General Comment

With the threat of growing threat from Climate catastrophe looming on the horizon, and the unreliability of current and future battery technology, nuclear is one of the few ways that we can avert a disaster waiting to happen. These rule changes will streamline regulation which in turn will draw greater investment and lessen the cost of development for the densest power source in the world. I firmly believe that with nuclear power at the fore, combined with the dynamism of renewable energy, we will be able to bring our power grid to net 0 before 2050. With the advancement in designs, we will be able to build safer and more reliable reactors. Please enact these changes soon, so that our children can breathe cleaner air.
