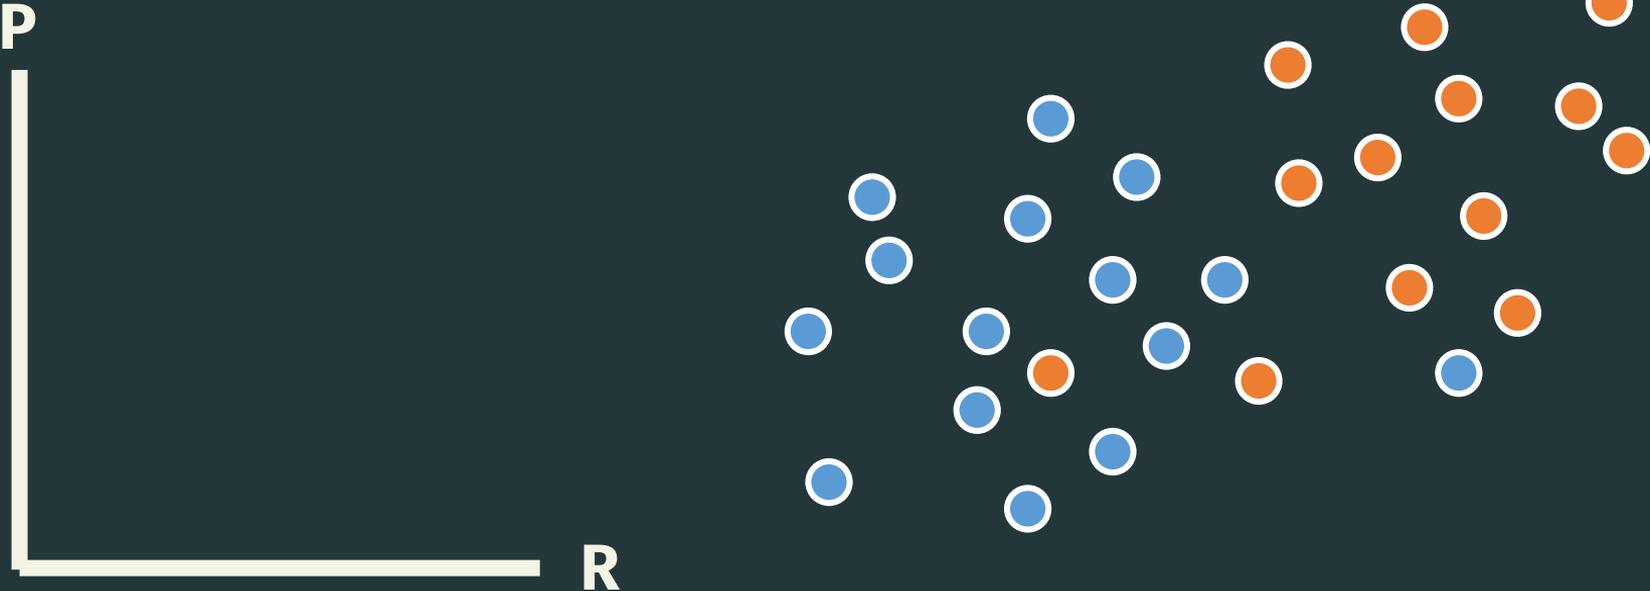

- Also *True Positive Rate* or *Sensitivity*:  $[TP / (TP + FN)]$
- “Of the things that **are** X, how many were **predicted** X?”

- F-Score

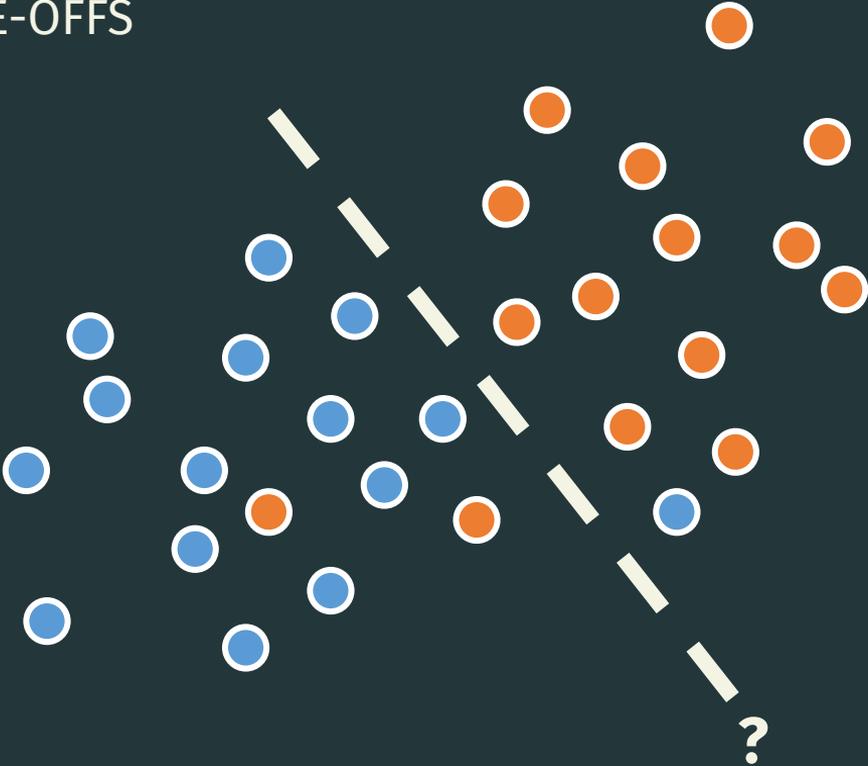

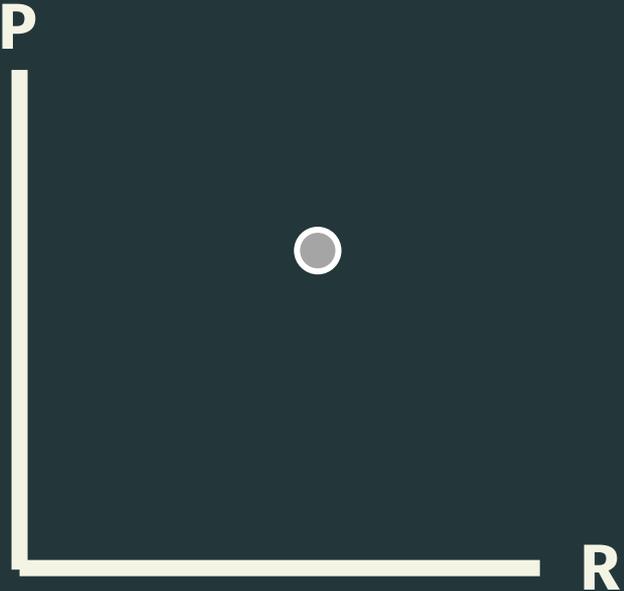

- Harmonic mean of Precision & Recall:
- Explicitly combines our preferences for the two
- Parameter  $\beta$  (usually 1) : assign  $\beta$ -times more importance to Recall than precision.

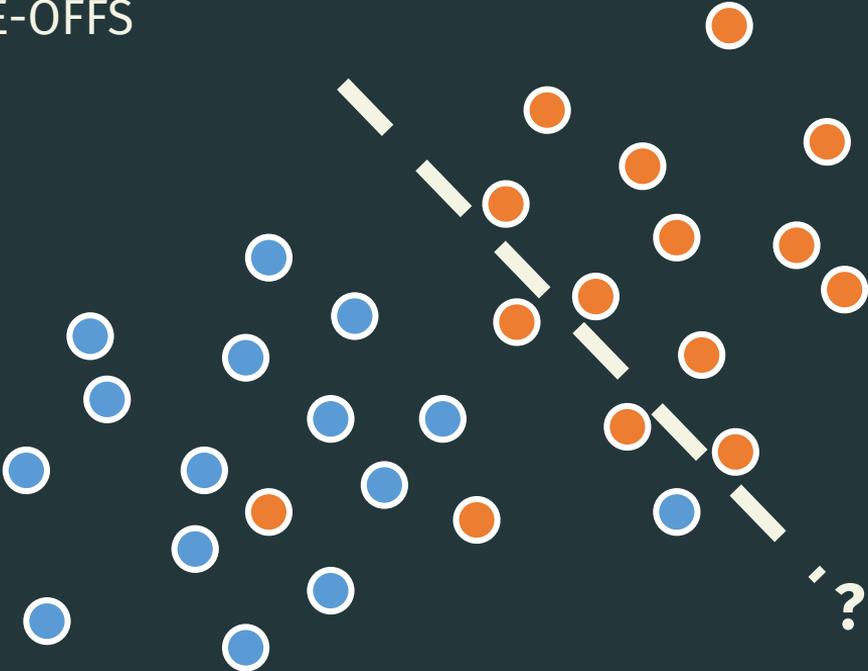

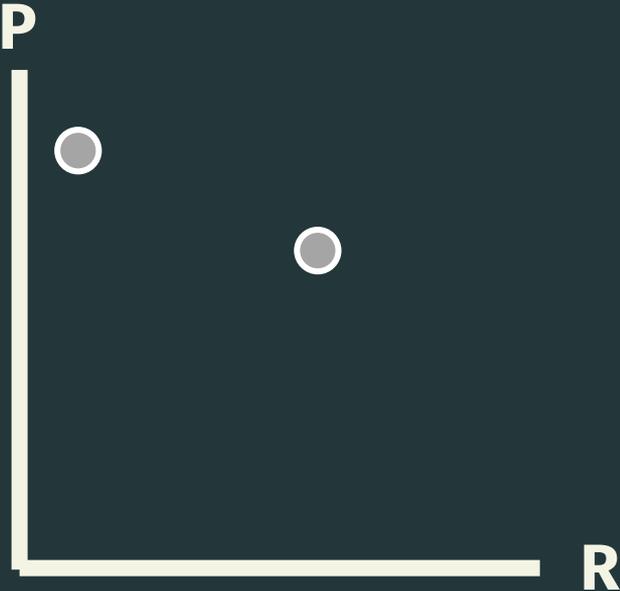

# EVALUATE: THRESHOLDS AND TRADE-OFFS

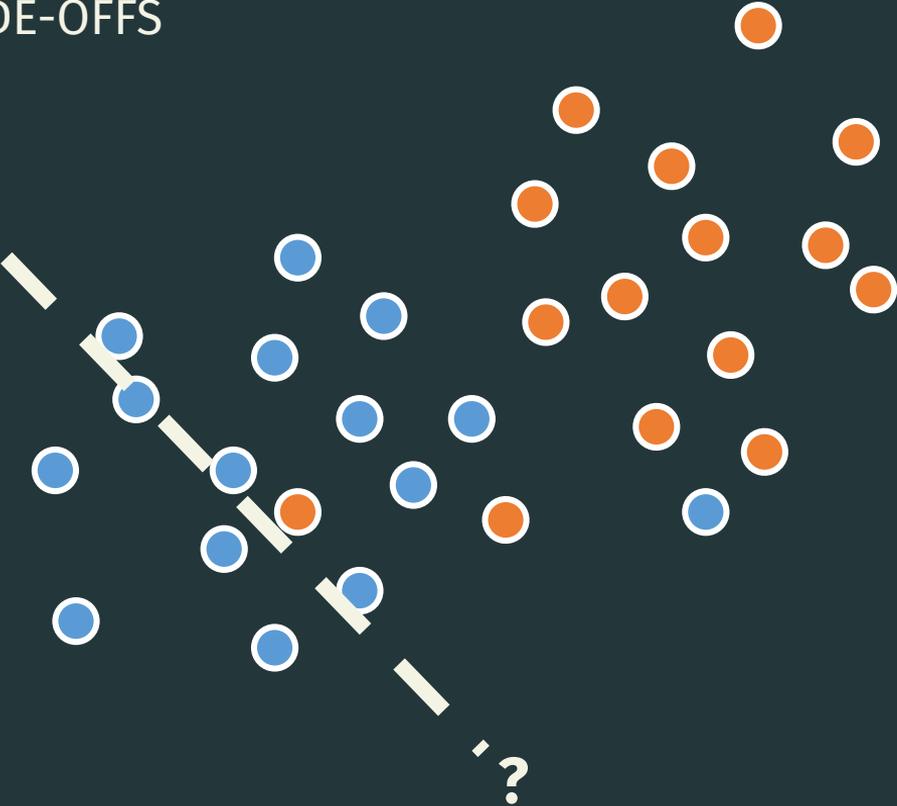

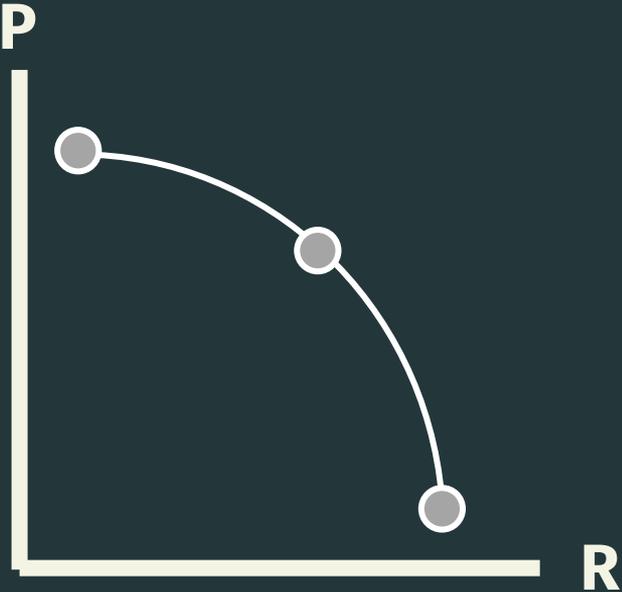

# EVALUATE: THRESHOLDS AND TRADE-OFFS

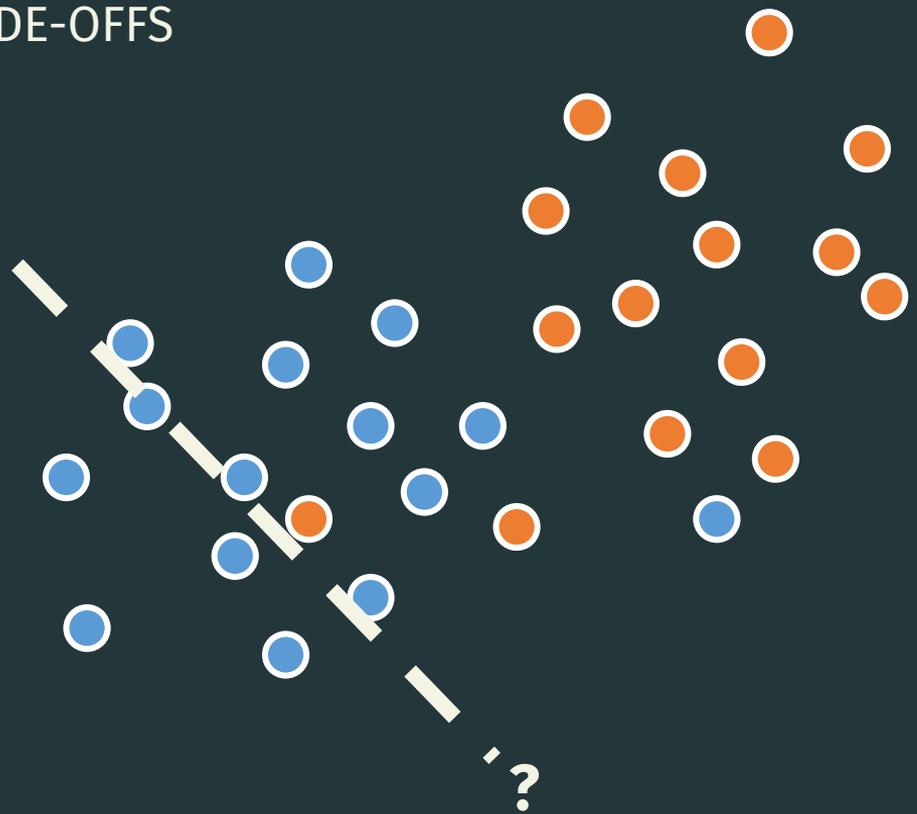

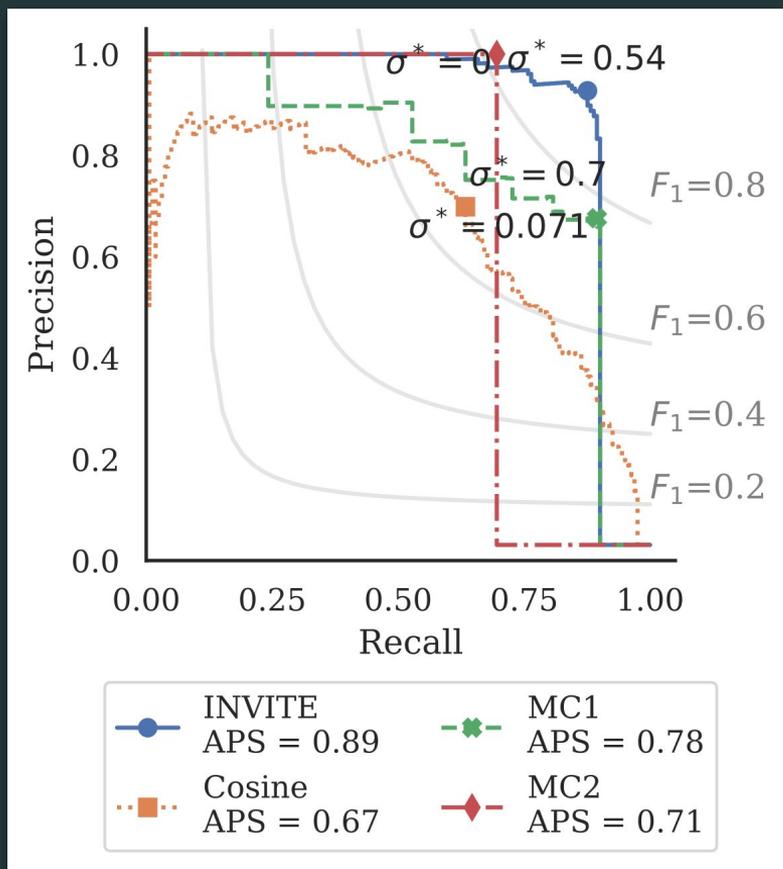

# EVALUATE: THRESHOLDS AND TRADE-OFFS

# EVALUATE: THRESHOLDS AND TRADE-OFFS

# EVALUATE: THRESHOLDS AND TRADE-OFFS

Sexton, T., and Fuge, M. (January 13, 2020). "Organizing Tagged Knowledge: Similarity Measures and Semantic Fluency in Structure Mining." *ASME. J. Mech. Des.* March 2020; 142(3): 031111. <https://doi.org/10.1115/1.4045686>

# EVALUATE: SUMMARY

## Do your **homework**

*If there's something you want to measure, a metric may exist.*

## Metrics **evaluate**

*Use fundamentals to design metrics that assess what matters.*

## Metrics **communicate**

*Confusion is never the answer; strive for mutual understanding.*

Remember that NLP is working on data *for humans, by humans.*

Be **transparent** and **reproducible**.

# VALIDATION

---

The “open problem” of human-in-the-loop, domain-specific NLP

# VALIDATION: PROBLEMS

So far we have glossed over some very common problems:

- Interpreting topic models can be fraught <sup>1</sup>
- Out-of-the-box tools are pre-trained on very different text
- There is not enough data to train custom models
- Too hard to hand-annotate the data we have
- No existing standard annotation to apply, no ontology we agree on
- Events of interest are far too rare (unclear if over-sampling applies)
- ...

In most Engineering Design and Reliability tasks, we *validate*:

*Sanity checks, second opinions, processes for oversight and collaboration*

<sup>1</sup>Chang, Jonathan, et al.  
"Reading tea leaves: How humans interpret topic models."  
Neural information processing systems. Vol. 22. 2009.

# VALIDATION: RE-ASSESSING “THE PIPELINE”

Reality is never as clean as “The Pipeline”.

*“In practice, the line between input and output are not well defined. An analyst might use intermediary tasks and representations to enrich annotations and cascade into further tasks. A holistic approach to improving one component will inevitably improve the others; a stolid adherence to a given pipeline can prevent progress all-around.*

*[...]*

*By lowering barriers to entry for text analysis through the development of efficiency-boosting tools and a more human-centered annotation approach, engineers have a unique opportunity to simultaneously learn from other domains and improve on their processes. A new approach is needed to adapt NLP methods to industry use cases in a scalable and reproducible way.<sup>1</sup>*

→ View NLP as a socio-technical system rather than as an algorithmic pipeline.

<sup>1</sup>Brundage, Michael P, et al.  
"Technical language processing: Unlocking maintenance knowledge."  
*Manufacturing Letters* 27 (2020): 42-46.

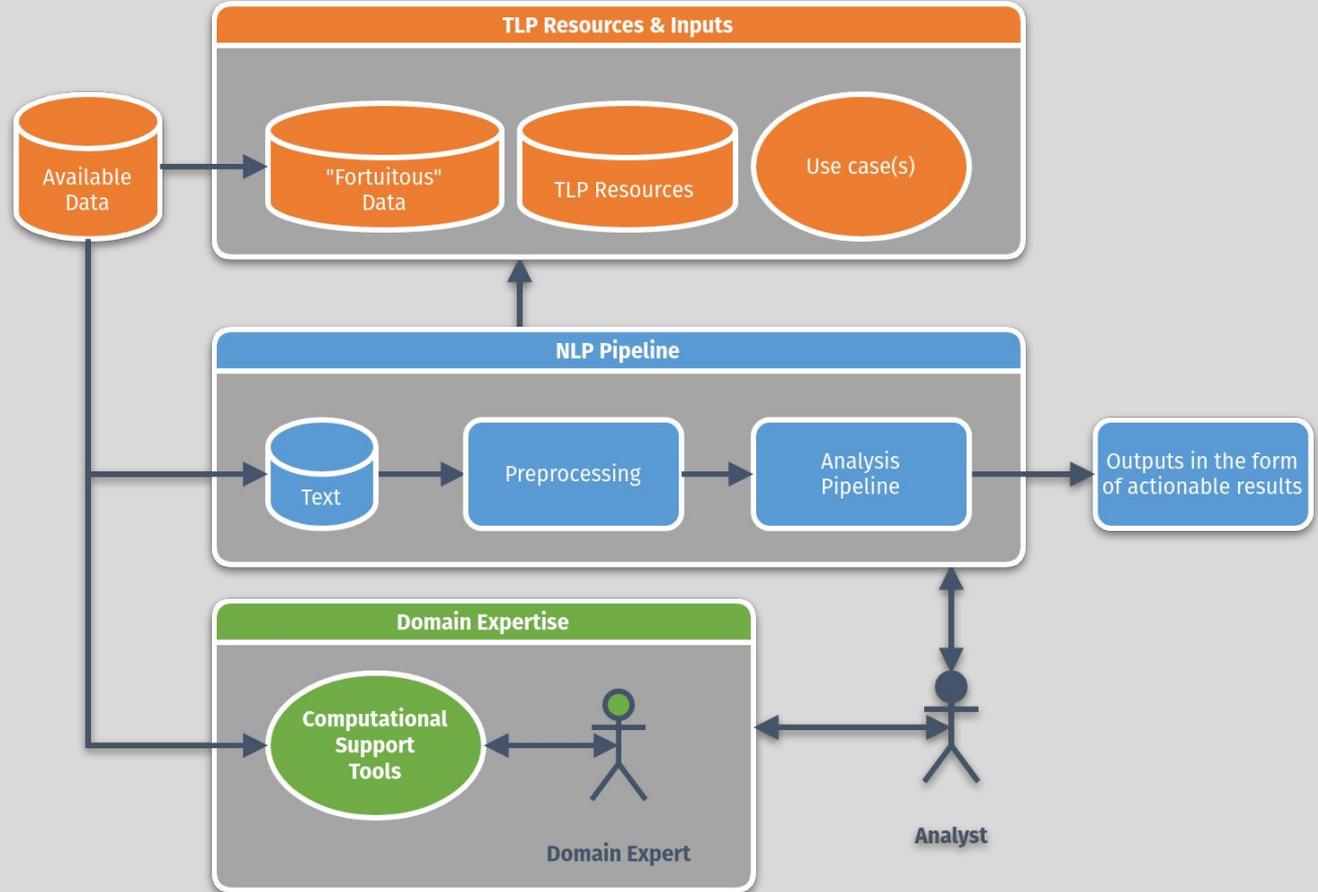

## *Enter **Technical Language Processing***

- NLP Techniques do not *always* adapt well to engineering text
- Current NLP solutions need to be adapted **correctly** for use in technical domains
- TLP is a methodology to tailor NLP solutions to engineering text and industry use cases in a scalable and reproducible way

*Adapting Natural Language Processing for Technical Text*

Dima, Alden, et al.  
Applied AI Letters: e33.  
Image adapted from original

- How the TLP approach to meaning and generalization differs from NLP
- How data quantity and quality can be addressed
- Potential risks of *not* adapting NLP

## Plan for Distributed Collaboration in the TLP Col

- I. GitHub Organization (just started): [TLP-Col](#)
  - A. Documentation - best practices for TLP, theory, etc
  - B. Networking - curated list for state-of-the-practice: [awesome-ttp](#)
  - C. Collaboration - base or forks for open tool repositories
  
- II. Events:
  - A. Past Workshop ([slides](#)):
  - B. TLP-COI Slack Workspace - QR code →
  - C. Other options? Webinars? Let us know!

# THANK YOU

# AI Enabling Technologies

## Grooper and Watson Content Analytics

June 29, 2021

---

---

# Overview

## What is Grooper?

Software that provides “*Thrilling Automation with Intelligent Document Processing*”\*

Use Case: Extraction of data from operator licensing (OL) applications

Forms:

- NRC Form 396 (Certification of Medical Examination by Facility Licensee)
- NRC Form 398 (Personal Qualification Statement – Licensee)

Interfaces:

- Electronic Information Exchange (document ingestion)
- Reactor Program System (authoritative OL data source)

# Grooper

## NRC Grooper Features

### 1. Capture Tool

De-skew,  
Brighten, etc.

### 2. Image Processing

Optical  
Character  
Recognition  
(OCR)

### 5. Extraction

Parse and  
extract data,  
and write in  
XML schema

Other features used:

Optical Mark Recognition  
(OMR) – Recognizes  
checkmarks

Fuzzy Logic – Dictionary of  
defined values that can be  
OCR'd or extracted based on a  
confidence threshold

---

# Grooper

## AI Grooper Features

**Natural Language Processing** and **Machine Learning** finds paragraphs, sentences, or other language elements in documents based on contextual meaning.

Use Case: Document sensitivity

Method:

- Manually review documents for sensitive keywords and identify true positives (in Grooper client)
- Start to train Grooper to contextually search around area of true positive
- Repeat with several document samples until properly trained

# Grooper

## AI Grooper Features Cont'd\*

### Context Scope

*Type: ContextScopeEnum, Default: Zonal*

Determines the scope of context feature extraction. Can be one of the following values:

- **Zonal** - Context features will be extracted from one or more zones, specified relative to the data value.
- **Flow** - Context will include a limited number matching features before and/or after the data value in the text flow.
- **Self** - Context will include all matching features which occur inside of or overlap with the data value.
- **Nearest** - Context will include a limited number of features which are closest to the data value.

# Overview

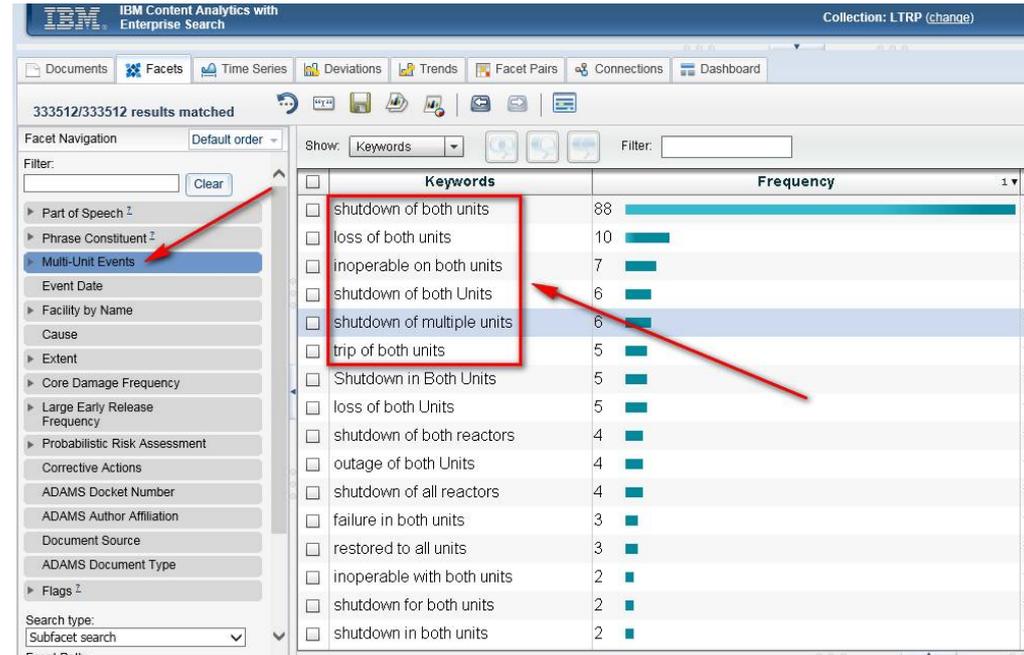

## What is Watson Content Analytics?

Software that extrapolates business information from large collections of documents and uses natural language processing to uncover meaningful business insights.

Use Case: RES - Identify Event Reports that included an outage of two or more units

NLP Method:

- Define noun/verb combinations and NLP automatically contrives derivations of those combinations

## Grooper and Digitizing Success

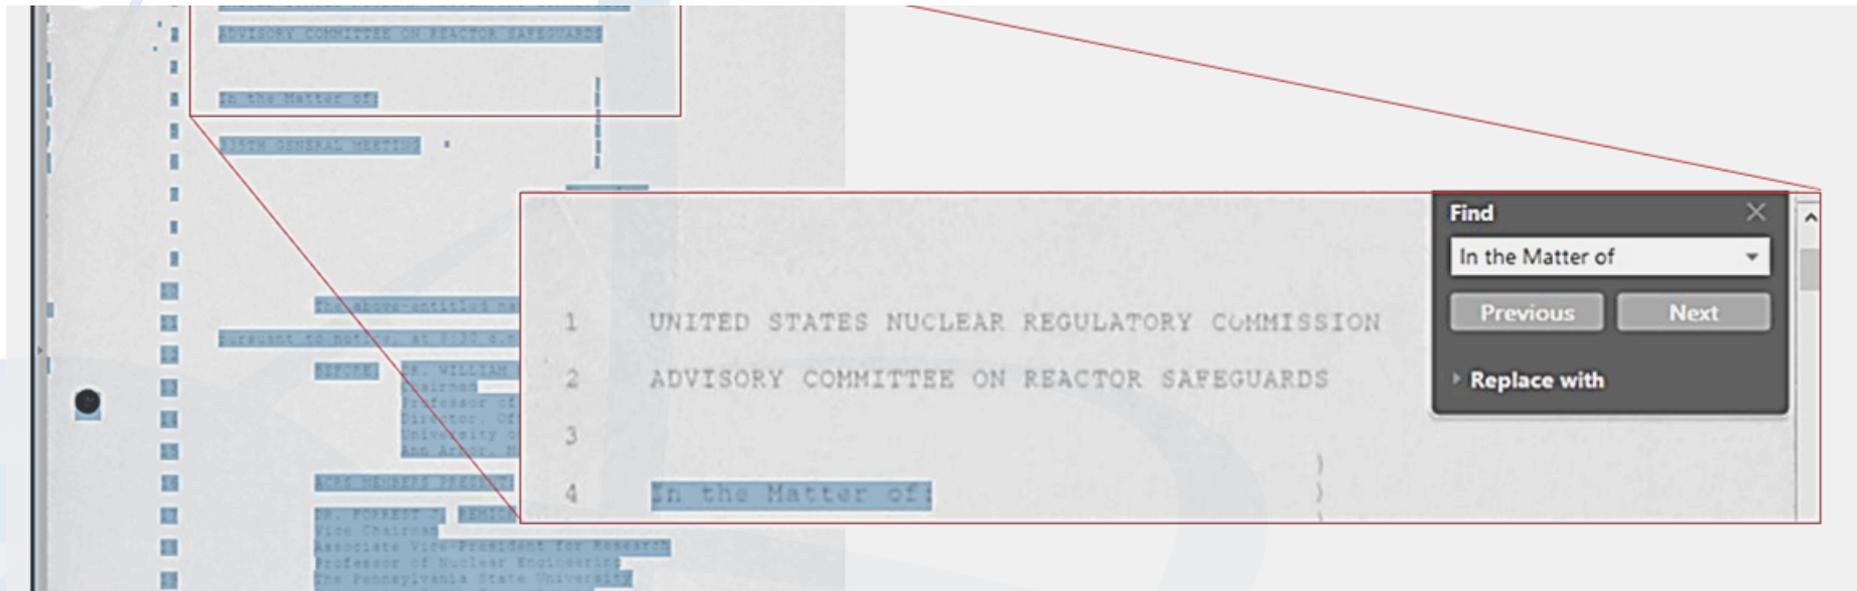

June 29, 2021

---

# **DIGITIZATION PROJECT**

- **Digitize Key Docketed Information**
  - Making licensing and design basis information readily available to staff streamline the review process
  - Expand public access to materials
  - Comply with federal records management mandates (e.g., M19-21)
  - Reduce storage cost
- **NUDOCS microform** (1979-1999) – 110K microfiche and 88K aperture cards consist of 2.3M documents or 43M images
  - **109,424** (100%) microfiche, **87,929** aperture cards digitized
  - **43,009,225** (100%) images of 43M fiche/aperture scanned
  - Over **2,355,157** PDFs generated
- **AEC Paper** (pre 1978) – 1,095 boxes of paper records which consist of 205K documents or 3.2M images
  - **191** boxes, **332,879** pages digitized (COVID-19)
  - **13,619** PDFs generated
- **Components**
  - Mekel Mach 7
  - Grooper software

## Enterprise Data Warehouse

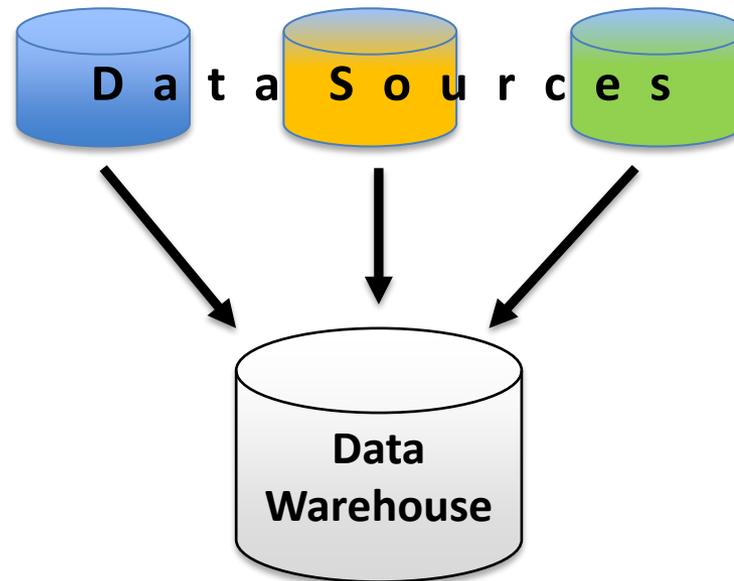

June 29, 2021

---

# Overview

## What is the Enterprise Data Warehouse (EDW)?

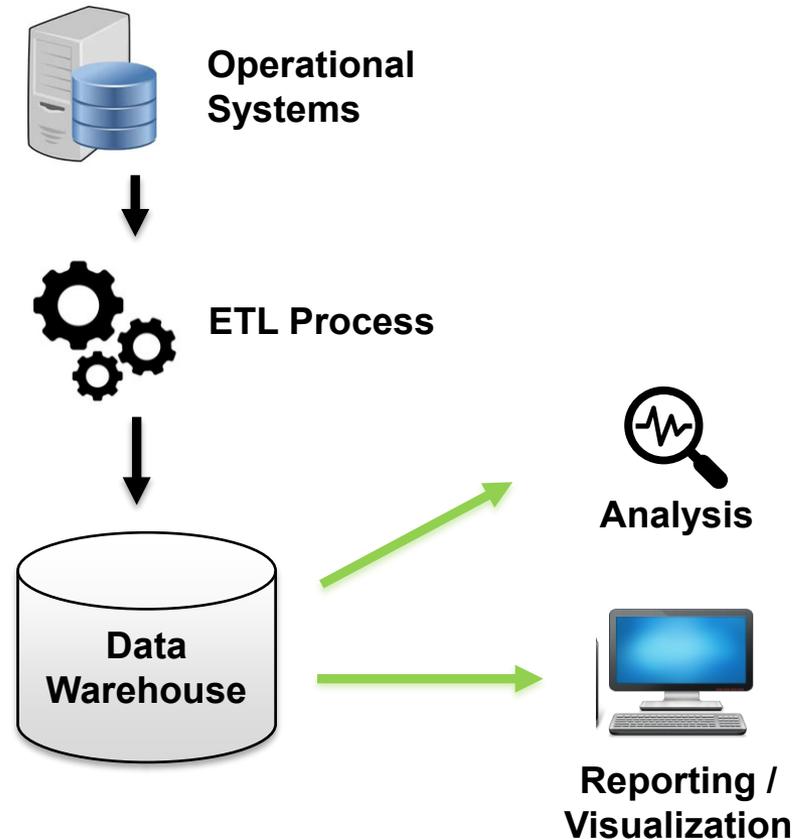

- Central repository of integrated data from NRC's authoritative systems
- Purpose is to provide timely, accurate data from authoritative data sources to be used for reporting and data analytics

# Overview

## Enterprise Data Warehouse Architecture

- Interfacing systems – NRC’s operational systems, authoritative data sources
- ETL Process - The Enterprise Data Warehouse extracts data from authoritative sources, transforms it in a staging area then loads it into the EDW on a scheduled interval
- EDW - Database that stores the data to be used for reporting and data analytics

---

# Overview

## Benefits of the Data Warehouse

- Improved Reporting Performance and Efficiency
- Improved Data Quality and Consistency
- Empowers Users to Gain Data Insights

## Azure Cloud

- Data Warehouse migration to Azure Cloud

- **Azure Analysis Services**
- **Azure Cognitive Services**
- **Azure Machine Learning**

# What is the Event Management Response Tool (EMRT)

- Single location to consolidate various data sources for searching and correlation
  - Uses machine learning to refine and make future searches better
- Ingests various file formats (Excel, PDF, PowerPoint, etc.) to make unstructured data structured
- Allows previews of relevant locations within the document to ensure downloading is valuable

Structured Data (e.g. Excel, Access, etc.)  
Unstructured Data (Word, PDF, PowerPoint, etc.)

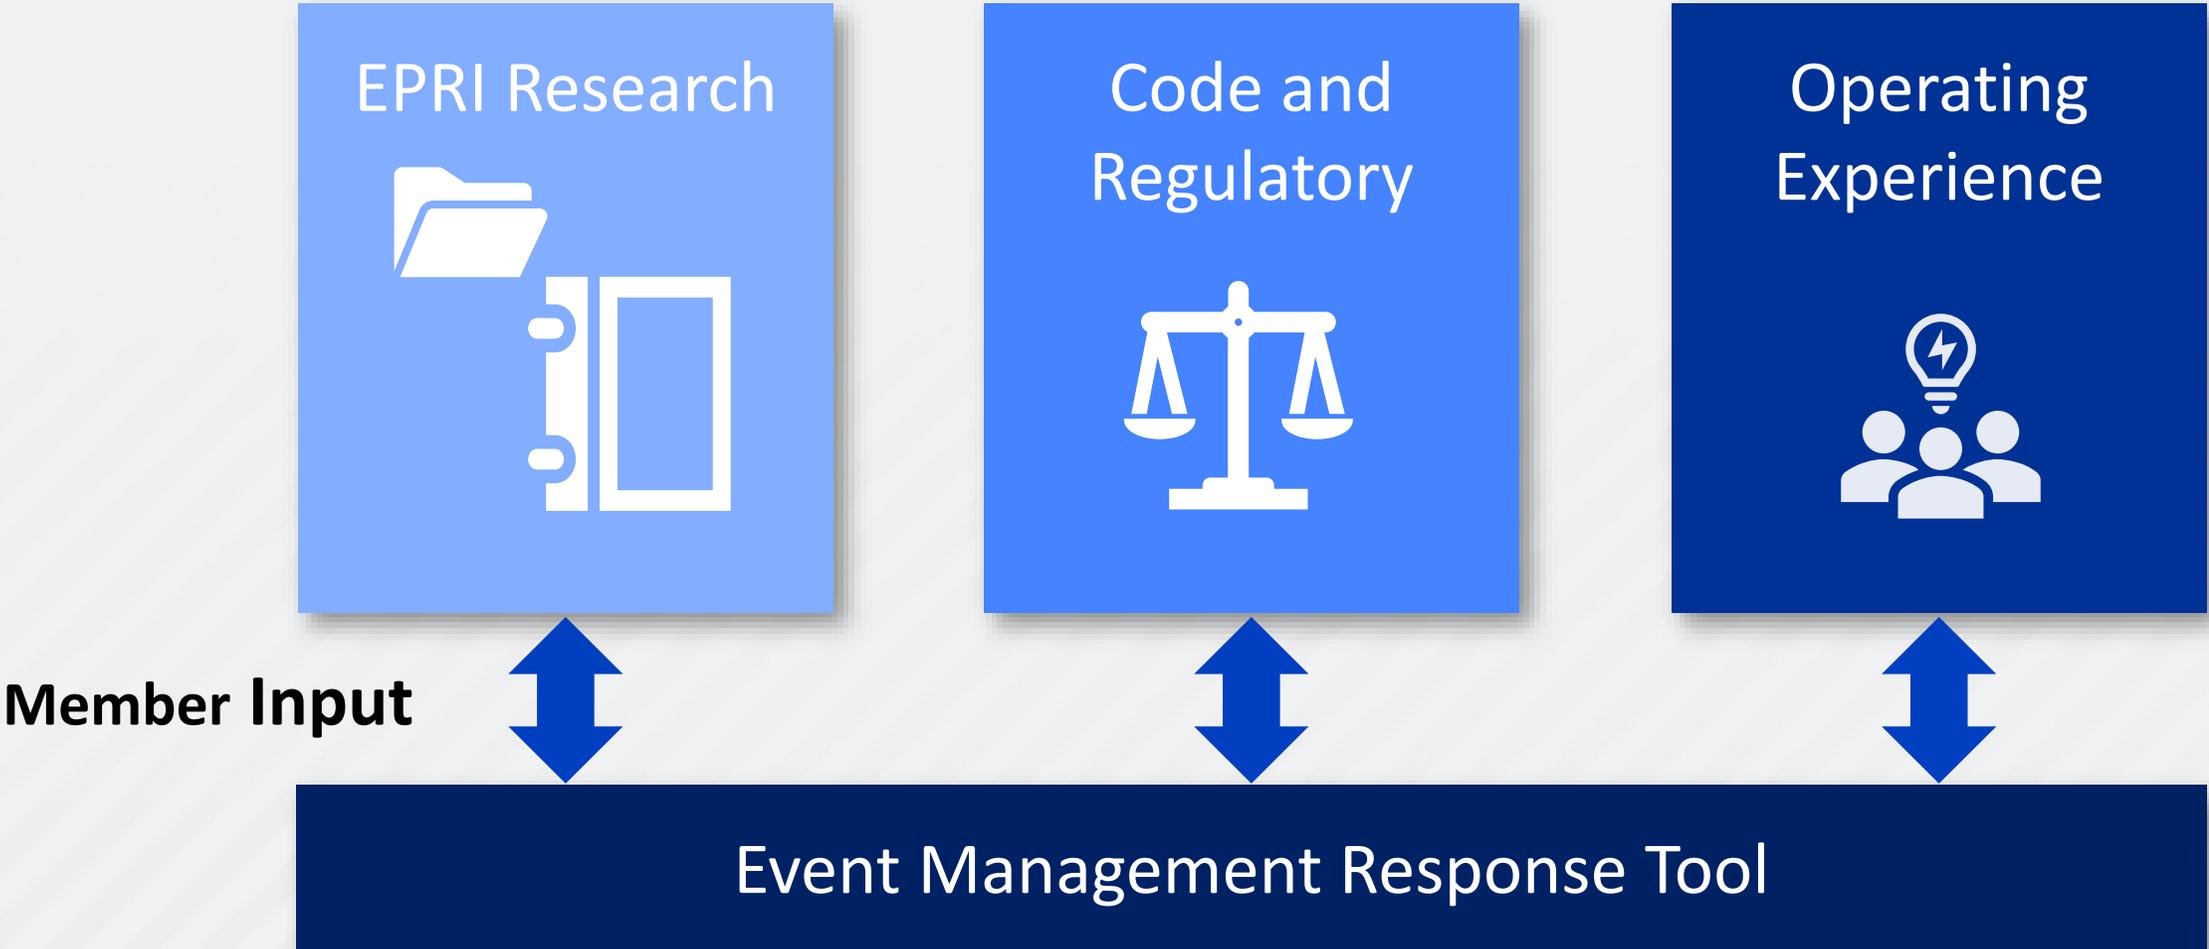

# Purpose and Objectives

- Goal to increase productivity by:
  - Reduction of time associated with finding the needed research products
    - Display the most relevant information based on a member search within research products
  - Reduction of time associated with finding Code and Regulatory information (e.g. regulatory submittals, content within Nuclear Regulatory Research, etc. )
  - Reduction of time associated with find operating experience and lessons learned from other EPRI members related to event

Value/Objective:  
**Provide EPRI members the needed information to make informed decisions in one location in reduced time**

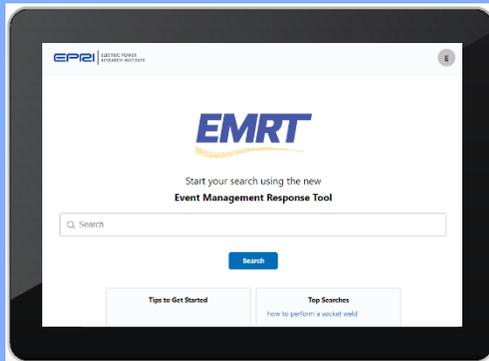

# Event Management Response Tool (EMRT)

**OBJECTIVE: Provide members needed info in one location to make informed decisions in reduced time**

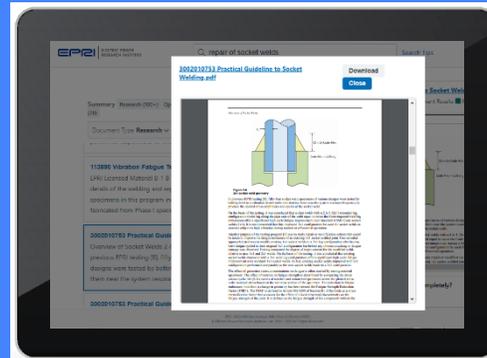

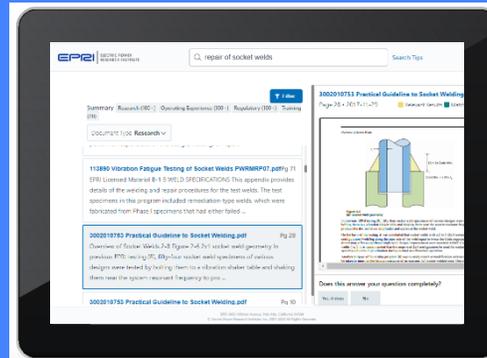

# EMRT: Natural Language Processing & Access Full Data Library

## Input

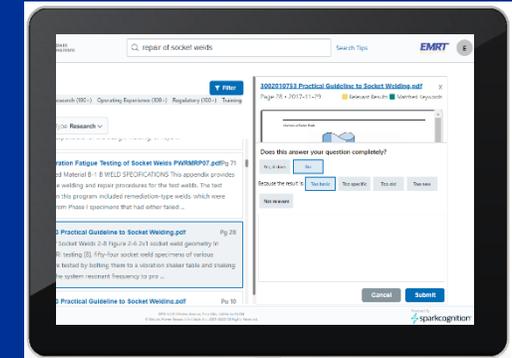

Typeahead search based on prior search terms

## Display of Output

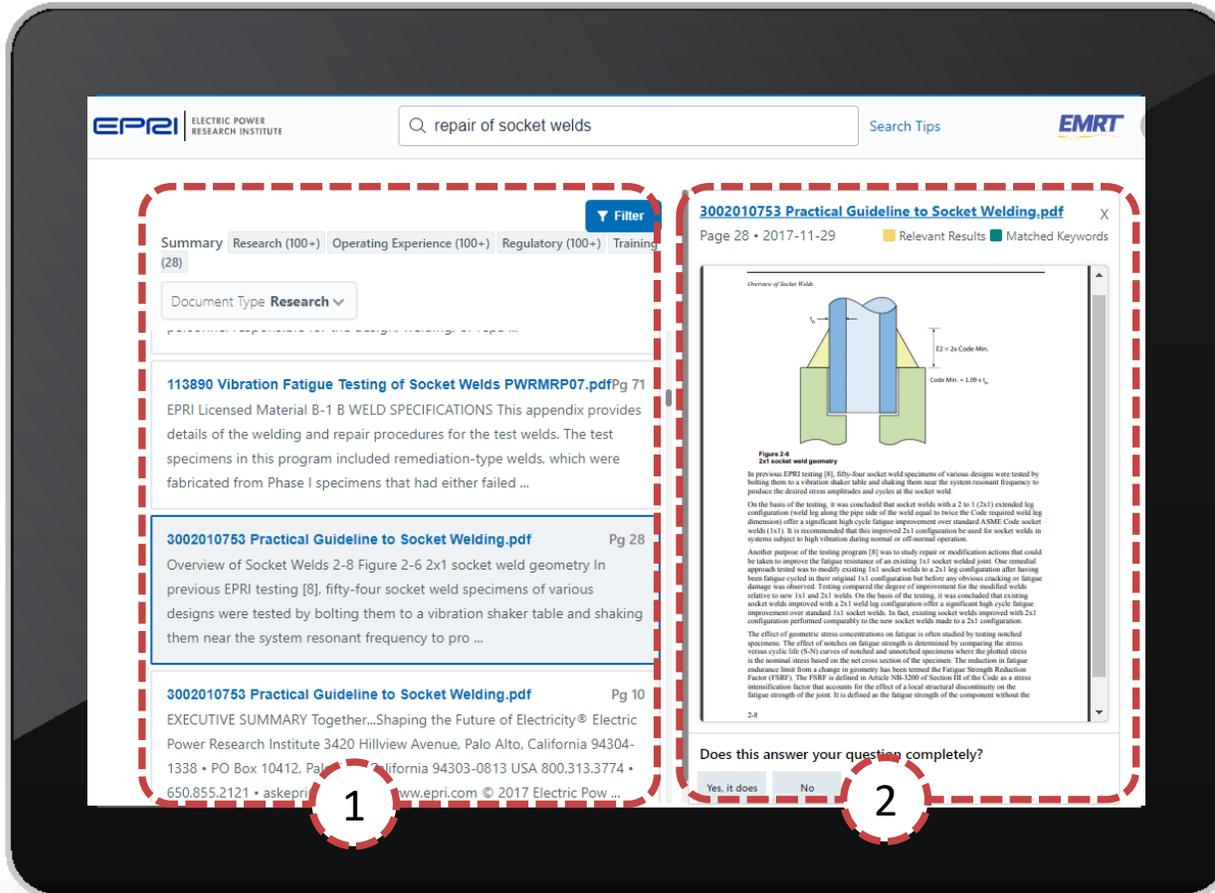

## Feedback Loop

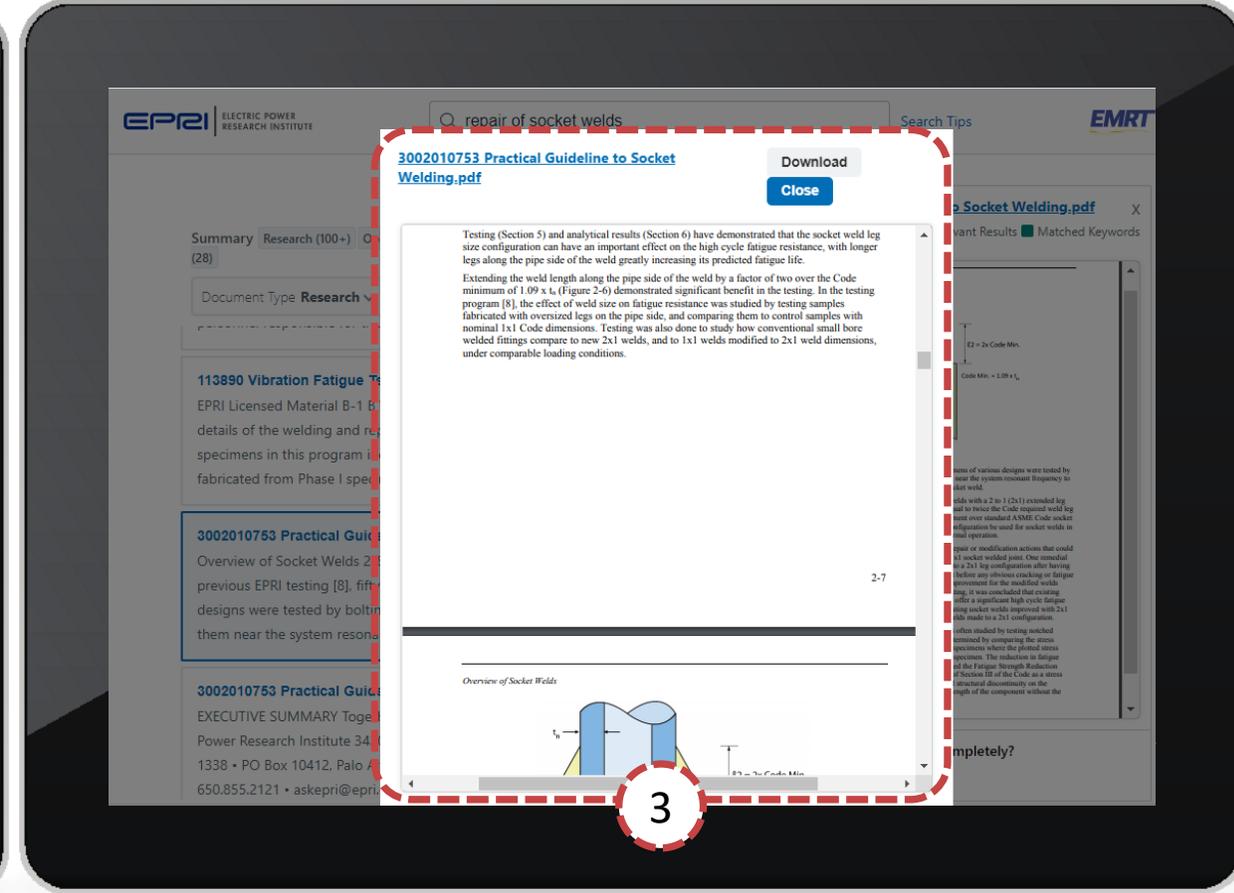

Machine Learning & Refinement of Output

Current input is text string but we would like to also use other input methods in the future

# EMRT Search Results – 3 Locations Display Content

- 1) Tabulated search results
- 2) Preview of user-selected search result within the respective document

- 3) Preview of user-selected search result with ability to scroll to different pages within the respective document

# EMRT-Regulatory Information-NRC ADAMS Document Library

- Regulatory information is necessary to make decisions
- NRC ADAMS contains a number of **publicly** available documents (subset shown)
- Currently, users search ADAMS but finding data can be difficult
- We can use NLP and machine learning if we ingest and extract the data from these documents
- This would help members search this information more effectively
- Use of existing NRC Application Programming Interface (API) permits filtering by document type

# Project Overview-High Level

2020

- Prototype was developed with small subset of information
- Alpha Version was completed late 2020 incorporating a large set of data and EPRI member and personnel feedback and suggestions

2021

- Beta Version is currently being developed that will include larger set of information (EPRI Nuclear research, EPRI OE (meeting materials, surveys, etc.), NRC ADAMS data)

2022

- Incorporate feedback from users and consider other sources of Operating Experience, etc.

# Relief Request Index Project

**Jacqueline Espinoza, Beyond the Arc**

**Steven Ramirez, Beyond the Arc**

# 2020-2021: Relief Request Index-Proof Of Concept

## Research Question:

Can we apply modern text mining and natural language processing techniques to curate a body of knowledge that would be helpful to plant engineers who are addressing welding repairs and material reliability situations?

**NRC ADAMS is a large source of valuable information... but can be difficult to find desired information.**

## Value:

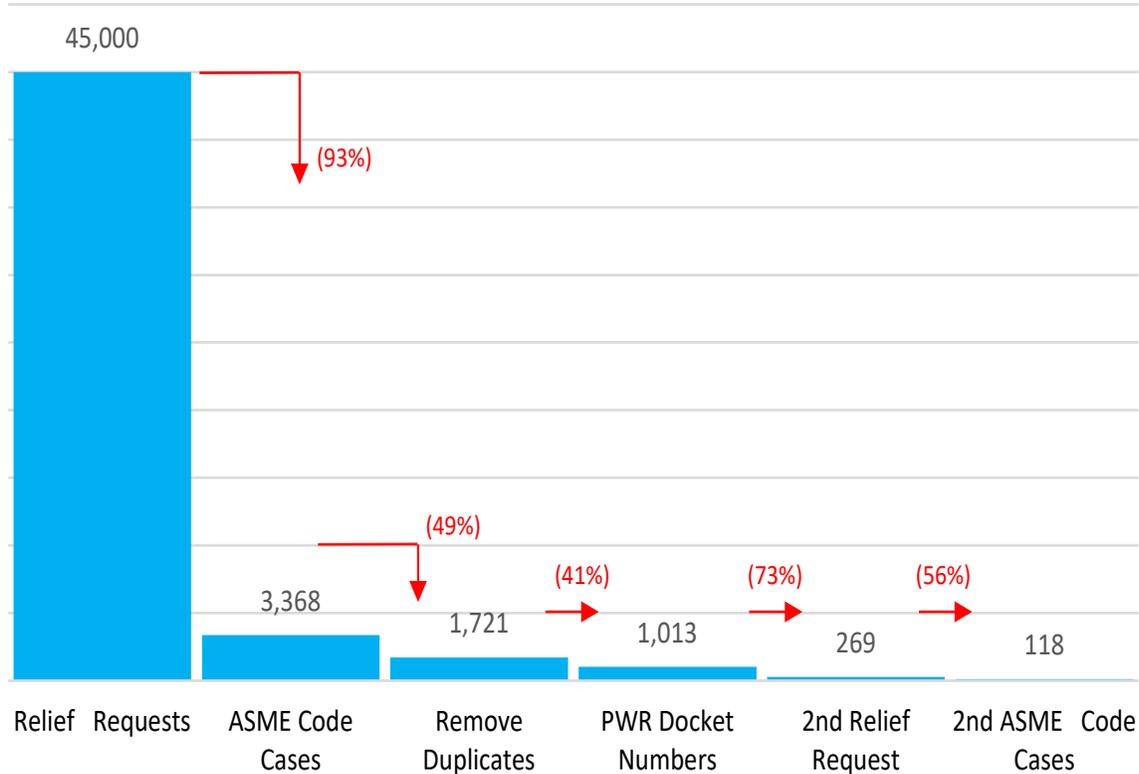

- **Reduce time spent finding complete series of request for alternatives “relief requests”**
- **The curated index assists users in understanding:**
  - **Where code cases have been used**
  - **Any potential conditions that should be addressed when a similar request is being submitted**
  - **Identify new trends**

# Background

- EPRI decided to explore a proof of concept in 2021 using subset of desired code cases
- Index to filter by these topics:
  - ASME Code Case Number
  - Systems / Assets
  - Relief Requests for Inspection
  - Relief Requests for Repair
  - Plant Name
  - Operator

ASME Code Case Number in Series

# Process Flow | Creating Code Relief Series

Each bar represents the number of leading documents found after applying the filters described to the right. The objective of the filters is to isolate the most relevant records.

The percentages represent the reduction in records after each filter is deployed.

Query the ADAMS database for Relief Requests (in title or document type)

Identify those Relief Requests that include ASME Code Cases of interest

Identify duplicate documents and remove them

Identify documents that include PWR plants and isolate them

Identify documents with an API document type that equals Relief Request and isolate them

Remove Relief Requests that do not include the ASME Code Cases of interest

# Process Flow | Creating Code Relief Series

## Extract More Records

- Convert PDF files to TXT
- Tag these documents as “Origin”(\*) records
- Run NLP algorithm to extract reference numbers, dates, and accession number
- Query ADAMS for additional records based on origin record

## Organize the Records

- Group records by the Origin document
- Organize by topical dataset beginning with the oldest date to most recent within dataset
- Assign each dataset a three-digit “Series” number

## Refine the Topical Datasets

- Remove records within the Series that are not related to the Relief Request for an ASME Code Case
- Remove duplicate series

**\* This designation means that these documents are the ones used to expand the search for related records.**

## Index of Relief Request Datasets from the NRC

For Internal Use Only – Pilot Project

The EPRI Welding Repair and Technology Center (WRTC) and the PWR Materials Reliability Program (MRP) developed an Index of records for Relief Requests. The project used natural language processing/machine learning techniques to aggregate documents from the ADAMS database. Our NLP models programmatically identified topical datasets for Relief Requests.

### Beginning Record

Re: St. Lucie Unit 1  
Docket No. 50-335  
Inservice Inspection Plan  
Fourth Ten-Year Interval Unit 1 Relief Request No. 5, Revision 0

Pursuant to 10 CFR 50.55a(a)(3)(ii), Florida Power & Light (FPL) requests relief from the 10CFR50.55a(g)(4)(F)(4) exception to ASME Code Case N-770-1 that essentially 100% coverage be achieved for the baseline required volumetric examinations. The details and justification for this request are provided in the attachment to this letter.

FPL requests approval of this relief request to support the upcoming Unit 1 SLI-25 Fall 2013 refueling outage.

Please contact Ken Frehafer at (772) 467-7748 if there are any questions about this submittal.

Sincerely,

Eric S. Katzman  
Licensing Manager

### Additional Correspondence

**NRR-PMDAPem Resource**

From: Orf, Tracy  
Sent: Friday, March 15, 2013 1:11 PM  
To: Frehafer, Ken  
Subject: St. Lucie Unit 1, Acceptance Review Regarding Relief Request No. 5 from the Amer Society of Mechanical Engineers Boiler and Pressure Vessel Code Regarding Exar Welds (TAC MFO075)

Dear Mr. Frehafer,

By letter dated February 4, 2013 (Agencywide Documents Access and Management System Accession No. ML13046A101), Florida Power & Light (the licensee) submitted a relief request for St. Lucie Unit 1. The purpose of this email is to provide the results of the U.S. Nuclear Regulatory Commission (NRC) staff acceptance review of this relief request. The submitted letter requested relief from Title 10 of the Code of Federal Regulations, Part 50, paragraph 50.55a(g)(4)(F)(4), which imposes a condition on America of Mechanical Engineers (ASME) Code Case N-770-1 requiring essentially 100-percent coverage be for the baseline volumetric examinations of dissimilar metal welds at reactor coolant pump nozzles at Unit 1. The licensee proposed an alternative to the required examination coverage for the subject we documented in Relief Request Number 5, Revision 0.

The acceptance review was performed to determine if there is sufficient technical information in scope depth to allow the NRC staff to complete its detailed technical review. The acceptance review is also to identify whether the application has any readily apparent information insufficiencies in its character the regulatory requirements or

The NRC staff has reviewed you sufficient detail to enable the N assessment regarding the acceptance review as compare impact the NRC staff's ability to

### Ending Record

UNITED STATES  
NUCLEAR REGULATORY COMMISSION  
WASHINGTON, D.C. 20555-0001

December 11, 2013

Mr. Marc Nazar  
Executive Vice President and  
Chief Nuclear Officer  
Florida Power and Light Company  
P.O. Box 14000  
Juno Beach, Florida 33408-0420

SUBJECT: ST. LUCIE PLANT, UNIT NO. 1 – RELIEF REQUEST NO. 5 FOR EXAMINATION OF COLD LEG DISSIMILAR METAL WELDS (TAC NO. MFO075)

Dear Mr. Nazar:

By letter dated February 4, 2013 (Agencywide Documents Access and Management System (ADAMS) Accession No. ML13046A101), as supplemented by letters dated July 30 and August 22, 2013 (ADAMS Accession Nos. ML13219A254 and ML13235A309, respectively), Florida Power & Light Company (the licensee) requested relief from Title 10 of the Code of Federal Regulations (10 CFR), Part 50, Section 50.55a(g)(4)(F) at the St. Lucie Plant, Unit No. 1 (St. Lucie Unit 1). This part of the regulation mandates and imposes conditions on the use of American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code (Code) Case N-770-1, "Alternative Examination Requirements and Acceptance Standards for Class 1 PWR (Pressurized-Water Reactor) Piping and Vessel Nozzle Butt Welds Fabricated With UNS N06082 or UNS W8182 Weld Filler Material With or Without Application of Listed Mitigation Activities." This ASME Code Case and the conditions require essentially 100-percent coverage be achieved for the baseline volumetric examinations of nickel-based Alloy 62/182 dissimilar metal welds (DMWs).

Specifically, pursuant to 10 CFR 50.55a(a)(3)(ii), the licensee requested to use the proposed alternative in Relief Request No. 5 on the basis that compliance with the specified ASME requirements would result in hardship or unusual difficulty without a compensating increase in the level of quality and safety. Relief Request No. 5 proposes an alternative to the required examination coverage for the subject DMWs at reactor coolant pump (RCP) nozzles at St. Lucie Unit 1. The relief request is applicable to the fourth 10-year inservice inspection interval.

On September 25, 2013, the U.S. Nuclear Regulatory Commission (NRC) staff verbally authorized (as documented in ADAMS Accession No. ML13268A510) the use of Relief Request No. 5 at St. Lucie Unit 1 for 64 months of plant operation at normal operating temperature (i.e., at Modes 1, 2, and 3) from the previous inspection of the RCP welds, which was last conducted in April 2010.

(Entergy) proposes, as an emergent repair, to mitigate the SCC susceptibility of the Waterford Steam Electric Station, Unit 3 (Waterford 3) reactor coolant system (RCS) cold leg drain nozzle DMWs between the nozzle and safe end by installing a full structural weld overlay (FSWOL) on the DMWs.</p>	ML19028A436
Plant Name	Abstract - Closing NRC Letter	Doc Number
Waterford 3	<p>In lieu of repairing or replacing the subject welds in accordance with the ASME Code, Section XI, the licensee proposed to install a full structural weld overlay (FSWOL) on the affected welds based on the methodology contained in ASME Code Case N-740-2, "Full Structural Dissimilar Metal Weld Overlay for Repair or Mitigation of Class 1, 2, and 3 Items</p> <p>Adherence to Section XI of the ASME Code is mandated by 10 CFR 50.55a(g)(4), "Inservice inspection standards requirement for operating plants," which states, in part, Throughout the service life of a boiling or pressurized water-cooled nuclear power facility, components (including supports) that are classified as ASME Code Class 1, Class 2, and Class 3 must meet the requirements, except design and Enclosure - 2 - access provisions and preservice examination requirements, set forth in Section XI of editions and addenda of the ASME BPV Code....</p> <p>The licensee compared the proposed alternative to ASME Code Case N-504-4, "Alternative Rules for Repair of Class 1, 2 and 3 Austenitic Stainless Steel Piping, Section XI, Division 1," and the ASME Code, Section XI, Appendix Q, as shown in Attachment 2 of the relief request dated February 4, 2019.</p>	ML19232A025

# Where are we going next

- Easier way to find a complete series of information
- We can now look at data in new ways
  - What does this data mean?
  - Are we seeing initial trends (example: start of degradation in certain components, need for new Code changes, research, etc.)
- Next Steps:
  - Mine a larger NRC ADAMS data set now that the process has been developed and determine if there are any interesting trends
  - Obtain broader member feedback from proof of concept
- Future: Potential to use developed process on structured NRC ADAMS dataset from Event Management Response Tool (EMRT) project and other code cases, requests for alternative

U.S. NRC Data Science and Artificial Intelligence  
Regulatory Applications Workshops  
Workshop #1 June 29, 2021

# Today, NLP tools will parse words based on their more common usage

**Objective: Build a Nuclear Industry NLP Dictionary**

# Our *use case* for this proof of principle

## Groundwater Contamination

Use case owner: Karen Kim-Stevens

**Goal:** Develop a NLP proof of principle that demonstrates the potential benefits of machine learning applied to this domain.

### Tasks

- Create a preliminary dictionary to be used for classification.
- Develop a NLP text analytic demo and generate preliminary insights.

### Benefits

Natural language text analytics will help the industry enhance preparation and implementation of mitigating actions in the event of inadvertent leaks and spills of radioactive materials.

### Scenario

The industry has thousands of text documents from operating experiences, maintenance reports, work orders, regulatory filings, and more that reference Groundwater Contamination. Given the safety significance and the need to find ways to operate more efficiently, all nuclear plants would benefit from extracting and sharing key information from these documents to make quicker, informed decisions, reduce the number of inadvertent spills and leaks, and enhance the safety and response time to a contamination situation.

# Potential use cases to develop risk mitigation strategies

## Identify Specific SSCs

Identify which SSCs could be associated with a failure and release radioactive liquid into the environment

- How have the sources of SSC leaks and spills changed over time?
- Does the age of the plant impact the components?
- Do certain components leak after a certain amount of time in service?

## Work Practices

Identify which work practice tasks could be associated to which jobs or systems that could cause the most release of radioactive liquid into the environment

- Do work practices during planned vs. unplanned outages affect the prediction?
- Do routine vs. non-routine affect the prediction?
- How have leaks from work practices changed over time?

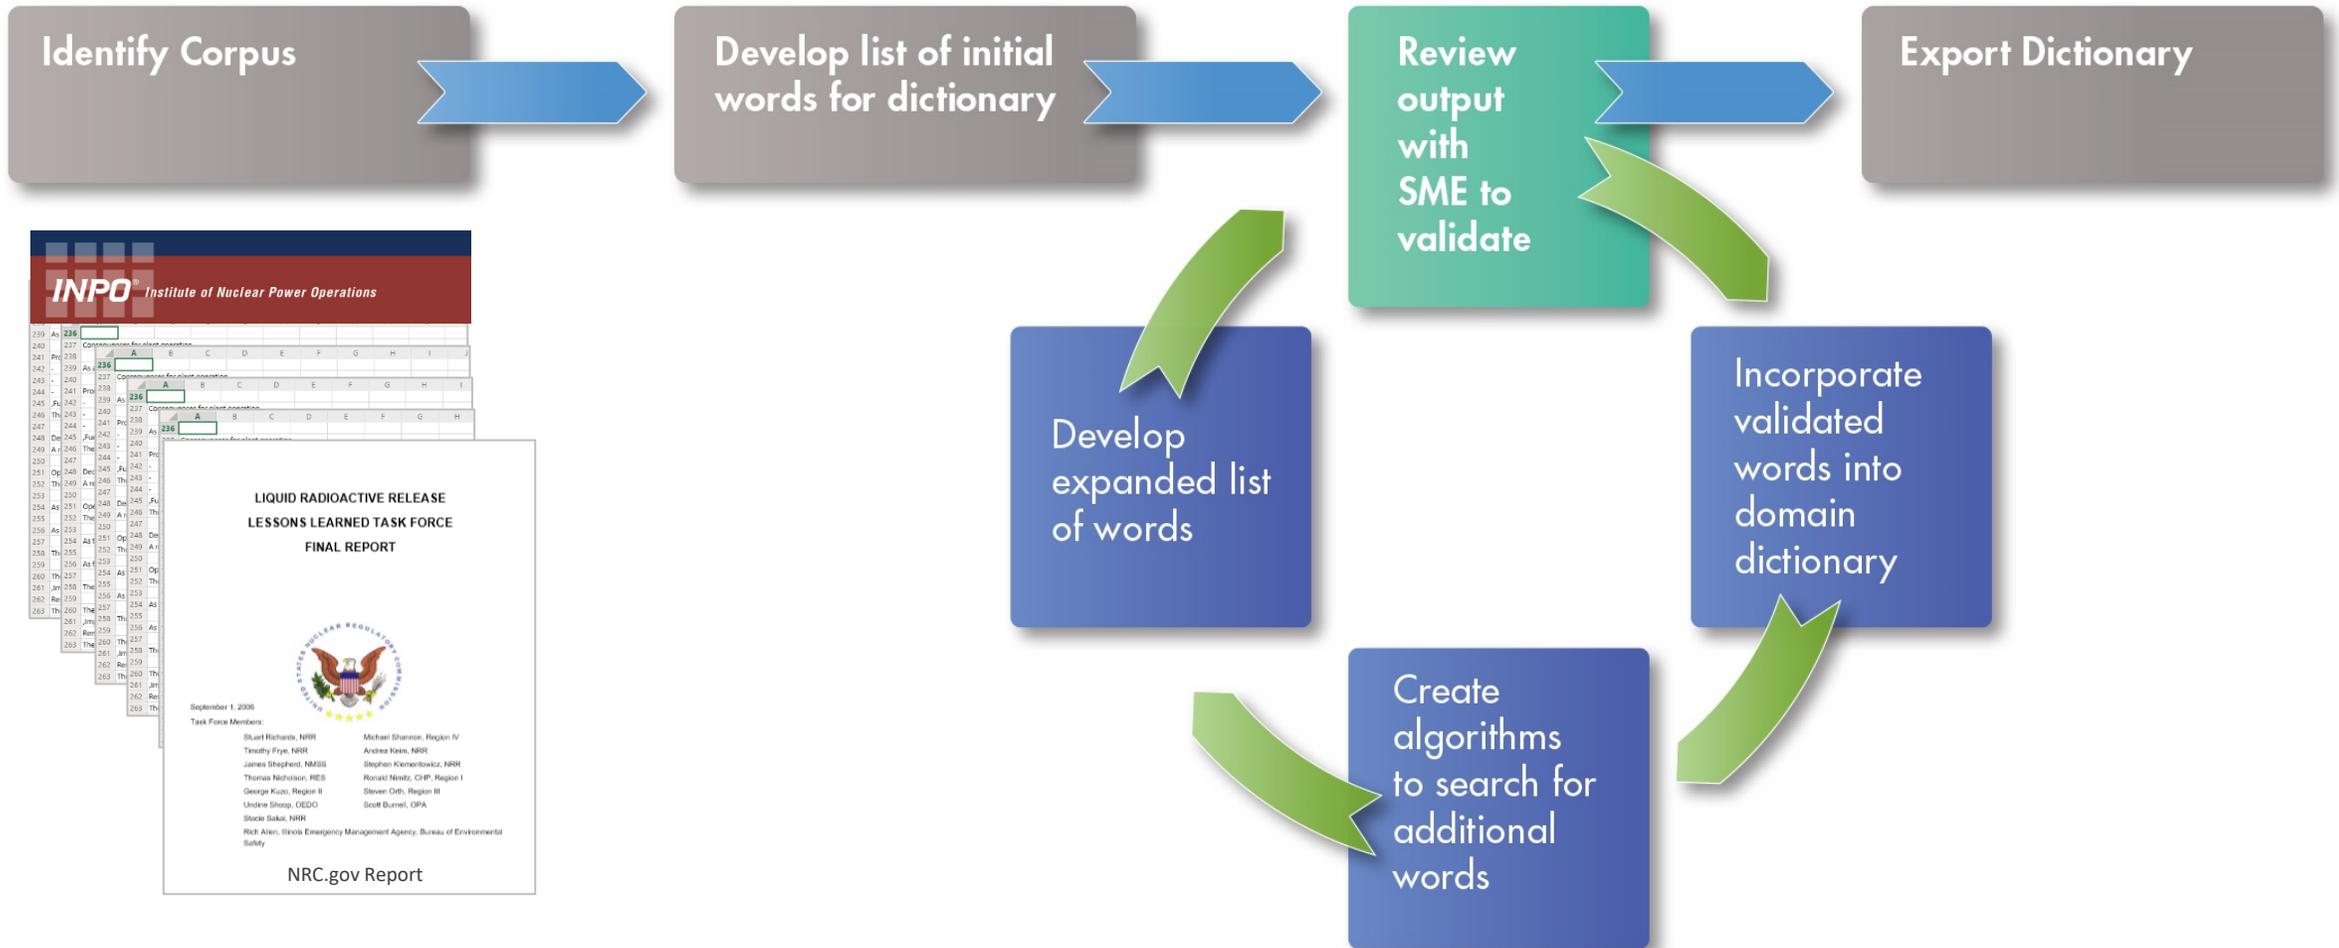

## Concentration of radioactive material

Identify how concentration of radioactive material varies by type of leak or spill

- How much does the concentration vary by SSC or WP?
- Does the magnitude vary by for SSCs at BWR vs. PWR plants?
- Can this information be used to help plants identify the source of leaks or spills?

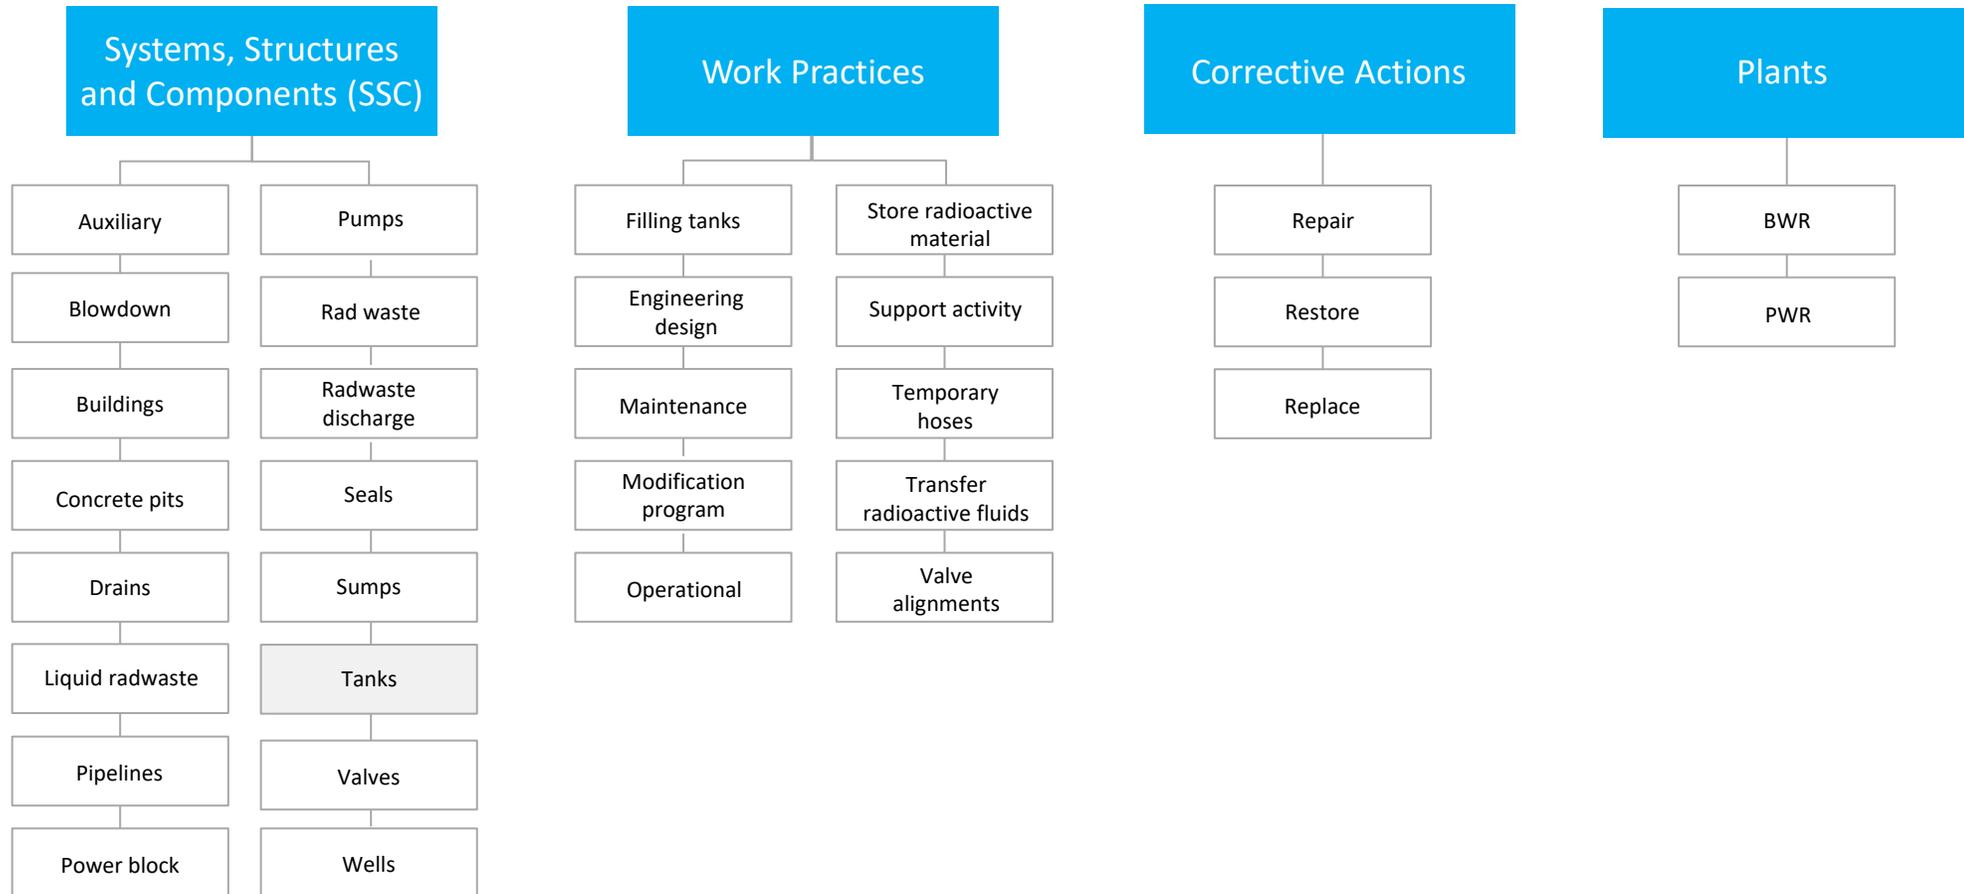

# To ensure data integrity and quality results, we followed a structured data science approach

# These NLP techniques help to get preliminary results quickly

	What is it?	Why?	Example
1 Tokenization	Algorithms to segment text into groupings, phrases, punctuation, called "tokens."	Tokens become the inputs for conducting text mining.	<p>A relief valve in the feedwater system <b>Text</b></p> <p>"A" "relief valve" "in" "the" "feedwater system" <b>Tokens</b></p>
2 Part of Speech	Statistical models that assign a part of speech to each token - noun, verb, adjective, adverb, etc.	These tags enable modeling to infer the relationships between words in phrases and sentences.	<p>A   relief   valve   in   the   feedwater   system</p> <p>DET ADJ Noun ADP DET Noun Noun</p>
3 Name Entity Recognition	Statistical models that assign labels to tokens such as date, quantity, location and more.	Entity recognition is helpful for information extraction and filtering.	<p>On April 6, 2006 <b>DATE</b>, a drain cooler relief resulting in secondary plant steam being released wall. Approximately 114,000 gallons <b>QUANTITY</b> property <b>LOCATION</b>. The system containing the</p>
4 Rules-based Matching	Algorithms that find phrases, sequences of tokens, and entities.	Improves information extraction and text mining. This approach is one way to directly incorporate SME input.	<p>The <b>cause of the leak</b> was from the <b>liquid radioactive waste processing system</b>. The system containing the feedwater was known to contain <b>tritium</b>.</p> <p>"cause of leak" "liquid radioactive waste processing system" "tritium"</p>

# Architecture for the library of dictionaries

The dictionary map provides us with guidance on how topics are organized, overlap and relate to each other. The design evolves based on programmatic exploration and feedback from our SME.

# Each word has an additional level of word associations that serve as training topics for machine learning

# The lack of a consistent industry nomenclature is a key challenge in building NLP models

For example

## groundwater

- gw
- ground water
- ground-water
- gnd water
- g water
- g-water

## picocuries

- pCi/L
- pCi
- pCi / L
- picocuries / liter
- picocuries per liter
- pCi/liter
- pCi / liter

## pits

- basins
- moats
- motes
- ponds

## power block

- auxiliary building
- auxiliary system
- rad waste building
- radwaste building

## seismic gap

- cracks
- rattle space
- seals
- structural joints

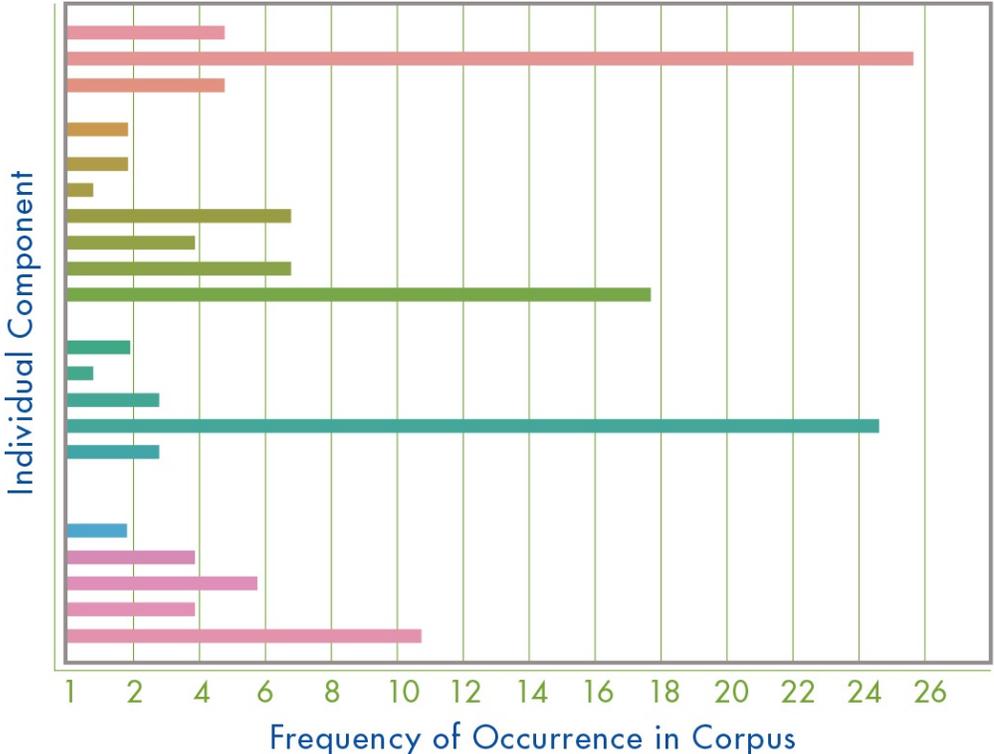

## storm drains

- drain systems
- roof drains
- storm systems
- yard drains

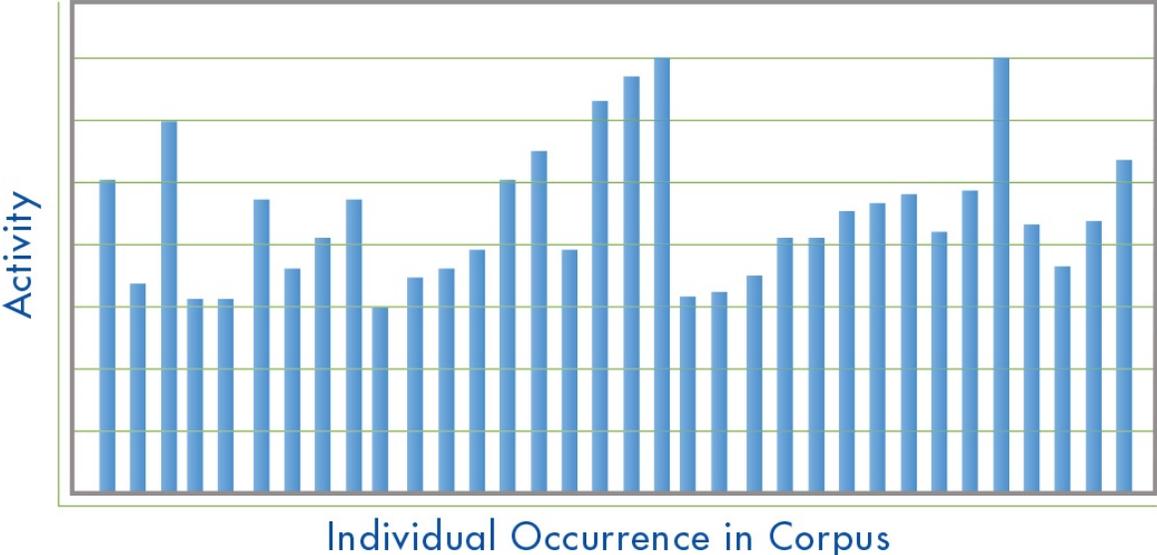

These word variabilities were identified through NLP algorithms and augmented by our subject matter expert (SME). A SME needs to provide guidance as we use the NLP tools.

# Preliminary Visualizations

Counts for systems, structures, components associated with groundwater incident reports

Tritium activity (logarithmic scale) of reported events extracted from corpus for one type of reactor design

Elements of our work are transferable  
and can help others get started on a similar project

# Roles to make this type of project successful

- **Project Sponsor**

- The project sponsor is the person or group who owns the project. They hold overall accountability of the project and are responsible for providing resources, support and guidance to enable success. This role ensures that the analysis is aligned with research and business goals.

- **Subject Matter Expert (SME)**

- The SME plays a vital role in helping the data scientist understand the data and its nuances. This role will evaluate the text analytic output, ensure it is producing relevant results, and help to describe the specific real world problem that the machine learning project is trying to solve.

- **Data Scientist**

- A data scientist collects, analyzes, and interprets large amounts of data. Their skills and expertise in highly advanced analytical tools enables them to understand the data and develop operational models, systems and tools by applying experimental and iterative methods and techniques.

- **Data Analyst**

- A data analyst examines the patterns, trends, and other insights extracted from the data. They are responsible for deriving meaningful, actionable insights from the data. They support the project by creating visualizations.

# Key Takeaways

- Open-source dictionaries do not understand electric power industry language
- An industry-specific dictionary is needed to conduct text mining and apply NLP-based algorithm
- A workflow template for dictionary construction is repeatable that can be applied to new topics
- The development of an industry specific dictionary will require investment
- However, the nuclear industry will benefit from more efficient ways of digesting and applying industry data and knowledge

Data Management and Industry Trends

# Data Science Application

- Supports monitoring station and corporate performance between evaluations/peer reviews
- Informs application of resources

# Data Science Tools - Current

- Neural Models Applying Artificial Intelligence
- Models Leveraging Machine Learning

# Neural Modeling

- Hundreds of data points are collected monthly
- Experience records are continuously reported
- Thousands of indicators are developed combining the data points and experience records
- Effects based models – limits subjectivity
- Neural modeling identifies patterns within these indicators that correlate to overall and area assessments

# Data Science - Future

- Neural Forecasting
- Scram Correlations
- Equipment Failure Correlations
- Predictive, Behavior-Informed Modeling
